6. Wetland area from where wetland resources were collected/harvested/extracted for following uses (home garden/own plot in the wetland/community land/any other):

- (a) Fuelwood
- (b) Fodder
- (c) Raw materials for preparing handicrafts items.....
- (d) Raw materials for preparing furniture.....
- (e) Soil (sand and clay):
- (f) Other (please specify):

Part C: Perception of flood-affected communities regarding adverse effects of flood in their villages and the expected deliverables from the Government for overcoming such adverse effects.

1. What are the reasons for occurrence of flood?
2. What are the problems you face during flood?
3. What are the problems you encounter related to your livelihood?
4. How do you overcome the problems of livelihood?
5. What would you suggest in terms of intervention by any organization or the government to settle the problems related to your livelihood?

Abstract

This chapter attempts to explore community vulnerability and disaster risk reduction at Sundarbans answering four questions: (i) What are the microlevel learning experiences for building community resilience to the storm surge and flood in the Sundarbans areas? (ii) What are the major causes of community vulnerability? (iii) How do the disasters impact upon livelihood pattern of the community? (iv) What are the government strategies and plans for reducing disaster risk there? The methodology followed for this chapter is the field survey by the author and another field survey data collector, Sandip Samanta [who was an M.Phil. Scholar (2019–2021) of the Department of Political Science, the University of Burdwan] carried out for a number of times in various years, viz., 2013, 2016, 2020, 2021, and 2022. Other than the field survey, the government

and nongovernment documents/reports related to state and national policies on Sundarbans and strategy for reducing community vulnerability have been consulted. Implementation of the Sendai Framework for Disaster Risk Reduction remains as the basic framework.

Keywords

Sundarbans · Cyclone · Storm surge · Aila · Amphan · Yaas · Community vulnerability · Community resilience

Introduction

Sundarbans is situated at the super confluence of Hooghly, Padma, Brahmaputra, and Meghna rivers at the Bay of Bengal, which has been crisscrossed by many rivers like Bidyadhari, Raimangal, Ichamati, Thakuran, and so many others. The whole of the Sundarbans area experiences cyclones and super cyclones on a regular basis. Sidr (2007), Aila (2009), Bulbul (2019), Amphan (2020), and Yaas (2021) are the examples of such super cyclones in the new millennium. Storm surge due to cyclone and concomitant flood have also been a regular occurrence in the Sundarbans region. Collapse of the river dams, mostly built of mud, makes the situation more complex that has increased the community vulnerabilities. Governments, at various levels, have taken steps toward disaster risk reduction, which have substantially decreased loss of human lives. But the impact of storm surge and flood disaster is manifested through the loss of homes, agricultural land, livelihood, and livestock. The research questions of this chapter are as follows: (i) What are the microlevel learning experiences for building community resilience to the storm surge and flood in the Sundarbans areas? (ii) What are the major causes of community vulnerability? (iii) How do the disasters impact upon livelihood pattern of the community? (iv) What are the government strategies and plans for reducing disaster risk there?

Storm Narrative

“It was 20 May 2020.” Ranajit Mandal, a college student, residing at Bhubaneswari village of Maipith coastal thana in the Kultali block of the South 24 Parganas district, was recollecting the horrendous experiences of Amphan. Maipith coastal thana area under Kultali main thana in the Jaynagar II block is that area where Srinibas Mondal was killed by a tiger on November 2, 2021, while sleeping on a small fishing vessel (The Telegraph Online, 4.11.2021). Maipith, like many areas in the North and South 24 Parganas, was severely affected both by cyclones Amphan and Yaas. “We had to leave our home second time after Aila cyclone during Amphan for a safe shelter,” Ranajit recollects. On that fatal day in the morning, Ranajit along with his elder brother was watching through the little open window that the asbestos roofs of

nearby houses were being thrown off or the trees being broken in halves or being uprooted. They were not leaving the home hoping that the strongest push of the cyclone would be over soon. But just before the dusk, the asbestos roof of their own house began to break. They also got the news that the embankment of Thakuran river, a little away from their home, had collapsed and all the people were moving for safe concrete (*pucca*) buildings. So the valuable deeds and papers were packed by Ranajit's father in plastic bags and were kept on the cot, the height of which was slightly elevated by putting bricks under the cot legs. His mother was sent to the flood shelter earlier. Now, Ranajit, his father, and his elder brother also had to move for nearest concrete building. They could not walk properly due to the push of the gale. It was raining forcefully as well. They stayed in the shelter until 10 p.m. along with a huge crowd and their pets like ducks, chickens, goats, and cows and came back to their home with risk to look for the condition of their home around 10 pm, once the full thrust of cyclone was over; but found the whole area as fully inundated. Ranajit had the same experience during Yaas cyclone just 1 year after Amphan.

The Problem of Community Vulnerability and Community Resilience

Maipith area was just one of the many. As per the website of the Department of Sundarbans Affairs, Government of West Bengal (https://www.sundarbanaffairswb.in/home/page/block_profile accessed on 23.3.2022), six blocks of North 24 Parganas district, viz., Haroa, Minakhan, Sandeshkhali-I, Sandeshkhali-II, Hasnabad, and Hingalganj, and 13 blocks of South 24 Parganas district, viz., Canning-I, Canning-II, Mathurapur-I, Mathurapur-II, Jaynagar-I, Jaynagar-II, Kultali, Basanti, Gosaba, Kakdwip, Sagar, Namkhana, and Pathar Pratima, constitute Sundarbans region in India. In fact, a total of 102 islands in these blocks consist of the Sundarbans, which is "criss-crossed with mighty and often turbulent estuarine rivers having no headwater linkages and a crazy maze of innumerable creeks and tributaries. Of these 102 islands, 54 islands have human habitation supporting a population of about 3.5 million" (Bandyopadhyay, 2000, p. 3926). Besides, Sundarbans deltas spread across six *upazilas* of Khulna division and two *upazilas* of Barisal division in Bangladesh. South 24 Parganas district Human Development Report mentioned, "Sundarbans is the world's largest prograding delta region that spreads over India and Bangladesh covering around 25,500 sq. k.m. The Indian part is approximately 9,630 sq. k.m." (Development and Planning Department Government of West Bengal, 291). However, there is a conjecture regarding the measurement of the total area of Sundarbans as online Encyclopaedia Britannica mentions, "The total area of the Sundarbans, including both land and water, is roughly 3,860 square miles (10,000 square km), about three-fifths of which is in Bangladesh" (<https://www.britannica.com/place/Sundarbans> accessed on 5.2.2021). It is worth mentioning here that in 1997 Sundarbans has been declared as a UNESCO World Heritage Site.

Methodology

The methodology followed for this chapter is the field survey by the author and another field survey data collector [Sandip Samanta, who was an M.Phil. Scholar (2019–2021) of the Department of Political Science, the University of Burdwan] carried out for a number of times in various years, viz., 2013, 2016, 2020, 2021, and 2022. The author visited Gosaba block and particularly Rangabelia Gram Panchayat and Bally II Gram Panchayat in November 2013, 4 years after super cyclone Aila and other than field survey interviewed Gosaba Block Development officer to get an idea about *Administrative Planning and Political Response to a Post-Disaster Reconstruction: A Study of Gosaba Block* (in Huong Ha, L. Fernando and A. Mahmood (eds.), 2015, *Strategic Disaster Risk Management in Asia*, Springer: New Delhi). Thereafter, as part of Disaster Research Project team of the Jawaharlal Nehru University (JNU), the author participated in 4 days' workshop from January 30 to February 2, 2016, on “Community Resilience and Preparedness” at Sundarbans and conducted Household Survey on Livelihood in the Bally II Gram Panchayat with three objectives in mind: (i) to explore the ways by which people coped up with the super cyclone Aila disaster in 2009; (ii) the impact on the livelihood pattern of the people of Bally II GP in the post-Aila situation; and (iii) the learning experiences of Aila. In the third week of May 2020, super cyclone Amphan struck the Sundarbans region again, and just after 1 year in the fourth week of May 2021 super cyclone Yaas caused a havoc in the same region. After both super cyclones, Sandip Samanta [who was an M.Phil. Scholar (2019–2021) of the Department of Political Science, the University of Burdwan], a primary data collector, visited the inundated areas of the Bhubaneswari Gram Panchayat of the Kultali thana of Jaynagar II block to provide relief as part of a relief team and collected data from field observation. Once the flood receded, the said field surveyor recorded the interviews of the super cyclone-affected villagers under Maipith coastal thana in February 2022 on the abovementioned research questions.

Other than the field survey, the government and nongovernment documents/reports related to state and national policies on Sundarbans and strategy for reducing community vulnerability have been consulted. Implementation of the Sendai Framework for Disaster Risk Reduction remains as the basic framework.

Climatic Conditions of Sundarbans Region

Singh (2007) of the India Meteorological Department, in his paper, has shown data regarding threefold rate of increase in the occurrence of severe cyclones in the Bay of Bengal and Arabian Sea during the intense cyclone months of May, October, and November (Singh, 2007, p.62). Manas Mondal et al. (2020) in their paper on “Micro-level Assessment of Rural Societal Vulnerability of Coastal Regions: An Insight into Sagar Island, West Bengal, India” cited Mitra et al. (2009) which reveals

that there has been more than 6% increase in surface water temperatures (SWTs) in coastal blocks of West Bengal, especially in Sagar, Kakdwip, Namkhana, and Patharpratima (eastern and western sectors), during the last three decades, and during 2003–2009 sea surface temperature also showed a rising trend (p. 60). On the basis of these findings, Mondal et al. have come to the conclusion that the frequency and severity of cyclonic storms are straightforwardly connected with the increase in sea surface temperature (p. 60).

In a report published by the Council on Energy, Environment and Water (CEEW) in December 2020, it has been observed that in India in the second decade of this millennium 58 extreme cyclonic storms have vandalized 258 districts (p. 24). North 24 Parganas has been mentioned there as one of the most affected districts. Once the cyclone-induced storm surge occurs, the whole area becomes inundated with saline water that kills fishes in ponds, damages the crops, and makes the inundated land infertile for agriculture at least for 2/3 years.

Community Vulnerability

The whole community living in 19 blocks were severely affected by super cyclone Aila in 2009, Fani and Bulbul in 2019, Amphan in 2020, and Yaas in 2021, although there was variance in the severity. According to the NASA Earth Observatory website on cyclone Aila, wind speeds during super cyclone Aila ranged from 74 kilometers per hour to 120 kilometers per hour (<https://earthobservatory.nasa.gov/images/38786/cyclone-aila> accessed on 29.3.2022). The Indian Express (May 27, 2009) reported a total of 36 fatalities by Aila only in South 24 Parganas and North 24 Parganas districts. In 2016, the author as part of the JNU disaster research team visited ten households consisting of two Muslims, three scheduled castes, three scheduled tribes, and two general caste household in the Bally II Gram Panchayat in Gosaba block of the South 24 Parganas selected on a random basis. During that survey, it was found that every household had its own story of how they were affected and how they coped up with Aila. One household narrated that they had a boat and all the members of the family along with the members of other two households of the neighborhood rode the boat when the flood water gushed into their houses collapsing one room at about 10 a.m. in the fatal morning and they were on the boat for 2 consecutive days. Before riding on the boat, they freed the livestock (like poultry birds and cows) which were lost during Aila. However, the boat, the only means of their livelihood, got damaged during this disaster, and they did not have money to repair it. So they had to sell it on a little price. It was found that the people were shifted on that fatal day to a primary school building and the young members of a club nearby rescued all the aged people. However, they could not save the livestock. What the survey team found is that:

- (i) Community is the first responder, although there was no community leader among the en masse people in the GP. The community people were the first

who rushed to save the embankment on the fatal day, although they could not save that and the embankment collapsed to the flood water.

- (ii) Just after Aila, NGO relief would come through the rivers and would be distributed on the river *ghats*. The people living deep inside the island did not get the information of relief distribution. Even if they would get the information, it would have been impossible for them to get the relief pushing flood water for a long distance.
- (iii) Households had insurance neither for their houses nor for the livestock. The households could not save their livestock and were most affected in their immediate earning by losing the cattle or poultry birds.
- (iv) Other than Rs. 10000/- as onetime compensation and 16 kg rice per household per month for 3 years since Aila occurred (both these were given by the Gram Panchayat), Aila-affected people did not get any other compensation.
- (v) In those who had little land for cultivation or pond for fishing, their land or pond became salinized because saline flood water gushed into the land as well as to the ponds. Thus, livelihood on agriculture and fishing became very much affected by the Aila disaster. In such a situation, other than working as laborers in others' farm or working as assistant to mason/unskilled laborer of any contractor outside the Bally II GP as inter-district migration, almost no skilled avenues were open for the households, struck by Aila.

Going by the lessons of Aila, there were many changes in the coastal areas of Sundarbans. In 2010, West Bengal got 300 crores of rupees from the central government for setting up cyclone shelters, which was upheld as a major step toward disaster mitigation (*Times of India, Kolkata, 21 September 2010*). Going by Map 2, one may find a total of 45 cyclone and flood shelters in the North 24 Parganas district (some are being constructed/some are there). On January 30, 2018, *Millennium Post* reported "Govt to build 45 cyclone shelters in Sunderbans." Similarly, South 24 Parganas also is going to get 15 new shelters as has been notified by the West Bengal Disaster Management and Civil Defence Department in its website (accessed on 30.3.2022). But the major problem remains the relative distance of the residence of some people from the shelter, which bars them to bring the domestic pets or all members to that place.

Super cyclones Fani and Bulbul occurred in Sundarbans in 2019. Fani had the landfall at Odisha (not in West Bengal) with a peak intensity on May 2, 2019, with 180 km per hour wind speed (*Hindustan Times, 9 May 2020*). Yet mighty super cyclone Fani, as villagers of Sundarbans region were quoted in the news report (*Mitra, Dola, The Weather Channel (TWC), 5 May 2019*), caused 7–8-feet-high salt water waves, due to which a large area became inundated with the saline water making the farmlands unusable overnight. Super cyclone Bulbul had a land fall at Sundarbans "with maximum sustained wind speeds of 110-120 kmph gusting to 130 kmph" as reported by the TWC India Edit team (9 November 2019). It claimed a total of seven lives in North 24 Parganas and South 24 Parganas (which contain Sundarbans area)

other than eight fishermen, who were missing in South 24 Parganas (The Times of India, Kolkata, 10 November, 2019). Besides, the same report mentioned that 2.73 lakh families were affected in the storm and the fishing towns of Bakkhali and Namkhana were among the worst affected. But the super cyclone could have been more disastrous, since a low tide at the time of the storm prevented the inundation of salt water (Basu, Jayanta, Down to Earth, 12 November 2019). After Bulbul came super cyclone Amphan that crossed West Bengal coast during May 16–21, 2020, with a maximum sustained wind speed of 155–165 kmph gusting to 185 kmph (Ministry of Earth Science, Government of India posted by PIB Delhi, 14 June 2020 Available at: <https://pib.gov.in/PressReleasePage.aspx?PRID=1631493> accessed on 31.3.2022). Citing the Press Release, Government of West Bengal, printed on *Anandabazar Patrika* (National Daily in Bengali), dated May 23, 2020, the Joint Rapid Need Assessment Report on Cyclone Amphan (June 2020) prepared by the State Inter Agency Group – West Bengal mentioned in the report that the following damage was caused by cyclone Amphan: (i) 86 deaths; (ii) 384 blocks/municipal corporation/municipality were affected; (iii) according to the estimate of the West Bengal government, 21,560 sq. km of area was affected in the cyclone impacting the lives of millions of people; (iv) 13.6 million people were affected/28.56 lakhs households were affected; (v) 0.618 million people were evacuated; (vi) 5136 relief camps and 1500 gruel kitchens were set up (p. 8). Just 1 year later, super cyclone Yaas again hit the Sundarbans between May 23, 2021, and May 28, 2021. On May 26, 2021, within hours of landfall, massive inundation occurred followed by surge. “As such, about 281.2 km² of land (11.6% of district area) in South 24 Parganas was flooded, followed by East Medinipur (138.7 km², 12.4% of district area) and North 24 Parganas (10.8 km², 1.7% of district area)” (Paul & Chowdhury, 30 September 2021, p. 230).

Causes of Vulnerability

- (i) Embankment: From the above discussion, two points are clear: (i) super cyclones are occurring in Sundarbans region with an increasing intensity on a regular basis; (ii) inundation of saline water due to surge causes major damage upon livelihood based on agriculture. The inundation can be resisted, if the embankment is substantially high and stable so that it does not collapse by the water force due to storm surge especially during high tide time. In the foreword of the Report (July 2021) of the Expert Committee on the protection of coastal areas and earthen embankment through vegetative solutions, prepared by the Environment Department, Government of West Bengal, it has been noted that due to co-occurrence of high tide and land fall of Yaas, 297 km river embankment and 21 km sea dikes were damaged (p. 4). After the super cyclone Yaas, The Third Pole reported on 6 July 2021 (Basu, J., The Third Pole) citing West Bengal’s minister for disaster management, that the farm lands and fresh water ponds [main sources of livelihood in the region] being flooded with salt water,

livelihoods had been badly hit during cyclone Amphan in 2020. Besides, the gushing flood water also flattened the mud huts. The same thing happened after Aila and Bulbul.

Thus, the collapse of embankment (*Baandh*) is one of the major points of vulnerability for the people living in the coastal areas of Sundarbans. *Sundarban Nodi Bandh o jibonjibika rokha committee* (Sundarbans river embankment and life-livelihood saving committee) has been demanding for concrete embankment for long (Basu, The Third Pole, 6 July 2021). But the Expert Committee on the protection of coastal areas and earthen embankment through vegetative solutions in its report marked a total length of 559 km consisting of 378 stretches of different rivers as vulnerable (p. 5). The Expert Committee emphasized upon multilayer vegetative shield solutions in Sundarbans area rather than erstwhile focus on civil engineering measures to repair damaged/breached embankments (p. 5). Thus, one may find a shift in the policy of the West Bengal government from protecting the embankment by taking civil engineering methods to creating an eco-friendly sustainable vegetative shield of the embankment. Since eco-friendly method may take a decade or more, till then civil engineering measures are to be adopted.

- (ii) Livelihood: In the interviews (February 2022), villagers double whined against the loss of livelihood like crab or fish trading due to the COVID-19-related lockdown, on the one hand, and loss of livelihood due to inundation of saline water by Amphan into the agricultural land damaging all standing crops and making the land infertile for a number of years, on the other hand. The website of the [Department of Sundarban Affairs, Government of West Bengal](https://www.sundarbanaffairswb.in/home/block), mentions the total literacy rate in all the 19 blocks as 64.30% (<https://www.sundarbanaffairswb.in/home/block> accessed on 7.4.2022), whereas the total literacy rate in West Bengal, as per the 2011 Census, is 76.26% (available at: <https://www.census2011.co.in/census/state/west+bengal.html> accessed on 4.4.2022). From this, it is clear that the literacy rate is substantially low in Sundarbans. Moreover, People's Archive of Rural India (PARI) prepared a report on October 10, 2020, on "The slowly disappearing students of Sundarbans" (available at <https://ruralindiaonline.org/en/articles/the-slowly-disappearing-students-of-sundarbans/> accessed on 6.4.2022) that mentioned a sharp rise in dropout rates (in the Sundarbans region) since 2009. The Sendai Framework for Disaster Risk Reduction 2015–2030 has specifically focused on "to anticipate, plan for and reduce disaster risk in order to more effectively protect persons, communities and countries, their livelihoods, health, cultural heritage, socioeconomic assets and ecosystems" (p. 10). The document also mentioned that committed action should be mobilized in dealing with some significant risk drivers like consequences of poverty and inequality, climate change and variability, unplanned and rapid urbanization, poor land management, and so on (p. 10). The website of the [Department of Sundarban Affairs, Government of West Bengal](https://www.sundarbanaffairswb.in/home), mentions (Demographic Information Table 1 – given above) that total scheduled castes (TSC) and total scheduled tribes (TST)

Table 1 Demographic information of Sundarbans region as per 2011 Census

	HH	TP	TM	TF	TSC	TST	TLT	MLT	FLT	TW	CULT	AL

 Person/household, 4.63; person/sqkm, 996; male/female, 1000:955; decadal growth rate, 1.5%; % of cultivators in regard to TP, 4.6;

% of agril. laborers in regard to TP, 7.4

Note: HH household, TP total persons, TM total male, TF total female, TSC total scheduled castes, TST total scheduled tribes, TLT total literates, MLT male literates, FLT female literates, TW total workers, CULT cultivators, AL agricultural laborers

population percentage in respect of total population in the area is 35.56% and 4.79%, respectively. Although it is difficult to get the number of below-the-poverty-line households in Sundarbans, the poverty and illiteracy in the region remain clubbed with a large number of households particularly among the SC and ST population. In 2009 Planning Commission, the Government of India published the West Bengal Development Report where district-wise Human Poverty Index (HPI) was constructed by taking the weighted average of the indices of knowledge deprivation and that of public provisioning (p. 29). Accordingly, it was found there that South 24 Parganas had an HPI of 41.0 and North 24 Parganas had an HPI of 29.3. Also a large number of people remain excluded from the BPL listing. Being unskilled and uneducated, most of the population in the region depend on traditional forms of livelihood farming in one's own land or works as cultivators in others' land as day wage laborers, fishing in the river as well as ponds and forestry that is forest resource exploitation. Once the super cyclone occurs, these people with traditional forms of livelihood begin to migrate to urban areas as masons. Thus, the livelihood will continue to remain a major cause of vulnerability, if education and skills of the residents of Sundarbans face limited opportunities.

- (iii) Inaccessible Communication: The principal means of communications is navigation through rivers and creeks. On November 23, 2013, the then Gosaba BDO told in his interview that there was no other transport except navigation tide to reach Kumirmari, one of the 14 Gram Panchayats under Gosaba block, and it takes 3.5 hours' motorboat ride during high tide and 2 hours' journey during low tide, from the Gosaba BDO office. In terms of transport and communication, the whole of Sundarbans area is backward. Vulnerability to super cyclonic storms is increased in the Sundarbans by this inaccessible communications. Other than transport and communication, Sundarbans has not developed good information communication system despite the fact that mobile phones are now accessible to even the poorest inhabitants. It was found from the interview of the Amphan cyclone- and Yaas cyclone-affected residents of Sundarbans that before the cyclones for a couple of days nearest police stations or Panchayat offices make the miking through the villages making people aware of the imminent dangers and advise people to take shelter at the cyclone and flood shelters, which are made ready along with storage of food grains. But this could be done digitally by sending mobile SMS messages or voice messages. Also FM radio may be utilized for this purpose. Thus, there is no synchronized disaster risk management policy at a higher plane, and consequently responses, whether during pre-disaster or post-disaster phase, remain mismanaged, late, or uncoordinated. The World Bank in its report ([2014](#)) on Building Resilience for Sustainable Development of the Sundarbans: Strategy Report noted that the quality of disaster risk management in Sundarbans remains very low even "on traditional grounds of disaster planning, preparedness, and response" (p. 134). The report noted that "One of the weakest links in early warning dissemination was the inability of local authorities, such as GPs, to send warnings effectively to coastal communities" (p. 134).

Disaster Management Plan, 2020–2021

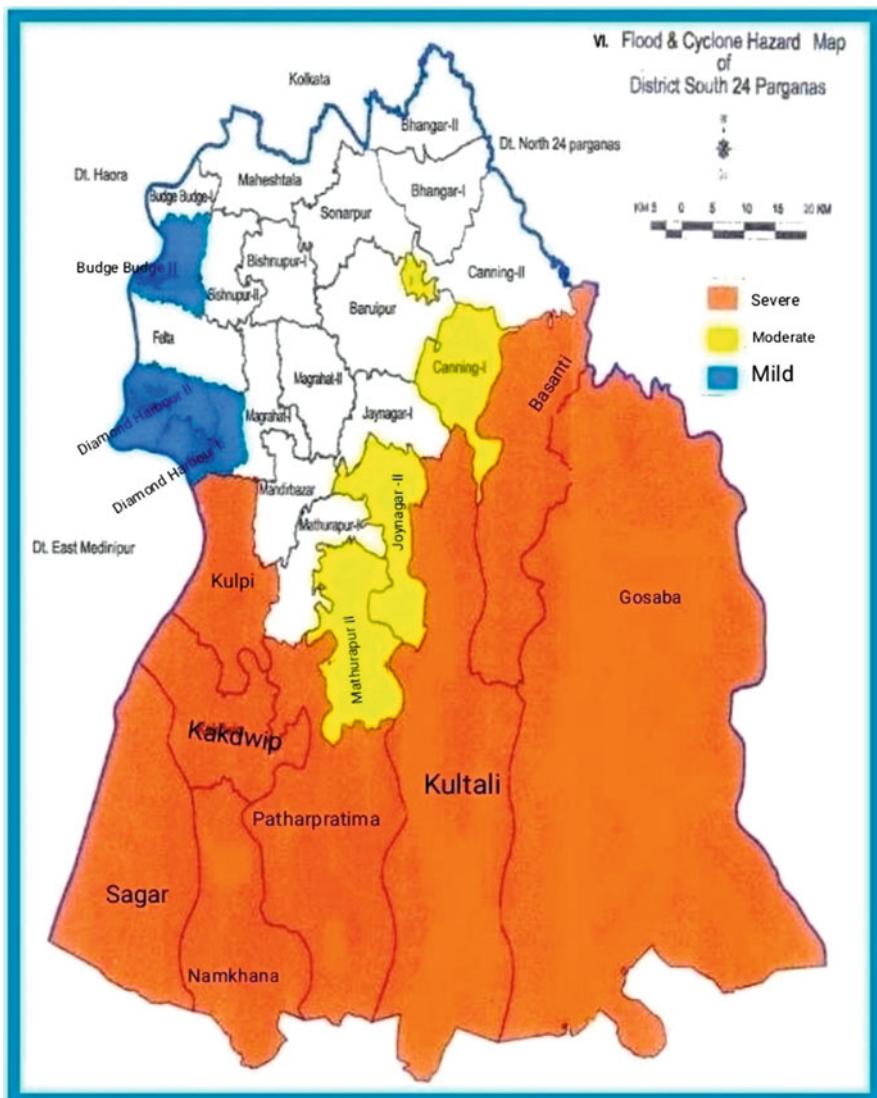

Both South 24 Parganas and North 24 Parganas districts have prepared a detailed plan for the disaster management. In the document of the South 24 Parganas district (p. 8), that detailed plan has mentioned certain targets for disaster management. These are (i) effective communication system networks; (ii) preparedness by general staff of the department and all the associated stake holders; (iii) procurement, inventory, transportation, and distribution management; (iv) setting up of the Civil Defence Establishment of Emergency Operation Centre (EOC); (v) identification of stakeholders for disaster response – early warning system (EWS); (vi) awareness, training, and capacity building; (vii) emergency support functions and preparedness; and (viii) crowdsourcing and media management.

There are certain facts which should be accepted while these plans are to be implemented. The constant change of climate and associated increase in tidal surges will remain for the time to come, and flood- and cyclone-related damage will take place on a regular interval. At the same time, building concrete embankment throughout 3500 kilometers where “the earthen embankments were built along the banks of rivers to protect the floodplain from the tidal submergence during the Raj-era” (Environment Department, 2021, Report of the Expert Committee, p. 5) is not at all possible going by the huge cost. The Report of the Expert Committee, Environment Department, Government of West Bengal, also has noted that “The embankments were built along 3500 km.-long river bank but now the length of effective embankments is not more than 1800 km” (p. 5). Realignment of embankment of the rest 1700 kms may be a long-term disaster management plan. But as short-term measures, the government should plan three things: (i) building as many cyclone and flood shelters within vicinity of the village especially in the multi-hazard areas and fully inundated areas (as shown in Maps 1 and 2) so that the residents may reach there at the time of emergency; (ii) development of education and skills of the residents of Sundarbans so that alternative livelihood could be generated in a post-disaster situation that can change the migration pattern; and (iii) development of a broad consolidated plan (World Bank, 2014, p. 139) to deal with multiple coincidental emergencies like salinity in agricultural land and fishing ponds, damage and breaking of embankment, problem of drinking water, or development of epidemics, which may develop as an aftermath of disaster.

Conclusion

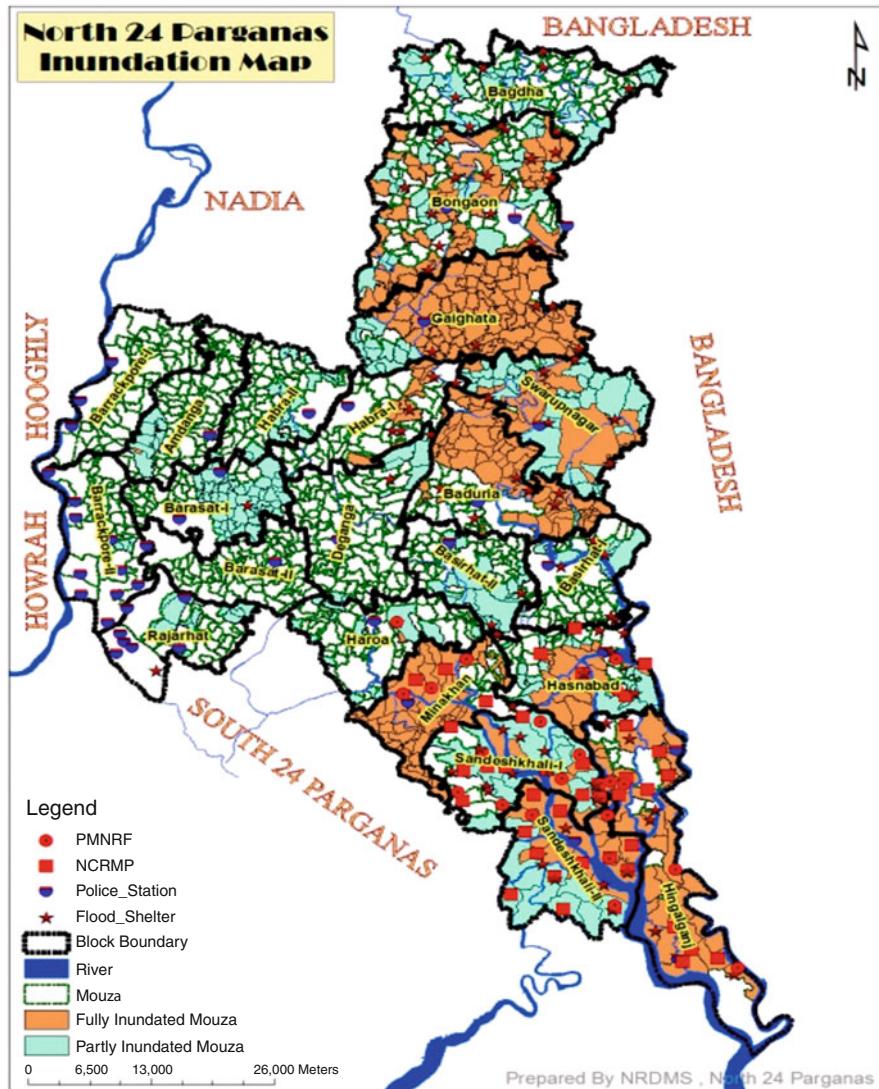

Sundarbans coastal area remains highly vulnerable from the onslaught of storms and storm surges; those are increasing due to the rise of temperature of the surface water of the Bay of Bengal. Every such onslaught destroys the livelihood and infrastructures of the coastal Sundarbans. Both the Government of India and the Government of West Bengal provide relief in every post-disaster situation. But there is a need for a comprehensive plan for disaster risk reduction. Implementation of such plan will lead to the development of capability of the local people and may cut the cost of crisis management in a post-disaster situation.

East Japan Great Earthquake and Tsunami, has been renewed and reconstructed the entire urban city within 12 years.

Introducing the practical cases of the City of Rikuzentakata, each stake holder in the multiple layers from individual, small community, municipality and national governments, civil society, and private sectors conducts critical function to maintain the governance of the respective area. This chapter discusses practical operations in Rikuzentakata provided by each sector including the author's personal experiences and signifies the importance of the post-disaster operations for the future of the urban city.

Japan · Tsunami · Earthquake · Disaster · Recovery · Reconstruction · Rikuzentakata

Introduction

Almost 12 years ago, a devastating 9.0 earthquake struck Japan's east coast, followed minutes later by a massive tsunami with 15-meter-high monster waves. Japan's legendary investment in earthquake-resistant design ended up with only about 100 people died in the earthquake itself although over 20,000 people lost their lives in the tsunami. The economic destruction of the "Disaster" was massive: 138,000 buildings were destroyed and \$360 billion in economic losses were incurred. This was the most expensive disaster in human history. Japanese response to the earthquake and tsunami was rapid, effective, and lifesaving (Ferris and Solis, March 11, 2013).

The author introduces his own experience and practical recovery operations in the City of Rikuzentakata, Japan, with the three-phase approaches for making its reconstruction and renewal processes after the Great East Japan Earthquake and Tsunami on 11 March 2011. The chapter discusses the experiences and responses focusing on the urban city with the active involvement of local communities, city government, civil society, private sector, the national government, and the international communities.

The City of Rikuzentakata, in northeastern Japan, was struck by a major tsunami – the product of an offshore earthquake that registered 9.0 on the Richter scale. Within the course of 5 min, the 14.5-meter-tall tsunami had covered the entire city and ultimately killed 7% of the city's population. As Exhibition 3 shows, nearly 1800 of the city's 24,000 residents died in the tsunami. Half of the households in the city lost their homes. The humanitarian response was hampered not only by the scale of devastation but also by the loss of one-third of the city's public officials in the disaster, many of whom died while working to save and protect fellow citizens. A further 185 members of the Chamber of Commerce in the city, out of 700 total members, perished in the disaster; and nearly 40% of all businesses closed (Giles, 2014).

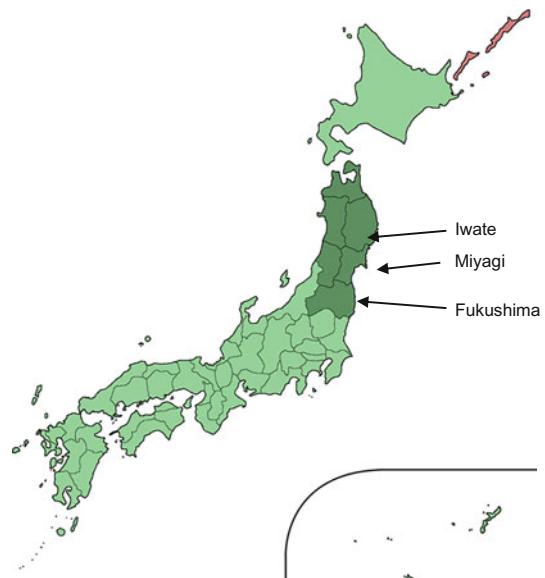

Two days earlier, on March 9, there was also an earthquake of magnitude 7.3 with its epicenter off the coast of Sanriku, the area of northeaster Japan with 300 km length in the Pacific Ocean side within three prefectures of Aomori, Iwate, and Miyagi. After all, the seismic intensity was lower than 5 in Kurihara City, Miyagi Prefecture. Iwate and Fukushima had a seismic intensity of 4. The scale of the earthquake was large, and a tsunami warning was issued. However, the tsunami that actually hit the Sanriku coast was about 20 centimeters across the board. Therefore, even though they knew that the quake on the 11th was indeed a considerable tremor and that a tsunami warning was issued immediately afterward, many people along the coast were skeptical that such a huge tsunami would come (Murakami, 2016).

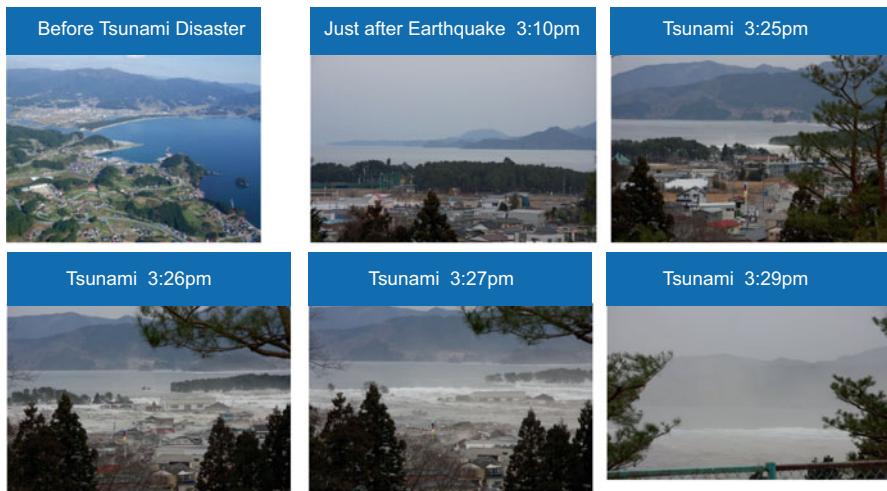

Destruction of Rikuzentakata and Neighboring Towns

Neighboring cities of Rikuzentakata are mostly fishing ports in the bays. The tsunami, literally spreading across the ocean like a giant ripple, entered the narrow bay, increased in height and momentum, and swallowed up the cities. In Miyako, the sea surface with fishing boats flowed into the urban area over several meters of seawall. In Kamaishi, the people who had evacuated to higher ground and still in the process of evacuating, was swallowed by the cold sea water. In Kesennuma, Miyagi Prefecture, next to Rikuzentakata, oil from a heavy oil tank caught fire, and the city was covered in flames in the darkness (Giles, 2014) (see Exhibition 1).

Rikuzentakata had suffered so much damage that the city center was devastated deep inside. There was no media report available from the city on the same day. This

Exhibition 1 2011 Tsunami affected prefectures on the map of Japan

Exhibition 2 Sources: The city of Rikuzentakata, presentation slides from the official report of the review committee on 2011 East Japan earthquake and tsunami, not in print

indicated the severeness of the damages and the destruction was immeasurable so that media reporters could not reach to the site of devastation. On the 12 March, the Self-Defense Forces and news helicopters were reporting aerial footage of various places (Murakami, 2016).

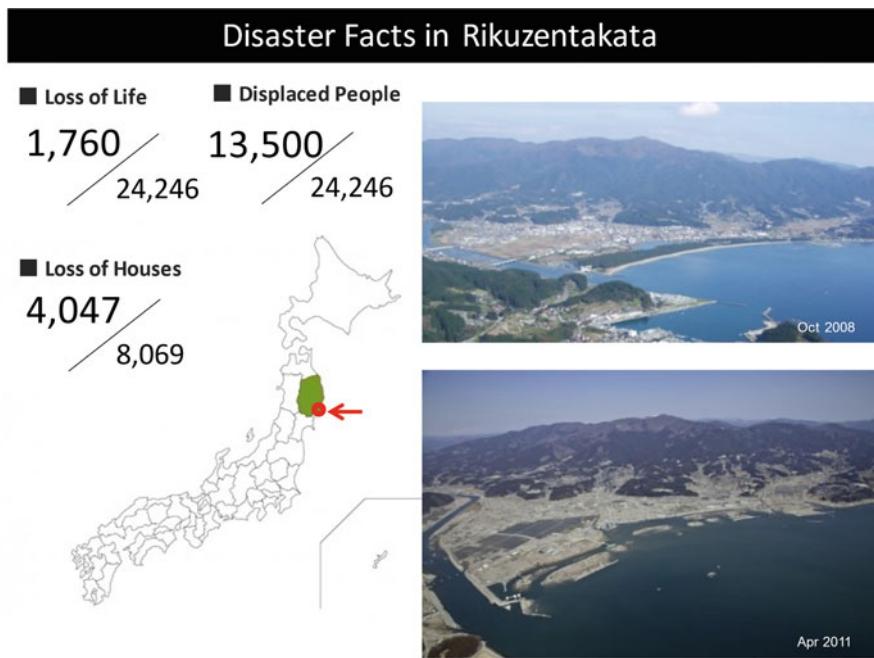

In Rikuzentakata, the “Takada Matsubara,” 70,000 pine trees on the white sands beach were completely swept away, and the tsunami rushed up the Kesen River, destroying not only the city center but also 8 km of inland area. The media reported that the third floor of the Rikuzentakata City Hall, which is a three-story building (partially a four-story building), was swallowed by seawater. Mayor Futoshi Toba, who had just become mayor 1 month prior to the fatal incident, was one of about 200 people who had to evacuate the top notch of the roof of the city hall building. The entire city was completely swamped, and some wreckages of the concrete buildings were shown over the seawater right after 14.5-meter-high tsunami clawed back from the scene (Whipp, 2011) (see Exhibition 2).

Individual and Local Community Response to the Disaster

The author had been appointed as Goodwill Ambassador of Rikuzentakata several years before this tsunami disaster and very actively promoted his own hometown to the world wherever he visited. At the time of the Earthquake and Tsunami on 11 March 2011, the author was in Hong Kong attending the regional business meeting at his company in the pacific region. Immediately after the event happened, he returned to Tokyo to gather information about the details in his hometown. Right

after arriving at the Tokyo Haneda International Airport, the author received a phone call from his long-term friend of the Japanese Diet member (The House of Representatives of the Parliament). Mr. Yoshihisa Inoue, a former Secretary-General of Komei Party of the Japanese Diet, told the author that Mr. Inoue would leave Tokyo for the affected area of Tohoku region, to find out and to give support to the region as a political party at the national level. Meantime, Mr. Toru Kikawada, a member of the House of Representatives with the Democratic Party of Japan representing the electoral district including the city of Rikuzentakata, was contacted by the author to gather the representatives of Rikuzentakata community in Tokyo area for the information gathering to be able to handle the situation for the local government of Rikuzentakata (Murakami, 2016) (Exhibitions 3 and 4).

This is an example of the author to begin conducting rescue and recovery operations. There were numbers of the similar situation among other affected local cities in the region. The residents who were severely devastated would not be able to initiate any operational movement immediately after the disaster. Therefore, many individuals having some connection with the affected area started their own activities and operations besides the government's response.

Exhibition 4 Emergency FM radio station by AidTAKATA. Sources: Photo taken by Murakami 2011

Responses of Civil Society

There were numerous responses to the large-scale disaster in Tohoku, which had been initiated by the grassroots groups from the entire Japan. Individuals from the affected area, or those who held some connection with the people in the affected area, got together in their respective urban city to organize and establish some supporting groups. The Great East Japan Earthquake and Tsunami triggered the promotion and the development of the movements by Non-for-Profit Organizations (NPO) in Japan.

In the case of Rikuzentakata, AidTAKATA was established immediately after the 2011 Tsunami disaster by those who were originally from Rikuzentakata, holding families and relatives who were victims, living in Tokyo metropolitan area, including the author (Murakami, 2021).

The members of the civil society were unable to get information on the devastated area; so they were not able to find out the exact needs of the people suffering from the fatal tsunami. The author, who has a professional experience at UNHCR, dealing with refugees in the conflict zones as well as 2004 Tsunami disaster relief operations in Indonesia, proposed to send life-saving basic materials to his hometown. AidTAKATA asked Tokyo Coca-Cola Bottlers to deliver one truck of drinking water bottles to Rikuzentakata. Although express ways and other highway systems to Tohoku region from Tokyo area were also destroyed, AidTAKATA requested Tokyo Metropolitan government's deputy governor to issue special permission for Tokyo Coca-Cola to deliver the then mentioned relief supply to Rikuzentakata via the roads available in Japan. Thus, AidTAKATA's special permission process provided was an example for other NPOs to pursue their relief activities at the disaster area in Tohoku (Murakami, 2016).

Disaster Emergency FM Radio Station

One of the most significant and influential activities of AidTAKATA in Rikuzentakata was to establish and operate the Disaster Emergency Radio Station for the local residence, visitors, and volunteer. Immediately after the disaster with the destructive condition at the entire city, the capacity of the municipality administration was impossible to make any information dissemination to local residence in emergency shelters, and saved residential housing and building. AidTAKATA consulted with the national government on behalf of the municipality to establish the “Rikuzentakata Disaster FM Radio Station” (Temporary Disaster Broadcasting Station) to share information with the local people in timely manner (Murakami, 2016).

In the areas affected by the Great East Japan Earthquake and Tsunami, similar radio stations were established for the same purpose. In case of Ishinomaki City, Miyagi Prefecture, an existing FM radio station company immediately changed their status into the Emergency Radio Station so that the station was able to focus on broadcasting information to the residents in the affected area. However, in the case of Rikuzentakata City, the damage was too devastating for the city officials to plan and establish an emergency radio station. Six months later, the Rikuzentakata FM Radio Station was established and started broadcasting with the assistance provided by international and national NGOs and private corporations (Sankei Shimbun, 2018).

In the inaugural program of the radio station the mayor, the city council chairperson, and the author aired a live Talk-Show conveying administrative information and supporting programs for local residents. The Rikuzentakata FM Radio Station operated over 6 years from December 2011 to March 2018 while most of the other similar radio stations completed their missions in 1–3 years (Sankei Shimbun, 2018).

The Great East Japan Earthquake and Tsunami actually paved the way for the growth of Japanese local NPOs. Besides AidTAKATA, numerous other NPOs established and developed their operations, programs, and governance in Japan to serve in the affected areas. The local municipality was not able to accommodate the needs of individual and local communities in the area of mental health and social counseling; therefore, the roles of the local NPOs were crucial in each community (Whipp, 2011).

Leadership of Municipality, Response, and Planning for the Reconstruction

The leadership of the municipality government changes and lead the direction of the recovery and reconstruction. Although municipality mayors of the affected area of the Great East Japan Earthquake and Tsunami conducted their recovery activities, a strong leadership with dedication, devotion, determination, and strong compassion makes a significant difference in the budget, plan, and reconstruction quality (Giles, 2014).

In the case of Rikuzentakata, Mayor Futoshi Toba had been constantly and actively talking in the national and international media as well as making blunt and straightforward words to national diet members. His bluntness has been televised in the national and international media. His strong leadership with strong messages moved numerous political figures in Japan. Few weeks after the disaster, Mayor Toba started his consultation and discussion about the future of the city with people including city officials, national leaders, cabinet members, local citizens, and NPO members.

Mr. Futoshi Toba, who was elected Mayor of Rikuzentakata 1 month prior to the Tsunami disaster, lost his house and beloved wife leaving behind his two sons aged 10 and 8. Mayor Toba devoted himself into the rescue of residents and recovery of the city from the day one. Staying and sleeping at the office of the lunch preparation facility, which was the only public facility that was saved, he led the surviving city official staff in the rescue operations while almost all buildings were destroyed including the city hall.

For 2 months he called for meetings with senior officials every morning at 7 am, delivered food for 13,000 people in the ad hoc rescue shelters in the diversified locations of the city, learnt about the status and situation of each community in the city, and held press conferences. He did not select any particular place for his discussion of city's future. For the discussions he used the mayor's office in the prefabricated temporary government building, any temporary shelters, or the author's parent house, which was also evacuated.

Unique and Special Recovery/Reconstruction Plan with Inclusion

In December 2011, the City of Rikuzentakata designed and formulated the "Rikuzentakata Recovery and Reconstruction Plan." The fundamental concepts and philosophy for setting the plan were (1) Build-Back Better, (2) Resilient City, and (3) Inclusion and Accessibility. Within 10 years of the reconstruction period, it was considered an unprecedently aggressive plan under the locational limitation, which such a rural area far from Tokyo would not be worth investing gigantic financial budget to recover. However, Mayor Futoshi Toba and his colleagues, including the author, insisted that the national cabinet ministers and senior officials of the Japanese government revitalize the vanished town into a newly rebuilt one, with the United Nations concepts of the Build-Back Better, Resilient City, and Inclusion as the fundamental concepts of the reconstruction. Mayor Toba introduced the new concept of the inclusion as the fundamental principle of the reconstruction and the development of the city named "the urban city which do not have to use the word of Normalization." The city had set its goal to become a completely inclusive and accessible community under the reconstruction and development plan. This integrated inclusion effort has been considered the first ever introduced at the post-disaster reconstruction in the international community. Thus, Mayor Toba was officially invited to make his presence and speech at the Third World Conference on the UN Disaster Risk Reduction in Sendai, Japan, in March 2015 (Toba, [2015](#)).

The reconstruction plan used a two-phase approach; (a) Creating foundation of recovery structure (FY2011–FY2013) and (b) Implementing Recovery Plan (FY2014–FY2018). However, the second phase of the Implementation Recovery Plan extended 2 years up to the FY 2020 to solve the unforeseen problems of the landscape with hard bedrock of the mountains. The reconstruction plan consisted of over 140 projects under the following categories.

1. Seawall Improvement.
2. Urban Disaster Area Land Readjustment.
3. Collective Relocation for Disaster Prevention.
4. Construction of Disaster Recovery Public Housing.
5. Development of Reconstruction Roads (Urban Planning Roads).
6. Building All Public Facilities.
7. Takata Matsubara Tsunami Reconstruction Memorial Park.
8. Development of Central Downtown of Rikuzentakata.
9. New Business and Industry Development (see Exhibitions [5](#) and [6](#)).

“Build-Back Better” – Rebuilding Rikuzentakata from Scratch

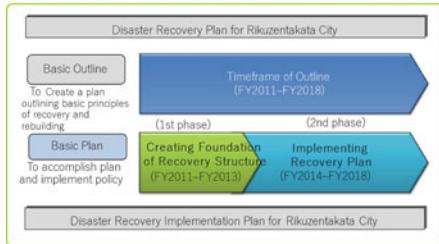

The UNDP and the World Bank started to use the term Build-Back Better (BBB) as the concept of disaster recovery is called “Build Back Better.” The idea of rebuilding the affected area is not simply to return it back to its pre-disaster state, but to transform the city into a much better state of condition and physical infrastructure by resolving the issues and obstacles the city used to have before.

All the categories and over 140 projects described above is aiming to realize the **“Build-Back Better”** in Rikuzentakata. With massive financial resources and the most advanced technologies of humankind, BBB had been testified and utilized for the city.

“Resilient City” Against Natural Disaster

As per BBB concept, Rikuzentakata was keen on the safety of the citizens and power of resilience against the natural disaster as lessons learnt from the Tsunami disaster. Especially, the Seawall Improvement projects, Land Readjustment and Relocations, Reconstruction Roads, and the Central Downtown Elevation projects were objectively implemented to seek this goal. The seawall in Rikuzentakata has been now completed with the 12 meter-high and more than 20 km long coastline of the Hirota Bay in the city. These seawalls will protect citizens from future tsunamis of 10–12 meters height in natural cycle of every 20–50 years. The central downtown area with the size of 18.7 ha has been elevated 10 meters high from the original land level so that a tsunami would not hit the elevated area. The reconstructed roads have been also realigned with wider width of about 25 meters. These new roads have been

designed to use the emergency evacuation for local residents and visitors to drive their own automobile to higher level hills (see Exhibitions 5 and 6).

“Inclusion and Accessibility”

Rikuzentakata City's concept of "Inclusion and Accessibility," or Inclusion, means that the city is aiming to build "a city that does not need the word of normalization." It was raised as part of its post-earthquake reconstruction efforts. Normalization is

Exhibition 6 Sources: City of Rikuzentakata

one of the social welfare concepts born in Northern Europe in the 1960s. Rather than a social welfare philosophy that separates and cares for the vulnerable, such as the elderly and the disabled, it refers to a society in which people can live together with anyone without such distinctions. The city has taken it a step further and aims to become an urban city with the fundamental concept of Inclusion where people of diverse backgrounds stay together without any prejudice and discrimination. This concept had been applied to the public facilities, the memorial park, and the central downtown shopping mall as well as private restaurants and houses in the city (Toba, 2015).

Strong Hope and Dream

Young Deputy Mayor

It was impossible for anyone to believe that Rikuzentakata City, which had completely disappeared, would be rebuilt as a whole urban city in the far remote area of the Tohoku region. However, Mayor Toba identified that the severely damaged residents and business owners needed “Hope” and “Dream” in their mind to grow for future. So, Mayor Toba took unpresented decision and action for the sake of the city. He appointed 35-year-old Mr. Takashi Kubota, a young bureaucrat of the national government, as the deputy mayor of the city. He was also the first ever young deputy mayor within the Tohoku region while other deputy mayors were aged 50–65 years. Mr. Kubota was well known among central government officials as an influential person in the public relations with regard to dissemination of information through social media. Mr. Kubota initiated the communication strategy for Rikuzentakata using the Facebook to update the city’s status as well as in giving information to local residents. As this aggressive initiatives, numbers of young people in and outside of Rikuzentakata were able to update the situation and to find out possibilities to start support programs as well as migrating into the city from metropolitan area.

Supports by Well-Known Business Figures

Meantime, Mayor Toba received many offers from private sectors to support the city. Mr. Miki Watanabe, the chairman and president of Watami Group, one of the well-known largest restaurant chain companies in Japan, offered the support and assistance to local businesspeople to restart their businesses. Mr. Watanabe organized in the last weekend of August 2011 the two-day Special Town Fair for local businesspeople, who had lost all of their business facilities and buildings. Using the school yard of Takata Elementary School as a venue, the city organized the town fair with the assistance of Watami Group, a national level private company in Japan, to encourage residents and business people to re-start their own businesses. Placing the imitation of the lost business district by over 100 event tents, the event invited local residents and local business owners to reinstate the sense of the commercial mindset and the activities since the tsunami disaster occurred. At the event, special cash voucher was distributed to the residents of Rikuzentakata to be able to attend the event without any hesitation. Most of the attendees were so excited and so happy with tears to meet with familiar faces of relatives, friends, community people, business acquaintance, and others at one place. The citizens did not have a chance to meet with other people until this time since the disaster. The event was also supported by people from private and public sectors, representatives of young mayors from Japan, officials from Tokyo Stock Exchange and financial institutions, representatives from Japanese university association, etc.

International Community and Global Assistance

Global Appeal at Photo Exhibition

It was clear that the people needed support and assistance domestically and internationally right after the devastating tsunami. It was also very crucial for the people of Rikuzentakata to inform the world what happened and about the status of the people in Rikuzentakata.

AidTAKATA, a not-for profit organization, headed by the author, took up a very speedy initiative to use the technics of the United Nations. "Global Appeal" has actively been utilized by the UN whenever financial and in-kind assistance are necessary to support and give assistance to those affected by man-made and/or natural disasters as in the case of the 2011 tsunami disaster. AidTAKATA organized in early June 2011 the Rikuzentakata Photo Exhibition in the middle of Tokyo using the photos taken by a Tokyo residing photographer whose mother was living in Rikuzentakata.

AidTAKATA sent out invitation letters of the Photo Exhibition to the supporting groups as well as 20 embassies of major counties in Tokyo. Fortunately, several diplomatic corps agreed to attend the event, including the ambassadors of Italy, Republic of Singapore, and others.

The Ambassador of Italy highly praised the photo exhibition and also announced plans to auction the famous Italian Ferrari in July and donate the proceeds to the city of Rikuzentakata. Minister Bay, Deputy Chief of Mission, of Singapore Republic, expressed his sympathies to the people of Rikuzentakata, and offered to discuss the possible assistance them.

The Rikuzentakata Photo Exhibition provided an extraordinary opportunity for the guests to see their own eyes the worst state of the city of Rikuzentakata .

Amazing Gift from Singapore

Mr. Bay, Deputy Chief of Mission, of Singapore Embassy, indicated to the author that they would provide the most significant assistance and donation to the City of Rikuzentakata.

The author was acting as a representative of Rikuzentakata on behalf of Mayor Futoshi Toba in front of diplomatic corps and international organizations including the case of Singapore and the United States. The Deputy Chief of Mission of Singapore requested the author to make the presentation of the state of Rikuzentakata at the Embassy with the presence of the Ambassador, Special Envoy to Japan on Disaster Relief, President of Singapore Red Cross, and senior officials of Singaporean Foreign Ministry. In this meeting the author presented the need for assistance as well as requested a multipurpose hall be built for the residents to get together at any time. As the city was washed away by tsunami, there were no public places for residents to gather for any occasion and most of the affected residents were living in evacuation shelters and temporary housing in various places, resulting in the community being completely fragmented.

The city of Rikuzentakata and the Republic of Singapore signed up the Memorandum of Cooperation by Mayor Futoshi Toba and Ambassador Ton after many preparatory meetings and discussions done by the author and DCM Mr. Bay within 3 months.

Thus, the Republic of Singapore agreed with the City of Rikuzentakata to support Rikuzentakata by building as multipurpose hall with the financial assistance of JPY 700 million and other assistance thereafter.

In March 2015, the multi-purpose hall, later named “Singapore Hall,” was inaugurated by having the affiliated meeting of the Third UN World Conference on Disaster Risk Reduction (Murakami, 2016) (see Exhibition 7).

In addition, the Singapore Red Cross Society established the “Japan Disaster Fund 2011” and carried out fund-raising activities in cooperation with the Japanese Residents’ Association in Singapore, and collected a total of 2.2 billion yen in financial donations.

This donated fund was also used for the reconstruction works in Miyako City, Iwate Prefecture, Shichigahama City, Miyagi Prefecture, and Soma City, Fukushima Prefecture later on (Murakami, 2016) (Exhibition 8).

The Republic of Singapore donated JPY 700M for Singapore Hall

Exhibition 7 Sources: AidTAKATA

TOMODACHI Initiative

Meantime, in September 2011, Mayor Toba and the author visited the US Embassy in Tokyo and met with the Ambassador Roos and his senior advisor. At the meeting, Mayor Toba told the Ambassador that children were particularly hurt by the tsunami disaster, and requested the US Embassy to establish the “cross-cultural education” to assist school children in Rikuzentakata to change their perspectives about the way of living.

Ambassador Roos promised with Mayor Toba to provide full support for the request made. The author acted as the point of contact for the preparation for formulating and implementing the newly developed program for the children of Rikuzentakata (Murakami, 2016).

The following year, the US-Japan Council established the TOMODACHI Initiative and introduced to the Japanese business and industrial associations. The first program for Rikuzentakata was to provide the 3 day “Homestay” for 13–14-year-old school children. The participants of the program spent time with the American families in the US Navy base of Yokosuka, Japan and learnt about the new culture, spoke English, and enjoyed their life style, but they also suffered in the tiny temporary accommodation for more than 6 months. This post-earthquake reconstruction project aimed to nurture the next generation of leaders with an international

Exhibition 8 Sources: Kiyoshi Murakami

outlook and qualities through programs such as education, cultural exchange, and leadership. The impact of the program was identified by each participant's career they took now (Murakami, 2021).

Conclusion

The East Japan Great Earthquake and Tsunami on 11 March 2011 was a once-in-a-thousand-years disaster. It was also extraordinary that the extent of the devastated area and the number of people who lost their lives, suffered damages, or had their livelihoods destroyed. The City of Rikuzentakata, completely devastated and wiped out, has been renewed and reconstructed into an entire urban city within 12 years. The author introduced his own experiences and practical recovery operations within Japan as well as outspoken to the international community especially with the United States and Singapore. In the City of Rikuzentakata, it was very crucial to keep and maintain the assistance resources, promotion of support needs, as well as three phase approaches for making its reconstruction and renewal processes.

The city's main aim for the recovery and reconstruction was to come up with the designed and formulated "Rikuzentakata Recovery & Reconstruction Plan" in early stage with the consultation with residents and communities. The fundamental

concepts and philosophy for setting the plan were (1) Build-Back Better, (2) Resilient City, and (3) Inclusion and Accessibility.

Rebuilding the affected area with the idea of Build-Back Better is not simply to return it to its pre-disaster state, but to transform the entire city into a much better state of the condition and physical infrastructure by resolving the issues and obstacles the city used to have before. It may cost gigantic financial resources, but the trial attempt in Rikuzentakata has been worth investing the finance to it.

It would be a good opportunity to rebuild a resilient city. In the case of Rikuzentakata, it was so keen on the safety of the citizens and power of resilience against natural disaster as lessons learnt from the Tsunami disaster. Although the reconstruction with houses, buildings, and the fundamental infrastructure of the city have been completed, it is always crucial for local people to establish and to keep the community based disaster prevention programs. Therefore, the concept of Resilient City should be consisted with developing physical safe infrastructure in an urban city and well-trained human behavior by local community.

Although it was a very new concept at the time of the tsunami disaster in 2011, the concept of “Inclusion and Accessibility” has been the norm in the international arena after the Sendai Framework was formulated and disseminated. Residents in Rikuzentakata have been using this concept in the past decade so that city policies and practices have also been impacted by this concept of using another term of the Sustainable Development Goals (SDGs).

Through this chapter’s aim and basic concepts, it is author’s strong wish that all of the introduced measures against disaster and post-disaster could be utilized and shared with any other place wherever recovery and reconstruction is needed after a natural disaster as well as in post-conflict rebuilding of the community.

mitigation strategies can achieve limited success. It has to be linked with livelihood restoration, reinforcing market linkages, environmental protection, and catering to needs of diverse sections of society while having an effective grievance redressal system in place.

Case studies across the world have shown that owner-driven housing reconstruction is the most successful model. Owners have knowledge about the cultural construction of the place and their personal as well as community needs. This when combined with knowledge of hazard, exposure to disasters, and structural safety designs can lead to the best outcome.

The physical loss of housing eclipses various significant aspects of daily existences which are impacted negatively. Although housing reconstruction is accorded a higher pedestal in finance allocation, it has a low profile on the humanitarian agenda per se. A house safeguards health, privacy, dignity, and security of individuals. Thus, housing loss inevitably exacerbates vulnerability of the survivor.

Housing reconstruction faces many hurdles; it is strategically sandwiched between short-term relief work and long-term developmental agenda of the state. Post-disaster housing reconstruction may be limited by finance, strict time frames (up to 1.5 years), institutional capacities, and inaccuracies in damage assessment in addition to implementation failures. This chapter explores various aspects of housing by taking particular case studies of four states of India: Gujarat, Kerala, Uttarakhand and Odisha.

Housing · Reconstruction · Disaster · Development · Recovery

Introduction

Housing reconstruction occupies a pre-eminent position when it comes to prioritizing sectors needing attention in the immediate aftermath of a disaster. It should be highlighted, however, that housing reconstruction in isolation can achieve limited success. It has to be linked with livelihood restoration, reinforcing market linkages, environmental protection, and catering to needs of diverse sections of society while having an effective grievance redressal system in place.

Case studies across the world have shown that owner-driven housing reconstruction is the most successful model. Owners have knowledge about the cultural construction of the place and their personal as well as community needs. This when combined with knowledge of hazard, exposure to disasters, and structural safety designs can lead to the best outcome.

Housing Reconstruction

Research has proved that restoration of housing infrastructure is critical for individuals and households to carry on routine activities and function. Thus delay in restoration of permanent housing infrastructure impedes the ability of individuals to swiftly recover from the catastrophe. While the significance of housing reconstruction need not be emphasized, ironically housing reconstruction has emerged as central theme of recovery very recently. The process of housing reconstruction remains significantly understudied.

Gujarat Earthquake, 2001 (Map 1)

The state of Gujarat suffered massive damage in the Bhuj Earthquake. Close to 3.5 lakh houses were completely destroyed while more than 9 lakh houses suffered damage to various degrees.

The World Bank and Asian Development Bank came forward to provide financial and technical input to embark upon housing reconstruction. However, it is to be noted that the assistance provided is the basic minimum for housing reconstruction, immaterial of cost of erstwhile property of the owner. Families with totally demolished *kuchcha* houses were entitled to a maximum grant of INR. 30,000. On the other hand families which owned *pucca* houses, now totally demolished, were entitled to a maximum grant of INR 90000.

While it is true that there is differential assistance to rich and poor people, at the same time the quantum of assistance doled out to middle- and high-income houses was not enough to replace old structures (Simpson, 2013). Settling rights of tenants and homeless persons is a challenging task.

There are certain limitations which are imposed to the maximum assistance which can be provided under the central government Relief Code. According to the code not more than INR. 95,000 can be provided as compensation for totally demolished houses.

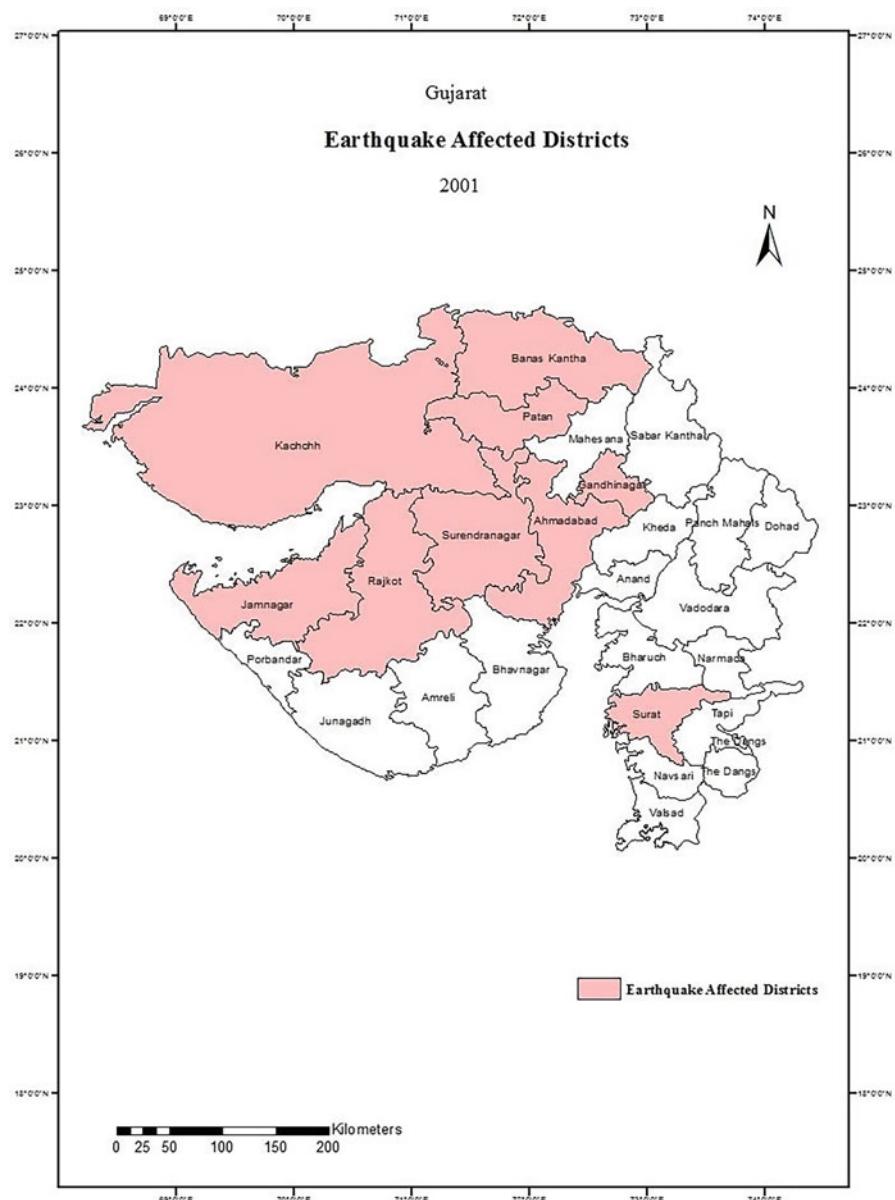

In case of Bhuj earthquake, the government undertook the ambitious target of reconstructing close to 2.3 lakh houses and repair and strengthening of about one million houses.

The state government announced five packages for reconstruction and retrofitting of demolished and damaged buildings.

Gujarat Reconstruction and Rehabilitation Policy

The GSDMA's Reconstruction and Rehabilitation policy document highlights that the government wanted to promote owner-driven reconstruction to instill a sense of confidence among the beneficiaries.

The government promised to support complete reconstruction of 2,30,000 collapsed and demolished houses. The government's housing recovery policy is

Map 1 Earthquake affected districts

participatory, community driven with technical support from the government, private sector, NGO, etc.

Community-Driven Housing Recovery

The state reconstruction policy document claims that the state has offered multiple options to the earthquake-affected population for partial to complete relocation to in situ reconstruction. The document notes that approach to reconstruction is decentralized which delegates financial and administrative and technical resources. The plan document claims that reconstruction should be a community-based, owner-driven program. Owners are responsible for carrying out reconstruction or repair through informal, formal contracts.

The recovery program has been envisaged to be a tripartite program, between the Government of Gujarat, the beneficiaries, and the private sector. While the homeowners were the primary drivers of the reconstruction process, the practical reconstruction exercise is carried out by a partnership between local artisans, NGO, contractor, cooperatives, and the home owner. The document underlines that if a home owner wants to increase his house size than before, he can approach a micro-finance institution for credit.

The government promised to support repair of more than a million damaged houses. Option was provided to the home owner to either repair their damaged houses on their own or to enter into a contract with an NGO or small contractor.

Assistance for Housing Recovery

Package 1

Package I was for the reconstruction and rehabilitation of villages in zone IV and zone V where more than half of the total houses have collapsed. It envisaged INR 3 crore per village of 200 households (1.8 crore for *pucca*, disaster-resilient houses, 70 lakh for infrastructure, 30 lakh for land acquisition, and 20 lakh for creation of emergency facilities).

Package 2

Package 2 is for settlements in seismic zone IV and V which decided to go for in situ housing reconstruction. In this case, those Below Poverty Line families which have lost their houses shall receive assistance of INR 40000, while others may receive assistance up to INR 90000 for reconstruction at the rate of INR 2000/sq. m. of built-up area to a maximum of 45 sq. m.

Package 3

Package 3 was provided for rural settlements located in zones other than Zone IV and V wherein houses have been completely destroyed or partially damaged. The assistance under this package ranges from INR 7000 for totally destroyed huts to INR 40000 for a fully damaged house. In case of assistance for repair of the house, the grant varies from INR 2000 to 20,000 depending upon the level of damage.

Package 4-A

It relates to Reinforced Cement Concrete. Under this package, assistance is provided to the owner of reinforced concrete structure for INR 3500 per sq. m. up to a maximum built-up area of 50 sq. m. Under this package, assistance is provided for repairs and structural strengthening of buildings.

Package 4-B

This package deals with load-bearing structures in municipalities and municipal corporations. Assistance will be provided at the rate of INR 2800 per sq. m. up to a maximum of 50 sq. m. (1. 40 lakh).

Package 5

It relates to the rehabilitation of four worst affected towns: Bhuj, Ajnar, Bhachau, and Rapar. Under package 5, assistance was provided at the rate of INR 3500 per sq. m. with a ceiling of INR 1.75 lakh for a maximum of 50 sq. m.

The state Reconstruction and Rehabilitation policy document underlines that the guiding principles behind these housing packages are twofold: the provisioning of basic shelter to all affected households and equity.

It is clear that the individual assistance for reconstruction of a house is for a minimum of 30 sq. m. and a maximum of 50 sq. m. The scheme of assistance compensates house owners with bigger houses better.

It is categorically stated that the intent of the reconstruction policy is to provide houses for basic sustenance. Those residential units which had non-residential uses would not be compensated for damage. While the reconstruction policy document underlines “resilience” as the desirable goal, it does not define the modalities as to how resilience will be built into the new infrastructure. There seems to be no objective criteria of defining categories of losses; “partially damaged” category is apparently the most extensive category which encompasses losses from 30 percent to 70 percent, the compensation being constant horizontally.

It is to be noted that the amount of compensation released by government is in nature of “ex gratia” grants. This to say that such a compensation is to be released based on government’s discretion and is not an obligation per se; thus it cannot be claimed as a matter of right.

Housing Reconstruction: Implementation Arrangements and Outcomes

The government of Gujarat involved a number of agencies, industrial houses, NGOs, private sector, professionals, and experts in the reconstruction exercise to support the community. Simpson based on his field visit observes that the villages which reconstructed their own houses (owner-driven approach) seemingly produced more sensible and better results as compared to contractor-driven approach. Owner-driven housing reconstruction approach improved awareness about safety designs in building. The model also encouraged local economy as artisans, laborers, and suppliers of

building materials. Even in the owner-driven model of reconstruction, private sector was co-opted as facilitator donning roles which was previously a prerogative of the state. In this manner the role of state was being re-imagined at the grassroots.

Tax Concession to Industries in Kuchh

Simpson (2013) notes that the tax concessions provided to industries to locate in Kuchh would have an impact that is more profound than the earthquake itself. Apart from partial restructuring of the state, the most significant intervention was setting up of new industries in the region. The World Bank, Asian Development Bank, and other development banks hailed this as a big success of their intervention. However, as Simpson notes, the onslaught of private sector immensely altered the character of countryside. He terms the imposition of industries as a “graft as opposed to a revolution at the grassroots.” While admitting that there isn’t anything intrinsically wrong with industrialization per se, the circumstances under which it was imposed and the desperation that accompanied it made it questionable. Notes that capitalism as a system uses public disorientation to control and profiteer. She cites example of the Indian Ocean Tsunami as a case of capitalist opportunism.

Priorities in Reconstruction

The priorities and classificatory practices that were adopted for impact assessment of the earthquake were determined by templates which were provided by the international development banks. The restoration of physical infrastructure was the primary focus objective. Field Study showed that rural urban areas were treated differently. While gender equality and livelihood generation were highlighted as key development interventions, the outcomes did not keep pace. The reconstruction policies were designed in a manner as to fundamentally alter the nature of society, economy, and polity of the region through restructuration.

Public Private Partnership

Public Private Partnership was the popular mode for housing reconstruction. A mandatory insurance policy was enforced in order to cover for future damages due to natural disasters. The loan agreement along with insurance coverage facilitated penetration of private insurance companies into rural markets. This mandatory insurance clause bode well for the profit seekers. The World Bank later acknowledged that this policy improved the customer base for insurance industry (Simpson, 2013).

By focusing largely on reconstruction of physical infrastructure and linking housing programs with private insurance, the recovery exercise has ensured that future cost of disasters would be borne by market forces, with the state playing a

facilitating role. Alternatively, the responsibility of regulation and management of disaster has now been shifted from the benevolent welfare state to the profit-seeking private sector. Watershed in that it the relationship between state and citizenry underwent a profound change. The state could no longer be held “entirely” responsible for clearing up after a disaster.

Disaster as an Opportunity

Looking at the pattern of reconstruction, it can be concluded that disasters are seen as an opportunity to redesign spaces and introduce new systems of land management and governance. Newer legislations were designed specifically in case of Gujarat to do away with protectionist measures. In accordance with the neo-liberal logic, to enable smooth functioning of the market, land records and titling procedures were improved. Simpson (2013) puts it aptly as, “policy drafted in offices in Manila, Geneva and New York rippled invisibly into provinces of Gujarat.” In case of Uttarakhand the disaster did little to ignite a debate on the faulty developmental practices of the state; rather it reinforced the priorities of the plain districts over the hilly ones.

Simpson (2013) notes that the tax concessions provided to industries to locate in Kuchh would have an impact that is more profound than the earthquake itself. Apart from partial restructuring of the state, the most significant intervention was setting up of new industries in the region. The World Bank, Asian Development Bank, and other development banks hailed this as a big success of their intervention. However, as Simpson notes, the onslaught of private sector immensely altered the character of countryside. He terms the imposition of industries as a “graft as opposed to a revolution at the grassroots.” While admitting that there isn’t anything intrinsically wrong with industrialization per se, the circumstances under which it was imposed and the desperation that accompanied it made it questionable. Notes that capitalism as a system uses public disorientation to control and profiteer. She cites example of the Indian Ocean Tsunami as a case of capitalist opportunism.

Looked at disasters as moments of hyper-consumption. Given the right set of conditions, this “moment” could be a powerful economic stimulus. To that extent, a disaster accelerates entropy of the economic system. A disaster is thus used as an opportunity to change the order of things. This may include privatizing commons, cheapening terms of trade, state forgoing its revenue, and consolidation of the private sector. Mill’s proposition of disasters as moments of hyper-consumption was exemplified in case of Gujarat wherein growth did pick up post-disaster.

Politics of Aid

The government of Gujarat in its correspondence with the World Bank while seeking financial assistance highlighted local problems as general issues needing attention. In this manner it lent an emotive urgency to its appeal. It used the earthquake as an

opportunity to speed up reforms and restructure its own institutions and governance framework to incentivize “service providers” and align with market principles. Alternately, these changes are also explained as necessary pre-conditions to be eligible for soft loans. The earthquake exposed the weaknesses and eccentricities of governance and planning in the region. The disaster, in this manner, became intrinsically linked to the general reforms of the financial sector particularly in terms of the ways in which local bodies could access funds for infrastructure development from commercial banks.

Priorities in Reconstruction

The priorities and classificatory practices that were adopted for impact assessment of the earthquake were determined by templates which were provided by the international development banks. The restoration of physical infrastructure was the primary focus objective. Field study showed that rural urban areas were treated differently. While gender equality and livelihood generation were highlighted as key development interventions, the outcomes did not keep pace. The reconstruction policies were designed in a manner as to fundamentally alter the nature of society, economy, and polity of the region through restructuration.

It is also important that housing reconstruction policy should cater to the concern of tenants in addition to that of owners.

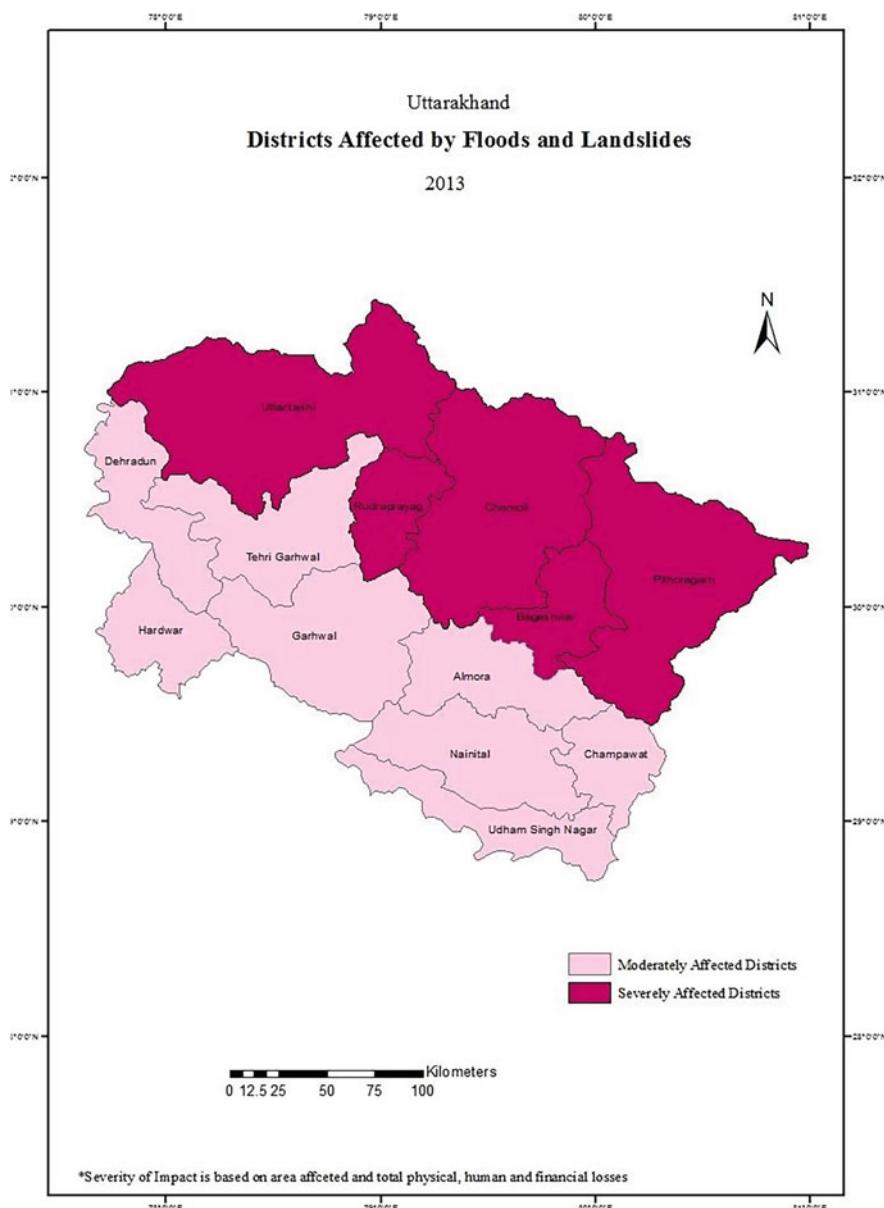

Uttarakhand Floods, 2013: Pre-existing Vulnerability and Post-disaster Reconstruction (Map 2)

In the post-disaster landscape, though structural rebuilding assumes primacy the real challenge lays in restoring lives and livelihoods of the people.

While disasters have been a part of earth’s natural system, there is a reason to believe that anthropogenic activities in the name of “development” exacerbate the impact of disasters. Taking the case of Uttarakhand floods, 2013, it is observed that years of perusal of economic growth-led development model which has little regard of the state’s predisposition to natural hazards have aggravated the impact of floods.

The economic growth centric development model was neither sustainable nor equitable which was manifested in the impact experienced by different sections of society.

It is to be recalled that the agitation which led to the creation of a separate state of Uttarakhand was based on the premise of differential needs of mountainous and plain regions. Paradoxically, the kind of development pursued later was same as in any other non-mountainous region. Though 9 of 13 districts in Uttarakhand are mountainous, policy prescriptions are tweaked towards the interest of districts in the plain.

Map 2 Districts affected by floods and landslides

The legacy of struggle to save the forests (which was epitomized by the *Chipko* movement) was pitching for a form of development which prioritizes the augmentation of human, sociocultural, and natural capital over mere economic growth.

Table 1 Uttarakhand flood, 2013: Summary of damage

Sector	Cost (INR Crores)	Damage as a percentage of Total Estimated Monetary Loss
Housing	151	3.8
Public buildings	103	2.6
Roads and bridges	2710	68.3
Urban infrastructure	127	3.2
Rural infrastructure	131	3.3
Livelihoods	167	4.2
Irrigation	140	3.5
Tourism infrastructure	117	3.0
Energy/power	266	6.7
Forest and biodiversity	54	1.4
Total	3966	

Source: Oxfam, 2015

The disaster experienced in Uttarakhand may also be seen as reminder that the model of development being pursued in the Himalayan states is destructive (Table 1).

As is evident, a substantial proportion of total loss is registered by “roads and bridges category” (68.3 percent). Losses to housing stock are estimated to be 3.5 percent which has been criticized for being an underestimation. Similarly losses to livelihood have been put at 4.2 percent. According to data from Oxfam, total Housing and Livelihood losses have been put at 8 percent.

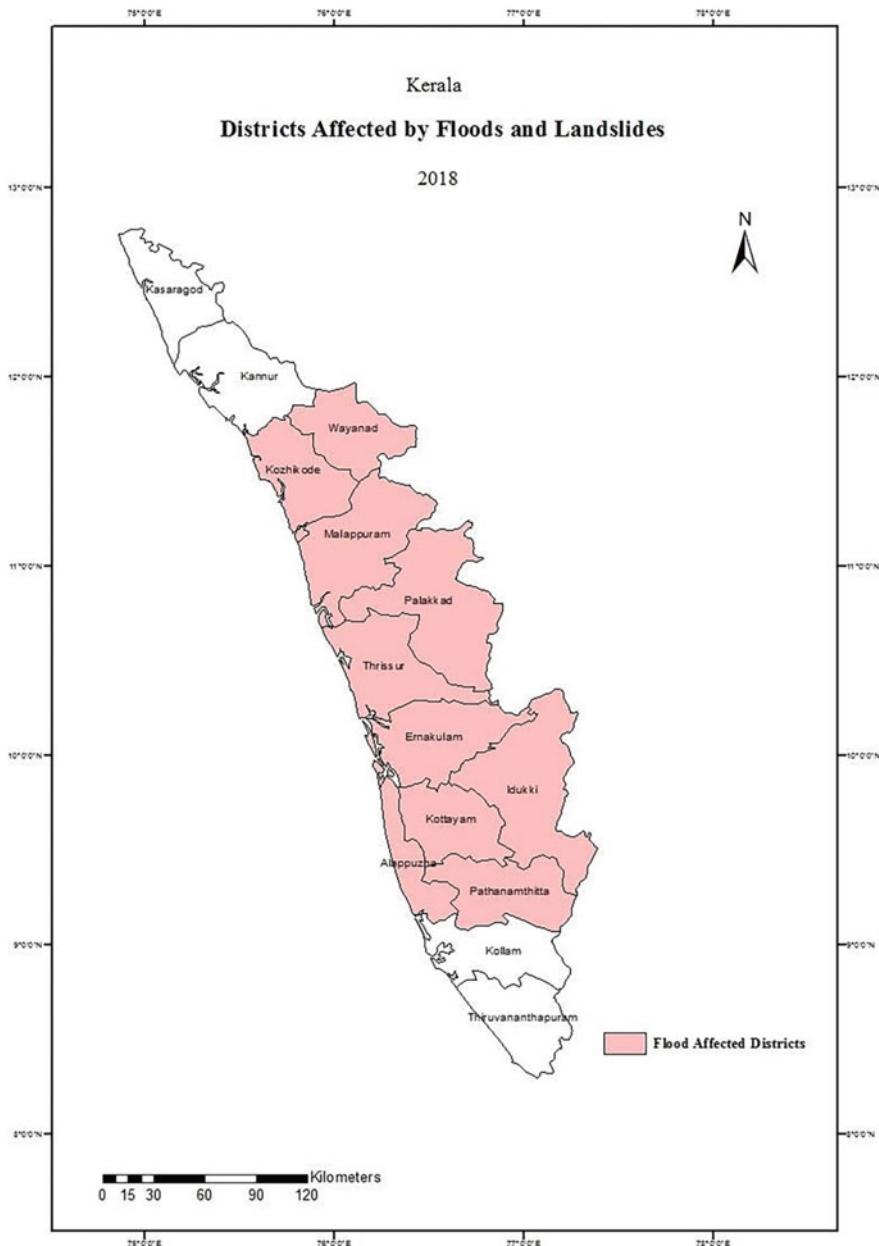

Needs Assessment exercise is crucial as it pegs damage to monetary losses. Underestimation of damage affects allotment of resources in prospective recovery. It is clear that in any disaster, infrastructure sector will account for maximum losses. This has a bearing on monetary allocation for housing reconstruction and livelihood restoration.

Kerala Floods, 2018 (Map 3, Table 2)

It is evident that the World Bank and Asian Development Banks are the major funding agencies for reconstruction in the aftermath of Kerala floods. State governments are increasingly resorting to external borrowings as domestic interest rates are high (Tables 3 and 4).

Highest package is accorded to villages in Zone IV and V where more than 50 percent of houses have collapsed. Amount devoted is to the tune of Rs. 3 crore per village (of 200 households). The package assumes Rs. 30 lakh for land acquisition, Rs. 70 lakh for infrastructure, and 1.8 crore for reconstructing.

The current system of estimation of housing damage is such that it accounts for only a fraction of total losses. Usually in absence of robust financial support, families

Map 3 Districts affected by floods and landslides

rebuild houses with substandard building material which predisposes them to prospective disaster-induced damage.

Table 2 Kerala: Summary of finance mobilization to undertake reconstruction of physical infrastructure

	Funding agency	Proposed loan amount (crore)	Percentage share
1	World Bank and Asian Development Bank	7200	45
2	RIDF	400	3
3	NIDA	2500	16
4	HUDCO	1300	8
5	Cess on GST	1000	6
6	LSGI development fund	1500	9
7	State plan savings	2000	13
8	Total	15,900	100

Source: Finance Department, Government of Kerala, order dated 12.10.2018

Fani Cyclone 2019 (Map 4)

The government of Odisha was praised for its effective preparedness and response when the cyclone hit.

However reconstructing damaged houses was more challenging. In the immediate aftermath of cyclone, the Chief Minister announced that all families with completely or substantially damaged houses would be sanctioned *pucca* houses.

Damage and Loss Assessment in Fani Cyclone

The Damage and Loss Assessment was carried out by Odisha State Disaster Management Authority, United Nations, World Bank, and Asian Development Bank.

The cyclone Fani falls in the “extremely severe cyclone” category. Damage and Loss Assessment was carried out for 15 sectors across four broad categories: Social Sector, Productive Sector, Infrastructure, and Cross Cutting sector. The Needs Assessment report itself concedes that the estimates it makes are conservative due to limited access to data on private losses. Total damage and loss are estimated at close to INR 30000 crore.

Fani affected 1.7 crore people in half of the districts of the state. Most affected districts were Puri, Khurda, Cuttack, Jagatsinghpur, and Kendrapara.

Damage to Housing

Puri has witnessed enormous damage to housing. Overall, 3.6 lakh households were damaged out of which 95 percent were in three districts of Puri, Khurda, and Cuttack. Rural and slum settlements were the worst affected. The Damage and Loss Assessment report pegged “resilient housing” recovery cost at INR 8996 crore (Tables 5, 6, 7, 8, and 9).

Table 3 Summary of disaster impact and recovery needs

Sector	Impact (Damage and Loss)	Percentage Impact	Total Recovery Needs	Percentage of Recovery Needs	Shortfall in Needs Assessment
Housing	6410	24.0	5443	33.4	15.1
Water, Sanitation and Hygiene	1361	5.1	1331	8.2	2.2
Health and Nutrition	527	2.0	600	3.7	-13.9
Agriculture, Fisheries and Livestock	7155	26.8	4498	27.6	37.1
Livelihoods	10348	38.8	3896	23.9	62.4
Education	179	0.7	214	1.3	-19.6
Disaster Risk Reduction	599	2.2	110	0.7	81.6
Environment	26	0.1	148	0.9	-469.2
Cultural Heritage	75	0.3	80	0.5	-6.7
Total	26680		16320		

Source: Data on Impact and Recovery from PDNA, Kerala 2018

Figures exclude data for power, irrigation, and transport. After accounting for these sectors, total impact is 27,000 crore, and recovery needs are 31,000 crores; shortfall in needs assessment calculated by $((\text{Impact}-\text{Recovery Needs})/\text{Impact}) \times 100$; while total loss is calculated to be INR 26680 crore, total recovery needs are placed at 16320 crore thus registering a shortfall of 10,630 crore. Data shows that damage to housing stock accounts for 24 percent of the total losses. Livelihood losses account for nearly 39 percent of the total losses. At the same time, losses to agriculture, fisheries, and livestock are estimated to be 27 percent. The recovery needs for housing has been put at INR 1000 crore greater than the damage

Of the total housing stock, rural kuchcha houses suffered maximum losses. Besides, major portion of losses have been categorized as “partial.” The “partial” loss category is taken as a homogeneous unit, with a blanket compensation of INR 3000. In reality, however, these losses have an enormous range (from 5 to 70 percent), and the meager compensation does little to address the problem (Table 10).

The Damage, Loss, and Needs Assessment exercise had estimated that the total cost of prospective recovery was INR 29,315 crore.

Resilient Housing

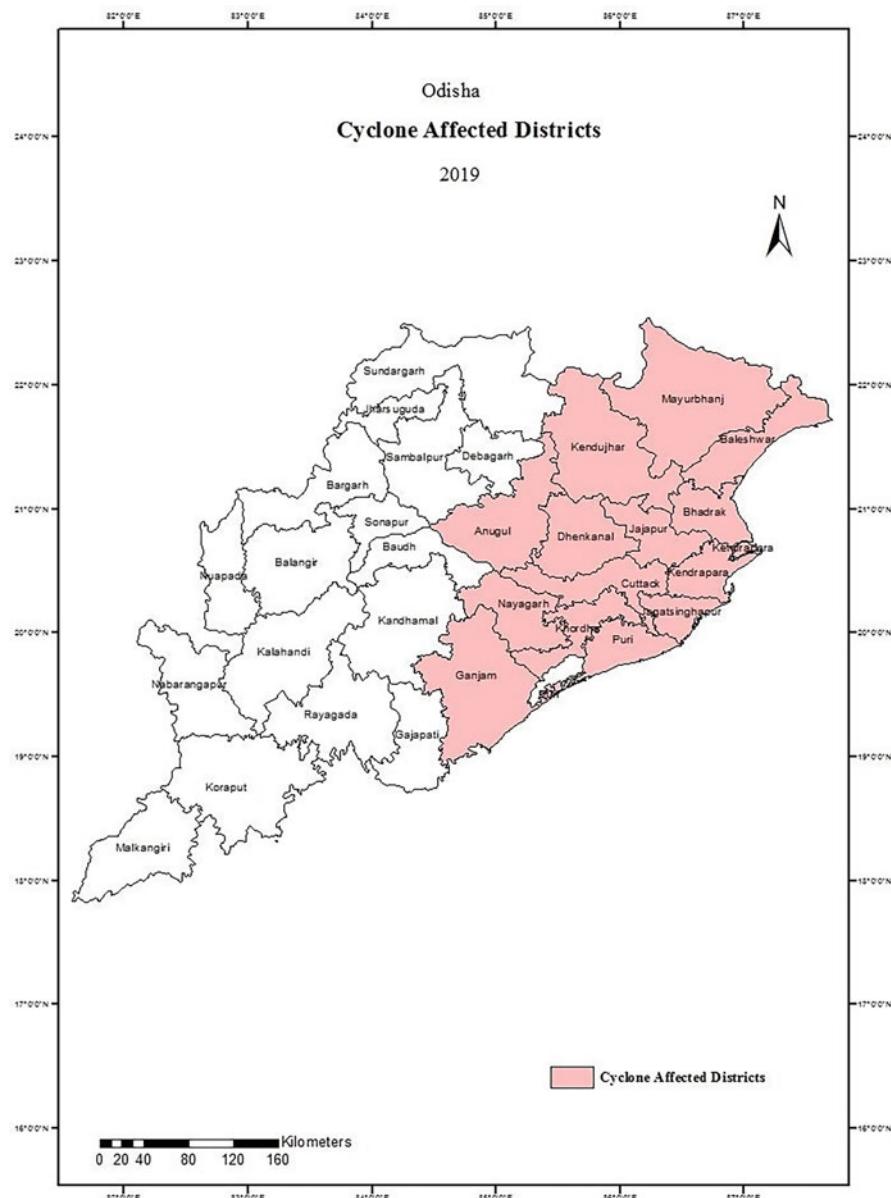

The Housing sector was worst hit by the cyclone. Approximately 3.64 lakh houses were damaged across the 14 affected districts. With the extensive damage to housing stock, the government attributed it to two factors:

- (a) The existing quality of housing stock
- (b) Poor-quality building material and construction design

The total cost of recovery of damaged housing stock was pegged at INR 8996 crore. Even with existing budgetary constraints, the recovery exercise provides an opportunity to replace old dilapidated housing stock to provide resilient and affordable housing for recurrent hazards. While there exists a consensus that reconstructed infrastructure should be resilient, there isn't much discussion on how to operationalize "resilience" in as far as reconstruction/rehabilitation policy documents are concerned. The only reference made to resilient infrastructure is in terms of the "expected cost." Also, there is lack of clarity on how this "expected cost" has been arrived at.

Experiences across countries have shown that owner-driven in situ model of housing reconstruction is most successful. In India too, owner-driven in situ reconstruction model is most popular.

Post-disaster recovery is often undertaken within a fixed time frame, usually 12–18 months. This short window for housing reconstruction is characterized by much haste. In the absence of comprehensive planning measures, the opportunity to "build back better" can be missed.

Suggestions

While the government of Odisha set records in evacuation, the relief and rehabilitation work was not as spectacular. Eleven districts of Odisha with population over one crore were affected by the cyclone. The state government announced relief of INR 95000 for families with fully damaged houses, INR 5200 for partially damaged houses and INR 3200 for minor damages.

There has been a consensus that minimalistic housing provided in the aftermath of disasters does little to address the chronic exposure in hazard prone areas. While daunting as it may seem, there is a need to radically shift from minimalistic provisioning to disaster-resilient housing. Research has shown that as opposed to popular perception, disaster-resilient housing need not necessarily be financially intensive.

Conclusion

The physical loss of housing eclipses various significant aspects of daily existences which are impacted negatively. Although housing reconstruction is accorded a higher pedestal in finance allocation, it has a low profile on the humanitarian agenda per se. A house safeguards health, privacy, dignity, and security of individuals. Thus, housing loss inevitably exacerbates vulnerability of the survivor.

Housing reconstruction faces many hurdles; it is strategically sandwiched between short-term relief work and long-term developmental agenda of the state. Post-disaster housing reconstruction may be limited by finance, strict time frames (up to 1.5 years), institutional capacities, and inaccuracies in damage assessment in addition to implementation failures.

In order to ensure better occupancy, housing designs should be in sync with the cultural sensibilities of the affected population. In situ reconstruction shows better results. Conceptualization of housing reconstruction and livelihood restoration as separate entities creates numerous problems, as was evident in case of Gujarat. It is therefore imperative to look at housing and livelihoods as seen Housing reconstruction and livelihoods restoration should be seen in a continuum.

Owner-driven, in situ mode of housing reconstruction has proven to be the most successful model worldwide. In India too, this model is gaining increasing popularity and wider acceptance.

In order to benefit from scale economies, typically a one-size-fits-all approach is adopted for housing reconstruction. Recovery experience from across the world has shown that instances in which some degree of flexibility in design is provided to beneficiaries are better received. As beneficiaries can mold and adapt structures to their convenience, the reconstructed houses have better occupancy. Besides, involvement of local community in reconstruction not just instills confidence and sense of stakeholder-ship but also aids in psychological recovery of the survivor.

While primacy at present lies in the end product of housing reconstruction, it should rather be viewed as a process. Engaging with the community and working along with them is more important rather than providing ready-made solutions.

Disasters, by their very nature, are unsettling. When faced with a challenge of such mammoth proportion, it is easy to get caught up between the binaries of conservation of status quo and large-scale reforms. While there is no one ideal way, the safest choice lies somewhere in the middle. There is a need to guard against over enthusiastic reform agenda with numerous changes in design, settlement pattern, location, and layout while ensuring that vulnerabilities of pre-disaster landscape are not exacerbated.

Housing reconstruction involves multi-stakeholder participation. While community engagement is much endorsed in theory, it is operationalized in a rather opaque manner, in reality. Reconstruction policy documents do not attempt to define the modalities of community engagement. Wherever community consultation does take place, the literature suggests that it is skewed with regard to representation and devolution of responsibilities and largely dictated by terms of the government. Thus, there exists a need to integrate community participation as a foundational component of project design while housing reconstruction is undertaken.

Abstract

The coastal zones of India are susceptible to multiple and recurring natural hazards, such as cyclones, floods, coastal erosions, salinity ingress, and earthquakes. Climate change and disaster risk literature have established climate change has the potential to increase the intensity and frequency of some of these natural hazards in coastal zones of India. The natural hazards turn disastrous for communities that are dependent on coastal ecosystems for their lives and livelihoods and face an uncertain future with the disaster risk and associated climate risk. The research aimed to understand the most vulnerable social groups

and their livelihoods in the coastal district of Kachchh, Gujarat, through the experiences of developmental organizations. The study is undertaken to address the research gap of understanding experiential knowledge of developmental organizations on disasters, developed through engagement with coastal communities over a long period of time. Through the interactions with 15 organizations, it was understood how the social and economic aspects of the traditional communities in the coastal districts of Gujarat limit their capacity to adapt to the adverse consequences and events, making them vulnerable to disasters. From the analysis of the interviews, it was inferred that the most vulnerable livelihoods in Kachchh are fishery-based (*pagadiyas*), salt-pan workers (*agariyas*), and pastoralists (*maldharis*); these are traditional and coastal ecosystems-dependent livelihoods. One prominent form of vulnerability that they experience is locational vulnerability. In addition to this, they experience social vulnerability, economic vulnerability, and structural vulnerability. Their different characteristics make them differentially vulnerable to disasters. The study emphasizes on the significance of locally relevant experiential knowledge of developmental organizations for understanding the vulnerability of traditional livelihoods and specific needs for enhancing resilience of coastal communities.

Setting the Context: Disaster Risk in Coastal Areas and Vulnerability

Coastlines are the land and ocean interface and have unique physical, geographical, and ecological characteristics of tropical areas. They also have a high exposure to hazards and associated uncertainties. The coastal areas are usually populated, and the demographic profile of the inhabitants is always in a flux (Adger et al., 2005). Around 1/5th of the total world's population inhabits coastal areas. They depend on coastal ecosystem services like the protection of shoreline, food and nutritional security, and economic security for the well-being of their lives and livelihoods (Kabir & Serrao-Neumann, 2020). Therefore, coastlines are complex and dynamic socioecological systems (Halpern et al., 2008; World Resources Institute, 2005; Sathaye et al., 2006).

Indian coastline is the seventh longest in the world, with a length of 7516.6 km spread over nine states and two union territories located on the eastern and western boundaries of the Indian peninsula. Among these, **Gujarat** is situated in the western boundaries and covers 22% of India's coastline (Ministry of Environment, Forest and Climate Change, 2011). This vast coastline consists of Rann of Kachchh, Gulf of Kachchh, Saurashtra Coast, Gulf of Khambhat, and South Gujarat Coast (Gujarat Ecology Commission, 2008; Kankara et al., 2018; Government of India-UNDP,

MAP SHOWING THE COASTAL DISTRICTS OF GUJARAT

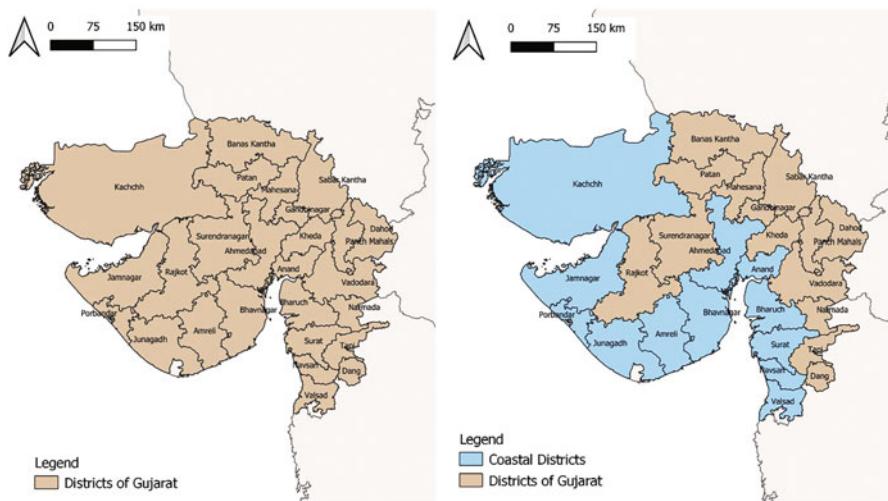

Fig. 1 Map showing coastal districts of Gujarat. (Source: Authors' own)

2007). Gujarat's coastal districts (Fig. 1) are enriched with diverse habitats, specifically mangroves, salt marshes, coral reefs, wetlands, and sea grasses reflecting geomorphic peculiarities and different physiographic features (The World Bank, 2012).

The coastal terrain, riverine nature, and high seismicity of Gujarat's coastline make it vulnerable to multiple hazards like riverine and flashfloods, associated coastal erosion, cyclones, earthquakes, and droughts (Government of India-UNDP, 2007; Government of Gujarat, 2014). Vulnerability of the Gujarat coast to sea-level rise has been scientifically established with western part of Kachchh and the north-eastern part of the Gulf of Kachchh at high risk (Mahapatra et al., 2015).

According to the Gujarat State Action Plan on Climate Change (2014), the extended coastline and high dependence of coastal communities (around 37% of the state's population) on climate-sensitive sectors like fisheries, agriculture, pastoralism, water, and forestation adds to their vulnerability (Government of Gujarat, 2014).

Interactions at the society-nature interface shape vulnerability and these interactions are crucial to understanding who is vulnerable, where the vulnerability exists, and how is vulnerability shaped (Hewitt, 1983; Bankoff et al., 2013). These dimensions of **vulnerability** have been studied through different approaches in different parts of the world. It has been conceptualized as the predisposition, sensitivities, fragilities, scarcities, or absence of capacities of human beings, livelihoods, and resources to overcome unfavorable exposure and adverse effects of hazardous episodes (UNISDR, 2004; Cardona et al., 2012). Severe and extreme weather, and climate events are termed as natural hazards. These natural hazards turn into

disasters when they adversely affect or destroy lives and livelihoods (World Meteorological Organization, 2021). United Nations Office for Disaster Risk Reduction (UNDRR) definition of disaster is “serious disruptions of the functioning of a community or a society at any scale due to hazardous events interacting with conditions of exposure, vulnerability and capacity, leading to one or more of the following: human, material, economic and environmental losses and impacts” (UNDRR, 2022). This resonates with the different forms of vulnerabilities to disaster risk.

Gujarat's state disaster management plan (GSDMP, 2016–17) differentiates between social, structural, economic, and environmental vulnerability (Gujarat State Disaster Management Authority (GSDMA), 2016). Social vulnerability is premised on social classification, which leads to inequalities in the society and makes the socially disadvantaged groups in the society vulnerable to disaster risk. Structural vulnerability is determined by the structure and material used in housing and other protective infrastructure, emphasizing the vulnerability caused by weak and inappropriate structure and material which cannot withstand the impact of disasters. A significant section of socially marginalized population may also experience structural vulnerability due to the weak and inappropriate structure of their housing. Economic vulnerability is referred to as the limited financial resources for meeting the basic daily needs. Environmental vulnerability refers to the compromised ability of communities to respond and recover from a hazard event in an environmentally degraded area. These areas like damaged coastlines, mangroves, deforested lands, areas with high air and water pollution caused due to chemical and pharmaceutical industries, and areas facing loss of biodiversity. In addition, the vulnerabilities and capacities index (VCI) refer to material, institutional, and attitudinal vulnerabilities. Vulnerabilities arising from material dimension are determined by lack and limited income sources, educational attainment, assets, and increased exposure. Institutional vulnerability is determined by lack of social networks, kinship ties, infrastructure, warning systems, membership of disadvantaged groups, and minorities. While attitudinal vulnerability results from a gap in the sense of empowerment and the knowledge on potential hazards (Mustafa et al., 2011).

There are certain overlaps and uniqueness of these classifications of vulnerability, for instance (Mustafa et al., 2011), material vulnerability refers to both the structural and economic vulnerability of GSDMP (2016–17). Further, one form of vulnerability can have an influence on the other forms. For instance, certain social constructs can aggravate economic vulnerability to disaster risks in Gujarat, such as landlessness of the socially marginalized, lack of financial resources, and exclusion from social welfare (Government of Gujarat, 2014). Environmental deterioration also aggravates vulnerability of natural resources-dependent livelihoods. Thirdly, forms of vulnerability existing individually or layered with other forms add to the complexity in understanding the risks.

The forms of vulnerability established in the literature are relevant in the context of the Gujarat's coastal communities and their livelihoods. With the high dependence on coastal ecosystem comes a grave concern of sustainable livelihood for these

communities because of the uncertainty posed by recurrent disasters. The remoteness and physical isolation of the coastal communities reduce their access to alternative livelihoods and make them highly sensitive to such uncertainty and disruptions (Pomeroy et al., 2006). Many of the polluted reefs have undergone radical regime shifts, and the populations fail to rebuild themselves after these external shocks (Adger et al., 2005). Further, the social systems, governance, and management practices can lead to changes in the resource use patterns (Adger et al., 2005). Some of the context-specific underlying causes of vulnerability among the coastal communities are the social and economic inequalities, lack of involvement in decision-making, an absence of ownership rights, reliance on natural resource, and slow pace and lack of policies, programs, and schemes that constraint people's capacity to prevent, cope, and recover from disasters. Identifying key drivers of vulnerability is crucial for designing and implementing interventions for strengthening community's resilience (Pomeroy et al., 2006). In coastal districts of Kachchh, industrial development has led to transformation of the common lands into private industrial lands which have significant implications on the livelihoods of the pastoralist community, comprising of nomadic tribes (Government of Gujarat, 2014).

Understanding key drivers of vulnerability across households, and community scales, are relevant for organizations and authorities who are engaged in monitoring the vulnerability to disasters. Mapping various forms of vulnerability helps in strategizing action and gathers knowledge useful for the present and future disasters (Mustafa et al., 2011).

The notion of vulnerability is evolving over space and time; however, there are persistent concerns of poverty, inequality, and exclusion leading to the loss and damages associated with the disasters (Bankoff et al., 2013). These are a major barrier in the path towards sustainable development. Therefore, disaster risk reduction measures have the potential to contribute to two specific sustainable development goals (SDGs) – ending poverty in all its forms everywhere (SDG 1) and building resilient infrastructure – promote inclusive and sustainable industrialization, and foster innovation (SDG 9) (World Meteorological Organization, 2021). Therefore, reducing vulnerability to disaster risk becomes an important step towards sustainable and resilient development.

Developmental organizations also develop an approach to understanding vulnerability to disaster risk through their engagement with the community, state authority, and other organizations. In the space of disaster risk reduction, *developmental organizations' role* has been recognized to be significant (Izumi & Shaw, 2014). This recognition has come through their involvement in the process of disaster response (post disaster relief, rescue), to recovery (in the short, medium, and long term). Their specific role of representation of the vulnerable is dynamic in nature. It is shaped by the opportunities found and created through the intertwining of various activities like capacity building, community mobilization, capacity building, facilitating access to important resources, and providing support in policy decisions, as well as advocating policy changes at the environment-development interface (Katyaini et al., 2021). This highlights that the nature of mediation by the organization between the communities and other stakeholder groups is embedded in the

relations between them. As the characteristics of the communities and their relations vary with time and space, the context-specific understanding of disaster risk, vulnerability to it, and disaster risk management need to emerge. This would be crucial input in strategizing resilience building.

With this background, the study aims to address the research gap in understanding the context-specific vulnerability of coastal communities' livelihoods to disaster risk, through the perspective and experiences of non-governmental developmental organizations in Kachchh district of Gujarat. Through the methodological approach discussed in the next section, case studies of three most vulnerable livelihoods were identified and analyzed.

Methodology

The research methodology was designed to collect qualitative data on the two important aspects of the research – the most vulnerable livelihoods of the coastal communities to disasters and the most vulnerable groups or sub-groups of the coastal communities in Gujarat.

Sample Selection

There are several developmental organizations that are engaged in the disaster risk management cycle in the coastal districts of Gujarat in interaction with coastal communities and the district disaster management authority. These organizations have a diverse expertise and orientation towards disaster risk management ranging from scientific, technical, social, to environmental. With their long-term involvement (over the last 15–20 years), they have gathered context-specific knowledge on the vulnerability and resilience to disaster risk. Two organizations were approached for participating in this study and sharing their knowledge with us to unpack the layers of vulnerability of livelihoods and social groups. Depending on the referrals from this initial sample, the sample grew to 15 organizations (Table 1). Therefore, snowball sampling was used in the study. Eighteen respondents from these organizations participated in this study; among them, thirteen are men and five are women. It was important to gain an insight of women respondents because gendered lens is vital in understanding vulnerability to disaster risk.

Study Area

Kachchh as a study area was selected in consultation with these organizations (Fig. 2). Kachchh is among 12 coastal districts in Gujarat (Coastal districts of Gujarat- Kachchh, Jamnagar, Bhavnagar, Surat, Bharuch, Amreli, Porbandar,

Table 1 Organizations and their expertise in terms of areas, disasters, and livelihoods.

Organization (Codes)	Expertise	Areas	Disasters	Livelihoods
1	Consultancy Social Enterprise	Kachchh	Floods, cyclones, tsunami, earthquake, coastal erosion, droughts, salinity ingress, violent sea action, pollution, sea-level rise, industrial development & climate change.	Pastoralists - Maldhari community
2	Social Development	Kachchh	Coastal erosion, floods, industrial development and pollution	Fishing community - Pagadiyas, and Saltpan workers
3	Research and advocacy organisation	Kachchh, Diu, Sompnath, Hazira, Surat, Khambhat	Floods, cyclones, tsunami, earthquake, coastal erosion, droughts, salinity ingress, violent sea action, pollution, sea-level rise, industrial development & climate change.	Coastal communities
4	Social ecological development	Kachchh (Bhachau, Mundra, Janpath and Abdasa blocks)	Climate Change, Droughts and Floods	Pastoralists - Maldhari community
5	Research and advocacy organisation	Kachchh, Valsad, Navsari, Surat and Bharuch	Cyclone, Shoreline change, Oil spills	Fishing community - Pagadiyas (small-scale)
6	Trade Union	Kachchh (Anjar, Mandvi and Mundra)	Coastal erosion, floods, industrial development, sea-level rise	Fishing community - Pagadiyas
7	Trust and social development organisation	Kachchh, Patan, Rajkot and Surendranagar	salinity ingress, drought, coastal erosion	Saltpan workers
8	Social Development	Kachchh	Cyclones, salinity ingress, sea-level rise, unplanned development, coastal erosion	Coastal communities
9	Social and Educational development	Kachchh coastline	Floods, cyclones, tsunami, earthquake, coastal erosion, droughts, salinity ingress, violent sea action, pollution, sea-level rise, industrial development & climate change.	Coastal communities

Junagadh, Ahmedabad, Anand, Navsari and Valsad). It is an important district even in the context of state disaster governance. The 2001 earthquake (26th January) which struck the district headquarter Bhuj led to establishment of the GSDMA (Government of Gujarat, 2017).

Data Collection Process

Detailed understanding of vulnerability through different organizations' view requires going beyond quantitative measures. Paavola et al. (2006: p. 274) states that "While it is easy to recognize personally the feeling of vulnerability and perhaps to grasp the outcome of vulnerability in others in a similar situation, the translation of this complex set of parameters into a quantitative metric in many ways reduces its impact and hides its complexity." Therefore, for the study, qualitative method of data collection was used. The process involved designing a semi-structured questionnaire to guide the interviews and conducting the interviews. Details of these steps are discussed in the sub-sections.

Designing the Data Collection Tool

The questionnaire consisted of sections on (1) vulnerability to disaster risks with the focus on the nature of recurring disasters and the risk they pose, (2) areas of engagement of the organizations with the coastal communities in disaster risk management, (3) most vulnerable livelihoods and social groups and the drivers of their vulnerability, and (4) understanding the organization's approach to addressing vulnerability.

Conducting the Interviews

Primary data was collected through interviews with the respondents; either individually or as a group interview, most of the interviews were with individual respondents, and only a few were with a group of two or more interviewees. The interviews were conducted during December 2020–March 2021, when the COVID-19 pandemic restricted in-person meetings. Therefore, the interviews were conducted over the telephone, or through online meetings on Zoom and Google Meet platforms, as per the preference and convenience of the interviewees.

The interviews were conducted with the ethical considerations of providing prior information to all the respondents who participated in the study. The information provided was regarding the purpose of the research, and their prior informed consent was taken for conducting the interview and recording it for aiding the process of analysis. The recording was done to ensure that all the relevant data is included. Secondly, confidentiality and anonymity of the respondents were maintained throughout the research, and a method of coding was developed to carry out further analysis. The recordings were transcribed, and the transcripts with the coding were used for the analysis.

Analysis

The responses collected were analyzed using the technique of content analysis. This analytical method is best suited for the study because it helps in drawing a valid inference from interpreting and encoding the textual information. The content analysis was carried out to develop case studies through bringing forth the case

specificities of vulnerability of social groups, and livelihoods to disaster risk, and the specific needs for building their resilience. The method is appropriate for this research as in-depth and comprehensive understanding on selected social units is pursued (Crowe et al., 2011).

Results

Vulnerability to Disaster Risks

Around 16 of the 18 respondents stated cyclone as the predominant disaster in Kachchh, followed by drought, floods, earthquake, coastal erosion, and tsunami (Fig. 3). There was also reference to sea-level rise, salinity ingress, invariability in rainfall, and violent sea action, as the changes in the meteorological and hydrological systems are leading to increase in disasters or giving rise to new forms of disasters. In addition, the respondents also expressed the concern over vulnerability to disasters created by industrial development, oil spill, and pollution.

The respondents cited the cyclone in Arabian Sea in the years 1998 and 2001 as they left massive impact on the coastline of Gujarat. In a four-category classification of degree of proneness to cyclones, Kachchh district lies in P2 category referring to high degree of proneness (Gujarat Institute of Disaster Management (GIDM), 2019). The respondents also referred to increase in cyclone being linked to climate change

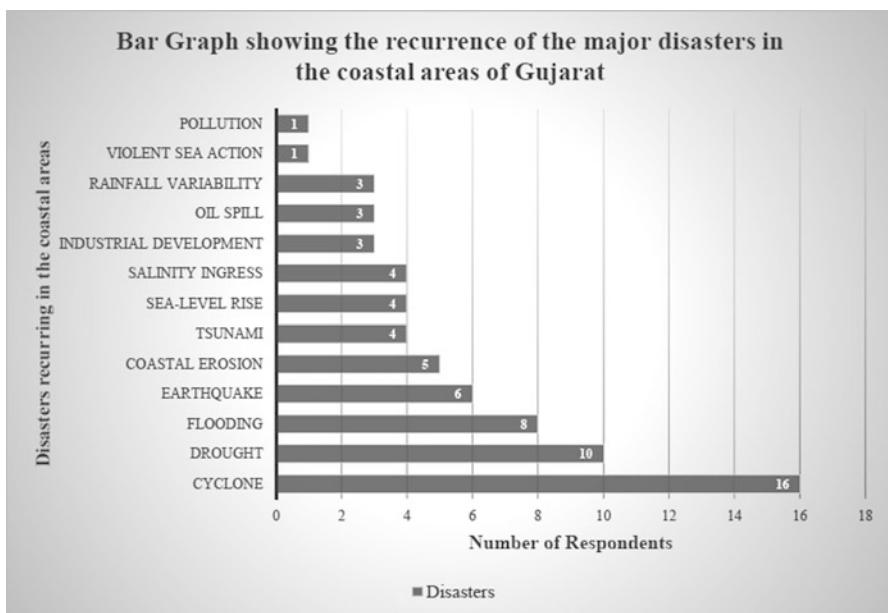

Fig. 3 Recurrence of the major disasters in coastal areas of Gujarat according to the respondents. (Source: Authors' own)

and human-induced activities. The Intergovernmental Panel on Climate Change (IPCC) special report of 2019 also indicates that the frequency of severe cyclone has increased threefold in recent times, and the intensity of the tropical cyclones is reaching to its extreme in the region (GIDM, 2019).

Kachchh has diverse ecosystems ranging from wetlands, mangrove forests, grasslands, and deserts (Mehta et al., 2019). Occurrence of droughts and floods is a major concern in Kachchh according to ten and eight respondents, respectively. The semi-arid and arid parts of Kachchh suffer from droughts. The region of Kachchh district adjacent to Banaskantha district experiences floods; in some parts, it is as frequent as every second year according to the respondents. The respondents identify the reasons for flooding as not exclusively natural; they reflected on developmental activities which have led to obstruction of the flow of water creating flood, for instance, Narmada Canal was found to create such an obstruction. Many areas where fishing is practiced were destroyed and faced degradation due to developmental activities such as setting up of power plants and human-induced floods.

The zones in the Mundra coastline, such as the 32000-megawatt power project, are present, and alongside, a 10000-megawatt project is also progressing. And for this, the industrial waste, “around 6000 lakh liters per hour of water for cooling purposes,” and then it dumped into the sea. The temperature of the seawater increases, and the fishes are migrating due to temperature rise by “approximately 7 degrees”. Due to this man-induced activity, the fish-killing phenomenon occurs because their water intake is harmful to their health. (Organization 2)

Vulnerability to tsunami is also a concern for the coastal communities according to four respondents; the tsunami of 1945 was a prominent disaster in Kachchh. It was triggered by an earthquake of 7.8 magnitude on the Richter scale along the Makran fault line (Prizomwala et al., 2022). Further, a major event acquiring “the shape of a disaster” is salinity ingress according to four respondents. One of the reasons is the presence of limestone. An associated concern with salinity ingress is salinity pollution, which leads to difficulty in getting and storing freshwater, according to the respondents. This resonated with a scientific review carried out by Siddha and Sahu (2020) suggesting that the salinity pollution is immensely noticeable in regions with coral limestone in Gujarat, which includes Kachchh.

Areas of Engagement of the Organization

The organizations have engaged in understanding different forms and levels of vulnerability to multiple disaster risks. This has been shaped by their differential engagement in disaster risk management with distinct thematic and geographical areas.

Specific organizations engage with the livelihood issues of particular social groups in the communities. Organization 6 is a trade union that focuses on livelihood rights specifically the fishermen's rights. A few organizations (1, 3, 9, 12, and 14) are

engaging in understanding the impact of climate change on livelihoods. Their field-based understanding of the global phenomenon reflects that it is a *silent and dormant phenomenon impacting the livelihoods and the ecosystem of the place*. Their consistent engagement in the northwest Kachchh has led to their perspective that climate change and associated sea-level rise intensify the variability of the disasters and severely affect the traditional livelihoods that solely depend on the natural ecosystems. This resonates with the finding that sea-level rise in the Gulf of Kutch is reported to be highest on the west coast of India Noronha et al. (2003). Four organizations (10, 11, 12 and 13) work on the issues of “poverty and malnutrition” because in their perspective *poverty is not independent of disasters or the difficulties that the people face*. They consider these as drivers of vulnerability to disaster risk which need to be combated.

Most engage in rescue and relief activities, while some of them specialize in particular stage of disaster risk management. For instance, engaging in knowledge dissemination, policy advocacy, and providing legal support for compensation based on experienced loss and damage. Around six organizations (1, 2, 3, 8, 9, 12) provide capacity building and awareness generation trainings and leadership training and facilitate institutional development and pilot demonstration of new advances, in addition to mobilizing disaster relief. Their broader orientation was building capacity of the communities on integrated risk management, where disaster is viewed as a juncture of environment and development. Within this scope, the different dimensions of sustainable development – social, economic, environmental, and institutional aspects – are covered. Organization 10 focuses on the post-disaster rehabilitation and *reconstruction in terms of infrastructure of the communities*. Organizations’ engagement at the grassroots level and in rehabilitation activity is from a more right-based approach catering to the marginalized communities’ requirements and their resettlement with relief packages that can be done equitably and transparently.

The organizations expressed that their contact with the community members is on a day-to-day basis through the presence of the “Sangathanas” (literal translation is committees). The organizations are connected to each other and governmental departments through a state level interagency coordination group to carry out disaster preparedness, response, and planning activities in different districts of Gujarat.

The organizations which are part of this study work in parts of ten talukas (sub-districts) of Kachchh including Mundra, Mandvi, Anjar, Abdasa, Bhuj, and Bhachao in Kachchh (Fig. 4), covering 924 villages. In addition to Kachchh, they also engage in Jamnagar, Amreli Bhavnagar, Surat, Bharuch, Navsari, and Valsad districts of Gujarat.

Understanding Vulnerability and the Most Vulnerable Livelihoods

The organizations’ understanding on the vulnerability of coastal communities emanates from their context-specific association. The approach of the organizations is

Fig. 4 Map of talukas in Kachchh. (Source: Extracted from <https://bhuvan-app1.nrsc.gov.in/state/AP#>)

specific to the kind of vulnerability they perceive to be most important. Most organizations perceive social vulnerability to be very prominent and hence plan interventions on addressing social vulnerability. A key finding from the interview with organizations (6, 8, 9, 11) is that *socioeconomic backwardness is the basis of a vulnerability assessment*. This is because the organizations have found that the communities belonging to the socially marginalized groups experience lack of access to relief, rescue, and even rehabilitation assistance. Their vulnerability is enhanced because of the communication gap and unawareness of the coastal and national development plans. Organizations' (7, 8, 12) interventions are in specific reference to marginalized social groups – schedule caste, schedule tribe (also known as indigenous tribes), woman (pregnant), elderly, children, and people with disability or with specific health condition which needs consistent medical attention.

In Kachchh, we have another challenge, which is the high rate of thalassemia cases there. Thalassemia is a particular genetic disorder where the person cannot produce their blood; every person needs to have blood from outside. During the disasters, we keep the account of the thalassemia patients in the communities and simultaneously cater to their requirements. (Organizations 7 and 8)

The organization (13) shared young widows with their children are being abandoned. Women are lacking equal employment and equal pay as women. This is because of stages of pregnancy, menstruation, fostering their children, and household responsibilities. This archaic system of gender inequality exists along with caste and religious minorities in the coastal communities of Kachchh. There is a “considerable gap” in recognizing the role of women and also inclusion of women in the disaster relief schemes, rehabilitation, and reconstruction plans, therefore making

them vulnerable within their social groups. Caste-based distinction in some coastal areas is reflected in Dalit family's lack of access to resources and unawareness of their entitlement. GSDMP (2016–17) also recognizes "women, adolescent girls, old age persons, differently able persons, children, destitute, below poverty line population, scheduled castes, scheduled tribes, and particularly vulnerable tribal groups."

Location is also a very important determinant of exposure to disaster risk. The organizations shared that the coastal areas have greater locational vulnerability to cyclones, tsunami, and floods, and the coping capacity to overcome locational vulnerability depends largely on knowledge, skills, and practices of the communities residing there.

A majority of the organizations stated that the Kachchh region comprises mangroves, coral reefs, mudflats, seaweeds, commercial fishes, and varied marine species. The coast provides a favorable habitat for the diverse sea-based traditional livelihoods like fishing and salt production apart from land-based occupations like agriculture, livestock rearing and breeding, and handicrafts. The large tracts of flatlands provide space for developing saltpans. The different kinds of livelihood dependent on the coastal ecosystems and natural resources in Kachchh are fisherfolks (Pagadiya), saltpan workers (Agariyas), animal herders/pastoralists (Maldaris), and agriculture. The specific resources on which fisherfolks depend are freshwater patches and marine creatures, animal herders/pastoralists rely on the mangroves, and saltpan workers depend on salt farms. Agricultural crops grown are food grains (wheat, bajra), oilseeds (castor oil, groundnut, cotton), and chili, different kinds of vegetables, and coconut trees. Coconut is mainly grown in Saurashtra by farmers with large landholdings. Due to salinity ingress in recent years, the agriculture production and practices have been affected enormously. Instances of the agricultural field where castor oil, cotton, bajra, and wheat are cultivated have been observed to *be disappearing from the coast in Gujarat because of the saline water* (Organization 12).

There are other traditional and evolving livelihoods like charcoal-making (Kohli), artisans weaving handicrafts, and leather processing. There are more than fifty thousand families engaged in leather coloring and leather processing. These families largely belong to the socially marginalized group who were historically considered as untouchables. According to the organizations interviewed, these livelihoods are vulnerable to disasters directly as well as indirectly. The loss and damages to these livelihoods are yet not completely understood, and this kind of lack of information also continues to add vulnerability to these livelihoods.

Understanding the Organizations' Approach to Taking Measures for Reducing Vulnerability

The organizations (2, 5, 6, and 12) specified that they are involved in collecting evidences which are relevant to policy-shaping, capacity building, pilot demonstrations of interventions, review and evaluation of interventions, and co-production of

the local knowledge. These are intended to help the community to be resilient by overcoming different forms of vulnerability.

An important example is the involvement of the coastal village panchayats by the organization (13, and 14) to discuss their issues and challenges and advocate for the schemes, namely, the Coastal Area Consolidated *Sagar Kheru Yojana* (literal translation is farmers of the sea “Sagar,” sea, and “Kheru” – farmer). All the communities were considered as the farmers of the sea. In addition to this scheme, 18 other schemes were consolidated to generate more opportunities for livelihoods and employment diversification in the coastal areas. One of the other developmental schemes cited as important in reducing the vulnerability to disaster risk was *Palan Mata Pita* which supports the children without parents and provides community-based rehabilitation. It is like a social responsibility of the community towards reducing the vulnerability of the children and provides access to education. To reduce the vulnerability of women in the coastal communities, there is specific emphasis on supporting women entrepreneurship, livelihood, and their social welfare.

The organizations (2, 4, 6, and 13) work in coordination with the government authorities, like gram panchayats, and the other governing institutions. In the women federations (Vinayak Samiti), drought as a disaster has been discussed, and the issue of water scarcity has been resolved through setting up developmental committees (*Mahila Mandals*, literal translation women committees) to manage water resources equitably. There are several *Mahila Mandals* organized to support women’s participation in campaigns like *Pani Roko* (literal translation is stop water).

Further, the organization’s focus is also on improving quality of living through intervention like creating a market and introducing technological innovations like solar pumps for agriculture in the Rann of Kachchh to sustain and enhance livelihoods. They also engage in innovations like “bio shield” to create a multilayer plantation of mangroves to help rejuvenate the resources and protect agriculture, animal husbandry, and fisheries from cyclones and floods. These efforts also enhance the capacity of vulnerable groups.

Case Studies of Vulnerable Social Groups and Livelihoods in Kachchh District, Gujarat

Based on the detailed discussions with the organizations, case studies of foot fishermen (*pagadiyas*), saltpan workers (*Agariyas*), and pastoralists (*Maldharis*) were identified as the most vulnerable social group and livelihoods. Around eleven organizations (2, 3, 5, 6, 8, 9, 10, 12, 13, 14, and 15) identified *pagadiyas* as the most vulnerable livelihoods, while seven of the organizations (2, 3, 7, 8, 9, 10, and 13) referred to agariyas and six organizations (2, 3, 4, 8, 9, and 12) referred to maldharis as vulnerable livelihoods. These case studies are discussed with emphasis on the context-specific vulnerabilities from the perspective of these organizations.

The Foot Fishermen: *Pagadiyas*

The intertidal zones in Kachchh are the areas where the fishermen (locally known as *Machimar*) practice a particular method of fishing on foot. In the local parlance, this method is referred to as *pagadiyas*. These intertidal zones are situated in the Bhachau, Mundra, Mandvi, and Abdasa talukas, up to the Jakhau stretch (Fig. 4). The intertidal area has conducive conditions for carrying out this traditional form of fishing, because the net is placed in the water during the low tide and the fish is caught after high tide (IL&FS, 2017). There is an inverse relationship between the tide and the height of the net used; this provides a good catch and enhances the income of the fisherfolks. Their movements are coordinated with the tides and ebb timings in a precise manner, which requires staying out in the water for many hours.

This fishing method is a seasonal livelihood spread over 4–5 months in a year; the fisherfolk migrate from their foremost villages to the banders (fishing settlements) to practice this form of livelihood. A section of the fishing community belongs to the religion of Islam. They are known as the Wagher. They are the denotified tribes (listed initially under the Indian Criminal Tribes Act of 1871) (Government of India, n.d.). One of the respondents from organization (13) traces that the origin of Wagher of Kachchh was primarily located in Okha Mandal in Jamnagar district and suggests that they have migrated according to their needs.

Wagher is most affected because they relocated to the coast for fishing as their primary and only livelihood. Their livelihood is exposed to natural and new forms of man-made disaster risk. The fish catch over time has been impacted by changes in the sea shoreline and industrial waste disposal.

The industrial development at the coast is affecting the coastal ecosystems and affects these fisherfolk through diminished access to the seacoast and intertidal zones which are the fishing grounds. Mundra block is the greatly affected in Kachchh, because it is a Special Economic Zone (SEZ). The ports and sites for the power projects are in close proximity to the fishing grounds. Major types of the industries in the coastal district of Kachchh are port-led infrastructure projects, metallurgical, textiles, chemicals, and cement industries (Gujarat Ecology Commission, n.d.).

The children and women of Wagher tribe are the most vulnerable, with absence of proper and immediate facilities for water, sanitation, and healthcare (anganwadi) and inadequate educational facilities. In addition, adjusting to changes in the language spoken at home and at school makes it challenging for the children of the Wagher tribe to attain formal education in community-run schools. The organizations interviewed shared that this has led to seclusion of the Wagher tribe members from other social groups in the coastal communities. This has implications on their lack of access to different social and loan schemes thereby reducing their capacity to withstand the loss and damage from disasters like cyclone, droughts, and floods.

The fisherwomen play significant roles in fisheries' pre- and post-harvest sectors, especially in the fish processing and marketing, and increase the household's income to a greater extent. The Wagher, due to their low literacy and awareness, find it difficult to supplement income by diversifying their livelihood sources.

Not all forms of vulnerability of these coastal communities are understood completely. This is also because of their practice of periodic migration (6–8 months) and lack of ownership of land. This also adds complexity in recognizing them in the disaster management plan, their access to disaster relief, and other disaster management activities to reduce their vulnerability.

The Saltpan Workers: Agariyas

The communities associated with the salt production in the Little Rann of Kachchh were traditionally called “agariyas.” These traditional saltpan workers came from different religious and caste groups. Most of the agariyas belong to the social category of “Other Backward Castes” and denotified tribes (Bharwada & Mahajan, 2008). Most of the agariyas live without a formal identify because of absence of land survey in the Little Rann since independence and also due to the region being notified as wildlife sanctuary in 1973 (Manzar, 2016).

Around 76% of the total salt produced in India is contributed by Gujarat, and within Gujarat significantly large production of salt takes place in the Little Rann of Kutch. Approximately 15,000 families migrate to the Little Rann of Kachchh every year to produce salt (Bharwada & Mahajan, 2008). During the salt season (September to June) (Manzar, 2016), they are under the direct sunlight of the salt flatlands, with temperature of above 45 degrees Celsius in the daytime. The abnormal rains, floods, cyclones, declining brine yields, fatal gases from wells, and high-velocity winds are the main natural risks. The agariyas dug the flatland and secure it as a shelter to guard themselves against the extreme temperature and prevailing climatic conditions. Financial assistance is provided to licensed salt workers for the damages caused by natural calamity such as abnormal rains, floods, cyclones, etc. (Government of India, 2021). This is a primary step towards reducing their vulnerability.

The marginal salt producers live in a state of chronic poverty because of multiple reasons. About one million tons of salt that is produced and extracted each year from the region is sent to states like Madhya Pradesh and Chhattisgarh and countries like Nepal. The trader gives Rs 15/100 kg of salt to the Agariyas, which has changed to Rs 140–160 per ton with time (Bharwada & Mahajan, 2008). Due to low incomes, the agariyas are caught in a debt through a faulty credit system built by middlemen, traders, and entrepreneurs. Further, there is no assurance in the price rise of their production due to market imperfections. Due to these factors, agariyas focus on maximizing the quantity of salt production rather than quality. Inferior quality of salt, seasonal nature of livelihood, subjected to various natural calamities, market shortcomings, and other production and market-related risks unfavorably affect their livelihoods. These multiple layers of vulnerability faced by agariyas indicate how it weakens their capacity to respond to and manage the risk of any disaster that strikes.

Apart from the severe economic living conditions, the agariyas have to deal with the high salt content in their bodies, leading to several severe body ailments. Their

hands and feet are often affected by salt that they have to be cut off when cremating the body, for they cannot be burnt (Mukherjee, 2018). Stamping and walking all day on the salt pans with bare feet leave agariyas with blisters and skin diseases. It is only lately that some of the NGOs have provided them with gumboots (Organization 11).

The salt workers are engaged in this traditional form of livelihood generation after generation. The periodic migration of agariyas with their family members during September–June to the salt pans has a severe impact on saltpan workers' children's education and literacy levels. With poor living conditions and remote location, these children are excluded from quality formal school education. Organization (2, and 8) has been working on supporting schools where these children of salt workers study. Government of India allocates rewards for the children of the salt workers to pursue education. Around 1580 of 3500 rewards are allocated to Gujarat (Government of India, 2021). This is an initial step towards building their resilience.

The Pastoralists: Maldharis

Through interaction with organization (4), vulnerability of *maldharis* who breed a unique variety of camel referred to as Kharai camel was inferred. They consist of Jats and Rabaris; predominantly, male members of these two social groups engage in camel rearing, while a few women from the Jat community are involved. Camel rearing as a livelihood activity is practiced generation after generation.

According to a report by Sahjeevan (2010–2011), there were more than 12,000 camels in Kachchh district, out of which 10,335 were Kachchhi camel and the rest 2173 were Kharai camel. Kharai camel has a unique ability to swim in the open seas for a stretch of ten kilometers. It has favorably adapted to the ecotone zones and the transitional areas of vegetation – coastal mangroves, grasslands, and saline vegetation. Kharai camels feed on saline trees, shrubs, and grass species like *Salvadora persica* (Khari jar) and Lano (*Suaeda* spp.) (Kachchh Unt Uchherak Maldhari Sangathan, 2012). Kharai camels are found in four talukas of the district – Mundra, Abdasa, Lakhpat, and Bhachau. Due to heavy industrialization, particularly in Mundra, Lakhpat, and Bhachau, mangroves, which are an important food source for the Kharai camels, are reducing (Report by Sahjeevan, 2010–2011). Over the years, there has also been an increase in pressure on the Banni grasslands, which is spread over an area of 2618 square kilometers and accounts for about 5.73% of the area in the district (Geevan et al., 2003). It is also a food source for the Kharai camel which is adversely impacted by extremely sparse rain events, short length of monsoon season, and very high temperature differences between summer and winter (Basu et al., 2019). Growth of certain plant species, like *Prosopis juliflora* (gando baval), in protected areas is useful as fuel; however, it is harmful for livestock rearing. These factors are threatening camel population and in turn affecting the livelihoods of *maldharis*. Due to these threats, the organizations (3, and 4) shared the concern of considerable decline in the camel population over the past couple of years. Further, migration of the camel breeders is also rising because of increased salinity ingress and decreased accessibility to mangroves.

Camels and camel products like milk and wool are traded. Camel milk is considered to have medicinal properties, and this property is further being explored (Sahjeevan, 2010–2011). Due to the establishment of cooperative milk societies, the people of Banni are now preferring to trade camel milk. The handicraft business and small-scale weavers use camel wool as a raw material. However, the camel herders experience uncertainty in access to market for camel wool and milk and are concerned about their livelihood security.

Women, children, and elderly from the *Maldhari* community experience water, sanitation, and hygiene (WASH) issues during cyclones. Lack of safe sanitation facility is their key concern as they have to defecate in Matka (mud-pot) during disaster.

On the basis of these case studies, social, economic, material, locational, and environmental vulnerability of Wagher practicing pagadiyas (fishing on foot), other backward caste forming the agariyas (saltpan workers), and Jats and Rabaris as Maldharis (pastoralists-camel breeders) were inferred.

Conclusion

The understanding on coastal communities' vulnerability, through the lens of developmental organizations, brings forth three important conclusions. Firstly, it provides case-specific context to multiple layers of vulnerability. Among these layers, social and locational vulnerability are persistent concerns that are transferred intergenerationally. The groups facing social marginalization historically continue to be the most vulnerable at present to disaster risks. The concern of a sustainable future is very prominent in the context of uncertainties posed by disaster risks directly and indirectly on their lives and livelihoods.

Secondly, the developmental organizations have also carved their role and focus on specific activities in the disaster risk management cycle, social groups and their issues, and geographical areas facing higher locational and environmental vulnerability. This process of identifying their focus has involved varied interactions with the communities, state departments, and other developmental organizations in the evolving space of disaster risk management. New and emerging challenges posed by climate change, developmental pathways, and persistent gap in meeting the fundamental needs add complexity to this space and interactions between actors in this space.

Thirdly, contribution of the persistent concerns of intergenerational transfer of vulnerabilities in coastal communities, emerging disaster risks to uncertain future, and complex disaster risk management space necessitate taking a resilience approach. Resilience is a relatively recent and budding approach to minimize vulnerability through building or enhancing the existing capacity to respond (UNDRR, 2022; Rashid, 2013; Manyena, 2006). There are various understandings on resilience. Hyogo Framework for Action views disaster resilience as the degree to which individuals, communities, and organizations are capable of learning from past disasters and reducing their risks to future ones at multiple levels (UNISDR, 2005).

Further, socioecological resilience is based on systems' thinking with emphasis on interconnections between the social and ecological systems. The socioecological systems provide essential resources and services to support livelihoods and social development in coastal areas which need recognition. Most of the vulnerabilities cited emerge from incomplete understanding and consideration of the socio-ecological linkages. Further, it is also important to build further on the understanding of the coastal socioecological systems and focus on the cross-level interactions and cooperation for enhancing the adaptive governance as suggested by Adger et al. (2005). Coastal communities' knowledge, preparedness, ability to reorganize, and the responses to disasters are important to preventing long-term social disaster (Berkes et al., 2002). UNDRR, earlier known as UNISDR, views resilience as the ability of a system, community, or society which is exposed to hazards to resist, absorb, accommodate, adapt to, transform, and recover from the effects of a hazard in a timely and efficient manner. It also prioritizes preservation and restoration of its vital basic structures and functions during the process of risk management (UNDRR, 2022). These are the avenues for future research on developmental organizations and their interactions with important actors in the space of disaster risk management for transformation from risk to resilience of coastal communities.

Acknowledgments The authors thank the respondents who participated in this study and shared their experiences and learnings. The authors would express gratitude to Dr. Ranit Chaterjee, co-founder of Resilience Innovation Knowledge Academy (RIKA), for sharing valuable thoughts that shaped the research.

megalopolis, but dealing with urbanization means working along this range of town to metropolis.

When this heterogeneity is viewed from the lens of disaster risk, the idea of single frame solution needs to be interrogated. Every city is unique from spatial, cultural, and economic development, so how does one apprehend the idea of urban risk governance to posit itself to answer these pluralities?

India's present urban system comprises over 7933 cities and towns of fluctuating population sizes. In the decade between 2001 and 2011, many of these cities and towns transformed into burgeoning centers of industrial and business activity. This expansion put pressures on housing, transportation, WASH infrastructure, healthcare, and waste management and exacerbated spatial inequalities and widened income gaps. Urban governance today must be cognizant of the multi-dimensional nature of urban inequality and the overlapping nature of other geographical factors such as urban spatial planning, scale, zoning, environment, and accessibility to various urban facilities.

The authors argue that in confronting this heterogeneity of the urban scape, one must be cognizant of several factors. The current framing of Urban DRR is technocratic, and this chapter interrogates the differential urban needs and how urban DRR needs to be designed within a framework of intersectionality of urban identities.

Disaster risk governance · Urban transformation · Urban spatial inequalities · Urban heterogeneity · Urban intersectionality

Introduction

Urban centers around the world are shaped by shifting population demographics and socio-spatial divisions along socio-economic lines. Further, the urban environment is influenced by developmental interventions and environmental extractions that lead to land use modification that is manipulated by biophysical conditions of land (Douglass, 2015).

Governing the urban is a continuous and iterative process of conciliation and contestations over urban space, spatial inequalities, material resources, and political powers. Contemporary cities face several challenges related to increasing interconnectivity and interconnectedness in a globalized era. Disaster forms one such challenge where the impacts can spill over and have cascading consequences beyond spatial and temporal boundaries; this brings about emergence of newer risks along with unexpected interruption and growing vulnerabilities (Oldham & Astbury, 2018).

This chapter argues that governance must not only confront but also adapt to the heterogeneity of urban landscapes, issues, and actors. In other words, the urban may not be imagined as a monolithic homogenous entity but must be grounded in the

recognition of the distinctness and plurality of what the urban really is. The issues pertaining to towns, suburbs, ghettos, urban sprawls, the peri-urban, or the urban village are vastly different from the issues of megacities, large metropolises, or the megalopolis.

India's present urban system comprises over 7933 cities and towns of fluctuating population sizes (Habitat for Humanity, 2018). In the decade between 2001 and 2011, many of these cities and towns transformed into burgeoning centers of industrial and business activity. This expansion puts pressures on housing, transportation, WASH infrastructure, healthcare, and waste management and exacerbated spatial inequalities and widened income gaps. Urban governance today must be cognizant of the multidimensional nature of urban inequality and the overlapping nature of other geographical factors such as urban spatial planning, scale, zoning, environment, and accessibility to various urban facilities (Nijman & Wei, 2020).

The authors argue that in confronting this heterogeneity of the urban scape, one must be cognizant of several factors. Borrowing from the emerging body of thought on disaster risk governance, the authors present a case for coherence and harmony between different urban stakeholders and the line departments of the state at the local, regional, and national level.

Urban DRR: Contestations and Challenges to Urban Risk Governance

Kelman (2008) has attempted to provide definitions of disaster for the urban context as “the capacity of a system, community or society potentially exposed to hazards to adapt, by resisting or changing in order to reach and maintain an acceptable level of functioning and structure. This is determined by the degree to which the social system is capable of organizing itself to increase its capacity for learning from past disasters for better future protection and to improve risk reduction measures” (pg 197). In the urban context, disaster is the ability of a system to maintain its function and structure when exposed to hazards, which influences the capacity of the social system to learn from past events and prepare for the future through risk reduction measures. This perspective on the definition of disasters in urban environments places emphasis on change and learning from the past to achieve resilience (Kelman, 2008). Urban populations residing in middle- and low-income countries are at risk as they're exposed to multiple hazards resulting from extreme weather events, anthropogenic activity on the urban environment, diseases, or accidents (Adelekan et al., 2015).

Urban Spatial Inequalities and Urban Heterogeneity

According to the United Nations Department of Economic and Social Affairs (2008), the world currently is more urban than rural. As urbanization increases, cities are spatially organized as urban-centric regions that go beyond city borders

into peri-urban drawing on resources from rural hinterlands through daily flow of goods, services, and people (Douglass, 2015). Urban centers provide substantive benefits to residents by offering greater opportunities for work and access to critical services such as healthcare and education. In developing economies, rural to urban migration is on a steady rise. In the Indian context, as per the 2001 Census, 52 million persons, out of the-then population of 1.02 billion persons, migrated from rural to urban areas, and such urban shifts have only increased; the 2011 Census recorded a migratory increase with 72 million moving away from their rural homes to urban centers. The burgeoning urban centers place massive demands on urban space and key services such as transportation, sanitation, solid waste management, and health services (Bosher & Ksenia, 2017). As urbanization increases spatially and spreads to peri-urban regions, new forms of vulnerability are created by ill effects of inappropriate planning and development encompassing coastal and swamp areas, inland floodplains, unstable hillsides, and other lands unsafe for settlement (Miller & Douglass, 2016).

Dimension of the built environment, financial investment, and related infrastructure have brought new potentials of large levels of losses (Horlick-Jones, 1995). Since urbanization is inevitable, the resultant urban vulnerability is reality (Balgos, 2016). Cities have to cope with the agglomeration effects that in itself increases impacts of disasters involving millions of people in a single urban setting (Douglass, 2016).

Historically the development of cities and concentration of population has increased risks for urban populations for a variety of reasons. Since the 1980s the shift in Asian cities has entered a period of continuous corporatism of spaces which has increased vulnerability; for instance, mega projects have impinged on development schemes such that poor neighborhoods have been relocated from central to more hazard-prone areas (Douglass, 2016). In addition the changes brought by colonial ports to urban agglomerations have endangered location along with the increasing rural to urban migration to coastal cities coupled with the exposure to rising effects of climate change (Miller & Douglass, 2016).

With nearly half a billion of the Asian population living in slums, the pursuit of alternate safe, secure, and socially just form of urbanization can be seen as overwhelming. Yet the lack of transparency has alienated the civil society from the formal government processes of recovery and reconstruction and led to decrease in public confidence. An outcome of such a type of culture leaves the voices of civil society neglected and creates a feeling of disorientation in the community with destructive consequences on long-term capacities to build resilience to future disaster risk (Miller & Douglass, 2016). The gated housing territories in peri-urban areas have replaced the small farms, while in cities privatization of space along with replacement of local enterprises with global chains has increased concentration of resources for few and resulted in replacement of family-owned farms and business with wage earners (Douglass, 2016).

A disaster does not occur in apolitical spaces and urban societies at the same time are places of heightened contestation, compromised, negotiated and cooperation during crisis, emergencies and disruption (Miller & Douglass, 2016). Urban growth

is unequal globally, but the rate of urbanization is increasing exponentially in developing countries. The accelerated urbanization with lack of planning has brought with it a host of problems: growth of dense and unplanned residential areas, environmental pollution, unavailability of services and facilities, and solid waste and slum growth (Choudhary & Neeli, 2018). High levels of migration have led to growth of slums and informal settlements in places that are highly prone to risk of disasters. For instance, several slums are located near canals or flood-prone areas where flood management measures like canal widening means eviction of informal settlements (Douglass, 2016).

These urban population categories along with the homeless are extremely vulnerable to risk of hostile environments resulting from disasters. The divisions between rich and poor have created risk ghettos that have exposed the conventional vulnerable group to higher levels of risk while the turbulent socioeconomic situations impact the resilience of complex sociotechnical systems resulting in unpredictable effects of system vulnerability (Horlick-Jones, 1995). At a larger level urbanization has brought a new level of vulnerability through “production and ownership” of spaces for the middle class. While for those compelled to live in slums in disaster-prone areas, vulnerability is also added due to lack of land, capital, and resources (Douglass, 2016).

Urban centers contribute to around 43% of India’s GDP that is generated by 100 of the most populous cities in the country. Yet, urban inequalities are stark and reproduce social disparities (Abhishek, 2020). An interrogation of such urban social disparities and implications for urban space will be presented in latter sections of this chapter.

According to the United Nations Department of Economic and Social Affairs (2018), the world currently is more urban than rural with 55% of the world’s population concentrated in urban centers, with projections estimated at 68% by 2050.

The burgeoning urban centers place massive demands on urban space. Homes, workplaces, schools, hospitals, transport networks, water supply, sanitation systems, public health systems, energy generation, solid waste management systems, and distribution networks are part of critical infrastructure that support lives and livelihoods; these are also vulnerable to a broad range of risks and threats including those posed by climate change and extreme-weather induced urban disasters (Bosher & Ksenia, 2017).

Despite spatial exhaustion in urban spaces on increasing built environments, demands for urbanization continue. These are fueled by a combination of population increases including rural to urban migration and unbridled pursuits of modernist developmental ambitions that are backed by bureaucracy. These result in urban sprawls that are characterized by unsystematic extension outside the city’s territorial limits. Such unplanned built environment expansions and change of land-use, land cover result in loss of open green spaces, arable agricultural land, and surface water bodies. The growth of urban sprawls poses several ecological and socio-economic challenges increasing distances between peri-urban population and urban resources

(Bhat et al., 2017). Urban mobility also becomes increasingly difficult for the urban poor.

The heterogeneity of urban spaces, urban population, and social groups requires differential governance based on equity. Variation in vegetation, economic activity, and architecture shapes the urban. The city must not be treated as a homogenous entity while framing urbanization in a singular dimension with scant regard for diversity of ecosystems, people, and needs.

Urban Intersectionality

Social identities in the urban setup are vastly diverse and varied. Urban identity and urban demography are often shaped by migratory patterns with population influx from rural areas. Urban centers provide substantive benefits to residents by offering greater opportunities for work and access to critical services such as healthcare and education. In developing economies, rural to urban migration is on a steady rise. As presented earlier, in the Indian context, there is a massive and increasing migratory rural to urban shift.

The urban identity therefore is not a homogenous one, and social groups occupying the urban space are heterogeneous carrying with them different burdens of identity. Social disparities are typically mediated through historical cultural processes, and in urban settings, such social inequalities are also by-products of prevailing modes of production and allied labor relations (Nijman & Wei, 2020). Categories such as caste, class, gender, disability, indigeneity, race, ethnicity, and religion intersect with each other to produce a multi-dimensional identity on which several axes of discrimination operate on.

The conceptual framework to analyze different burdens on identity termed as intersectionality emerged from black feminist thought to enable comprehension of how intersecting and overlapping social identities of gender and race bring about discrimination and marginalization. The term was coined by UCLA law Professor Kimberle Crenshaw in 1989. Over the years, through Crenshaw's own work as well as others' experiences of discrimination, intersectionality began to take into account other forms of marginalization brought about by systemic oppressions on account of ethnicity, caste, aging, disability, mental health, sexuality, class, religion, indigeneity, membership to certain groups, etc. 20 years later, Crenshaw herself stated that there has been an "intersectional erasure" as power continues to be held by structures of "maleness and whiteness" in the US context (Crenshaw, 2017). Crenshaw revisited the idea of intersectionality a little later and argued that the framework should not be considered as a "totalizing theory of identity" (pp. 1244) but as a way to account for plural grounds of identity construction in the context of the social world (Crenshaw, 1991). Drawing from feminist thought that patriarchy intersects and overlaps with other structures of power (such as racism) has been a useful analytical frame to look at overlaps of different axes of power that make identity a compound (e.g., woman with disability or migrant Muslim).

In the urban space, there are a myriad of identities that comprises the urban demographic. Labor migrants and low-skilled workers, refugees, long-term residents, students, white-collar workers, and affluent migrants across a range of socially and culturally mediated identities such as caste, class, ethnicity, religion, age, gender, etc. occupy the urban space. Such plurality of identities experiences different forms of subjugation in the urban space.

Delhi, for instance, hosts a range of refugees such as Sikh and Christian Afghan refugees (Non-Muslim Afghan refugees), Rohingyas, as well as older refugee populations from the Partition era. Their identity as refugees as a form of political categorization mediate pathways to self-reliance in the urban space. According to the UNHCR, “Self-reliance is the social and economic ability of an individual, a household or a community to meet essential needs (including protection, food, water, shelter, personal safety, health and education) in a sustainable manner and with dignity. Self-reliance, as a programme approach, refers to developing and strengthening livelihoods of persons of concern, and reducing their vulnerability and long-term reliance on humanitarian/ external assistance” (UNHCR, 2011, p. 15). Ideas of belonging and citizenship mediate access to urban resources, and the self-reliance of the refugee population in an urban space is an instance of urban intersectional inquiry.

Several large cities report intra-ward income disparities. Mumbai, for instance, houses the M-Ward which is one of the poorest wards in the megacity. Governance of wards or administrative units is decentralized, and developmental gains have been uneven. The M-Ward’s Human Development Index (HDI) is one of the lowest in the city. Other social indicators such as health and nutrition are also dismal with 50% of the children being malnourished. Megacities are often spoken about as two cities, the city of the “haves” and the city of the “have-nots,” and while both the cities are located within the same geographical territory, they occupy entirely different physical, economic, and social spaces (Mumbai Human Development Report, 2009).

Cities are heterogeneous across a range of socio-economic, cultural, political, ecological, and infrastructural dimensions. Studies surrounding urban heterogeneity immediately draw from studies around urban inequalities and inequities.

Mumbai is home to all major world religions including Islam (20%), Buddhism (4.9%), Jains (4%), Christians (3.2%), Sikhs (0.5%), and a small Parsi population of fewer than 60,000 persons (Census of India, 2011). Urban inequalities manifest spatially through the processes of residential segregation along caste, religion, and migratory patterns. While Dharavi is home to Tamil migrants, areas such as Mazgaon, Mahim, Govandi, and Cheeta Camp record a high concentration of Muslim population. Many of these areas are densely populated and populations live in informal settlements.

There is an insecurity of housing tenure in informal settlements, and environmental injustices are evident with poorest and most vulnerable groups exposed to hazardous wastes and effluent discharges of industries. As an urban entity with increasing industrial overstretches, the Mahul village of Mumbai is an example of how income inequalities and social disparities inequalities manifest as spatial inequality. A former fishing village, Mahul was converted into a resettlement colony

for Project Affected Persons (PAP) as part of rehabilitation programs for various projects. Roughly 60,000 persons (5500 families) were housed in 125 square feet flats located in the specially constructed 72 buildings. Mahul is a substantially industrial area that is home to several petroleum refineries and other industries including power and chemicals. According to residents, both the air and the ground-water are heavily contaminated. The Maharashtra Pollution Control Board (MPCB) has studied the area certifying that the industries release unacceptable levels of volatile organic compounds (VOCs) including benzene. VOCs pose serious threats to the central nervous system.

Resettling PAPs in a heavily polluted area, exposing them to critical public health risks, reveals the unfortunate nature of urban poverty as it intersects with unbridled capitalistic pursuits.

While the elite and white-collar workers traverse the cityscapes in private transportation from posh high-rise homes to sanitized central business districts, the homeless, the labor migrant, the sanitation worker, and the socially excluded groups live in ghettos, peri-urban locales, or urban sprawls or are rendered homeless. Intersections of income poverty and spatial injustice manifest as urban deprivations. The poorest of the urban dwellers in cities live in unplanned, unauthorized developments, characterized by infrastructural deficiencies in terms of access to water, sanitation, and hygiene facilities, healthcare, and other constitutionally guaranteed rights.

Urban Risk

Cities have always operated against the changing background of risk with the twenty-first century providing a better understanding of risk and uncertainty (Oldham & Astbury, 2018). The cumulative impact of everyday, small or recurring disasters is much more significant than a rare occurring larger emergency crisis (Adelekan et al., 2015).

Risk is unevenly distributed both socially and spatially in the urban context. While the vulnerable groups are well established in literature, specific forms of vulnerability related to specific types of hazards are poorly researched. Differential vulnerability in terms of age, gender, class, poor housing conditions, informal settlements, and accessibility to basic amenities and services is discussed frequently. The everyday risk of low-income marginalized groups relate to issues of poor water quality, health and hygiene, sanitation, air pollution, poor ventilation, and built environment; these crucial aspects of people's lived experience do not find adequate space in mainstream DRR thinking. Other urban phenomena such as fires, road accidents, epidemics, and large-scale public health risks such as those related with poor air quality, sanitation, hygiene, and communicable diseases owing to water logging in low lying areas often do not find space in the larger urban disaster risk reduction discourse and remain neglected by DRR policies (Adelekan et al., 2015).

Dramatic changes in urban infrastructure have been possible due to global economic restructuring, the transformation process known as "postmodern urban

landscapes.” These processes reproduce radical social, cultural, and spatial deviations which have implications on vulnerability demonstrated as gentrification of older cities. The process of gentrification in cities is followed by large consumeristic development of shopping and entertainment facilities. This is contrasted by homelessness as an ever-present phenomenon of the megacities (Douglass, 2015). In this regard, what remains to be deliberated is how risk and vulnerability are distributed in urban areas with a focus on poor households, informal settlements, gender, age in the context of climate change, and resulting complex disasters; these continue to impact urban areas with the planning and city management determines the extent and the distribution of risk. The risk accumulation, its tolerance, and acceptance in low-income urban settlement need critical examination in absence of city planning and management and lack of capacity of local government to manage the risk. The risk accumulation and its underlying social, political, economic, and political determinants are associated with its process related to everyday hazards (Adelekan et al., 2015). Other megatrends also include impact of climate change, ignoring inequalities and migration where the immigrant population is left out of welfare schemes creating more vulnerability. These changes in urban forms have sharpened the contrast between the newly established privilege and marginal groups (Horlick-Jones, 1995). These urban transformation and construction related to ever-increasing demands of urbanization and development are all linked to disasters (Douglass, 2015).

Urban Risk Governance and Urban DRR

Urban governance is significant in creating or reducing risk in cities (Rumbach, 2016). Cities are the centers of intense growth and development, with disaster preparedness and resilience along with disaster governance becoming central to addressing vulnerability of urban areas (Douglass, 2016). City regimes that have focused on economic growth or livelihood generation are also discussing disaster risk management (Rumbach, 2016). Risk and their distribution at local level, especially those associated with everyday life, are highly dependent on the way cities are governed (Jorgelina, 2019). Governance strategies for disaster are inclined towards bring about transition in societal foundation. At the same time it is influenced by changes in society. Disaster governance regimes will also shift with changes in predominant governance and its alignments; similar to that seen in risk and environmental governance (Tierney, 2012).

There are several characteristics of current urban planning and development including disaster risk reduction that needs investment decisions (Murray, 2017). The capacity of the city government to manage local development, land use planning and change, benefit distribution, safety standards, resilient infrastructure, and ability to reach out to the most vulnerable influence the everyday risk in urban areas (Jorgelina, 2019). The success of a country’s ability to decrease the gap between actual and potential rate of development and reduce risk is also dependent on leadership ability and commitment to develop and implement suitable policies

(Ahrens & Rudolph, 2006). However, often there is a mismatch between the urban population growth, development trends, and the ability of governance structures to manage levels of risk (Jorgelina, 2019). In several cities investment in disaster risk reduction and capacities for implementation are often lacking which results in emergence of new patterns of intensive risk. In the context of low- and middle-low-income countries, often there is a lack of capacities to plan and manage risk-sensitive urban development; as a consequence disaster risks have increased rapidly in urban areas (Murray, 2017). With a large number of cities now being concentrated in middle- and low-income countries, the projected population growth, infrastructure, and economies mean urban areas will continue to rise unless drastic measures are implemented. Adding to this the climate risk and vulnerabilities are rising in cities making it challenging to distinguish disaster risk reduction from actions on climate change adaptation (Jorgelina, 2019).

The increasing risk to urban areas has also contributed to the argument of linking disaster risk to development. This idea has greatly influenced mainstreaming disaster risk reduction through risk management strategies. There has been considerable progress in managing disaster through efficient response and recovery stages. As a result, losses of lives have reduced drastically; however there has been steady rise in economic losses along with inequity in risk reduction (Jorgelina, 2019). Uncertainties in disasters are too complex to be dealt with; traditional approaches with fixed rules of bureaucratic systems of governance are ineffective, since they are based on predictability models rather than the breaks in the status quo (Douglass, 2016). The governance approach for disaster management takes the larger public policymaking framework into consideration at national and local level along with the executive division, the administration, the interface with public and private actors, and those affected by disasters (Ahrens & Rudolph, 2006). Local governments are better placed to prepare for disasters through interventions such as maintenance of infrastructure, disaster-resilient structures, emergency planning, and land use regulation. They are also the first to arrive for rescue and mitigation efforts and own the knowledge of space and conditions that are valuable in emergencies. Decentralization is considered to have a positive impact on public services delivery, and since disaster management involves provisions of public safety services, it can have a constructive result for efficient disaster management. The benefit of decentralization, enabling local authority to apply local knowledge, leads to better comprehension of local context and vulnerability, effective in preparing for different types of disaster (Bae et al., 2016). In the past several programs by international science and policy agencies focused on improving the national level government capacities that are tasked with risk reduction and to some extent the improving local or global governance. Though it is understood that rational science-based management is required in processes, well-developed cities investing highly in such measures are often criticized as these measures do not offer comprehensive protection to those at risk. An alternative to this is to decentralize and adapt using scientific and vernacular knowledge (Mitchell, 2015).

Strengthening of disaster risk governance at local level was strongly acknowledged in the Hyogo Framework for Action (HFA) and has been better put together in

the Sendai Framework for Disaster Risk Reduction. Disaster risk governance has shown positive progress at international and national level. Such international frameworks have played a crucial role in creating institutions that have provided legal and regulatory frameworks to strengthen DRR. However there is growing recognition that more is required to manage recurring disasters that impact lives and cost. The institutionalization of DRR has created necessary regulations and action for DRR, but at community level efforts are still lacking. There is a lack of comprehensive data and reporting on implementation of DRR at the local level. The major challenge is the capacity of local actors and societal issues that affect the perception and action taken to reduce risk. Hence there is growing attention to strengthening local level governance and its actors, data availability, decision-making, engaging local communities, and vulnerable groups (Djalante & Lassa, 2019). Addressing underlying risks such as poverty, lack of access to services and resources, marginalization, poor settlements, health, and education continues to persist (Jorgelina, 2019). Measuring these through tools of risk assessment in urban areas is complex and challenging to contextualize for local city municipalities/institutions. By considering disaster research from a governmental point of view rather than management brings to light the local power dynamics related to spatial and social inequalities.

DRR Towards Urban Transformation: Deliberations and Conclusion

Governance arrangements for disaster and climate change are occupied by global dynamics, inequality, socio-demographic trends, and globalization on one hand and population density, assets and infrastructure, waste management, improper land-use planning, etc. on the other. The transformative agenda for sustainable city development ensures benefits such as managing rapid urban growth, rural-urban linkage management, decentralization, resilient critical infrastructure, strengthening facilities and services delivery mechanism, provision of jobs, education healthcare, safety and security, and environment protection (Djalante & Lassa, 2019). Disaster risk reduction is incremental when disaster management is improved with the existing status quo, but the same action is considered transformative when there is a system-wide change towards sustainable development through drivers of risk reduction. Such actions of risk reduction become relevant to development and are not merely associated with extreme events. Managing disaster rather than disaster risk leads to actions that do not have the ability to recognize development pathways that generate and propagate underlying risk (Jorgelina, 2019). Twenty-first-century risk governance requires multi-disciplinary, integrated approaches to cope with socio-technical risks in a complex and uncertain risk environment.

The irregular pattern of development of cities creates diverse and divided societies that produce spaces of contestations and fragmentations during disaster due to understandings of vulnerability and exposure. It is important to understand the past experiences of disaster and its implication for better collaboration between

management, policy, institution, social science, and sciences for a better transformation in practice and scholarship. The temporal and spatial complexities of disaster in urban areas need reflection on the chain of interdependencies related to past action that demand a longitudinal lens to study disaster risk governance (Douglass, 2016). Research that addresses poverty, inequality, and institutions in urban areas focusing on dynamic political complexities which result in weak governance leading to unplanned development and mismanagement is pressing necessity. These factors produce better understanding of underlying factors for risk accumulation that can be beneficial for policy-based intervention for risk reduction initiatives. This requires institutional understanding of risks that are historically shaped by organizational and individual actions forming legislation, policy, and practice of urban management. The role of informal mechanisms beyond the state purview active in influencing city risk along with formal structures that are stakeholders in overall city development over time is worth examining (Adelekan et al., 2015).

Considering the growing importance of community-based DRR and climate change adaptation for urban areas, research on urbanization processes that influence risk and knowledge co-production coming from scientific and community are significant to the field of Urban DRR. The capacity of local governments to manage risk is severely lacking in several LMIC. There is a need for the documentation of work where city governments have partnered with local populations and civil society organizations to reduce risk and build resilience to extreme weather (Adelekan et al., 2015). Since it is an urban location, the exchange of practice among varied groups can lead to loss or modification of knowledge due to the interaction of several identities. The changing nature of disaster may need new approaches and initiatives, and in this context certain knowledge and practice may not be relevant. Hence the assimilation of local knowledge with the changing scientific information and governance structures that promote risk reduction and adaptation is an important concern (Molina, 2016).

Abstract

On September 19, 2017, one of the most destructive earthquakes in Mexico's history occurred. Mexico City was the most affected region in the country due to the loss of human life, the destruction of public infrastructure, and the damages and loss to thousands of housing across the whole socioeconomic structure. The magnitude of the disaster exceeded the scarce local public resources available to reconstruct the city. As a result, many homeowners faced the collapse or

This research was partially funded by the Lincoln Institute of Land Policy. The working paper WP21JF1 and Fuente's Master Thesis offered important inputs for this chapter.

demolition of the buildings in which they lived. City authorities mobilized building rights as an in-kind public resource to co-fund the reconstruction of many buildings.

This chapter documents the case and explores some foundational questions: How to finance the reconstruction of those homes? Why do practitioners choose to use building rights? What is the institutional design and performance of this tool? What are the results? This research includes a review of documents and interviews with key actors. It shows preliminary but positive results and illustrates the implementation challenges when using additional building rights to finance building reconstruction in developing countries. The Mexican City pioneer experience shows a feasible recovery based on an equal financial alternative for local governments in similar conditions.

Building rights · Earthquake · Reconstruction · Mexico city, local public finance · Extreme events

Introduction

Disasters cause human, social, financial, economic, and environmental impacts. The effects can be long-lasting and multi-generational. Countries like Mexico face more significant challenges with limited capacity to manage the impacts and recovery costs. In addition to dealing with an emergency, authorities must implement actions to repair and rebuild buildings, equipment, public infrastructure, service networks, and architectural heritage that demand great economic and human resources. Land value capture – using the selling of building rights – is integrated into the municipal power of planning and land use regulation. It is available to many local governments and can be a relevant and fair alternative to help cities and citizens recover after a disaster.

This case begins with a description of the disaster, the extent of the damage, and the challenge of rebuilding. Next, it explores the resources mobilized to address the emergency and reconstruction and the context of the apparition of additional building rights tool (in the future ABRs). Next, it delves into this alternative mechanism to co-finance the reconstruction of thousands of lost homes. This case seeks to answer questions about the ABRs' nature, design, implementation route, and results. Finally, it offers some conclusions regarding this case and ABRs' possibilities for local governments to recover after a catastrophe.

The Disaster and the Extent of the Damages

In September 2017, two earthquakes shook Mexico's central and southern regions. The first, with a magnitude of 8.1 degrees on the Richter scale, occurred on September 7 at 11:49:17 p.m. in the state of Chiapas, in the country's south (SSN, 2017a).

According to the Presidential Chronicle, at least 98 people died: 78 in the state of Oaxaca, 16 in Chiapas, and 4 in Tabasco (Office of the Presidency of the Republic, 2017: 40). Twelve days later, on September 19, at 1:14:40 p.m., a new earthquake with a magnitude of 7.1 on the Richter scale occurred between the states of Puebla and Morelos, 120 kilometers from Mexico City (SSN, 2017b). According to the statement by Luis Felipe Puente, National Coordinator of Civil Protection, a total of 369 people died: 228 in Mexico City, 74 in Morelos, 45 in Puebla, 15 in the State of Mexico, 6 in Guerrero, and 1 in Oaxaca (Excelsior, 2017) (Fig. 1).

Mexico City (CDMX) was undoubtedly the most affected region in the country, considering the number of deaths and the magnitude of the economic damage. The earthquake of September 19, 2017 (from now on, "the earthquake") was one of the most destructive in Mexico in the last 100 years due to the damages to construction and human lives (GOCDMX, 2019a: 8). It caused 228 deaths and at least 59,248 victims (considering only housing damages) (CENAPRED, 2019: 28).

The city reported physical damages in 4 public markets, 2951 commercial establishments, 47 hospitals and health centers, 83 government buildings, 1900 educational buildings, and 419 cultural and historical heritage buildings (GOCDMX, 2019a: 9). Damages to the water and drainage system and road infrastructure included 45 wells, 2712 leaks in drinking water networks, 39 kilometers of drainage networks, 87 kilometers of drinking water networks, 12 roads, and 2 pedestrian bridges (*ibid*: 9). It constituted enormous damage to the public infrastructure and equipment for urban activities.

The nature and intensity of the damage depend on the risk of collapse (high, medium, and low risk) and the scheme of property intervention: rehabilitation or

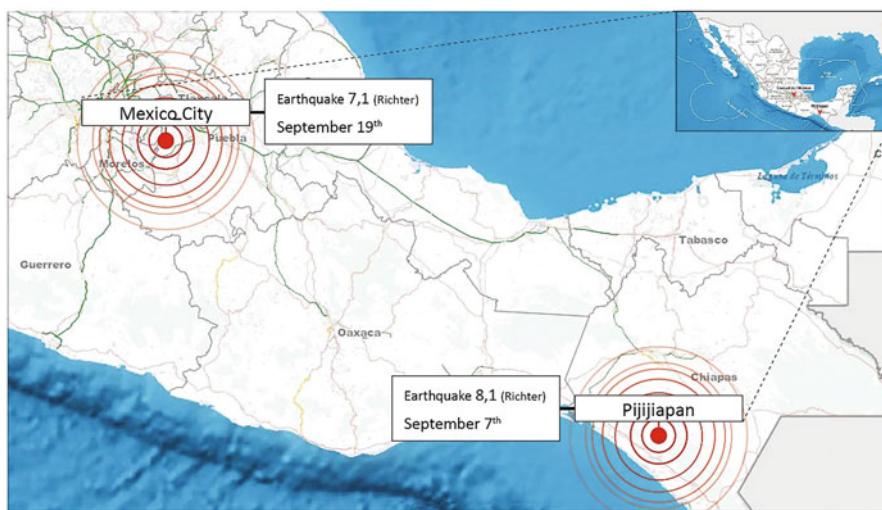

Fig. 1 Mexico: Epicenter of the earthquakes of September 7 and 19, 2017. (Sources: Adapted by authors downloaded on April, 2019, from USGS: <https://www.usgs.gov/> and INEGI: <http://gaia.inegi.org.mx/mdm6/?v=bGF0OjE3LjUwMDY1LGxvbjotOTUuMjcxNzQsej0z>)

reconstruction (for destroyed or demolished properties). In 2018, about 98% of the 26,672 residential properties censored reported damages (GOCDMX, 2019a: 11). In May 2019, the property census registered 371 multi-family properties (from now on, "buildings") as impaired and 109 would need complete rebuilding. Likewise, the

(Source: Adapted from Mexico City Reconstruction Commission; Map of Districts limits downloaded on June 2022, from: https://es.wikipedia.org/wiki/Demarcaciones_territoriales_de_la_Ciudad_de_México#/media/Archivo:MX-DF-División_pol%C3%ADtica.svg)

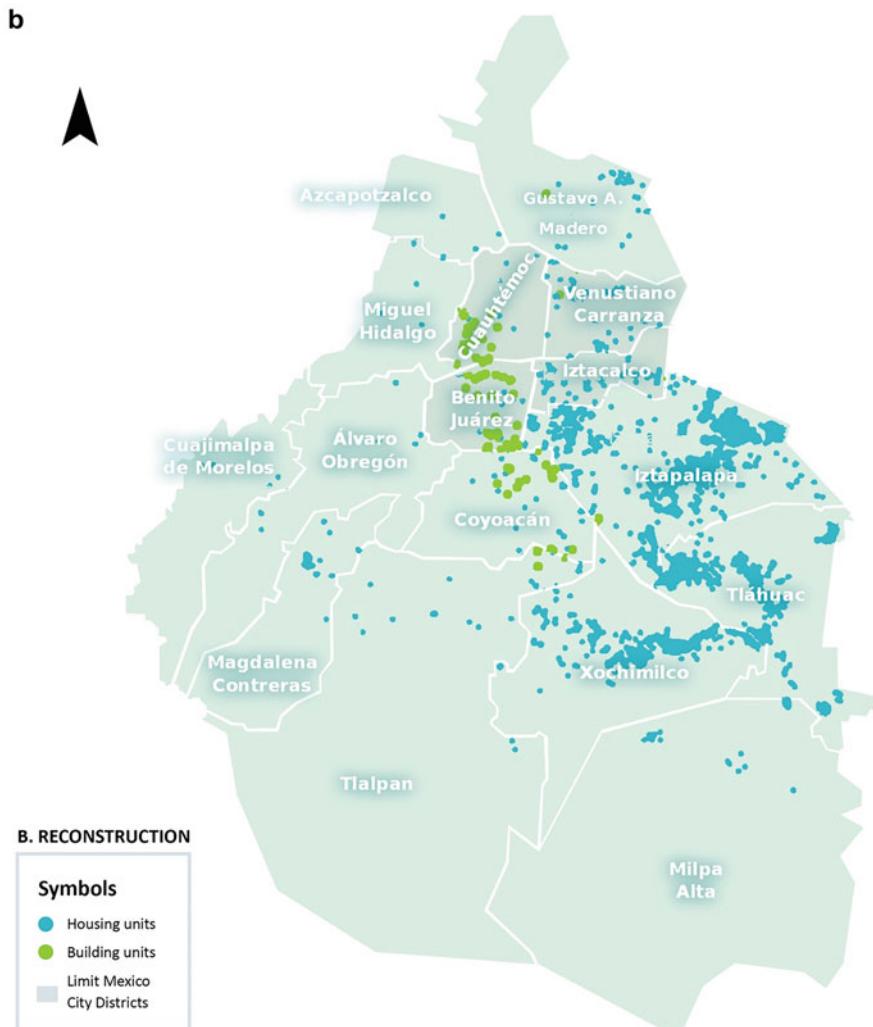

Fig. 2 (continued)

census reported 11,882 damaged single-family properties (from now on “houses”), and 2824 would need complete rebuilding.

Figure 2a, b show the distribution of the 12,253 damaged residential properties identified in May of 2019; it includes the level of risk, treatment (rehabilitation or reconstruction), and type (buildings or houses).

Building damages occurred in different areas of the city. However, 91% of them were concentrated in the central and eastern districts (Cuauhtémoc, Benito Juárez, Coyoacán, Venustiano Carranza, Iztacalco, Iztapalapa, Tláhuac, and Xochimilco),

while the remaining 9% were distributed in the other eight districts (Azcapotzalco, Gustavo A. Madero, Miguel Hidalgo, Cuajimalpa, Álvaro Obregón, La Magdalena Contreras, Tlalpan, and Milpa Alta).

The spatial concentration of the damage is more conclusive if one considers the type of intervention required (rehabilitation or reconstruction) and the type of property damaged (buildings or houses). For example, of the total residential properties that required rehabilitation, 76% of the buildings were downtown (Cuauhtémoc, Benito Juárez, and Coyoacán districts). In comparison, 95% of the houses were in the eastern part of the city (Venustiano Carranza, Iztacalco, Iztapalapa, Tláhuac, Xochimilco, and Milpa Alta districts).

Of the total residential properties that required complete reconstruction, 84% of the buildings were in the same central districts. Similarly, 84% of the houses were in four east districts (Iztacalco, Iztapalapa, Tláhuac, and Xochimilco) (see Fig. 2b). The damage was concentrated territorially by type of structure: buildings in the central areas (more densely occupied) and houses in the eastern with lower occupancy. The public policy schemes to attend the victims considered the territory, type of structure, and resources along with the institutional and operational design.

The Resources and their Sources

Between 2017 and 2020, more than US\$1.037 million funded the emergency and some recovery actions. Those resources came from federal and local budgets and private donations. However, a disaster of such magnitude implies severe financial challenges for the municipal government. Therefore, this chapter concentrates on the financial effort made by the city (Table 1).

During the emergency (2017), resources came mainly from federal funds (Trust Fund for Natural Disasters, FONDEN) and private donations (according to Plataforma CDMX, it was around 1.3 million dollars from civil society and the Walmart economic group). Those resources funded three actions: assessment, reconstruction, and rehabilitation of infrastructures in culture, sports, education, forestry, hydraulic system, monuments, health, and housing. Private donations came from different parts of the republic and other countries – those resources funded just emergency actions without covering the public policy for recovery.

As of 2018, the economic efforts came from the city and focused on reconstruction (approximately 453 million dollars) (GOCDMX, 2017a; ALDF, 2017a). The resources came mainly from the Fund for Attention to Natural Disasters in Mexico City (FONADEN), which feeds off the remains of the city's general budget. Active since July 2015, the FONADEN prepares the city for unexpected situations. By 2018 the FONADEN had accumulated close to 495 million dollars. This fund provided 84% of the resources given to the reconstruction. The rest came from the federal level through the FONDEN, with a specific destination for reconstructing historical monuments (SEGOB, 2018; Legislative Research Institute s.f.). Finally, in 2019 and 2020, the city invested around 208 million dollars per year for reconstruction (GOCDMX, 2018a, 2019c).

Table 1 Mexico City: Economic resources for the reconstruction and their sources (2017–2020)

Year	Total Amount per Year (Mexican pesos / USD dollar) Unit: millions	Amount by Source (Mexican pesos. Unit: millions)
2017	2.625	2.600 – FONDEN (federal found)
		5.3 – Private donations
		20 – Walmart group
2018	9.284	8.700 – FONADEN (City found)
		584 – FONDEN (federal found)
2019	4000	4.000 – City budget
2020	4000	4.000 – City budget
Total amount (2017-2020)	19.909	1.037

Source: The authors based on GOCDMX (2017a, 2018a, 2019c), ALDF (2017a), SEGOB (2018), Instituto de Investigaciones Legislativas s.f.

From the preceding, the city became primarily responsible for funding the great challenge of reconstruction. Although the city counted on reserves for emergencies (FONADEN), the magnitude of the damage exceeded its investment capacity. Thousands of families from different socioeconomic conditions and needs (from reinforcement of physical structures to demolition and total reconstruction) waited for help. Therefore, it was urgent to find new monetary sources that did not depend on the public budget. In this context, an urban financing alternative that had been politically discarded a few months prior during the Constituent Assembly of Mexico City reappeared in the political arena. The land value capture tools derived from land-use regulations came back as a financial option for the recovery.

Land Value Capture and Building Rights

Economics foundations state that land value depends on its attributes. Its attributes depend on the availability of infrastructure and land-use regulations. The land-use regulations define the uses and physical exploitation of the land (building potential) as defined by local governments through urban planning tools. Land use and occupation decisions have economic effects. More profitable uses (such as commerce, services, and non-social housing) and more intensive occupancy conditions (high-rise buildings) reflect higher land prices. The land value effect refers to land-use regulations and public works investments. Hence, the instruments that seek to

recover, mobilize, or capture part or all of these increases in land value are called land value capture tools or land base tools (Ingram and Hong, 2012; Smolka, 2013).

The use of land value capture tools is considered fair for two reasons. First, land value increases are not due to the landowner's efforts but the society and public investments. Second, revenues from land value capture tools finance urban development and help reduce inequalities in urban supports and services between territories. There is a broad spectrum of land value capture tools; one group focuses on building potential and more profitable uses. This group of tools is generally called building rights or development rights and as implied offers the payment of economic compensation to the municipality in exchange for a specific buildable area, mainly in high-rise buildings (Furtado and Acosta, 2020).

In the case of Mexico City, the instrument adopted is the additional building rights. Would it be possible to use the economic potential of urban land through ABRs to subsidize the reconstruction after the earthquake in the city? Unfortunately, the initial answer is no. In December 2016 (just a few months before the earthquake), the Constituent Assembly of Mexico City had eliminated from the new constitutional charter the political proposal to implement land value capture (article 21, paragraphs 7 and 9). The chapter referred to: (i) the land value from the urbanization process would be a public wealth of the city, and (ii) the city government must manage the building rights for the benefit of all. Such a proposal to democratize the land value had been politically crushed based on the argument that “the symbolic force of home ownership (...) the defense of an expectation about the future based on personal sacrifice” (Azuela, 2019: 220).

However, the urgency to find sources for the reconstruction changed this picture. The ABRs changed from a symbolic threat to property rights to a mechanism for securing housing reconstruction. Likewise, this instrument went from being excluded, by the political decision of the constituent power, to being adopted and regulated by the local executive power. Undoubtedly, an episode marked by legal ambiguity. In the context of political transition, two local tenures (outgoing and incoming) saw the ABRs as a powerful tool given the pressure for resources imposed by the magnitude of the disaster.

The First Public Policy Attempt

The local government published the first reconstruction law on December 1, 2017, at the end of its tenure. This law established five housing categories to attend to the victims and different types of financial aid. The housing category and the type of relationship (ownership or rental) were decisive in the definition of the public assistance schemes for the victims, as shown below (Fig. 3):

Next, an analysis of the ABRs policy chosen to co-finance the reconstruction of buildings declared a total loss. Total loss cases required a financial alternative to cover the complete cost of rebuilding. Therefore, the law established two public support options for the victims to choose from. In both cases, Mexico City

Housing Type	Support/financing scheme
Social Housing in rural areas on community property	Direct subsidies to the victims (without specific financial mechanism)
Housing for low-income and vulnerable population	Direct subsidies to the victims (without a specific financial mechanism)
Vecindades*	Mixed financing schemes: subsidies, resources, contributions from victims, credits
Buildings for residential use	Mixed financing schemes: subsidies, resources, and contributions from victims, credits, and ABRs**
Rental Housing*	Support linked to the victims' resources

Fig. 3 Mexico City: Public support by housing type, (2017) (Source: The authors. *Vecindades: Usual arrangement in Mexico City composed by multiple housing lots aggregated in small units that share the yard and other services. **Additional Building Rights)

Building reconstruction costs	Financing Mechanism
Option A. New building with increased buildability. The profit is obtained from the additional buildable area sales to finance the new building.	Benefit: +35% of ABRs* to the original building surface and housing units. Benefit alternatives: <ul style="list-style-type: none">• Construction volumetry increased• Additional building levels (floor) and,• Additional housing and commercial units
Option B. New building with additional housing units but keeping the same volumetry. The profit is obtained from the additional housing unit sales to finance the new building. Victims give up part of the original area to increase the housing units for sale.	Benefit: undetermined from new housing units for sale Benefit characteristics: <ul style="list-style-type: none">• Additional number of dwellings maintaining the original volumetry• New apartments with less space

Fig. 4 Financial alternatives for building reconstruction. (Source: The authors. *Additional Building Rights)

Department of Urban Development and Housing (from now on SEDUVI) is in charge of the support, as follow (Fig. 4):

Redensification, more intensive use of the land (more housing units, higher buildability), and more profitable uses (such as commercial) were the base of financial support for the victims. Selling additional housing units could cover the cost of rebuilding the destroyed homes (GOCDMX, 2017c). Additional funding mechanisms were: the victims' resources or credits for the initial financing of the

reconstruction works and public resources for up to 500 thousand pesos (approximately \$26,000 dollars) per housing unit (GOCDMX, 2018c, d).

The law expressed a motivation “the conditions presented by the affected people and (...) the insufficient resources that CDMX had to attend to the multiple effects caused by the earthquake” (GOCDMX, 2017b). According to some public officers, the main reason to introduce the ABRs was insufficient public financial resources. Between January and August 2019, we interviewed the former secretary of finance, the former general director of urban development (SEDUVI), the first commissioner for reconstruction, and the former reconstruction program director of Mexico City. All of them agreed and highlighted the resources as the main reason for implementing ABRs. Officials also stated that using ABRs was an alternative to finance the reconstruction of the buildings so the cost burden would not fall on the victims or scarce government resources. Thus, re-densification would be public and in-kind support, a density bonus to help the victims rebuild their homes.

However, by December 5, 2018, the first day of the new local tenure and just over a year after enacting the first reconstruction law, none of the 87 buildings that planned to rebuild using the funding scheme had begun reconstruction. The new tenure (2018–2024) kept the ABRs strategy and made essential adjustments to their design and implementation path.

The Second Public Policy Initiative

On December 7, 2018 – two days after the beginning of the new tenure – the new government published the second reconstruction law showing its electoral importance. The new reconstruction program sought to simplify procedures and speed up home reconstruction (Colín, 2018). All the policies of the first law were repealed, except the one based on ABRs to fund rebuilding buildings in a situation of total loss (GOCDMX, 2019a). The second law granted access to public funds for all victims to reconstruct their homes (regardless of the type of home and whether it was rehabilitation or reconstruction). The law also defined that the city government covered the demolition costs, the reconstruction project design, the preliminary and complementary studies, and the work supervision of both houses and buildings.

The policies designed in this phase were more homogeneous and detailed. Economic support for reconstruction was established for all owners of apartments up to 65 m² in size (GOCDMX, 2019a). The city government proposed two alternatives:

1. The increase of up to 35% in the construction potential (ABRs) established in the zoning of the urban development program
2. Redistribution of the preexisting building volumetry to produce more housing units

The law allowed businesses and services to use the ground floor (established in the first law) and added freedom to define the number of levels (floors) and additional dwellings. It also established that the sale of additional housing units and business spaces resulting from the ABRs would fund the building

reconstruction. In an interview developed in March 2019, the General Director of Victims' Attention, Maestra Jabnely Maldonado Meza, confirmed that officials preserved the ABRs reconstruction scheme for three reasons: (i) insufficient public resources to cover all reconstruction costs; (ii) economic viability – the victims would not have to go into debt, and (iii) enable the owners to recover their homes with the original (or similar) size. In her words:

[For the buildings], we did not have resources to reach all victims with direct subsidies (...) For us, [the ABRs] was a sustainable public financial tool without people going into debt. In other words, if we assumed the re-densification (...), we could reach, at reasonable costs, the total financing of the building. So, we kept it [the ABRs] because it was a viable mechanism that allows the government to meet the needs of the people who demand 120 m² with the sale of additional homes: *the resource comes from selling additional housing units.* (Jabnelly Maldonado, March 2019)

The Additional Building Rights and Their Public Policy Pathway

In May 2017, months before the earthquake, the city council approved a subsidy consisting of a density bonus for a specific group of beneficiaries: formal workers affiliated with the national housing agencies. National housing agencies could ask the local government for a density bonus in re-densification projects; the density bonus applies to well-located but low-occupied lots. The bonus allowed to produce additional housing units while expanding access for this group of beneficiaries (SEDUVI, 2018; GOCDMX, 2017d; ALDF, 2017b). The institutional, operative, and financial route was mapped out. The former SEDUVI general director of urban development comments:

...we based our idea on the recently approved norm for the workers of the national housing agencies (...). Let us say that we had already incorporated the scheme into the urban regulation and what we did after the earthquake were some (financial) counts and scenarios to see how much was needed. We saw that, in general, although there were some exceptions (...) with an additional 35% housing units, square meters, and levels built, the cost of reconstruction could reach zero [on the public budget]. In other words, with 35%, the apartments could come out at zero cost for their owners or very close to zero (...). (Luis Zamorano, 2019)

The norm for the workers of the national housing agencies constitutes the most important antecedent for ABRs as a concrete answer to financial needs. The workers' tool "allowed and facilitated the operational route for the city to grant public support, through greater buildable areas, for the construction of homes for workers entitled to national housing agencies" (Fuentes and Acosta, 2021).

This illustrates that ABRs were selected as the primary financial tool to rebuild after the earthquake, which resulted from an institutional adaptation to an already existing tool and path. However, implementing this adaptation still required significant adjustments. The second law defined three groups of actors: (1) *victims*: owners or legal tenures; (2) *government authorities*: institutions, agencies, and dependencies of the Mexico City government, especially the Commission for the Reconstruction, involved from the beginning to the end of the reconstruction process; and (3) the *real*

estate sector: private actors involved in the architectural design and rebuilding such as designers, surveyors, architects, engineers, builders, and developers. The law structured a government-society hybrid governance model for the financial and control components. This model aimed to guarantee the maximum social and economic welfare to the victims and financial viability through additional real estate products for sale.

The financial structure has mixed resources. The city contributes with the ABRs (in-kind input to each building) and public resources; the public resources go to a trust that is replenished and managed in a circular scheme. In addition, the victims contributed to the land (in-kind contribution). The ABRs plus the public resources cover, in many cases, the financial costs of the entire reconstruction cycle – from the design to the delivery of the new building. Once the new building is ready, the victims receive an adequate replacement housing unit with a great advantage: the original location. The city obtains additional real estate products (housing and business units) for sale.

The economic benefits from selling the additional units return to the public trust to support the most significant number of victims in a cross-subsidy scheme between projects (GOCDMX, 2019a, b). Furthermore, commercializing the additional real estate units is designated to SERVIMET, the public company of metropolitan services; it sells those units through private companies. In this way, the local government assumes the financial risk and additional benefits; the latter in the case the income from the sale of the additional units exceeds the costs of reconstructing the building.

The law also established the operational route for using ABRs (24 steps). Table 2 shows those steps grouped into nine phases (Phase 1 to Phase 9). The steps make explicit the logic of public command in management:

The starting point of the Reconstruction program is the high risk of collapse declared on a technical opinion; it includes the demolition recommendation and subsequent complete reconstruction (Phase 1). In cases where it is possible to rehabilitate the building but is more expensive than the complete reconstruction, the group of victims (100%) may opt for demolition and apply to the ABRs program for reconstruction. However, the requirement of total agreement – 100% – has implied significant delays in implementing ABRs (Fuentes, 2020).

The projection phase (Phase 2) begins with the open call for the designer selection (GOCDMX, 2018b, 2019a). Then, the project must define all the new residential and business units, dimensions, and destinations (replacing units for the victims and selling units at market prices). It must include a financial proposal estimating the total cost of reconstruction and the expected revenue from selling additional housing and business units. Finally, the project's approval must be carried out jointly by the Commission and the victims; the victims' group must also participate in the consultation process with authorities. In this phase, the local administration must ensure the victims' well-being through replacement housing units close in size to the original ones and the most efficient economic use of the ABRs in additional units. The aforementioned interviews with different actors indicated that in ongoing projects, the Commission requested designers and victims to include as many additional units as possible to cover the maximum cost of the new building.

Source: The authors based on information obtained from the Portal for the Reconstruction of CDMX, retrieved on June 2020

After the victims and the Commission approves the project, it goes to Phase 3. The Institute for Construction Safety of Mexico City (ISC-CDMX) verifies the structural safety of the proposed building and may request adjustments or adaptations. Phase 4 details the project costs, including all supplies and labor. The Commission should monitor the material cost list.

The execution (Phase 5) starts with a public call. The Commission selects two companies by lot, one to reconstruct and the other to supervise the construction advances. The winning companies present a financial budget that, in turn, is approved by the Commission. The public resources for the reconstruction must be approved (Phase 6). The law and the comprehensive reconstruction plan established that the resources for the reconstruction can only come from the public trust and not from victims' loans from financial institutions, such as the Federal Mortgage Society or commercial banks. This premise guarantees that the victims will not pay interest rates or loans (GOCDMX, 2019a).

Phase 7 requires the constitution of a public-private council to carry out procedures, especially legal ones related to land ownership and the formalization of the government's participation as a partner in the real estate project. The council's constitution takes place in a notary with the participation of the Commission and 100% of the legally recognized victims. The council represents all its members. The council carries out legal procedures such as signing contracts with the companies (builder and supervisor), legal end of the previous condominium, formalization of

the government as new co-owner, and transfer of 35% of the land from victims to the government (GOCDMX, 2019a). The government's condition of co-owner is crucial to it holding the property of the additional real estate products and obtaining the revenue from their sale.

The legal feasibility of a tool is as important as its financial feasibility, and the legal accreditation of a victim that lost his or her property is a very complex aspect of the reconstruction process after a disaster. The first law only accepted one legal condition: ownership. The facts showed that it was an extremely restrictive requirement that, in many cases, seemed impossible to attest to or required a slow and uncertain legal process. The second law kept the absolute majority (an agreement requirement of 100% of the victims) but offered a little juridical flexibility: accredited victims, not just owners. However, in practice, it remains a significant obstacle to the start of the reconstruction project. To stop the entire process requires just one victim with legal difficulties. What to do in cases where there is no possibility to attest the required legal status? In extreme cases and always in agreement with the victims, the law established the possibility of using "*a mechanism through public law*," which means using eminent domain (GOCDMX, 2018b, 2019a; c). Additionally, the law established a restrictive clause for the victims who benefited from trust resources at any phase: the beneficiaries could not sell their properties during the first five years after the delivery of the rebuilt property (GOCDMX, 2018b).

The reconstruction begins with the resource's approbation for the reconstruction and the sign of the construction and supervision contracts (Phase 8). During this phase, the construction company must present progress reports, and the supervising company verifies them. Finally, Phase 9 refers to the completion of the construction, the delivery of replacement housing to the victims, and the additional real estate products for the government to put on the market.

Implementation and Numbers

According to the Mexico City Reconstruction Portal, at the end of 2020, 135 buildings required complete reconstruction. Eleven would be rebuilt through private loans and 26 through private donations (Carlos Slim Foundation). The remaining 98 buildings go through ABRs financial scheme for reconstruction; the group included cases where rehabilitating was more expensive than the entire reconstruction. By January 2021, in an interview with the General Director of Victims' Attention 43 buildings were under the reconstruction process (Phase 8), nine buildings were under the administrative process (Phases 3–7), and the remaining 47 were in the design phase of the architectural project (Phase 2).

The application of ABRs is exemplified in two reconstructed buildings: "Pacífico 223" (Coyoacán district) and Nicolás San Juan 304 (Benito Juárez district). In both cases, all recognized victims already received replacement housing, and the government received additional real estate products for sale. Table 3 shows each proposal and its results:

According to the same Portal, as of June 2022, a total of 111 buildings were under reconstruction; however, 14 would not use ABRs. It was not possible to verify the state of progress of each of the remaining buildings. The public data indicated at least 16 wholly reconstructed buildings were made through the ABRs financial scheme. Hundreds of families received their replacement housing in adequate conditions in their location while the city recovered the reconstruction cost (partial or total).

Conclusive Remarks

The magnitude of a government's challenges depends largely on the disaster's magnitude. This is especially true for local governments, who by territorial principle are closer to the citizens and the effects of the catastrophe. For municipal governments, even those with considerable state capacity and financial preparation, such as a disaster relief fund, recovery from a disaster requires millions of dollars, attending to many fronts, and almost sole responsibility for their resolution. The institutional conditions will be decisive for the approach and implementation of alternative and sustainable financing strategies, such as those linked to real estate and land value capture.

This chapter documents Mexico City's pioneering and perhaps unique experience in implementing additional building rights to finance the reconstruction of hundreds of dwellings lost after a major earthquake. From a financial point of view, there are several aspects to highlight. This case shows the difficulty that these challenges represent, even for a city with the magnitude and economic dynamics of Mexico City, which was forced to deal with a disaster with minimal support from the federal government. It also shows the weight of urban, constructive, and social conditions, in the modeling of tools and in the search for financial sources. This case highlights an aspect little considered by the literature, the need, in the face of massive damage situations, to find support alternatives for populations with better incomes but who are left equally vulnerable as a result of a disaster and have the capacity to organize themselves and be heard by the authorities.

Customary municipalities establish land-use regulations that increase property prices without charging their owners. At the same time, cities suffer immense difficulties in financing urban development, which multiply when faced with reconstruction after a major catastrophe. This journey illustrates, in the public and political spheres, that a disaster can be a turning point and an opportunity for local governments to implement land value capture tools. This evidence is crucial because it reflects that the adversity and urgency of public resources offer unique opportunities for land value capture tools.

The additional building rights constitute a fair alternative for financing urban recovery. However, this case shows that, in addition to being fair, this is a viable mechanism in countries with less economic and institutional conditions. Redensify, through more intensive and flexible land uses, is a feasible financing option but demands the development of an institutional route and financial estimations. The spatial concentration of damage to homes and buildings, respectively, facilitated the

territorial matching between the ABRs and the affected group of buildings concentrated in a region with potential market demand for density. This case illustrates that the implementation of ABRs was an adaptation and improvement on an existing tool that faced legal ambiguities, something common in the public policy arena. The changes between the first and second reconstruction laws depict the authorities' progress in understanding the tool and its implementation toward the reconstruction target.

From the financial point of view, this case illustrates the permanent tension between the victims' needs and expectations and the reconstruction scheme's viability based on maximizing additional real estate products for sale. From the legal point of view, two challenging questions emerge: the dwelling's legal condition and the use of eminent domain. More frequent than expected dwellings lack adequate property title, this is common in informal markets of the global south. This lack of a title affects the victim's legal status, mainly for governmental reconstruction aid programs. At the same time, it creates obstacles to using land-based financial tools such as the ABRs in this case or the land readjustment in the Chilean experience (see Hong & Brain, 2012). Both land value capture tools require collective decisions and are oriented to attend primarily formal markets. The exit door is the eminent domain that can be the only alternative in cases where the dwelling cannot prove its condition, which addresses social and political challenges and opposition. Reconstructing is a long process that requires social presence and the government's hard work to harmonize potential conflicting interests between victims, private companies, and public policy goals. The victim's participation and involvement are essential to promote and successfully develop a project based on ABRs financial aid.

Considering that the ABRs scheme started in 2019, mere months before the COVID-19 pandemic, this case offers a success story. Typically, a private construction building cycle, without collective decisions or governmental management, takes 24 to 36 months. By June 2022, at least 16 buildings had been rebuilt through the ABRs financial scheme. Preliminary results suggest that the ABRs can be a real alternative, especially in markets with high demand.

In addition, the ABRs anticipate two "extra-financial" and valuable virtues for disaster and reconstruction public policies. Reconstruction policies tend to move people from their original places to the worst locations; they carry negative social impacts and a loss of networks that reinforce damages instead of relieving them. Second, reconstruction housing programs traditionally offer small-sized and homogeneous units regardless of the previous housing condition. The ABRs guaranteed the victims' right to stay in their location while keeping habitational quality; this tool facilitated replacement housing units with similar or equal dimensions to the previous one.

The experience of Mexico City reveals the social, legal, financial, public management, and political complexities of implementing ABRs as part of a public policy strategy for recovery. This case opens a research agenda regarding the potential of land value capture tools as a financial strategy for disasters in the global south.

Abstract

The chapter places the need for integration of conservation of heritage with disaster risk reduction with narratives from the city of Varanasi. Varanasi is one of the ancient cities which have seen changes in the landscapes as well as in culture. The presence of the river Ganges gives it important resources as well as makes it prone to hydrological hazards. The chapter captures the rapid

urbanization and the current state of city level services which adds to the vulnerability of the population to the impending hazards. The policies on disaster risk reduction as well as on heritage conservation and management exist but not implemented in an integrated way which leads to gaps in providing coverage from risks. Finally, the chapter dwells into the varied solutions offered by the authors as a way forward to truly build Varanasi as a future-oriented and resilient-smart-heritage city.

Keywords

Cultural tangibles · Heritage smart city · Varanasi · Disaster risk preparedness

Introduction

One of the central discourses of Disaster Risk Reduction in the present times has been shifting towards the concerns of cultural heritage; however it is parsimonious. Largely the initiatives of the preservation and conservation of the Cultural Heritage management exist separately and very much on its own. With times, there is a growing realization that each of these cultural and heritage sites is susceptible to multiple hazards and disaster risks. Each site has its own peculiar concerns and challenges that necessitate the need for an integrated approach of disaster risk assessments of the cultural, historical sites.

This chapter focuses on Varanasi, one of the oldest and lived ancient sites, which is also a storehouse of numerous cultural and heritage sites. It elaborates on the kinds of challenges that this city and the other cultural and heritage sites suffer from existing and emerging risks. Taking narratives from Varanasi, this chapter shall elaborate the challenges that this ancient living heritage city grapples with. It also elaborates on the possible solutions that can be offered to remit these challenges. Making arguments for the need for an integrated approach to cultural risk reductions, it explores the possibilities of undertaking such an approach. Through the lens of Varanasi, it engages with the feasibility of aping and strengthening the existing conservation strategies offered by the governmental agencies in case of disasters and its challenges in the long term or the need for innovative ways. With the changing time, there is a need to focus on the tangibles and intangibles, which foreground cultures. The growing awareness on this concern necessitates engagement with this theme and informs the larger paper. The other significant argument is about attending to the differential needs of each of the sites, depending upon their location and proximity to the kind of disaster risks that each faces.

Some of the significant questions that foreground this chapter are as follows:

- What are the challenges that an ancient living city like Varanasi faces in situations of hazards like floods and unplanned urbanization?
- Where does the protection of cultural heritage stand in the context of smart city governance?

- What have been the attempts made by the local administrative as well as governmental policies on the front of disasters and conservation management?
- Can we take the same approach generic to conservation management and disaster risk reduction, towards cultural tangibles and intangibles?

This chapter is divided into four broad sections; the first section is based on exploration of India as a land of cultural and heritage sites and the diversities of disaster risks faced. The second section engages with the kind of policies, both national and international governments and other agencies have with regard to the conservation and heritage protection. The third section focuses on Varanasi, as a site of the cultural tangibles and intangibles, engaging with varied disaster risks that it faces and grapples with. The last section presents in different possible solutions that can be explored in terms of disaster risk and cultural and heritage management.

India: Land of Diverse Cultural Heritage (Tangibles and Intangibles) and Disaster Risks Challenges

India is a land of multiple cultural and heritage sites, each spread across the diverse geographical expanse. In the context of huge cultural and religious diversities, there are many sites that are rich in bearing that diversity. At present India has 40 sites (32 cultural sites, 7 natural sites, and 1 mixed) which are enlisted in the UNESCO World heritage list (UNESCO Centre, 2022). Consequentially, it is rich both in terms of the cultural tangibles and intangibles. The tangibles come to us in the form physical embodiments as the monuments, sites, cultural and religious landscapes, buildings, and typologies of structures. As central as the tangibles, there has been growing focus on safeguarding the intangibles as well. In 2003, UNESCO Convention specified the meaning of the Intangibles. According to the convention, “The ‘intangible cultural heritage’ means the practices, representations, expressions, knowledge, skills – as well as the instruments, objects, artefacts and cultural spaces associated therewith – that communities, groups and, in some cases, individuals recognize as part of their cultural heritage. This intangible cultural heritage, transmitted from generation to generation, is constantly recreated by communities and groups in response to their environment, their interaction with nature and their history, and provides them with a sense of identity and continuity, thus promoting respect for cultural diversity and human creativity. For the purposes of this Convention, consideration will be given solely to such intangible cultural heritage as is compatible with existing international human rights instruments, as well as with the requirements of mutual respect among communities, groups and individuals, and of sustainable development” (UNESCO Convention for the Safeguarding on the Intangible Cultural Heritages, 2003. <https://ich.unesco.org/en/convention> (Accessed on 19th Feb 2022)).

In the larger pursuits of risk reduction of the cultural heritage sites, the necessity for preservation of the tangibles and intangibles of cultures becomes a crucial undertaking. In its absence, there is a huge loss and deprivation for the individuals

as well as communities. Its absence not only takes away from them their heritage and rich past, but also the sense of identity. It is important to recognize that the material objects and monuments are not just static and physical embodiments of one's past or cultural history, but they are necessary medium through which one's identities and ideas of one's society are transmitted. It is also the medium for the preservation of cultural plurality and diversity. "To keep and maintain what we value and to hand it down to future generations is an aspect intrinsic to human development" (Merbach & Stamm, 2014).

As mentioned earlier about the deep diversities that India encompasses in the form of culture as well as geography, therefore, it is important to recognize the many sites (listed in the World heritage sites and many unlisted ones), and their susceptibility to various disaster risks. The Himalayan region is prone to disasters like earthquakes and landslides; the plains are affected by floods almost every year. The desert region of the country is affected by droughts while the coastal zone experiences cyclones and storms. Depending upon the location and proximity of these cultural and heritage sites, to the source of hazards, the threats are manifold and distinct from each other. To add to the list of existing natural hazards, there are human-induced hazards which more often result due to unplanned and non-systematic urbanization.

The threat of disasters has always existed, and many societies grapple with the challenges and the threats and they have found their ways of safeguarding and preservation in myriad ways. There are certain points that need to be made: firstly, the disaster risks to these sites are an existing reality. Secondly, the kind and types of disaster risks that each of these sites is susceptible vary and are distinct from each other, and thirdly it will be an error to generalize the similarity of risks and kind of risks, as these are distinct from each other, and fourthly the urgent need to integrate and reinforce the link and connection between cultural, religious, and sacred heritage (tangibles and intangibles) and disaster risk reduction.

It becomes important to have different kinds of methods and approaches to address the unique disaster risks. While the monasteries in Ladakh, Himachal Pradesh, Arunachal Pradesh, and in other trans Himalayan region face the threat of earthquakes, the temples in Uttarakhand suffered immensely due to the flashfloods, which created havoc in terms of the loss of livelihood and cultural natural heritage. The states like Orissa, Andhra Pradesh, Tamil Nadu, and Gujarat have umpteen number of cultural and natural heritage sites that suffer from the challenges of cyclones. Not to mention some of the sites in urban cities, like Ahmedabad and Varanasi, reel under the pressures of the floods. The natural heritage sites like Majuli Island and Sundarbans mangrove forest suffer due to cyclical floods and cyclones. Few such examples include the Bhuj city palace, the commemorative chhatris which witnessed extensive damage during earthquake in 2001. Similarly, in 2011, the Sikkim Earthquake destroyed many Buddhist monasteries and temples. In the year 2019, the world heritage site of Hampi was flooded. While the tourists were rescued, the ancient site remained underwater and sustained significant damage (India Today,

2019). The flood situation emerged again in 2021 (Deccan Herald, 2021). These states and the sites have always seen worse kind of disasters and have been rebuilt over and over again. However an important argument that needs to be made is that the larger discourse on heritage conservation and management and disaster risk reduction has been divorced and separated from each other. The disaster risk reduction engages with the challenge of the risk reduction, with a focus on human life and assets; it still does not place much importance on the cultural and heritage intangibles. Therefore there is a need to integrate the cultural tangibles and risk assessment while engaging with disaster risk management.

Before we engage with the arguments for the integrated approaches to cultural heritage risk reduction through the narratives of Varanasi, let's look at the various national and global policies with regard to conservation and heritage management and disaster risk reduction.

National Policies on Conservation and Heritage Management and Disaster Risk Reduction in India: The Two Different Universes

With regard to the policies on conservation and heritage and disaster risk reduction, India has many acts and legislations. These are largely separated and are on conservation and heritage management as well on disaster risk reduction specifically and are in tandem with International provisions.

Conservation and Heritage Management

As per the Constitution of India, ancient and historical monuments and archaeological sites and remains, declared by parliament, by law to be of national importance are within the jurisdiction of the Center, the Union government. The state government looks after the ancient and historical monuments other than those declared by Parliament to be of national importance. The states may also have special notified areas under State Acts. Additionally, the Masterplans of several cities identify special heritage precincts, notified areas, etc. which are controlled through the city administration. The heritage cities as identified by central government function through MoUD, MoT, and MoRD and administered locally by state governments and local authorities. Article 29, Article 49, and Article 51 A (F) of constitution of India distinctly provide the guiding light for legislative protection and conservation of heritage.

The Archeological Survey of India (ASI) under the Ministry of Culture, Government of India, is the chief organization that is responsible for the conservation and management of the cultural and heritage sites and monuments. It operates through its State Circles, Museums, Excavation Branches, Prehistory Branch, Epigraphy

Branches, Science Branch, Horticulture Branch, Building Survey Project, Temple Survey Projects, and Underwater Archaeology Wing. The Indian National Trust for Arts and Cultural Heritage (INTACH), established in 1984, works through its various state chapters for carrying out listing of unprotected buildings of archaeological, architectural, historic, and aesthetic significance. The Government of India also launched the National Mission for Manuscripts to undertake digitization of the manuscripts as a means of preservation of our indigenous knowledge and heritage (Niti Ayog, 2020). Apart from this, India is also signatory to the below international conventions (Niti Ayog, 2020):

- (i) Convention on the Protection and Promotion of the Diversity of Cultural Expressions. Paris, 20 October 2005
- (ii) Convention for the Safeguarding of the Intangible Cultural Heritage. Paris, 17 October 2003
- (iii) Convention concerning the Protection of the World Cultural and Natural Heritage. Paris, 16 November 1972
- (iv) Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property. Paris, 14 November 1970
- (v) Protocol to the Convention for the Protection of Cultural Property in the Event of Armed Conflict. The Hague, 14 May 1954
- (vi) Convention for the Protection of Cultural Property in the Event of Armed Conflict with Regulations for the Execution of the Convention. The Hague, 14 May 1954

Disaster Risk Reduction

The National Disaster Management Act, 2005, governs the framework of disaster risk management in India. The Act established National Disaster Management Authority (NDMA) as the apex body for institutional, legal, financial, and coordination mechanisms at national, state, and local level. Various states have thus established state disaster management authorities and district disaster management authorities to execute the work. The Act also established National Institute of Disaster Management (NIDM) to undertake necessary capacity building exercises for disaster risk management. NDMA has developed National Disaster Management Policy (2009 and revised in 2019) and National Disaster Management Plan (2016) for guiding the various activities on risk management. Further it has also published sector-specific guidelines for various domains to undertake disaster risk management activities.

In 2017, NDMA has come up with guidelines on disaster risk management for cultural heritage sites and precincts. The guidelines are comprehensive and serve to provide framework for state level and local government to integrate disaster risk management for heritage management. The new government schemes of HRIDAY

and PRASAD focus on development of infrastructure at the heritage sites, but neither of them integrates strengthening the risk resilience in context of conservation of tangible heritage.

Global Attempts

The global policy document (UNESCO, 2015) for the integration of a sustainable development perspective into heritage conservation as adopted by UNESCO is one of the important international document to holistically consider environmental sustainability, resilience to natural hazards, and climate change into the domain of heritage protection. Resonating the Sendai Framework for Disaster Risk Reduction, this document recognizes the need to inculcate disaster risk reduction for heritage sites and also introduces effective build-back-better for post-disaster recovery at heritage sites. The UNESCO has also come up with strategies to reduce disaster risk at world heritage sites with a focus on building a culture of prevention. It also advocates for cultural diversity, age, vulnerable groups, and gender perspective while preparing risk reduction plans. Community participation is an important aspect which is highlighted by UNESCO for plan preparation and implementation. The five objectives as listed in the strategy for reducing risks from disaster at world heritage properties are the following:

- (a) *Strengthen support within relevant global, regional, national, and local institutions for reducing risks at World Heritage properties.*
- (b) *Use knowledge, innovation, and education to build a culture of disaster prevention at World Heritage properties.*
- (c) *Identify, assess, and monitor disaster risks at World Heritage properties.*
- (d) *Reduce underlying risk factors at World Heritage properties.*
- (e) *Strengthen disaster risk preparedness at World Heritage properties for effective response at all levels.*

Maintenance of heritage sites and their diversity adds to the resilience of the society as a whole. The first priority of the Sendai Framework mentions about understanding the disaster risk of cultural and heritage monuments and develop strategies to reduce the same. Comprehensive disaster management plans need to be formulated based on the specific characteristics of the heritage site and nature of hazards within a regional context.

Attempts of Integration of the Two Universes, Still a Long Journey on Ground

Since 2017, there has been a significant attempt of integrating the concerns of the conservation and preservation of cultural and heritage tangibles and intangibles with disaster risk reduction. Prior to this, the two have been working independently of

each other and have little interface. This shift was pushed with a growing awareness with the changing times and global pressures enamored by UNESCO. The Archeological Survey of India (ASI) has been moving towards integrating the disaster risk reduction in larger conservation. The National policy of ASI, 2014 for the conservation of the ancient monuments, archaeological sites, and remains (ASI, 2014) focuses on preparation for natural or human-induced hazards. The policy mandates preparation of disaster management plans for heritage sites and also to provide training to person-in-charge to ensure effective response and post-disaster recovery. It also requires to undertake structural assessment of the structure to identify the need of retrofitting measures for mitigation. However, a close survey of the sites informs that on ground and in reality, not much is not happening and many a times, these get limited to being on paper.

While the above-stated conventions are important from the viewpoint of conservation, the aspect of integrated planning for disaster risk reduction for the heritage management still needs a lot of work and initiative. The integrated approach is missing on ground, and in reality the two sectors operate independently. When it comes to confluence of the two together, there is still a lot of bridging which is done. Many a times, when disasters lead to significant damage, loss, and destruction, the preservation of cultural sites is not really on top of the agenda. It is not new that many of the world's heritage sites have suffered significantly, to the extent that these have been lost completely and some are at the brink of extinction, but there is significant failure in prioritizing these sites, in situations of disasters. Related to the existing natural threats and risks, the addition of human-induced hazards is significant and is also a huge contributing factor to the threats to these sites. India is experiencing a growth in planned and unplanned urbanization, which increases the vulnerability of heritage sites. Further, the climate change increases the frequency of such hazards.

This has led us to ponder over the collective ignorance among the stakeholders, whether the governmental official or the common masses, on the adequate provision of risk reduction measures for cultural heritage. With this as the larger context and background, we shall now engage with the narratives that emerge from Varanasi with regard to risks that cultural and heritage tangibles and intangibles that Varanasi faces from. The section on Varanasi looks at the discourse around conservation and the kind of challenges it faces from.

Varanasi: The Ancient Lived City, at the Cusp of Tradition and Modernity

Varanasi is known by many names Banaras, Kashi, Muktidhaam, and many others. It is invoked as one of the oldest and ancient living cities in the world. Holding an important position in the Hindu religious milieu, it is seen as a city that liberates, the one that gives *Mukti* (The most common invocation of Banaras is Muktidhaam; it is considered that those who die here attain Mukti (salvation), as they are free from the cycle of life and birth. Therefore many religious Hindus come to the Ghats

(Waterfronts) to perform the last rites). Rana P B Singh refers to the multiple scapes that Banaras encompasses of in the form of ritualscapes, heritagescapes, and spiritualscapes.

Apart from being the haloed sacred city for the Hindus, with key cultural, religious, and pilgrimage sites (cultural tangibles and intangibles), it is equally important for believers of other religious dominations. It is not only a Hindu city, but a multicultural as well as multi-religious city with Jain, Buddhist, Muslim, and folk sites, making it a rich and diverse city. There has been a voluminous scholarship on Banaras's rich cultural heritage; some of the key texts include Diane L Eck's *Banaras: A City of Light*, Hertel and Humes's *Living Banaras: Hindu Religion in Cultural Context*, and Rana P B Singh's *Banaras: Making of India's Heritage City, Cultural Landscapes and the Lifeworld Literary Images of Benares and Banaras, The Heritage City of India: Geography, History, and Bibliography*.

Among the sacred cities in India, Banaras holds a special significance, since it is an ancient city that is living; it has been touched and shaped by many cultures. It has been constantly evolving, with additions coming and integrating. As people from different parts of the country came and eventually settled, they also brought a piece of culture with them and that came to shape Banaras, making everyone *Banarasiya* and making Varanasi a storehouse of many living heritages in one place. Its invocation in literary, cultural, religious milieu has been ancient. It has evolved significantly and holds an important place in temporal as well as the real world. Representations of many kinds are important, specifically in literary works. Banaras has been the house of many great names, from Tulsidas, who wrote the *Ramcharitamanas* at the Manas Ghat, or Sant Kabir or Ravidas. Banaras has been a historical city as well.

With changing times and the pressures of urbanization, there has been a growing focus on smartification of the ancient lived city, to which the heritage tag has been attached, therefore the growing recognition of Varanasi as a smart heritage city. Related to this there is also a growing demand for getting listed as part of the UNESCO's world heritage list. The focus is towards urban and spatial regeneration in tandem of safeguarding the urban heritage. It is important to understand that heritage in Banaras is much more than the monumental heritage, as scholars argue that spirituality is an important aspect of this city. Therefore, aspects of smart city need to be inclusive with the discourse of the heritage city needs to reinforced in any discourse on Banaras, in order for it to cater to the world class aesthetics.

With regard to the discourse on smartification of Banaras, there are multiple perspectives. Rana P B Singh explains the core ideas of one set of thinking as, "The six pillars of envisioning 'Smart-Banaras' Plan are: Suramya ('Picturesque', through religious, cultural and heritage), Nirmal ('Pure/clean', through greening spaces and ecological ordering and reviving the Ganga river as soul), Surakshit ('Safe', through better transport, pathways and vehicle movement), Smmunat ('Improved', through citizenship, civility, liveability and viable employment), Ekatrit ('Integrated', through interfacing and coordination among the various cells for maintaining SDGs) and Sanyojit ('Planned', through balanced between traditions and modernity

in the frame of ‘lifenology’ that would make a balance between liveability and appropriate technology” (Rana P Singh, 2018, 25).

The other set of arguments, largely coming from the masses, is critical of the state and governmental approach, arguing that this drive is disconnected from the understanding of people who have inhabited the city for generations and thus is anti-masses. The people who have been living in the city generationally argue the absence of due attention to the heritage aspect. Vera Lazzaretti argues that many protests have been carried by the local groups claiming that despite the claims of safeguarding the heritage of the city, as part of the smart city project, there is no sign that the larger projects like Vishwanath Heritage Zone and Kashi Vishwanath Corridor are being framed in terms of heritage. In Dec 2017, protests were made against the corridor, with the emergence of the civil society collective, Dharohar Bachao Sangharsh Samiti, arguing that the focus of the smart city initiative is on Vikas (Development), rather than on Dharohar (Heritage). The one major argument is posed against the working of the Kashi Vishwanath Trust (which is one of the key organizations for the Vistarikaran of the corridor). Further, this grand project, which was for preserving the cultural and heritage tangibles and intangibles, had no role or involvement of the national body, Archaeological Survey of India (ASI), and was carried under the aegis of Kashi Vishwanath Temple 371 Trust (KVTT, a private collective). Interestingly Varanasi being invoked as a national heritage, KVTT not being in collaboration with the ASI, explains the ways in which two bodies are being disconnected to each other. In Dec 2018, the Shri Kashi Vishwanath Special Area Development Board was constituted and the act was passed as UP ACT NO: 31 OF 2018, and the corridor was renamed as “Vishwanath Heritage zone,” now encompassing a larger area and territory and interestingly without much role of the ASI.

Though the idea of *Vistarikaran* has been there since a long time, as the argument was floated in 1938, and attempts made in 2007 and 2010, the work really started with the coming of BJP in power. Lazzaretti writes, “An analysis of press reports from the initial period sheds light, however on key words associated it: Vistarikaran or expansion; adhigrahan, or acquistion; sundarikaran, or beautification; and increasingly Vikas, or development. There is no sign of the project being framed in terms of Heritage” (Lazzaretti, 2021). With PM Modi, as the Member of parliament from the constituency of Varanasi, the work on the corridor has now been completed in 2022, but many of the civil society organizations are critical of the corridor and smartification, as they argue that this corridor displaced many of the existing heritage and cultural sites. There is a growing understanding among the masses that the development paradigm of the state, and the city authorities, has marginalized the heritage aspect. They argue that despite the claims of making Varanasi a heritage smart city, the focus is not so much on integrating heritage. In many ways, it is only a lip service. To add to this invisibilization, the additional challenges of disasters, whether natural or man-made, place the many diverse sites in a precarious situation. Let us now look at the various disaster risks that Varanasi suffers from.

Challenges that Varanasi Faces Are Manifold: Two Kinds of Hazards: Natural and Human-Induced

Floods

One of the most common hazards that Varanasi faces is the problem of recurrent floods every year in the month of monsoon. Over the years, the frequency and intensity of such floods have increased due to climate change. The annual floods put pressure on the existing preventive and mitigation measures to protect the heritage sites. The floods caused by swelling of Ganges submerge the city, and many a times, it reaches within the old and the inner city. There are many kinds of threats that it causes; apart from being the source of many vector-borne diseases and health hazards, it causes challenges of distinct kinds. As per the Climate Disaster Resilience Index of Varanasi (Chatterjee et al., 2015), the Varanasi city has capacity in terms of household assets, education, and awareness but ranks lower in terms of institutionalization and mainstreaming of disaster risk reduction and climate change adaptation. Though there has been significant scholarship produced on floods-related challenges that Varanasi faces from, there has not been enough scholarship on the impact of floods on the cultural and heritage sites specifically.

Since the older city is very close to the river front, there are 80 ghats that have been there historically. As the river is deeply imbued in everydayness of the city, it is important for ritualistic and common reasons. Over the years, this space on the river front came to be most occupied. There are historical settlements and thus housing many old temples and cultural sites. The river front is closely enmeshed in the everydayness of the city. Almost every year there are news about the inundation of the city and adjoining villages in the month of July and August, but there has been failure in terms of rectifying the problems ((Mishra, 2021). The year of 2016 specifically witnessed submergence of the ghats of the holy city of Varanasi due to swelling of the Ganga river (Khadka, 2016). There is a strong evidence that the frequency and intensity of riverine floods are going to increase owing to the climate change. The heritage city of Varanasi faces the maximum risk due to increased exposure and lower institutional level resilience. As per Nijesh M in an article written in 2020, flood-prone areas in the northeastern part of Varanasi include Cholapur, Chiraigaon, Kashi Vidyapeeth, and Pindra blocks. In addition to riverine floods (Mishra et al., 2022), waterlogging is identified as an important area of concern for Varanasi, especially in the monsoon season. It results in sewage back-flow adding to the concentration of storm water drainage while the river is already swelled. This can cause irreversible damage to the heritage sites and also make it unsafe for the tourists to visit.

Urbanization: Human-Induced Disaster

The crisis of the floods is further accentuated by the nature of the urbanization that the city witnessed over a long dure, with unorganized city planning and old drainage

system. Some of the efforts that have been taking place in beautification or decongesting the old city have been challenged on the grounds of its impact on the ecological grounds and its non-sustainability (especially the materials used for the same). Varanasi has been selected as one of the smart cities under the smart cities mission of government of India. However, the often neglected cultural and heritage sites within the city are under tremendous pressure. The kind of efforts that the administration has taken in offsetting the loss has not been able to translate in risk reduction.

Urbanization in Banaras has made it earn the status of a “Million city.” As per the 2011 census, the density of population in Varanasi was 2395 per sq. km (Varanasi| Demography, 2022), and the numbers shall be increasing over the years with the projection being skyrocketed by 2050. Rapid modernization and urbanization are related to the challenge of uncontrolled migration, as Banaras over the years has witnessed massive influx from Eastern Uttar Pradesh, Bihar, Orissa, and Jharkhand. Related studies on the emergence of slums in Varanasi need to be read with the challenges of urbanization. In a study of quality of life in the slums in Varanasi, Tripathi argues, “Slums in Varanasi city has been continuously increasing from 1941 to 2011. With the increase in population of the city, housing needs of the city also grew, which could not be met by the formal housing market. Migrating population, which could not avail the facilities of formal housing market, satisfied their needs by occupying vacant land and this has resulted in formation of slums. Another factor, which contributes in the formation of slums, is proximity to work place and low level of income and un-affordability of pucca houses. People living in the slums of Varanasi city are poor working as labour, rickshaw pullers and thela keepers” (Jha & Tripathi, 2014, 174). Over the years, the slums and squatter settlements have been increasing and in ways the pressures on the existing infrastructure, which is not in a very good position. The quality of life on the basis of various parameters like source of living, source of drinking water, housing condition, sewage disposal facilities, place of waste dumping, and medical facilities also informs us about the abysmal living conditions. In the absence of proper infrastructure, especially with regard to the sewage disposal, there are challenges as a lot of sewage as well as waste finds its way through the local nallas, into the Ganga which is already so pressured. This also reflects on the kind of health hazards that emerge in these spaces.

Over a period of time, some of the heritage sites have disappeared, as they are now taken over by the people. This is illegal, but in the absence of adequate living spaces and pressures, many of the sites in the form of temples do not exist anymore. The city municipal authorities have also come under fire, as in the pursuit of beautification of city, and widening of roads, many of the sites (unclaimed) due suffer the threat of extinction and loss.

Encroachment of the Flood Plains and the River Bank

Related to the concern of lack of spaces and non-sustainable forms of urbanization are the related concerns of the encroachment of the flood plains for human settlement,

furthering the vulnerabilities, which is a constant point of deliberations among the policy circles. With the emergence of the new high-rise buildings and housing, close proximity to the flood plains is alarming. The new buildings which are being constructed and some of them already in existence and lived in have complaints about the challenges when the city is flooded. In fact the area around Samne Ghat, which has many of the high-rise buildings, suffers a great deal in times of floods, which has now become an annual feature. There should be some policy that the city urban development bodies, like Municipal Corporation as well as Nagar Palika, should come up with, that forbids any housing or any other construction on the flood plains or in proximity of the ghats.

Loss of Sustainable Ecosystems

The existing ecosystem suffers because of loss of sustainable ecosystems. The traditional water spaces, called Pokhara/Talaabs which were important for both reasons of livelihood and sustainability, have disappeared over the years. Either they have been converted as wastelands, as they are dumped with the tons of waste that are produced every day, or the construction-related waste, in the form of concrete and Malba which are dumped. This heavy encroachment of the naturally existing water bodies, which have now transformed as wastelands, can be related to the challenges and threats caused to the ecosystem. The related concern of unsustainable development is a crucial point that needs to be reflected and discussed. The foremost reason identified for the devastating urban floods in Chennai had been the loss of natural water bodies at the hands of unsustainable development practices, including the city's lakes which used to capture and retain the excess rainwater (Chandrababu, 2021). A similar story is being repeated in Gurgaon where the fetter of development neglects nature's system of balance and conservation. In Varanasi also one witnesses the growth of construction sites and population which has overwhelmed the city's old drainage system.

Massive Tourist Footfall

Since Banaras is considered as one of the most revered cities in the Hindu Universe, every year one witnesses a massive tourist footfall, which is largely religious in nature. This not only creates pressures on the city but leads to massive challenges. As it is an ancient city, its infrastructure is also very old. It was neither designed nor shaped to sustain the large population that the city presently has. The Panchakoshi Yatra is one of the most popular pilgrimage circuits, with massive footfall during the Sawan month (Revered monsoon month, whereby pilgrims from all over the country come to Varanasi, for the holy dip in Ganges as well as to the Kashi Vishwanath Temple, one of the most important Jyotirling). Also, Varanasi is important for the Buddhists, as it is in proximity to Sarnath, which is a key Buddhist site. Since Sarnath doesn't have much of its own infrastructure, a large number of tourists visit

Sarnath from Varanasi. With large number of devotees gathering at Varanasi during specific days and occasions, there is a major risk of crowd-related disasters. Hence there is a need for crowd management with crowd control measures in place, viz., open spaces, traffic management with parking, first aid and medical services close at hand, and basic infrastructure for pilgrims and other visitors. While the COVID-19 pandemic has led to exploration of digital measures to support the administration as well as ease the pressure of tourism, the pandemic management amidst the risk-prone areas along with the efficiency of the services required truly tests the governance capacity. The possibility of integration of digital technology and smart city governance in the backdrop of an ancient heritage city of Varanasi is yet to be explored.

Possibilities and the Way Forward

In the larger context of disaster challenges, risks, and threats that are endemic to cultural and heritage sites and spaces, some of the possible solutions that can be worked towards are as follows:

- (i) Documentation of cultural heritage and disaster risk management plans and practices is required as the first step. The documentation will provide light on the existing plans and also the gaps in the planning needs. There is a need for a Masterplan which integrates all the aspects, and any kind of encroachment should be nipped in the bud.
- (ii) A holistic impact assessment of the current heritage sites needs to be undertaken. While this paper's scope is confined to built heritage, further research should be undertaken which goes beyond and includes the intangibles also. While built heritage can be salvaged through retrofitting and structural improvements, the cultural aspects, the local folklores, the local food, livelihood, and art and craft all are connected as an ecosystem. When a historical monument loses its importance, so does the whole ecosystem which essentially thrives around it.
- (iii) Sustainable livelihood and revenue generation options should be explored for the community which dwells around it. While the states recruit the Bollywood actors as brand ambassadors of the region, investment is required to develop on ground local marketing hubs for the heritage-based goods. Other than providing financial incentives to aid the small-scale craftsmen, adequate training on digital marketing can prove to be a game-changer. The quality and accessibility of the local heritage-based products would be a brand in itself.
- (iv) Embedding of smart cities with smarter heritage sites should be done. Keeping in line with the upcoming smart cities mission, the heritage properties of such cities must be embedded with the new-age cutting-edge digital technologies

including AI. GIS-based mapping and installation of real-time early warning systems in the heritage properties can also provide a base for generating knowledge and awareness on disaster risks and its management. This can aid in inculcating practices of disaster risk management into our culture.

- (v) Cultural diplomacy is an important aspect of conserving and preserving nation's heritage. While India has already made a name of itself in terms of being one of the oldest civilizations, the new age cultural diplomacy requires specific approach. While the Varanasi-Kyoto cultural exchange project provides a head-start in promoting cooperation, it has to be strengthened further to actually implement best practices in conservation of heritage. Japan's history and culture of disaster risk management practices can be contextualized and adopted for Indian regions such as Varanasi.
- (vi) Finally, breaking the silo-based approach and looking at heritage and disaster risk management from perspective of different government departments needs to be changed. Skill development and joint training programs can be explored to educate, train, and build capacities of local government departments so as to undertake a holistic approach. The central government can facilitate this by bringing in a policy which addresses the concerns of the heritage from disaster risk perspective and allocates clear responsibilities and accountabilities to all the concerned departments. India's Heritage is underfinanced, and a comprehensive vision for heritage budget and planning with innovative means of financing is essential. It is equally important to train the common masses in acts of heritage management and preservation, inculcating a sense of responsibility among the locals and visitors to protect the city, and take pride in keeping it clean and visitor-friendly, because in the truest sense they are the true custodians.

Conclusion

Through the narratives from Varanasi, it becomes pertinent that attention is given to the cultural and heritage sites, as they are the most important links to our past and heritage. The need for some ground work and serious engagement with the concern of risk assessment and reduction is the way forward. Heritage management and conservation is not only important from the perspective of glorious tribute to a rich past, but it is also an opportunity of investment and generating employment through tourism. There is a need to protect heritage from unregulated and unsustainable development processes, disasters, climate change, and other human-generated factors. This requires a need to harness the potential of heritage to make cities and human settlements inclusive, safe, resilient, and sustainable for current and future generations (ICOMOS, 2021). Further, the SDG 11 which focuses on making cities and human settlements inclusive, safe, resilient, and sustainable requires the safety and resilience of heritage too.

Abstract

Globally, disasters and climate change pose a significant threat to sustainable urban development, with increased impacts on the communities and economic costs. Subsequently, policy makers and practitioners face the challenge of introducing a holistic approach integrating risk reduction and adaptation strategies for

urban sustenance. Sri Lanka is a tropical island which has been experiencing impacts of a variety of disasters as well as climate change in many urban areas. Against this backdrop, the present chapter attempted to examine the impacts of water-related disasters on Sri Lankan cities. Therefore, a comprehensive literature review was carried out supplemented by analysis of available data on disasters. Published reports, research papers, and data portals were used as sources of information.

This chapter begins with an overview of water-related and climate change-induced disasters in cities with a special focus on floods, droughts, and landslides. Key findings reveal that floods, droughts, and landslides in urban areas have demonstrated an increasing trend in the recent few decades. Many coastal cities have faced impacts of floods and droughts, while inland urban areas have exhibited more impacts from landslides. In this respect, the chapter presents challenges in managing water-related disasters. Finally, the chapter sheds light on how the cities could prepare for the rising impacts of climate change and disasters. Equally important though is adopting possible best practices and “environmentally smart” solutions to make cities disaster-safe and disaster-resilient places.

Sri Lanka · Cities · Climate change · Disaster management

Introduction

Cities are one of the most dynamic places on Earth, and a growing percentage of the population in many countries live in cities. According to the United Nations, 50% of the global urban population resides in cities, and this is projected to rise up to 68% by 2050 (United Nations Department of Economic and Social Affairs-UNDESA, 2019). They further state that 90% of this increase in global population will be centered in Asian and African cities.

Cities are areas with multiple issues, challenges, and opportunities due to complicated internal factors and compound external influences. Cities are increasingly vulnerable to natural or man-made disasters due to complicated physical infrastructure and socioeconomic networks. Further, a considerable share of city dwellers live under conditions in which high disaster risk prevails, which coincide with enhanced exposure with high vulnerability. On the contrary, there is a growing global concern to understand the nature of complex urban disasters and their influence on cities.

Sri Lanka is an island lying between 6°N and 10°N latitude and 80°E and 82°E longitude in the Indian Ocean, with a land area of approximately 65,000 km². Nearly 48% of the country's population lives in urban areas (Ellis and Roberts, 2016). The country has witnessed a significant increase in both frequency and intensity of climate change impacts. Adverse impacts are particularly evident in the water cycle, especially as alterations leading to floods and droughts. According to the

Climate Risk Country Profile (2021), Sri Lanka faces significant threats from extreme heat and an increased incidence of flooding from climate change. For instance, 2017 was a “threatening” year for Sri Lanka as it was among the three most affected countries by weather-related disasters (Eckstain et al., 2019). In the same year, Sri Lanka ranked the second highest on the Climate Risk Index as a result of weather-related disasters and economic losses. Such projected disaster events may generate increased droughts, riverine floods, flash floods, and landslides. In this context, it is essential for Sri Lanka, like any other country in the global south, to adopt efficient management strategies to achieve urban resilience and safety (Ministry of National Policies and Economic Affairs & Ministry of Disaster Management- MoNPEA & MoDM, 2017).

In this wake, this chapter will present a general description of disasters in cities. Further, the factors that contribute to the increased disaster vulnerability of cities will also be discussed. Then the chapter will focus on water-related disasters in Sri Lankan urban areas and their socioeconomic impacts, paying special attention to floods, droughts, and landslides. Key challenges in different phases in disaster management will then be discussed. Finally, gaining from Sri Lankan experience, the chapter sheds light on possible best practices where environmentally smart solutions are offered to make cities disaster-safe and disaster-resilient places.

Disasters

Any part of the world is not free from hazards that appear in different ways: hydrometeorological hazards (e.g., floods, droughts, and cyclones), geo-hazards (e.g., volcanic eruptions), etc. Yet, not all hazards are transformed into disasters. Hazards, disasters, and vulnerability are linked to communities and their lives adversely. Nevertheless, enhanced resilience uplifts communities. Hazards and disasters can be defined as below.

Hazard: In simple terms, hazard is any natural or man-made event that has the ability to harm, destroy, or destruct the physical or biological environment or people.

Disaster: The central concept of a disaster is “a combination of the exposure to a hazard and vulnerability of people or a place.” The United Nations Office for Disaster Risk Reduction (UNDRR, 2019) defines hazard as a “dangerous phenomenon, substance, human activity or condition that may cause loss of life, injury or other health impact, property damage, loss of livelihoods and services, social and economic disruption, or environmental damage.”

The terms defined below are significant in understanding disasters.

(a) Vulnerability

When the communities possess insufficient capacity or methods to lessen or cope with the impacts of disasters, they become vulnerable to disaster impacts. Vulnerability is the insufficient capacity or measures to reduce or cope with the potential negative consequences.

Vulnerability can be of different categories: physical (inappropriate and weak construction of buildings), social (restricted education, including insufficient knowledge about disasters), cultural (public indifference about disasters), political (limited number of institutions which have knowledge of disasters), economic (fewer resources like planning and management which are important in preventing disasters), and technological (the lack of using appropriate technology to mitigate the impact of disasters) (McEntire, 2001).

(b) Resilience

As a working definition, we describe disaster resilience as the ability of any component of society to withstand disaster impacts, adapt, and recover from the adverse effects of any natural disaster or stress sustainably. In the literature, the ability of a community or a system to “bounce back to its original state before exposure to the hazard” has been highlighted (Klein et al., 2003).

Cities and Disasters: Obvious Links?

Cities are prone to a plethora of natural disasters as poverty and people are concentrated in limited landscapes (United Nations Human Settlement Program UN-HABITAT, 2010). In fact, in the last two decades, natural disasters claimed lives of many and affected thousands of people in Asia (Table 1). Experts predict that the frequency and impacts of disasters would rise in the coming decades, especially in cities that are becoming more disaster-prone due to increased population pressure and unsustainable developmental activities (Schneider and Woodcock, 2008).

In many parts of the world, attributed to several factors, urban areas are increasingly becoming susceptible to water-related disasters and the impacts of climate change.

Table 1 Disasters in Asia for the last two decades and their effects

Disaster	Number of incidents	Number of deaths	Number of affected people
Drought	85	279	1,124,969,850
Earthquake	370	489,904	103,309,378
Epidemic	169	13,754	2,545,932
Extreme temperature	121	16,629	87,340,817
Flood	1,318	74,379	1,529,828,789
Landslide	240	12,147	4,253,164
Mass movement (dry)	7	158	360
Storm	864	179,757	578,192,044
Volcanic activity	35	889	1,122,493
Wildfire	28	156	499,598

Adopted from EM-DAT, 2021. <https://emdat.be/>

(a) Increased occupancy in hazard-prone areas

Globally, demand for land in cities is increasing, while the land values are also escalating. Such situations force poor communities to live in marginalized lands. They have been left with no option other than choosing to live in hazard-prone areas. Further, they have only remote chances to escape from hazardous events and avoid their impacts. Slum development is increasingly evident in many parts of the world, where most of such locations, such as reservations of waterways and roads, are hazard-prone, especially to floods (MoNPEA & MoDM, 2017).

(b) Increased vulnerability

Vulnerability to disasters is exceptionally high in urban areas, due to increased population density. For instance, 13 of 19 megacities in the world are located in low-lying coastal areas, which encompass high vulnerability to floods due to climate change-induced sea-level rise and storm surges. Since most of the future global population growth is projected to take place in the urban areas of developing countries, the proportion of people who will be particularly vulnerable to natural disasters will rise further.

(c) Poor urban planning and management

In many parts of the globe, poor urban planning and management have affected the living conditions of people while paving the path for many disasters (UN-HABITAT, 2010). According to Habitat for Humanity (2022), 75% of the urban population in rapidly growing cities of developing countries lives in squatter settlements with minimum basic requirements. Inadequate regulations and weak enforcement lead to failure in urban sustainability. With the increased demand for living spaces in cities, many regulations and laws are breached by communities. As an example, slums and shanties will be constructed in marginalized areas in cities to occupy any space left for settlement.

Poorly articulated unsafe housing including slums and temporary dwelling units will be fragile and easily damaged by floods and landslides. Inadequate drainage facilities and poor management of waterways lead to disturbed water flow regimes, inundation of low-lying areas, and flooding (Jerome, 2021). Inadequate solid waste management can result in the blockage of waterways and drainage networks with increased waterlogging and inundation. In many urban areas, it is inevitable to avoid land use and land cover changes. Consequently, in many cities, there is a change in natural infrastructures with time. In this context, destruction and encroachment of wetlands to expand cities have been identified as a major cause of flooding (Hettiarachchi et al., 2014).

(d) Rise in demand for water and water scarcity

Urban areas are seriously facing water scarcity as a result of the overexploitation of groundwater together with increasingly exerted pressure on limited natural

resources. Due to the increase in impervious surfaces and disturbances to the water cycle with lower abilities to recharge aquifers, many urban areas experience a lowering of the groundwater table. Additionally, depleted soil moisture contents lead to poor water availability. Further, the increased population in cities demands more water which puts water resources at risk. Against this backdrop, the impacts of climate change, which put immense pressure on limited water resources in cities, contribute to magnifying urban drought (Wickramasinghe, 2021).

(e) Rise in ambient temperature

Climate change-induced increase in temperatures intensifies the intensity of the heat-island effect in the urban areas. City centers with high-rise concrete buildings and paved roads and similar infrastructure could influence the microclimate of the cities and contribute to unhealthy and unpleasant environments.

Water-Related and Climate Change-Induced Natural Disasters in Sri Lankan Cities

This section elaborates on water-related disasters in Sri Lanka (namely, floods, landslides, and droughts) which are linked with and are closely connected to climate change. It also analyzes the socioeconomic impacts of each considered disaster in terms of the parameters: people affected, number of fatalities, number of injured, property and livelihood destruction, and the loss to the economy.

Floods

General Overview on Floods

Floods are considered the most destructive form of natural hazard in both local and global contexts due to loss of both life and property. It is also the most prevalent form of natural hazard in Sri Lanka (United Nations Office for Disaster Risk Reduction-UNDRR, 2019) where riverine floods are a major constituent.

Since Sri Lanka is located in the Indian Ocean between the Gulf of Mannar and Bay of Bengal, it is often subjected to adverse repercussions by pressure variations created in Bay of Bengal. Consequently, sudden strong wind currents that bring heavy precipitation to Sri Lanka arise (Fig. 1). This, coupled up with the southwest monsoon season and the two inter-monsoon seasons, often results in severe floods in the lower river basins of Sri Lanka (Samarasinghe et al., 2010). The mean annual rainfall to these river basins accounts for about 2,400 mm (Wagenaar et al., 2019). Furthermore, anthropogenic activities like development of infrastructure to accommodate needs in cities, increased extent of impervious areas, blocked drainage systems, and loss of habitats such as wetlands contribute to the occurrence of floods (Dahanayake and Wickramasinghe, 2022).

Fig. 1 Floods in Kaduwela city of Colombo district in 2016

Socioeconomic Impacts of Floods

Understanding the nature of flood damage is essential in managing its risk. Figure 2 depicts that cities of Colombo, Gampaha, and Kalutara districts of the Western Province and Batticaloa and Ampara districts of the Eastern Province are the areas of severe flood damage, with more than 500,000 people affected (Desinventar, 2021). A noteworthy factor is that all these districts are bordering the coastal zone of Sri Lanka implying that coastal cities are severely affected by the floods. This is because these cities are located in the low elevation coastal areas. For example, Kelani River which flows across the most populated Colombo district brings heavy floods during the monsoons. Similarly, the Attanagalu Oya which flows to the sea across Gampaha district (houses the second highest population density of the country) and Kalu Ganga which flows across the Kalutara district (accommodates the third highest population density of the country) contribute to heavy floods in these respective districts.

Both Figs. 3 and 4 depict that in the Western Province, the number of people affected and fatalities due to floods show a gradual increasing trend with time. In fact, both the frequency and the intensity (height of the spikes) have increased from 2000 onward attributed to impacts of climate change and irregular rainfall patterns.

Year 2010 reports the highest number of people affected by floods (Fig. 3). During April 2010, the Colombo metropolitan region experienced serious flood

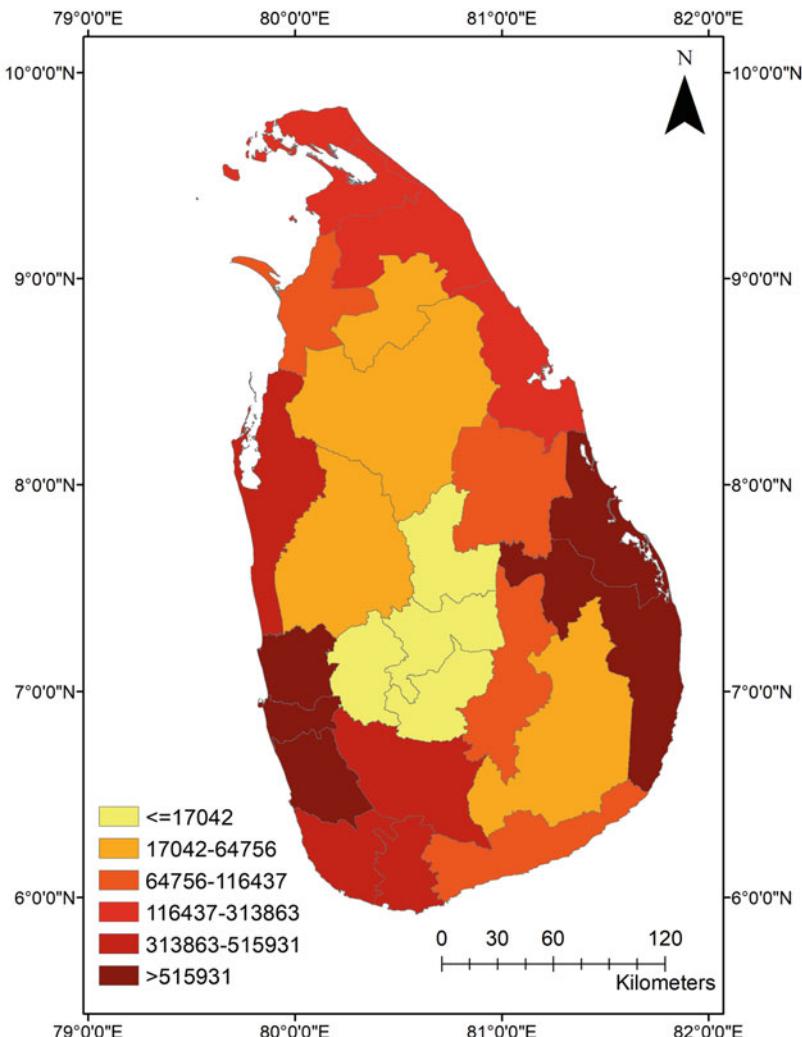

Fig. 2 Spatial distribution of flood-affected districts of Sri Lanka based on the number of people affected from 2000 to 2020 (prepared by a co-author using data from http://www.desinventar.lk:8081/DesInventar/thematic_def.jsp)

damages. The flood event reportedly incurred a cost of USD 1 billion which accounted for 2% of Sri Lanka's GDP (Disaster Management Centre – DMC, 2014). Similarly, 2017 records the highest number of fatalities (Fig. 4). Eckstein et al. (2019) point out that more than 200 fatalities happened nationwide due to 2017 floods confirming the spike in fatalities for 2017 in the Western Province. Further, the Centre for Research on the Epidemiology of Disasters (CRED, 2019) has

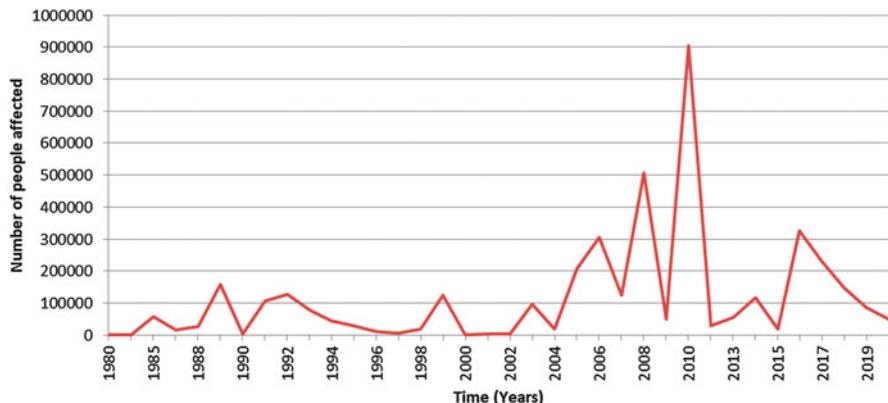

Fig. 3 Plot of number of people affected by floods vs. time (years) in Western Province of Sri Lanka from 1980 to 2020 (prepared by a co-author using data from <http://www.desinventar.lk/>)

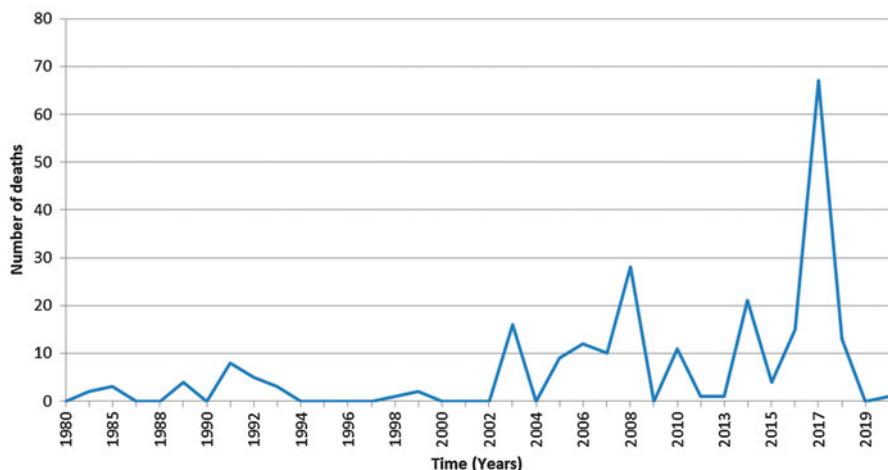

Fig. 4 Plot of number of fatalities by floods vs. time (years) in Western Province of Sri Lanka from 1980 to 2020 (prepared by a co-author using data from <http://www.desinventar.lk/>)

identified that 539 casualties have occurred between 2016 and 2018 which account for 40% of all recorded casualties since the year 1990.

According to UNDRR (2019), a cost of USD 2 billion has been incurred due to flood damage between 1990 and 2018. The impacts include destruction to buildings, properties, and cultivations; interruption to infrastructure provision such as electricity transmission and transport; and disturbances to livelihood of communities (De Silva and Kawasaki, 2018). The damages due to 2017 floods account for USD 415.5 million with the 46% of the burden weighed by housing, education, and health sectors (MoNPEA & MoDM, 2017).

Landslides

General Overview on Landslides

Landslides are one of the deadliest natural disasters in the world that annually accounts for many deaths and injuries and incur billions of damages. In Sri Lanka, landslides are triggered by both natural and anthropogenic factors. Nevertheless, since recently, land use change-induced landslide occurrence has become prominent over natural landslides. Heavy rainfall increases the rate of infiltration into the soil, thus raising the groundwater table. The resultant increase in the pore water pressure of the soil leads to landslides (Harden, 2014). Further, terrain factors including slope angle, bedrock geology, soil type, and elevation of a location increase the vulnerability of slopes to landslides (Jayasinghe et al., 2017; Kalubowila et al., 2021; Somaratne, 2015).

With the overpopulation of cities, the anthropogenic pressure they undergo has exacerbated. Perera et al. (2019) report that landslide occurrence in Sri Lanka has risen due to anthropogenic intervention such as unplanned cultivation, non-engineered construction, and deforestation. The National Building Research Organisation (NBRO) predicts that landslides will be the most catastrophic disaster to create adverse impacts on the up-country of Sri Lanka (Sangasumana, 2018).

Socioeconomic Impacts of Landslides

Figure 5 demonstrates that in the last two decades, Ratnapura and Kegalle districts of the Sabaragamuwa Province and Nuwara Eliya district of the Central Province are the areas with the highest occurrence of landslides, with over 26,000 people affected (Desinventar, 2021).

Therefore, it is observed that landslides predominantly occur in the inland regions of the country, while their risk of occurring in coastal zones is very unlikely. This is attributed to the mountainous topography of the Sabaragamuwa and Central Provinces as opposed to the flat topography in the coastal zone.

Figure 6 depicts the number of people affected by landslides from 1980 to 2020 in the cities of Sabaragamuwa and Central Provinces, two of the most landslide-affected provinces of Sri Lanka. The cohort of people affected due to landslides show an increasing trend both in terms of frequency and intensity. This trend can be distinctly observed from 2000 onward.

The graph also demonstrates that a striking number of people have been affected by landslides in 2017. According to UN Sri Lanka et al. (2017a), 35 major landslides have taken place in Sri Lanka only during May 2017, which is also reflected by the spike for 2017 in Fig. 6.

As a water-related disaster, landslides do not occupy a prominent position in terms of occurrence in Sri Lanka (CRED, 2019). This is also proven by the comparatively lesser number of people affected by landslides (Fig. 6) when compared to that of floods (Fig. 3) and droughts (Fig. 7). Nevertheless, it is the country's second deadliest disaster accounting for 242 deaths (20% of total deaths occurred due to natural disasters in Sri Lanka) between January 2008 and September 2018 (United Nations International Strategy for Disaster Reduction UN-ISDR, 2020).

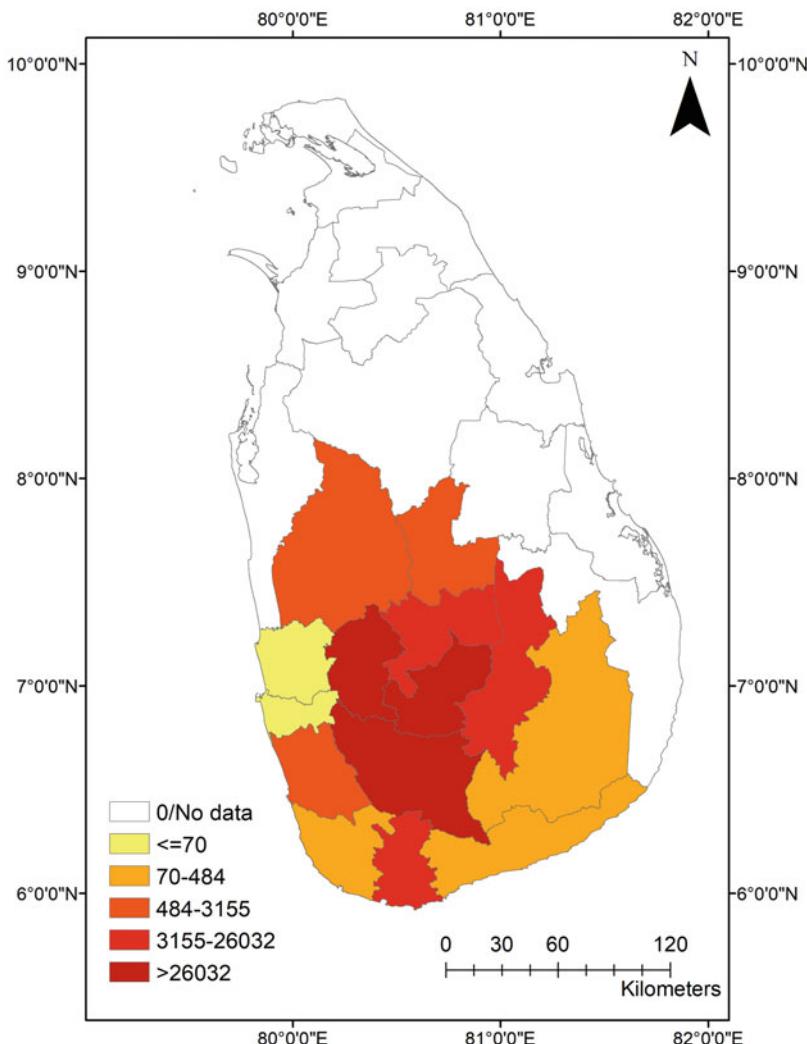

Fig. 5 Spatial distribution of landslide-affected districts of Sri Lanka based on the number of people affected from 2000 to 2020 (prepared by a co-author using data from http://www.desinventar.lk:8081/DesInventar/thematic_def.jsp)

According to DesInventar, between 2000 and 2019, 582 casualties (accounting for 1.77% of the total deaths due to natural disasters in the period) have occurred due to landslides in Sri Lanka (UN-ISDR, 2020).

Landslides create other drastic socioeconomic impacts on people with destruction of households and other properties, making them homeless. A study by Perera et al. (2019) reports that the country lost an annual contribution of USD 160,000 to the GDP by a massive landslide that occurred in the Kegalle district in 2016. This loss

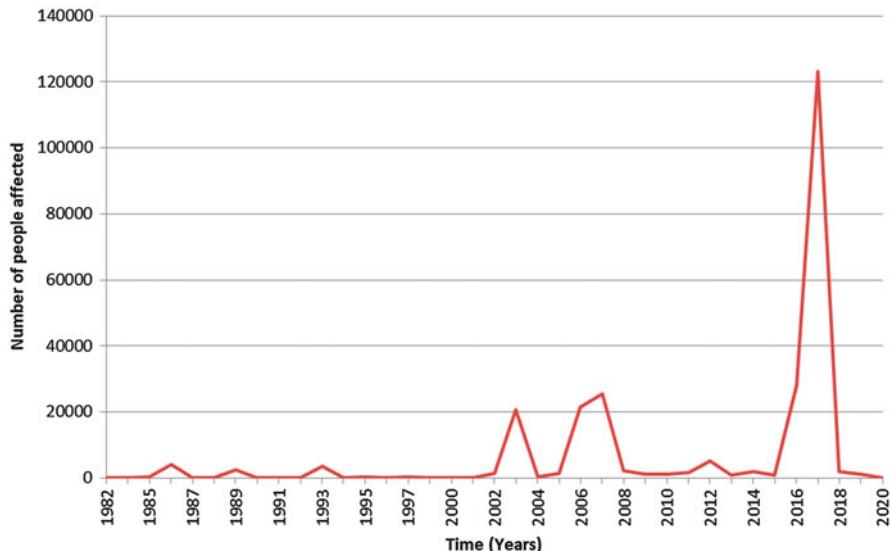

Fig. 6 Plot of number of people affected by landslides vs. time (years) in Sabaragamuwa and Central Provinces of Sri Lanka from 1980 to 2020 (prepared by a co-author using data from <http://www.desinventar.lk/>)

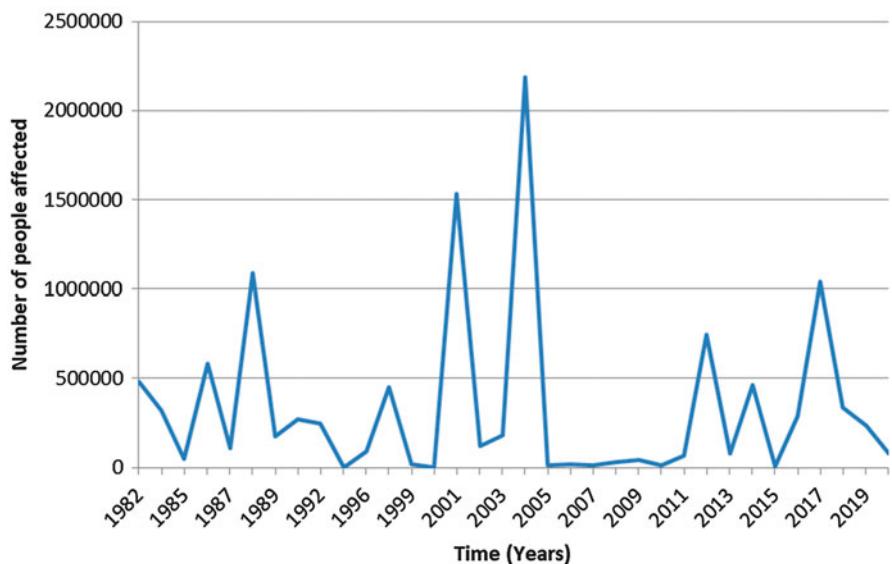

Fig. 7 Plot of number of people affected by droughts vs. time (years) in Northwestern and North Central Provinces of Sri Lanka from 1980 to 2020 (prepared by a co-author using data from <http://www.desinventar.lk/>)

was attributed to the destruction of home gardens and plantations (tea, rubber, and paddy) in the area. Furthermore, this hazard had a heavy impact on women in the area since most of these home gardens and plantations were managed by them. Landslides also incur several financial burdens to the affected by destroying structures, disrupting transport, incurring medical costs, and dwindling property value in the area (Perera et al., 2019).

Droughts

General Overview on Droughts

The World Health Organization (WHO, 2022) estimates that a global population of 55 million people is affected annually by droughts. Likewise, Sri Lanka has also been affected by droughts each year. For meteorological droughts, which are based on the rainfall and are easiest to detect, there are four key geographical and topographical features of Sri Lanka to be considered: (a) being a small island in the tropics, (b) close proximity to the equator, (c) central hills of Sri Lanka, and (d) country's location in the Indian subcontinent to the immediate north and northwest. The first two factors reduce the probability of droughts, while the last two factors trigger it. Apart from the climatic and geographical factors, droughts are also driven by anthropogenic activities like deforestation and play a major role in extending aridity in cities of Sri Lanka.

The International Water Management Institute (IWMI, 2007) states that 80% of the country's extent falls under the dry zone where the mean annual rainfall is 2,000 mm. The period from June to September characterizes the duration for the dry season in the dry zone where only less than 10% of the abovementioned rainfall is received.

Socioeconomic Impacts of Droughts

According to a study by ACAPS (2019), cities of Jaffna, Mullaitivu, and Mannar districts of the Northern Province, Batticaloa and Ampara districts of the Eastern Province, and Matale district of the Central Province are the most drought-affected districts of Sri Lanka with 50,000 or more people affected. One salient feature is that apart from the Matale district, all the other districts are bordering the coastal zone of Sri Lanka implying that coastal cities are severely affected by the droughts.

Figure 7 depicts that the number of people affected by droughts from 1980 to 2020 in the cities of Northwestern and North Central Provinces shows a varying trend. It further demonstrates that about once in every 15 years, the two provinces undergo aggravated drought conditions with the number of affected people exceedingly over 100,000. This fact is also proven by a study conducted by Nianthi (2011) which states that a severe drought condition arises in the dry zone once in every 10 years. Further, according to Fig. 7, the frequency and intensity of the spikes for droughts have increased over time, especially from 2000 onward. This could be attributed to adverse impacts of climate change and also alterations in the rainfall pattern.

Paddy cultivation which produces rice, the staple food of Sri Lanka, is predominantly taking place in the dry zone. Paddy is a very water-intensive crop where inadequate water supply could severely affect the farming system (Prasanna et al., 2011; Withanachchi et al., 2014). Paddy farmers are often influenced by prolonged droughts with less harvest, insufficient and poor quality of food to consume, disturbed day-to-day activities, and increased indirect costs related to farming, health, and medication (Prasanna et al., 2011; Manouri and Jayamanna, 2014). In extreme cases, farmers are sometimes reported to commit suicide due to their inability to pay debts and repeated harvest failures, but official reports are scarce in Sri Lanka compared to India (Parida et al., 2018).

Abeysingha and Rajapaksha (2020) and Wickramagamage (2016) mention that drought is the disaster to affect the greatest number of people in the country while incurring the greatest cost for relief provision. Further, drought is the disaster that incurs the largest cost in national healthcare. The government spends an estimated cost of USD 41.2 million for drought-related healthcare in Sri Lanka (Center for Excellence in Disaster Management and Humanitarian Assistance, 2021).

Droughts affect urban water security. In particular, women have to walk for hours to fetch drinking water, and in Eastern Province women walk for one and half hours at night to collect safe drinking water (The World Bank, 2021). In some coastal cities, the situation is much worse because with extended drought periods, saltwater intrusion makes water unusable. The poor communities are penalized not only in their income but also through sanitation mainly due to the lack of clean water for drinking and hygiene. Among marginalized communities, women and girls suffer the most due to inadequate water for their sanitation needs (Fan, 2015).

In addition, ecosystems are heavily affected from droughts due to loss of biodiversity, species extinction, reproductive failures, and deaths due to heat shock which too are increasingly evident in cities. The environmental and social impacts originated from a simple meteorological drought could cascade through natural ecosystems and end up as a more complex socioeconomic hazard (Van Loon et al., 2016).

Challenges in Water-Related Disaster Management

Disaster management, especially in urban areas, is a challenging task in many countries. Sri Lanka is no exception. According to the disaster management cycle, these challenges appear in each of its four stages, i.e., mitigation, preparedness, response, and recovery. These stages are sometimes overlapping and interconnected and encompass a wide array of sociopolitical aspects.

Challenges in Mitigation Stage

Water-related disaster management is linked with many social, technical, administrative, political, economic, legal, and environmental factors which could be in operation individually or in integration. Discrepancies of rules and regulations and lack of compatibility of different institutions due to the absence of long-term

political commitment have restrained the country for decades from implementing effective mitigation plans. As an example, UN Sri Lanka et al. (2017b) state that bad practices attributed to weak or nonenforcement of regulations and heavy political influences affect flood management.

Further, sociocultural factors pose unique challenges in disaster mitigation. Communities living in flood-prone areas have grown accustomed to the risks posed by annual flooding incidents (Askman et al., 2018; UNDRR, 2019) which hinder relocation to safer places. All these sociocultural factors combined with financial limitations, which is the number one constraint, make the reduction of flood disaster vulnerability by reducing the exposure nearly impossible.

Challenges in Preparedness Stage

Taking sound management decisions requires reliable and updated information. The existing data gap on disaster events has critically affected the ability of authorities as well as communities to prepare for water-related disasters through adequate vulnerability and risk assessments. Pathiraja (2018) has highlighted the importance of having a science-based data collection process with a central database through which different agencies can acquire data.

A proper database with vulnerability parameters such as disaster profile, poverty, and housing conditions is yet to be developed. Unavailability and inconsistency of data could also affect the effective implementation of early warning systems for both slow-onset disasters such as droughts as well as for rapid-onset disasters including floods and landslides.

Incorporation of disaster risk elements should be considered a priority when implementing development projects, construction projects, and other land usages. Inadequate attention paid to the use of planning tools such as the Environment Impact Assessment has crippled the effective implementation of preparation programs. Addressing this issue has been quite a challenge due to the lack of interest of authorities in strengthening policies, environmental standards and guidelines, and proper enforcement.

Challenges in Response Stage

Disparities exist between national-level disaster response plans and the extent to which these are implemented and deployed during disasters at local level. Issues such as inadequate institutional mechanisms at local level, inefficient communication of national-level decisions, and lack of engagement of local authorities in national-level decision-making could have contributed to these disparities (Malalgoda et al., 2016).

Long-term commitment issues have left the country due to profusion of policies, inadequate and less flexible rules and regulations, and also overlapping roles and responsibilities of agencies. These affect the smooth operation of response activities which could enhance the susceptibility of affected communities to the impacts of

disasters. The nonavailability of an emergency fund management mechanism to mobilize and handle funds with transparency during the rapid onset of disasters, such as floods, landslides, and tsunamis, has been identified to be a serious issue debilitating immediate response procedure.

Challenges in Recovery Stage

Lack of consistent government involvement is one of the major challenges during the recovery phase of disasters in cities due to factors like changes in opinions of governing parties, confusions in responsibilities allocated for different authorities, limitations of human and nonhuman resources, and lack of knowledge and technical know-how on reconstruction processes (Dissanayaka and Sangasumana, 2017; UN-SL et al., 2017b). As it has been in all the other stages, financial constraints, combined with lack of transparency in finance handling, play a huge role in creeping recovery actions like compensations and resettlements. Even though the government has made moves with the involvement of public and private parties to relieve the monetary burden on the government and the poor who are incessantly affected by water-related disasters, it still requires improvements to reach its objectives (DMC, 2014). Communication for the purpose of insurance compensations has also been challenging due to the lack of awareness of these communities on the importance of reducing disaster vulnerability.

Environmentally Smart Solutions to Reduce Disaster Risk and Build Resilience

In the backdrop of expanding urban areas and increased impacts of climate change and related natural disasters, where are the cities heading to? How do city planners seek solutions? Although these are obvious and straightforward questions, the answers are complicated.

The Sendai Framework for Disaster Risk Reduction 2015–2030 outlines four priority areas for action to reduce disaster risk, (a) understanding disaster risk, (b) strengthening disaster risk management, (c) investing in disaster risk reduction, and (d) enhancing disaster preparedness, and to “Build Back Better” focusing on recovery, rehabilitation, and reconstruction (Sendai Framework, 2015). The Sendai Framework presents a clear mandate to all the stakeholders, including the governments, local authorities, private sector, scientists, media, and the communities to reduce disaster risk and build resilience. As highlighted in the Sendai Framework, increasing capacity of the affected communities to “bounce back” or to achieve speedy recovery following disasters needs special attention in urban planning. Thus, proactive plans are of high priority, as reducing disaster risk and increasing resilience are significantly becoming central to safe and sustainable cities. In this context, plans should be emerged to integrate science, policy, and practice which address different issues related to sociopolitical and environmental dimensions.

Improved Environmental Governance

Resilient urban development goes hand in hand with poverty and inequality reduction, environmental management, and climate change adaptations. As expanding urban development has a direct influence on environmental degradation, which in turn exacerbates hazards and vulnerability, strategies for building resilience including investment in drainage and water management and the prevention of development in low-lying areas are becoming crucial. Implementation of such strategies in turn relies on good urban and local governance and multiple regulatory, financial, and technical factors.

In 2012, the Metro Colombo Urban Development was initiated by the Sri Lankan government to reduce flood risk in the Metro Colombo drainage basin (Ministry of Urban Development and Housing, 2022). The project, which is still continuing, was a product of multiple contributors that included the Colombo Municipal Council (the largest local government authority of the country) and Sri Lanka Land Development Corporation and many other governmental organizations. The project consists of a natural flood reduction network including canals, lakes, and wetlands in Colombo and suburbs with an improved flavor of environmental conservation and sustainability. Many recreational, transportation, educational, and other activities are included in the project which enhance urban resilience (Fig. 8).

Fig. 8 Urban wetland park in Colombo as means of recreation and natural flood reduction

Strengthened Urban Management with Integration, Inclusiveness, and Knowledge Sharing

In many instances, new policies are formulated to handle single and separate issues in cities, usually with shallow agendas. It is also noteworthy to mention that issues related to certain problems such as solid waste management are handled without paying attention to its link with other burning issues such as emission of greenhouse gases and water pollution.

No policies or plans for good governance of resilient cities can succeed without the active participation of all stakeholders. Opinions, perspectives, and suggestions offered by all stakeholders are key resources in discussions and multilateral divisions. In the era of cyberspaces and IT tools, knowledge management reflecting various perspectives of stakeholders is increasingly becoming efficient and easy. City planners should, therefore, provide platforms for collaborative engagement of stakeholders including the government, local agencies, private sector, researchers, media, and communities.

Nature-Based Solutions (NbS)

NbS could be used as promising techniques to mitigate the risk of water-related disasters. As an example, nature-based landslide risk reduction could be done through the self-organization of vegetation in the slopes (Rietkerk et al., 2002) to mimic a mosaic of different vegetation layers and varieties. This makes sure that vegetation intercepts more rainfall and prevents the free flow of stormwater far more efficiently (Berendse et al., 2015; Osterkamp et al., 2012) as different vegetation types hold onto soil at different strengths. In addition, different vegetation layers which are grown in various seasons (Shen et al., 2017) assure continuous coverage of soil during the whole year.

Further, ancient civilization of Sri Lanka reportedly had better catchment management systems where drought resilience was achieved through reservoir cascade systems (Prematilaka et al., 2021) which is gaining popularity again.

Preparing to Combat Impacts of Climate Change

In the context of climate change and aggravated disasters, the Sri Lankan government has taken steps to introduce new policies and strategies to reduce risks. Among the noteworthy outputs are the National Climate Change Adaptation Strategy (2010) and the National Climate Change Policy (2012) by the Ministry of Environment. The cities which suffer from water shortage will be selected for a pilot project with many sectors reshaped to include climate and environmentally smart solutions. One example is the recently launched project to develop a major inland city, Kurunegala, into a climate smart city with the technical and financial help from donor countries (Climate Change Secretariat of Sri Lanka CCS-SL, 2021). A major emphasis will be

paid to subsectors of water governance and infrastructure and settlements where conservation of land and water will be given priority.

Smart Cities and IT Solutions

Evolving technology can shed light to the development of sustainable and resilient cities in line with the concept of the Internet of Things (IoT) (Das, 2019). According to Singh and Neha (2019), the traditional disaster management systems respond slowly to transmit the disaster information. Cyber- and IoT-based sharing of information, artificial intelligence tools, and software models could be very efficient and beneficial in emergency situations with minimal human involvement (Atitallah et al., 2020). For instance, disseminating real-time information, planning relief distribution, and redirecting vehicles on the road to safer routes require quick responses which demand efficient flow of information using IoT. Sri Lanka's progress in using cyber information in urban planning and development is still progressing. Yet in contrast, cybersecurity threats, issues with personal information, and technological and financial hindrances call for careful consideration when transforming urban management subsectors to IT nodes and spaces.

Conclusion

Growing urban populations produce greater concentrations of people vulnerable to the impacts of natural disasters in cities. On the other hand, cities are at the risk of being exposed to the impacts of climate change-driven hazards. Sri Lanka is among the most affected countries in weather-related disasters in the world with increasing intensities and occurrences of floods, landslides, and droughts. It can be reasonably expected that the country will face more issues in the future with the synergistic effects of climate change and disaster vulnerability.

Following a comprehensive literature survey and analysis of available data, this study revealed some significant key information which would be critical to manage climate change-induced urban disasters. Firstly, floods have been identified as the deadliest disaster of the country with their impacts, in terms of people affected and fatalities, increasing with time. Further, it is identified that severe droughts have been occurring in the dry zone about once in every 15 years. Moreover, landslides, even though possessing a very low prominence in occurrence and affecting a lesser cohort of people when compared to that with floods and droughts, have been identified as the second deadliest disaster of the country. Secondly, the frequency and the intensity of these three disasters are aggravating with time, especially from 2000 onward. Therefore, we can expect these disasters to occur rampantly in the future. Thirdly, the present study indicates that the coastal cities were more affected with floods and droughts, while the inland cities were severely hit by landslides.

In light of this, the present chapter discussed the challenges faced in different phases of the disaster management cycle: preparedness, response, recovery, and

mitigation. Finally, it presented the perspective of environmentally smart solutions to increase urban disaster resilience which is crucial, given the impacts of climate change.

As may be in other studies that explore the local contexts, inadequacy in information and nonavailability of updated and previous data on disaster impacts were the main challenges in the present study. A promising future research, therefore, could consist of investigating disaster risk and vulnerabilities which would be felt more progressively across many urban areas. Integrated urban planning with multi-sectorial proactive strategies which include both hard and soft options should be promoted. Since mitigating climate change-induced disasters is a global issue, the essence of this chapter would contribute to the growing literature on disaster risk reduction in cities. Finally, this study calls for the urgent need of disaster preparedness to improve community and ecosystem resilience and also to build back better from the increasing trend of future disasters.

Abstract

The magnitude of impact of the COVID-19 pandemic immeasurable, spreading across regions, countries, and sectors, including the public sector, the private sector, and civil society. It is a wakeup-call to many organizations, especially business entities, as it does not only adversely affect the eco and human systems across the countries, but it also drastically disturbs business operations, supply chains, management practices, and many others. It acts as a “test” to measure business resilience, i.e., to what extend businesses are ready to manage risk arising from such pandemics which is considered one of the types of disasters. Many businesses have acknowledged that traditional approaches to planning and preparing for disaster risk are not sufficient to deal with such a pandemic. Also, environmental disaster, man-made disasters, ecological and biological disasters, etc. go beyond the control of any individuals, groups, and countries. Thus, new approaches should be explored to help businesses be more resilient and agile to respond to risk caused by extreme pandemics.

This section examines the challenges and opportunities that businesses have faced due to the COVID-19 pandemic, and responses by businesses to remain competitive and sustainable during the COVID-19 pandemic. It then proposes new approaches and directions that businesses may consider to preparing for future risk. This section includes ten chapters covering various topics, such as food security, corporate social responsibility, legal frameworks, and good practices to respond to the pandemic in Asian countries.

Keywords

Business resilience · The COVID-19 pandemic · Disaster risk management · Small and medium-sized enterprises (SMEs) · Asia · India · Indonesia · Hong Kong · Korea · Japan · Singapore · Hospitality and tourism industry · F&B industry · Food security · Corporate social responsibility (CSR) · Legal framework

Introduction

The recent report of the United Nations Office for Disaster Risk Reduction (2022) explains that climate disruption and abnormality and man-made and natural disasters, including the COVID-19, pandemic have posed serious threats to all sectors and all countries in all continents and hindered the achievement of Sustainable Development Goals (SDGs). The *Asia-Pacific Disaster Report 2022* by the United Nations Economic and Social Commission for Asia and the Pacific (ESCAP) (2022) also highlights that disaster riskscape in Southeast Asia is expanded given the increased number of extreme weather events and natural disasters. According to the report by ESCAP (2022), around 450,000 people in Southeast Asia lost their lives in the past 50 years, and 525 million people have endured natural hazards. The average annual losses from disasters were around US\$91 billion, and this figure may reach “US\$108 billion under the moderate climate change scenario (RCP 4.5) and to \$127 billion under the worst-case climate change scenario (RCP 8.5)” (United Nations, Economic and Social Commission for Asia and the Pacific, 2022, p. 5).

Igarashi et al. (2021) conducted a survey among micro-, small-, and medium-sized enterprises (MSMEs) in eight countries in Asia in 2020 and found that the sales of 78% of the surveyed MSMEs reduced due to the COVID-19 pandemic. In Southeast Asia, about 9.3 million of job loss was recorded, and 4.7 million people were classified as “extreme poverty” (2021) due to the pandemic (Asian Development Bank, 2022; Jiao, 2022, para. 1). The survey of 5800 small businesses in the United States in 2020 by Bartika et al. (2020) reveals that 43% of these businesses had to temporarily close due to the COVID-19 pandemic, and their active employment was reduced by 39% since January 2020. According to another survey of 132 small and medium enterprises (SMEs) in 2020 by the International Trade Centre (ITC), the pandemic has strongly affected about 67% of them, and about 20% of them mentioned that their business might be closed down permanently (ITC, 2020). In a survey of small businesses in April 2022 in the United States, Statista Research

Department (2022) indicates that about 21.6% of them were negatively affected by the COVID-19 pandemic. The rapid spread and ongoing nature of the COVID-19 virus has adversely impacted businesses around the world (EY Global, 2020). The International Federation of Red Cross and Red Crescent Societies also classified pandemics as natural hazard. Thus, the COVID-19 pandemic is considered a natural disaster (Seddighi, 2020). Hence, it is justified to discuss business resilience and the COVID-19 pandemic in the context of disaster risk management.

While countries have faced challenges to prepare for and manage disaster risk, the COVID-19 pandemic has escalated the situations. Countries across the world have to respond to the dual challenges of addressing the COVID-19 pandemic and managing disaster risk. Such crises have not only affected the ecosystems and human systems across the countries, but they have significantly disturbed business operations and economic development (IPCC, 2014a, b; Kim & Lim, 2016). It has been noted that environmental disaster, man-made disasters, ecological and biological disasters, etc. have gone beyond the control of any single individual, groups, and countries (Ha, 2016; Ha, 2017; Ha & Jose, 2017; Ha et al., 2019a, b). Also, a single governance approach to address such disasters has not worked well in all scenarios. Apparently, the negative effects of such disasters have required efforts of stakeholders to search for novel governance approaches and do research in various areas and disciplines as well as cross-sectorial, cross-national, and cross-continental to manage disaster risk incidents now and in the future. Such effort should be continuous.

Thus, this section aims to address the three questions, in the context of Asia. Firstly, what are the challenges and opportunities that businesses have faced due to the COVID-19 pandemic? Second, what have business done to remain competitive and sustainable during the COVID-19 pandemic? Finally, what are the new approaches and directions that businesses may consider to prepare for future risk?

This section includes 11 chapters, excluding this introduction chapter. These chapters are contributed by researchers, academics, and practitioners with different backgrounds and from different countries. Overall, this section provides better insights to businesses, policy-makers, researchers, and those who are interested in the topics so that they can have better understanding of how businesses have weathered the adverse impact of the pandemic to remain competitive and how they can better prepare for future disruption.

Businesses During the COVID-19 Pandemic

Challenges Faced by Businesses During the COVID-19 Pandemic

The COVID-19 pandemic has widely and substantially influenced businesses worldwide, hitting both large companies and small- and medium-sized enterprises (SMEs) in all sectors of the economy. At the macrolevel, the main challenges facing businesses during disasters, in general, and during the COVID-19 pandemic include (i) supply chain disruption due to border closures, export restrictions, and shortage of supplies and manpower, (ii) compliance with government regulation, (iii) disruption of operations, (iv) changes in customer behavior and preference, and (v) changes in organizational

behavior (Klint, 2021; Kohli et al., 2020; Moosavi et al., 2022; OECD, 2020b). Other challenges facing businesses include drastic and persistent sales drops, liquidity problems and insolvency risks, massive disruption in the supply chain, workforce shortage, and employee mental health problems.

The containment measures adopted to tackle the health crisis during the pandemic, including lockdowns, social distancing, working from home, etc., resulted in significant and persistent sales drops. A survey conducted by the World Bank Group in 51 countries over six regions showed that the negative impact of COVID-19 on sales has been enormous, widespread, and lasting. More than 80% of firms reported a significant sales reduction from the previous year, with the tourism sector most badly hit. For most firms, the significant sales drop could last 10 weeks or even longer (Apedo-Amah et al., 2020). For example, the closure of restaurants in the United Kingdom in March 2020 caused 85% sales order loss for Caws Cenarth, a small cheesemonger supplying the hospitality industry in the west of Wales (Ross, 2020).

Severe liquidity problems and insolvency risks were natural results of falling sales. At times of crisis, when sales decreased dramatically, fixed costs like rent and interest payments could not be saved simultaneously. This challenge made firms run out of cash, limited their ability to pay back debts, and forced many into bankruptcy. Firms in developing economies with less established financial markets are most vulnerable to these problems and risks (World Bank Group, 2020; Apedo-Amah et al., 2020). Huge inequality existed between large-sized companies and SMEs regarding their ability to assess to finance during the crisis. This inequality could even be observed in advanced countries with established financial markets like the United States (Apedo-Amah et al., 2020; OECD, 2020c; ACCA, 2021).

The pandemic also caused massive disruption in the supply chain which brought a significant impact on businesses, especially those heavily relying on global supply chains. Multiple national lockdowns, lack of transportation capacity, and different recovery paces slowed or even stopped the flow of materials and goods and disrupted economic activities (Harapko, 2021). For instance, the COVID-19 lockdowns in Zhengzhou, China, where Apple's main assembly plant is located have made the record-long wait time to 37 days for iPhones (Yoon, 2022). The closures of meat processing plants due to COVID-19 infection broke the meat supply chain, causing a shortage of meat products in the United States, Australia, and Ireland (Evans, 2020).

Another challenge facing businesses during the pandemic is workforce shortage. Many workers, especially women and senior employees, withdrew from the labor market because of the fears of contagion and the need to take care of the elderly and their children who stayed home due to school and daycare closures (Duval et al., 2022; Melhart, 2021). In many countries, the vacancy-to-unemployed ratios have kept increasing since the outbreak of the pandemic. People have been more and more concerned about low pay, poor working conditions, strenuous tasks, and weak well-being with the experience of the pandemic (Causa et al., 2022). Large-sized companies like Amazon, Apple, Google, etc. acquired talents from different markets by providing flexible working modes, competitive pay and benefits, and greater opportunities for career advancement, making the SMEs even more difficult to attract talent (Melhart, 2021; ACCA, 2021). According to a report by Melhart (2021), the resignation rate of managers was 11.8% higher than that of the pre-COVID period.

Meanwhile, employee mental health problems also called for attention because many employees felt stressful to deal with loneliness, disconnectedness, and loss of work-life balance stemming from working from home (ACCA, 2021; JBA, 2021). The pandemic also triggered reskilling revolution, in which everyone has been transformed by technology through learning and reskilling (JBA, 2021). At the time of returning to the workplace, new employee stresses arose because people who had experienced different ways of working during the pandemic now have new career expectations (Furness et al., 2021).

This section briefly discusses some challenges encountered by businesses. The disruption of business operations has happened across countries. Disruption in one industry or sector has caused domino effects on related/supporting industries. Thus, most of businesses have been adversely affected during crises. Yet, the scope the scale and the magnitude of damages vary across businesses and across sectors. Therefore, the impact of the COVID-19 pandemic on businesses is further discussed in the chapters included in this section.

How Have Businesses Responded to Such Challenges?

The most common response to sales drops caused by COVID-19 has been the introduction and expansion of digital platforms and digital solutions. In an extensive survey conducted from April to August 2020, the World Bank Group found that around 8% of firms started to use digital platforms and around 22% of firms increased the use of digital platforms within 6 months after the outbreak of COVID-19. The findings also showed that the probability of digital transformation increased with the firm size (Apedo-Amah et al., 2020).

Companies also conducted product or business model innovation to diversify into products or services that were less impacted or even needed during the pandemic such as health-related products and services. On average one in four firms performed some product innovation during this period (Apedo-Amah et al., 2020). This response is especially beneficial to SMEs that are flexible in operation but less able to access to finance for digital transformation and digital solutions. Caws Cenarth, a small cheesemonger suffering from a sales plunge after the UK government ordered the closures of restaurants in March 2020, quickly changed its business focus from the service sector to the retail sector by filming a plea for people to buy the cheese or even get the cheese without payment to avoid waste. Its employees quickly learned how to increase the company's social media presence and how to deal with many small orders instead of a few bulk sales. This strategy helped the small business survive the crisis (Ross, 2020). In a survey of 300 senior executives in Europe, McKinsey and Company found that business-model innovation was the most crucial response during the crisis (Diedrich et al., 2021).

Businesses proactively responded to the deteriorating liquidity and increasing insolvency risks by controlling costs, managing payables and receivables, focusing investments on strategic moves, and seeking support from financial institutes and governments. For example, banks quickly closed branches and laid-off staff to save

costs during the crisis. S&P Global Market Intelligence data shows that 3324 bank branches were shut in the United States in 2020, hitting a record high (Aggarwal et al., 2021).

The massive disruption in supply chains during COVID-19 has raised awareness of supply chain resilience. Ernst and Young LLP (EY US) conducted a survey of 200 supply chain executives in late 2020. The result shows that the top priority in the minds of those supply chain executives is increasing efficiency, reskilling the workforce, increasing the visibility of suppliers, and increasing supply chain resilience (Harapko, 2021). Although many businesses suffered from the massive disruption in supply chains, there were outperformers as well. As early as February 2020, Mark Schneider, the chief executive of Nestlé, the largest food producer, was alert to the coming massive global chain disruptions, and his immediate response is to “turn” the organization into crisis mode, i.e., prepare for the worst to come. In response to this crisis, the company built inventories for both raw materials and finished goods, and its crisis committee met twice a week to make prompt decisions to solve operational problems. “There is no magic bullet . . . In some very limited cases we can think about adjusting recipes if there is a critical ingredient missing,” Mark Schneider said (Evans, 2020, para. 4). The strong responsiveness and flexibility helped the company navigate the storm (Evans, 2020).

As for the workforce shortage challenge, large-sized companies solved it by providing appealing job offers. This strategy worked well because better pay, more advancement opportunities, better work-life balance, and more flexibility were the most frequent reasons for those joining a new company (Causa et al., 2022). However, SMEs could not provide comparable salaries. Instead, SMEs tried to build the employees’ loyalty and sense of belonging by creating intimate and shared culture. The strategy helped SMEs to recruit and retain employees during the crisis. For example, Jonathan Tham, the CEO of Guard My Ride (GMR), a Malaysia-based medium-sized company providing extended warranty services for used cars, mentioned that the company’s culture was the most successful selling point to its employees. To show its caring toward employees, the company distributed up to 45% of the profit earned and promised an IPO share to everyone when the company goes public (ACCA, 2021).

To deal with employee mental health problems, Josh Bersin Academy (2021) suggested adopting human-centered leadership, which focuses on inspiring and growing people, driving people to be creative problem-solvers, and supporting people to deal with change, stress, or disruption (Josh Bersin Academy, 2021). A McKinsey survey of 100 executives across industries and geographies provided supporting evidence on human-centered leadership. It was found that organizations that survived successfully with increasing productivity during the pandemic have supported small connections among employees, including coaching, mentorship, idea sharing, and coworking. Those companies have trained managers on remote leadership for the hybrid working mode, redesigned processes to better support a remote workforce, and helped employees adapt and thrive in the new roles (Alexander et al., 2021).

Generally, businesses should prepare for future uncertainties and crises by building resilient and innovative business models, flexible and visible supply chains, and human-centered leadership. Some chapters in this section recommend directions and business models to help businesses cope with ongoing changes in the external environment.

An Overview of the Chapters

The chapters included in this section endeavor to discuss what businesses have done to address issues associated with the COVID-19 pandemic and what businesses can do to further improve their business continuity during crises. Some chapters examine current and new enablers, such as corporate social responsibility (CSR) and behavioral approaches (e.g., nudges and nudging), that can help businesses be resilient during and after crises. Some chapters also propose what can be further done to better prepare for future risk.

This section starts with the chapter titled “Indonesia’s Legal Complexities in Responding to Natural Disasters and the Business Environment” (Chap. 156) by Afriansyah. In this chapter, the author introduces Indonesia’s legislative reform and development for disaster management. The legal framework required for disaster management was not available in Indonesia until 2004 when the severe natural disaster Aceh tsunami hit the country and revealed substantial weaknesses of the law at that time. The Aceh tsunami and the subsequent disasters like Padang earthquake, Mount Merapi eruption, and COVID-19 pandemic sparked the reform and development of the disaster management law in the country. According to its legal framework that was developed based on the international disaster response law (IDRL) guidelines, Indonesia defined natural, nonnatural, and social calamities as disasters. Its disaster management system was directed to focus on the whole spectrum from prevention to rehabilitation. The government also established a national disaster management authority named Badan Nasional Penanggulangan Bencana to oversee and coordinate disaster management across the country and opened the door to the participation from international institutions and NGOs. In response to the COVID-19 pandemic, a series of regulations and policies were introduced to allocate resources, minimize impact, and recover macro- and micro-economy. Generally, the author opines that Indonesia has taken necessary legislative reforms to implement the international disaster response law though more can be done.

► [Chapter 163, “Sustaining and Shielding Business from Disasters: Assessing Indian Experiences of COVID-19 Pandemic Disaster Management,”](#) by Kumar shares how public policy has helped businesses during the COVID-19 pandemic in India. The author examines regulations and policies introduced by the Indian government during the COVID-19 pandemic and the government’s capacity to deliver relevant measures. The prolonged lockdowns and the closures of working places in India during the pandemic resulted in millions of job losses and socioeconomic condition deterioration. To help the masses, the Indian government

announced financial packages, such as providing food and instant cash to the poor jobless migrant workers, distributing free food grains for near 24 months, giving relief to people in need, etc. (National Disaster Management Authority (NDMA), 2020). To help micro-, small, and medium enterprises (MSMEs) which suffered seriously during the pandemic, the Indian government provided interest-free loans, cash subsidies, training MSMEs, and incentivized loan to enterprises engaged in the healthcare, manufacturing, and logistics sectors. Trying to turn the crisis into opportunity, the Indian government enacted a series of economic, banking, and labor laws and announced the special economic and comprehensive packages in the hope to get a foot hold in the global supply chain (National Disaster Management Authority (NDMA), 2020). However, the resumption of normal operations was slower than expectation due to many factors, including socioeconomic changes and shift in consumer behavior and lifestyles. The disruptions in global supply chain and the geopolitical conflicts further obstructed the economic recovery and curtailed India's capacity of handling the disaster.

In the process of disaster risk management, the private sector plays an active role to complement the endeavors of governments by implementing corporate social responsibility (CSR) activities. In ► Chap. 160, “CSR and Sustainable Coexistence with Society During the COVID-19 Pandemic: The Case of Korean Large Enterprises,” Kim reviewed the development of CSR in Korea and documented how the private sector in Korea conducted CSR activities to solve the socioeconomic problems caused by the COVID-19 pandemic. Her study found that large Korean enterprises’ CSR engagement has been evolved from a reactive process to a proactive process (Kim, 2022). The CSR initiatives taken by large Korean enterprises with respect to disaster relief during the pandemic are agile and strategic. More specifically, large Korean enterprises would be able to quickly discover the emergent problems faced by their CSR target beneficiaries, and hence, they incorporated the revealed problems into their CSR planning and provided both immediate and long-term solutions (Kim, 2022). Their pursuance of sustainable coexistence with society in the presence of disaster helped them establish a good and trustworthy reputation which in turn accrued their social capital for business. Based on these findings, Kim concludes that companies should actively and continuously communicate their CSR activities to stakeholders and adopt an authentic, agile, and strategic CSR approach, particularly when there are disasters.

In ► Chap. 157, “Platform Co-operative Models and the COVID-19 Pandemic in Singapore,” Ha and Lin propose that digital platforms can be adopted by businesses, including cooperatives (co-ops), as an “enhanced” business approach, especially during the COVID-19 pandemic. This chapter discusses different types and forms of platform cooperatives, benefits, and challenges of digital platforms. Such platforms can provide on-demand services, job opportunities, and flexibility to users who can join and leave the platforms any time. The popularity of such digital platforms has been observed in many economic activities, especially when social distancing measures were implemented during the COVID-19 pandemic (OECD, 2021). However, challenges associated with such platforms, namely, governance, technology, growth, and capital, also surfaced (Borkin, 2019). In addition, this chapter revisits

Scholz's principles of platform cooperativism, including broad-based ownership, democratic governance, codesign of the platform, and commitment to open-source development (Scholz, 2016, 2018). The chapter assesses how digital platforms have been adopted by co-ops using Singapore National Co-operative Federation's platform as a case study. In order for co-ops' platforms to function well, the authors propose that (i) partnerships with multi-stakeholders and collaborative governance should be developed, (ii) the roles of co-ops should be well acknowledged, and (iii) harnessing technology to support a transparent and accountable digital economy is critical (De Filippi, 2017; Hoover & Abell, 2016; Meah, 2020; Yaraghi & Ravi, 2017).

The next few chapters discuss how different industries have weathered the pandemic to stay afloat. Ha and Wong examine how tourism industry in Indonesia has developed and responded to the COVID-19 pandemic in ► Chap. 158, "Tourism Industry and the COVID-19 Pandemic: A Case Study in Indonesia." Indonesia is a well-known destination for tourists with several iconic landscapes. However, the COVID-19 pandemic has caused much disruption to the country's tourism industry. This chapter examines how the pandemic has affected the tourism industry in Indonesia and how the industry could recover after the pandemic. The findings reveal that the numbers of international tourists to Indonesia reduced by 64.1% in March 2020 (Parama, 2020). Many travel agencies and tourism-related SMEs have temporarily or permanently closed (Hakim, 2020). The Indonesian Hotel and Restaurant Association and the Indonesian Travel Agents Association reported a significant loss of income during the pandemic (Djalante et al., 2020). To rebuild and revitalize the tourism industry, it is recommended that the government should (i) formulate proper policies and put in place effective mechanisms to implement such policies; (ii) improve coordinating efforts at the local, regional, and national levels to enable a speedy recovery for a more resilient industry; (iii) promote environmentally sustainable practices; and (iv) improve infrastructure (Soshkin, 2019; UNEP, 2019). At the industry level, Indonesia's tourism industry needs to strive for a fair balance between attracting tourists, preserving the environment, and complying with government agencies and health authorities to prepare for and mitigate health risks (Mulyanto, 2020).

If the tourism industry in Indonesia has endured huge challenges due to cross-border travel restriction and other social distancing measures during the COVID-19 pandemic, food and beverage (F&B) industry in Hong Kong has encountered different types of difficulties as explained by Wong and Ha, in their ► Chap. 164, "How Food and Beverage Industry Overcome the Impacts of the COVID-19 Pandemic in Hong Kong?." The F&B industry has been subjected to strict regulation because dining in F&B establishments is perceived as one of the key channels to transmit the virus. The impact of the COVID-19 pandemic was reflected through the number of job losses and the decreases in the sales volume of F&B establishments (e.g., a drop of nearly 30%) during the peak of the pandemic. However, the industry has recovered fast. This chapter employs a simplified four-stage framework of disaster risk management by the World Health Organization (n.d.), including mitigation/prevention, preparedness, response, and recovery, to examine how the F&B

industry in Hong Kong has prepared and responded to the pandemic. Apart from complying with all measures stipulated by the Hong Kong government, F&B establishments have also adopted measures that are pertaining to their operations and industry. Together with the experience in managing the SARS outbreak in 2013, timely preparation for all the four stages of the disaster risk management framework enables the industry to respond well to the pandemic and stay competitive during the crisis. It is also noted that preparedness by individuals and businesses could contribute to mitigating the damages caused by disasters (Adams et al., 2019; Sawalha, 2020).

Food security is another important issue that needs to be addressed, not only during the pandemic but all time. Thus, in ► Chap. 159, “Food Security and the COVID-19 Pandemic in Singapore,” Ha and Lim discuss how the COVID-19 pandemic has impacted food acquisition and food prices and review people’s panic buying behavior due to uncertainty (McKeever, 2020). The authors also discuss strategies to improve food resilience, using Singapore as a case study. Singapore is a small country with limited land, Singapore has sourced for much-needed food from around the world, and it has imported about 90% of the total amount of food required for the population (Thai, 2021). However, Singapore has strategically adopted a three-pronged framework, including core strategies, supporting strategies, and enabling strategies to ensure food security for the population (Agri-Food and Veterinary Authority of Singapore, 2020). During the COVID-19 pandemic, there was disruption of food supply chain due to border closures, import restrictions, and social distancing measures as well as panic buying behavior. Hence, food items, essential hygiene items, etc. were emptied from markets and supermarkets’ shelves at lightning speed. Yet, the food security framework implemented by Singapore has worked effectively. For instance, the timely release of stockpiling of food necessities for contingency purposes to increase food supply and the availability of locally produced products helped to control food prices (Singapore Department of Statistics, 2020). Singapore has also sourced for food supplies from overseas markets and invested in food production facilities abroad. Additionally, Singapore has focused on local production by supporting the development of alternative food sources, for example, lab-grown meat, cell-based protein products, and plant-based food products (Nielsen, 2021). Overall, the strategies adopted by Singapore can be reviewed, modified, and scalable to enhance food resilience in other countries with similar political, administrative, and socioeconomic conditions.

Using Japan’s agricultural business which heavily relied on imports and foreign labor as an example, Aoki, in her ► Chap. 161, “The Importance of Restructuring the Local Food System in the Context of Disaster Management: Lessons Learned from the Effect of COVID-19 on Agricultural Business in Japan,” illustrated how strong community engagement could help organizations go through crises. The outbreak and spread of COVID-19 caused disruption in food distribution and the shortage of foreign labor, limiting the supply of domestic food production (Committee for the Coordination of Statistical Activities (CCSA), 2020). On the other side, farmers who produced high value-adding products with a target on foreign tourists faced a

demand plunge due to lockdowns. The closure of schools also created business crises to farmers providing crops and milk for school lunch. To mitigate the impact of damages, people who lost jobs during the pandemic started helping with harvesting. Direct transactions were introduced to better connect consumers and farmers. Solidarity-based transaction and efforts of private social enterprises further relieved the food problem caused by the pandemic. Learning from these lessons, Aoki suggested to adopt the community-based disaster risk management (CBDRM) approach to engage various stakeholders (Van Niekerk et al., 2018). A continuous and trustful relationship among stakeholders is believed to be crucial to ensure stable food supply and food security, no matter in the disaster period or at the peacetime.

To strengthen organizational resilience and prepare for disasters, Seah and Ha, in ► Chap. 165, “[Behavioural Insights, Organizational Resilience, and Disaster Preparedness](#),” echo Linnemayr et al.’s (2016) supposition to implement behavioral insights (BI) in disaster preparedness and response, including the use of nudges and nudging, i.e., implementing activities/initiatives to alter people’s behavior to the expected directions but without significant changes in economic incentives (Marchiori et al., 2017; Thaler & Sunstein, 2008; Zimmermann & Renaud, 2021). The chapter elaborates that BI and nudging can be used in the three states of building organizational resilience, namely, anticipation (before the unexpected event), coping (during the unexpected event), and adaptation (after the unexpected event) (Duchek, 2020). However, the impact of BI and nudging may vary across businesses due to different factors. Therefore, future research should examine the impact of BI interventions for disaster preparedness on businesses with different size, capacities, resources, sector/industry, etc. Finally, although BI has potential to help businesses better prepare for disaster risk, BI is not a one-size-fit-all solution (e.g., Hummel & Maedche, 2019), i.e., BI should be used as an additional tool/mechanism, not a replacement of any disaster risk management frameworks, to provide a cost-effective push for businesses to prepare for and respond to disasters.

It is impossible not to discuss the role of other groups of stakeholders, for example, women and business leaders, in the fights against the pandemic. Thus, Johnson and Thomson try to address the question “Are women leaders more capable of managing disasters?” in their chapter titled “[Times of Crisis: Women and Leadership](#)” (Chap. 162). The authors provide evidence on the exemplars of business and political female leadership during the COVID-19 pandemic. They attribute the success of women leaders in times of crisis to their transformational style of leadership that is aligned with their traits (KPMG, 2019). Different from men leaders who tend to have the transactional leadership associated with their traits like assertiveness, self-confidence, and ambition, women leaders could guide their organizations through crises with empathy and integrity and inspire followers to work for the greater good even at the expense of their own interest (Windsor et al., 2020). Women leaders have been demonstrating their strong competency in managing crises despite the double-bind and glass cliff phenomena caused by the gender bias. Therefore, Johnson and Thomson argue that traditional gender discourse and social norms which doubt on women’s abilities to lead are outdated and women

should be given more opportunities for higher-level leadership in both normal and crisis periods.

The last chapter is titled “Leadership and Crisis Management for Businesses Globally: The Role of Leadership in Business Sustainability in a Crisis Environment” (Chap. 166) by Thomson, Roache, and Muschette. Extending the literature in leadership, Thomson et al. argue that the leadership style intensifies management functions in times of crisis. The functions of management at a time of crisis focus on the effective use of technical, human, and conceptual skills to turn challenges into opportunities and shield the organization from negative impact (Northouse, 2015). This calls for the adoption of an adaptable leadership style to manage changes and formulate strategies based on contingencies that can help organizations sustain and grow in crisis. Prior literature has studied democratic leadership, integrative leadership, transactional leadership, and transformational leadership. Common findings reveal that transformational leadership is the most suitable one during crisis because it focuses on changing, inspiring, and communicating transparently (Bojadjiev & Vaneva, 2021). However, some other studies (e.g., Agusta & Nurdin, 2021) also found evidence on effectiveness of the transactional leadership and multiple leadership styles. Grounding from these findings, Thomson et al. believe that situational leadership that adapts leadership approaches to different situations is most appropriate and effective in times of crisis.

The Way Forward

The COVID-19 pandemic is a wake-up call to many organizations, especially business entities. It acts as a “test” to measure business resilience, i.e., whether businesses have been well prepared for dynamic and significant changes in the external environment. Many businesses have realized that traditional approach to planning and preparing for disaster risk is not adequate to deal with a pandemic as highlighted by EY Global (2020). Actually, it is noted that pandemic preparedness has been inadequate across organizations and across countries (OECD, 2022). Thus, new approaches should be explored to help businesses be more resilient and agile to respond to risk caused by extreme pandemics.

Firstly, given the adverse impact of disasters on businesses, it is important that planning for business continuity and disaster risk management should be incorporated in their business strategies. The COVID-19 pandemic suggests that businesses should not only focus on financial risk but also on disaster risk. A clear disaster risk management framework is necessary for businesses to prepare for and mitigate to risk. Businesses should identify risk; analyze risk and resources available; formulate proper strategy for risk preparation, mitigation, and management; and implement such a strategy. Forbes Coaches Council (2022) discuss critical elements of an effective business continuity strategy, including an effective communication plan,

leadership development, an early succession plan, understanding of internal and external risk, and others. EY Global (2020) also recommends some priorities for planning and responding to future risk, e.g., new pandemics. Businesses should embrace a people-oriented approach to plan and execute business continuity plans because people are the assets to all businesses. No business plan or business strategy can be executed without the employees' contribution. Thus, human elements should be seriously considered during the whole process of disaster risk management. In addition, Asian Development Bank (ADB) and Organization for Economic Co-operation and Development (OECD) (2020) highlight that it is important to invest in technology and infrastructure to manage disaster risk because the economic and human loss due to disaster is huge.

Secondly, businesses should have an effective communication strategy and channels, including social media and other reliable platforms, to disseminate the information and reach relevant stakeholders timely during and after disasters (EY Global, 2020). Businesses should work closely with the public agencies and civil society organizations at all levels in order to receive information, guidance, and assistance as well as provide support to one another during disasters/crises (OECD, 2022). Effective communication during disasters would help stakeholders connect with one another and provide support to recipients. Effective communication would help public education with regard to risk preparation (Kharade et al., 2017).

Finally, cyber risk is not a new phenomenon, but it has been intensified during the pandemic that requires more effort from businesses. Many big companies have invested in technology and measures to ensure cyber safety for their internal and external customers and plan for business continuity and damage recovery (EY Global, 2020). Yet, recent incidents showed that big companies have also experienced such cyber risk that affected thousands of their customers. Apart from the current cyber risk, such as ransomware, spear phishing, etc., new threats have been growing fast. Cyber risk has become more severe during disasters like the COVID-19 pandemic (OECD, 2020a). For instance, a publication by Deloitte (Nabe, n.d.) reveals that about 47% of people encountered an online security incident (e.g., phishing scam) when they were working from home. In other words, the pandemic has presented opportunities to cyberattackers to increase their criminal activities via different forms (Nabe, n.d.). Therefore, public education on cyber risk and cybersecurity to stakeholders should help to improve their awareness of cyber risk, and technological solutions can also be adopted to nudge people to positive behaviors to prevent cybersecurity incidents as asserted by Guitard (2022).

Many businesses in various industries have adopted new practice to steer their organizations through the destruction and disruption during and after crises. For example, the ESG (environment, social, and governance) framework has drawn much attention from the public sector, business, researchers, academics, and practitioners given its relevancy to the volatile external environment and economy, the rapid development of technology, and the ongoing and emerging challenges for businesses. Businesses need to go beyond traditional ESG and CSR (corporate social

responsibility) activities to demonstrate their social responsibility that can also contribute to their business sustainability, especially in the digital age. Thus, a new form of CSR, digital responsibility (CDR), has emerged as a new CSR subtrend. Mellis (2022) defines CDR initiatives as activities that can help businesses protect stakeholders' privacy and security online, etc.

Overall, effective and efficient disaster management would require a comprehensive and integrated legal framework, meaningful and practical public policy, agile and authentic ESG/CSR approaches, effective communication, strong community engagement, appropriate leadership styles, and technology adoption.

Conclusion

SMEs account for the majority of businesses in many countries, and they have contributed a significant percentage to the GDP of the respective countries around the world (Lin et al., 2022). They have been seriously affected by the COVID-19 pandemic. For example, "between February 2020 and April 2021, 70–80% of SMEs across 32 countries lost between 30 and 50% of their revenue" (Lin et al., 2022, para. 1). This reinforces the significance of having a business continuity plan and disaster risk management framework.

Disaster risk management is a complicated, multifaceted, and challenging process, involving different groups of stakeholders in different sectors. Businesses in all sectors have faced multidimensional challenges when dealing with both natural and man-made disaster risk and reducing the impact of such risk to different groups of stakeholders. However, the current business continuity plans, models, and approaches to manage disaster risk by businesses may not be sufficient to withstand future risk. Thus, they should be reviewed, evaluated, and improved in a manner that can help businesses respond to the ongoing changing external and internal environments.

Since the adverse impact of disasters has transcended across industries and across countries and the traditional approaches to prepare for and respond to disaster by businesses have not been effective, innovative approaches to formulate and implement business continuity plans as well as manage disaster risk should be explored not only at the corporate level but also at the industry, national, regional, and international levels.

In general, this section is significant for its coverage of businesses' responses to the pandemic and new directions to respond to the current and future pandemics. The above chapters highlight the importance of searching for more holistic and comprehensive approaches to address the current and future challenges associated with disaster risk management.

Finally, one of the limitations of this section is the limited inclusion of sectors and topics related to business responses to disaster risk due to time and resource constraints. Thus, further research should include more relevant topics and more economic sectors.

Abstract

Indonesia is a country prone to natural disasters such as tectonic earthquakes and tsunamis. With several severe disasters occurring in Indonesia, it has been found that there are several crucial weaknesses in disaster management, including the unavailability of a comprehensive and integrated legal infrastructure. This chapter evaluates the implementation of Indonesia's disaster management law and the related rules and guidelines, including their impact on international disaster response participation. It focuses on the legal aspects of Indonesia's new disaster management system. It examines how the IDRL guidelines have been implemented into Indonesia's new disaster management system, with the legal framework for facilitating and regulating international help in disaster response and how it impacted the business environment. The focus of this chapter is the

development of a disaster management regime in Indonesia that is influenced by several disasters that happened in Indonesia.

Keywords

Indonesia · Disaster law · Business environment · Pandemic

Introduction

Indonesia is an archipelago between three faults underneath the country: the Indo-Australian, the Eurasian, and the Pacific. This geographic setting makes this country prone to natural disasters such as tectonic earthquakes and tsunamis (Ministry of Finance, 2018). It is also one of the most populous countries globally, with over 270 million people per December 2021 (Mursid, 2022). *Badan Nasional Penanggulangan Bencana* (BNPB), or the Indonesian National Disaster Management Agency, reported that almost 7000 villages/districts in Indonesia are in severe high-risk earthquakes. More than 35,000 others near the area are exposed to medium to a minimum earthquake with moderate risks (BNPB, 2016). This number, as of 2018, was stated by Indonesian Central Statistical Agency (BPS) cumulatively consisting of half the district/village registered in Indonesia (BPS, 2022).

Moreover, in Indonesia, natural disasters are not merely limited to just earthquakes. Geographically speaking, the tsunami is also considered one of the threats to this country's beach-side residents. As occurred in December 2004, the Aceh Tsunami was one of the most significant catastrophes in Indonesia. The counted casualty was estimated at over 130,000 people, with an economic loss of USD 5 billion (Danugroho et al., 2020).

Several crucial weaknesses in disaster management, especially the tsunami and earthquake in Indonesia, are the unavailability of a comprehensive and integrated special legal infrastructure. At the time of the disasters in 2004 and 2005, the existing legal infrastructure was sectoral, and some were oriented toward emergency response. The policy only focuses on government physical assistance. It should be noted that regional autonomy has brought about essential changes in the system of government. However, this transformation was not followed by governance adjustments. The delegation of authority from the central government to regional governments within the framework of regional autonomy does not coincide with the delegation of responsibilities, particularly in protection and public services (Siahaan, 2006). Local governments' response to disasters is often slow and depends on central government policies. Institutionally, the disaster management policy system is centralized. Therefore, the central government is dominant and provides instructional policies to local governments. At the same time, within the framework of regional autonomy, the local government's role is crucial when a disaster occurs. This framework is especially so in reducing the impact of disaster risk. The local

government where the disaster occurs is the most knowledgeable about the direct impact of a disaster (Putra & Matsuyuki, 2019).

After the earthquake and tsunami between 2004 and 2005, Indonesia's disaster management law was developed. Whether it is the line of order or the more integrated delegation of authority between the regional and the capital, this progress is proven by enacting Law No. 24 of 2007 on Disaster Management Regulation. The law indicated a shift in disaster management's general paradigm from responding to disasters to managing all stages of the disaster management spectrum, that is, before, during, and after. This enactment of the law established the BNPB, whose primary purpose is to minimize the damage inflicted by natural disasters on human casualty financial damage. In 2008, the government released three government regulations (*Peraturan Pemerintah*) on implementing the Disaster Management Law such as the Government Regulation No. 21 of 2008 on the implementation of disaster management, the Government Regulation No. 22 of 2008 on the administration of disaster management aids, and the Government Regulation No. 23 of 2008 on the participation of international institutions and foreign nongovernmental organizations. With those regulations mentioned above, Indonesia has finally opened to any participation from international institutions and NGOs. This participation means that Indonesia has taken a significant legislative reform to implement the International Disaster Response Law (IDRL) suggestion.

This chapter evaluates the implementation of Indonesia's disaster management law and the related rules and guidelines, following its introduction in 2007, with their impact on international disaster response participation. It focuses on the legal aspects of Indonesia's new disaster management system. It examines how the IDRL Guidelines have been implemented into Indonesia's new disaster management system, with the legal framework for facilitating and regulating international help in disaster response and how it impacted the business environment. The focus of this chapter is that the development of a disaster management regime in Indonesia is influenced by several disasters that happened in Indonesia. They are the Aceh Tsunami in 2004, the Padang earthquake in West Sumatera Province in 2009, the Mount Merapi eruption in Central Java Province in 2010, and the recent COVID-19 pandemic in 2020.

Development of Law Disaster Management in Indonesia Based on Natural Disaster That Occurred

Disaster management law in Indonesia has been developing since the mid-2000s. This development was caused by a few major natural disasters that shaped Indonesia's disaster management system. This chapter will describe the development of Disaster Management Law in Indonesia from the view of each disaster that happened.

Aceh Tsunami (2004)

The tsunami that hit the northern shore of Indonesia's Nanggroe Aceh Darussalam (Aceh) Province in late December 2004 killed over 130,000 people and destroyed vast infrastructure and property (Danugroho et al., 2020). In the aftermath of the tragedy, a vast local and international rescue and recovery effort exposed serious legal loopholes and institutional shortcomings in Indonesia's legislative framework for disaster response. This sad occurrence and the government's handling of the aftermath prompted the Indonesian government to reconsider its strategy to deal with the broad spectrum of disasters that strike the country's islands on a near-weekly basis.

When the tsunami hit, Indonesia lacked a unified national disaster management law and a statutorily formed national disaster management organization. The policy at the time was the Presidential Decision No. 28 of 1979 on the National Disaster Management Coordinating Board (BAKORNAS). This national institution regime was established during the Suharto and Habibie administrations. BAKORNAS was an inter-ministerial agency coordinating government agencies and international organizations' disaster response efforts. Its secretariat was composed of people seconded from other government offices, highlighting that it was only there for a short time (only during emergency response).

The then Indonesian president, Susilo Bambang Yudhoyono, declared a national disaster on the day of the tsunami in 2004. He put BAKORNAS in charge of organizing the response under a senior military officer (based in the Vice President's Office). BAKORNAS' regional counterparts, the joint task force (*Satuan Koordinasi Pelaksana – SATKORLAK*), handled the response at the provincial level. In contrast, its district counterpart, the task force (*Satuan Pelaksana – SATLAK*), provided relief at the district and subdistrict levels. Within a few weeks, more than 50 international organizations arrived in Aceh. By mid-January 2005, more than 200 international organizations were still working on the ground (Pan, 2005). The tsunami's damage and the outpouring of international aid overwhelmed Indonesian authorities, revealing substantial flaws in the legal regime and institutional architecture governing disaster management.

With the outpouring of international aid, Indonesia's government, especially the Aceh region, found new problems. The cargos were held up due to incomplete or incorrect paperwork or delayed approval without explanation. It is also noted that importation, registration, and insurance procedures were complicated and occasionally contradictory. Large and designated donations delayed the United Nations' efforts to coordinate international organizations. Because of the absence of coordination, competitive planning was encouraged rather than cooperative. Some international organizations, mainly those new to disaster relief, supplied expired pharmaceuticals, disregarded local culture and religion, and failed to consider the economic implications of their work on the local economy, among other things (Willits-King, 2009).

Like many other countries in the Southeast Asian region, Indonesia has focused primarily on disaster response to disaster management. However, following the

tsunami, the Indonesian government revised its approach. It recognized the need for a larger concept of disaster management, owing to the revelation of legal gaps and institutional shortcomings and the impact on the relief effort.

Underpinning this change in mindset are several critical new ideas and perceptions. First, catastrophe management must be viewed as a comprehensive type of risk management, focusing on prevention whenever possible. Second, the government is responsible for safeguarding, respecting, and fulfilling human rights in disaster zones. Third, society, not only the government, feels responsible for disaster management (Moroney & Rand Corporation. National Security Research Division, 2013).

This shift in thinking culminated in the passage of Law No. 24 of 2007 on Disaster Management (hereinafter Law 24/2007). This established legal framework provides a comprehensive collection of provisions delegating national and regional governmental responsibility. It specifies community rights and obligations, business and international institution roles, disaster management stages and needs, and disaster aid finance and management. According to Article 1, Law 24/2007, a disaster broadly includes natural, “non-natural,” and “social” calamities. This definition represents Indonesia’s scope for various natural disasters, the risk of non-natural disasters, and the potential for societal unrest. Furthermore, it defines “disaster management” as “a set of measures that includes policies on disaster risk development, disaster prevention, emergency response, and rehabilitation” (Art. 1, Law 24/2007).

This law was also supported by establishing a governmental body by President Susilo Bambang Yudhoyono called the National Disaster Management Agency (BNPB) in 2008. This body’s primary purpose and function are to formulate and stipulate disaster management policies and handling of refugees by acting quickly, appropriately, effectively, and efficiently. BNPB also coordinates the implementation of disaster management activities in a planned, integrated, and comprehensive manner. The BNPB, based on Article 12 Law 24/2007, also reports to the president every once a month in a nondisaster situation and at any time during the disaster to keep track of international and domestic financial donations.

The law is backed up by several regulations and guidelines covering all aspects of the disaster recovery process:

- Government Regulation No. 21 of 2008 on Disaster Management. It covers disaster management and related activities and international help supplied by governments, international institutions, and nongovernmental organizations from other countries.
- Government Regulation No. 23 of 2008 on the Participation of International Institutions and Foreign Non-governmental Organizations in Disaster Management. It describes the role of international actors in disaster management and response, particularly for international institutions and foreign NGOs.
- BNPB Guideline No. 22 of 2010 on The Role of International Organizations and Foreign Non-Governmental Organizations During Emergency Responses. It establishes a guideline that delves into further depth about international

supporting actors in disaster response, such as international organizations and foreign NGOs.

Padang Earthquake on West Sumatra (2009)

Two severe earthquakes happened off the coast of Padang, the central city in West Sumatera province, within 30 min of each other on September 30, 2009. Over 1000 people were killed and over 200,000 structures and residences were destroyed in the coastal area and further inland due to the earthquakes (Vaswani, 2015). Because the president was out of the country at the time of the tragedy, Vice President Jusuf Kalla called a meeting of seven ministries, including the BNPB, to review at least six assessment reports. Foreign Search and Rescue (SAR) teams were welcome, according to the BNPB, if needed. The president announced a state of emergency the next day during a cabinet meeting (Jennifer et al., 2013).

During this time, Indonesia already had a comprehensive and integrated legal framework for disaster management in Law No. 24/2007. By that, the focus of disaster management is currently more directed at community preparedness in the face of danger. It means disaster management not only in the emergency response but also in pre-disaster actions (mitigation). They can minimize the possibility of the victim and economic loss by disseminating and educating the public about earthquakes, building rules, and identifying disaster-prone regions (Yustiningrum, 2016).

As for the mitigation effort in Padang City itself, according to Copolla, mitigation operations are carried out in structural and nonstructural mitigation (Coppola, 2015). The following are the disaster mitigation activities carried out in the City of Padang. The following are structural disaster mitigation activities (Sugimin Pranoto, 2011):

1. The disaster mitigation spatial-based spatial plan was revised in Padang City Regulation No. 4 of 2012. The revised regional spatial planning (*Rencana Tata Ruang Wilayah – RTRW*) explained areas prone to disasters, resulting in the area becoming a red zone for the neighborhood in physical development.
2. Building and Housing Development Arrangements outlined in City Regulation No. 7. According to the legislation, the government created requirements for the public, private sector, and government in carrying out physical development in 2015. Hence, buildings are resilient and robust against natural catastrophes such as earthquakes.
3. Infrastructure is developed by constructing existing disaster evacuation routes and earthquakes. Even if they are not fully completed, the construction of this route is to provide the public's flexibility in evacuations when an earthquake strikes. It also guides the community to evacuation sites when natural disasters occur.
4. They provide maps and earthquake evacuation procedures to ensure that the community knows where to go and how to get there in the event of an occurring disaster.

The government of Padang carried out several nonstructural disaster mitigation activities. They are (Alhadi & Sasmita, 2014; Simandalahi, Ahsan, & Prasetyadjati, 2015).

1. Disaster preparedness. The program, which involves socialization and disaster simulation, is carried out in every village and school in Padang. The community responded positively to this activity. It has been shown multiple times that the community actively participates in disaster planning, particularly earthquakes. In addition, in this example, the Padang City Government created a disaster preparedness school program and a disaster preparedness community. This practice means the government has socialized directly with families and urban neighborhoods, mosques, *taklim* gatherings, and door-to-door dissemination.
2. The empowerment of the community through *Kelompok Siaga Bencana* (KSB), or Disaster Preparedness Group, disseminates and becomes the spearhead in disaster risk management among the people in a community or traditional gathering Padang. With this kind of group's development, the community should be able to overcome or minimize the risk of the disaster.

Disaster risk management plans in Padang have considerably impacted local governments' and communities' preparedness in disaster risk reduction measures. The government, the corporate sector, and the community supported the different actions to mitigate structural and nonstructural disasters. Furthermore, the willingness to undertake catastrophe mitigation measures in the Padang City Spatial Plan demonstrates a significant effort. This setting demonstrates that local governments are more responsible for the overall protection of the community. This shift represents regional government policy relating to pre-disaster conditions and disaster risk management activities.

Mount Merapi Eruption on Central Java (2010)

Mount Merapi, Indonesia's most active volcano, erupted on October 26, 2010. The eruption occurred near one of the country's centers of Javanese culture, Yogyakarta, which lasted several days, killing over 350 residents and causing many to flee (BBC, 2010). The government's initial response came from the district and provincial levels. The government of Sleman, Yogyakarta, declared a district-level emergency and the Central Java BPBD relocated its operational function to Magelang by establishing a provincial command post. The president declared a national emergency on November 5, 2010, and decided that the BNPB would manage disaster management. BNPB was supported by the Yogyakarta Governor, Central Java Governor, Central Java, and Yogyakarta Military Commander, Central Java, and Police Chief of Yogyakarta. The central government would be represented by the Coordinating Ministry of Public Welfare (International Federation of Red Cross and Red Crescent Societies & Palang Merah Indonesia, 2014).

On this occasion, the effectiveness of Law 24/2007 is shown in the line of order or the more integrated delegation of authority between the regional and the capital. For example, BNPB (regional branch) collaborates with the National Army, the National Police, BASARNAS (Indonesian Search and Rescue), and PMI (Indonesian Red Cross) in the search and rescue of catastrophe victims (BNPB, 2012). The BNPB collaborates with the Ministry of Social Affairs to manage displaced persons. The BNPB collaborates with the BIG (National Bureau of Spatial Information), departments, and agencies to map high-risk locations. The BNPB collaborates with the Ministry of Energy and Mineral Resources and the BMKG (Meteorological, Climatology, and Geophysics Agency) for geological risks, LAPAN (National Space Agency) for hydro-meteorological dangers, based on research from the Ministry of Research and Technology, LIPI (Institute of Science), and universities around Indonesia. The BNPB collaborates with the Ministry of National Education, the Ministry of Religious Affairs, and the Ministry of Communication and Media on disaster risk reduction education. Distributing donations is based on the Head of BNPB Regulation No. 7 of 2008 on Mechanisms to fulfill Basic Needs. Donor aid is distributed to the Internally Displaced Persons (IDP) camps under the supervision of the BNPB and the BPBD (International Federation of Red Cross and Red Crescent Societies & Palang Merah Indonesia, 2014).

COVID-19 Pandemic and Impact on the Business Environment

The first case of COVID-19 in Indonesia was reported on March 2, 2020. As of February 2022, the Government of Indonesia has reported 5,564,448 confirmed cases of COVID-19, including 148,335 deaths across all 34 provinces (AHK Indonesien, 2022). When the virus first attacked, the Indonesian government had never regulated the spread of viruses or pandemics before this new pandemic. As a result, the Indonesian government moved fast to pass numerous new legislation that could prevent the spread of the COVID-19 virus.

The COVID-19 pandemic spread worldwide requires humans to issue new policies and generate new economic conditions. In Indonesia, Presidential Decision No. 12 of 2020 on the Determination of Non-Natural Disasters Spreading Corona Virus Disease 2019 (COVID-19) as National Disasters not only affects the health and activities of the people but also has an impact on the business climate in Indonesia. The economy in Indonesia in 2020 has been affected by the COVID-19 pandemic. Some businesses have even been paralyzed due to unpredictable state regulations and policy changes. Not only that, but the country also even entered the brink of recession in the final quarter of 2020. A *recession* is a time condition that prevails in the economy's long term, and economic growth experiences a negative value for two consecutive quarters (Widiarsih, 2020).

Indonesia's economic activity slowdown focuses on tourism, trade, and investment. The slowdown of Indonesia's tourism can be seen in the decline in the number of tourist arrivals to Indonesia, which previously stood at 16.1 million visitors in 2019, which decreased by 7.62% in January 2020 (Christian & Hidayat, 2020). In

addition, the decline in Indonesia's exports to the world can also be seen as one example of the economic slowdown. Various state policies in tackling the COVID-19 pandemic have caused a slowdown in economic activity. An example is the enactment of Large-Scale Social Restrictions (PSBB) through Government Regulation No. 21 of 2020 on Large-Scale Social Restrictions, which forcefully restricts people's movements and requires people to stay at home (Disantara, 2020).

In the emergence of various policies that cause a recession, it is the responsibility of the government to issue various policies so that the country's economy returns to be stable or even better than before. Some scholars noted that the government should allocate, distribute, and stabilize functions to ensure its best-positioning economy (Musgrave & Musgrave, 1984). To ensure its allocation function is carried out, the government must allocate economic resources efficiently to meet the community's needs. Furthermore, the government must conduct the distribution function by imposing taxes, social security, and public services to balance income distribution. Above all, the stabilization function requires the government to create economic stability. It was also argued that these three functions must be carried out as government intervention in running the country's economy.

Joko Widodo, the president of the Republic of Indonesia, announced various related regulations in mid-2020 about COVID-19's early steps and response activities. The following are some of the initial policies of the Indonesian government:

1. Presidential Decision No. 7 of 2020 established the Task Force for the Acceleration of COVID-19 Handling, entrusted with preventing COVID-19's serious spread. The Task Force's responsibilities include carrying out operational strategies for the faster handling of COVID-19 and coordinating and controlling the implementation of COVID-19-related actions. Then, supervise the implementation of the Coronavirus handling acceleration plan and mobilize resources for the acceleration plan's implementation. The president must be informed of the Task Force's implementation of the COVID-19 handling acceleration.
2. Government Regulation No. 21 of 2020 on Large-Scale Social Restrictions in the Context of Accelerating COVID-19 Handling was enacted on a regional spectrum. Through this legal means, the president issued the regulation governing the issuing of Large-Scale Social Restrictions (*Pembatasan Sosial Berskala Besar* [PSBB]) to break the chain of the Coronavirus spreading. This policy is more appropriate for Indonesia than regional quarantine or lockdown. Local governments may use PSBB with the agreement of the Minister of Health, according to this regulation signed on March 31, 2020. The purpose of social limitations is to control the flow of people and goods into a province, district, or city. Based on Article 3 of this Regulation, PSBB must meet several requirements. Namely, the number of cases or deaths due to the disease has increased significantly. There is an epidemiological link with similar events in other regions or countries. PSBB at least includes school and work holidays, restrictions on religious activities, and restrictions on activities in public places or facilities, as stated in Article 4 paragraph (1). The rules regarding PSBB are then explained in more detail through the Minister of Health Regulation No. 9 of 2020 on PSBB Guidelines.

3. Presidential Decision No. 12 of 2020 on the Determination of Non-Natural Disasters Spreading COVID-19 determined the outbreak of COVID-19 as a National Disaster. This presidential decree is the latest regulation signed by the president regarding the first half of the COVID-19 outbreak. The president officially declared the coronavirus outbreak a national disaster. The regulation explains that the Task Force will carry out national disaster management for the Acceleration of Handling COVID-19. Then, the Presidential Decree also contains the regional head becoming the Chair of the Task Force for the Acceleration of Handling COVID-19 in the regions. Determining regional policies must also consider the central government's policies, as stated in the Presidential Regulation 12/2020.

Regarding the impact on the national economy and business, the government also issued policies related to procuring government goods and services: The Presidential Instruction No. 4 of 2020 on Refocusing of Activities, Budget Reallocation, and Procurement of Goods and Services in the Context of Accelerating Handling of Coronavirus Disease 2019 (Covid-19). This Presidential Instruction instructs to refocus activities using the budget so that procurement of goods during the pandemic can handle the handling of the COVID-19 pandemic. The president also directed the Minister of Finance to make budget changes more effortless. The Minister of Home Affairs to work with regional heads to expedite the use of the Regional Revenues and Expenditures Budget to deal with the COVID-19 outbreak.

Then regarding the procurement of goods and services, the Government Goods/Services Procurement Policy Institute (LKPP) through the Circular Letter of the Head of LKPP Number 3 of 2020 concerning the Explanation of the Implementation of the Procurement of Goods/Services in the Context of Handling Coronavirus Disease 2019 (COVID-19) further explains the mechanism of government procurement of goods/services in the context of handling the COVID-19 emergency.

During the COVID-19 outbreak, the government issued other policies, such as stopping the process of procuring goods and services for the 2020 Special Allocation Fund (DAK) through the Letter of the Minister of Finance No. S-247/MK.07/2020 of 2020 and the Circular of the Minister of Home Affairs Republic of Indonesia Number 440/2622/SJ of 2020 concerning the Establishment of a Regional Task Force for the Acceleration of Handling Coronavirus Disease 2019 (COVID-19). The two policies terminate all procurement of goods/services of types/fields/subsectors of the Physical Special Allocation Fund (DAK), except for the health and education sectors. Based on this letter, the government can stop all activities related to procuring goods/services of types/fields/subsectors of the Physical Special Allocation Fund (DAK) except for the health and education sectors. The government does the policies to focus more on recovering from the pandemic by procuring goods and services focused on health and education.

With the return of increasing economic activity in Indonesia, the economic situation in Indonesia toward the end of 2021 has moved toward a positive and raises a better prospect. One of the moving economic activities is the passage of domestic consumption. Domestic consumption is closely related to people's ability

to become consumers in production activity. In September 2021, the Indonesian Manufacturing PMI Index and the increasing Consumer Confidence Index returned to an expansionary level (Coordinating Ministry for Economic Affairs, 2021). To ensure that domestic consumption continues, the government has allocated a budget of Rp. 172.1 trillion to increase people's purchasing power. The budget is allocated concretely to Direct Cash Assistance, Pre-Employment Cards, electricity exemptions, and various other things (Sasongko, 2020).

It appears that the Indonesian government's COVID-19 policies are to maintain the safety of the people from a health perspective and an economic perspective. At the beginning of the policy's implementation, there was pessimism from the community and entrepreneurs. With the reopening of borders and tourism, the business climate in Indonesia has received a bright spot after a period of dimness. As time goes by, adaptations from all sides of the country's economy gradually return to life after being suspended in animation for the past few years.

Development of Law Disaster Management in Indonesia Based on the International Disaster Response Law (IDRL)

This section compares Indonesia's legislative framework for emergency response and international engagement to the IDRL Guidelines. It references other relevant international legislation applicable in this context and from which the IDRL Guidelines' provisions were based. Several vital stakeholders mentioned the importance of the IDRL Guidelines in shaping Indonesia's legal framework for disaster response since the enactment of Law 24/2007, particularly in drafting Government Regulation No. 23/2008 and BNPB Guideline No. 22/2010. The IDRL Guidelines cover both disaster relief and initial recovery support. "Disaster relief" is defined as "goods and services provided to meet the immediate needs of disaster-affected communities" (IDRL Guidelines, para. 2).

In contrast, "initial recovery assistance" is defined as "goods and services intended to restore or improve the pre-disaster living conditions of disaster-affected communities, including initiatives to increase resilience and reduce risk, provided for an initial period, as determined by the affected State, after the immediate needs of disaster-affected communities" (UN General Assembly, 1991). The IDRL Guidelines contain five main parts: "core responsibilities; early warning and preparedness; initiation and termination of international disaster relief and initial recovery assistance; eligibility for legal facilities and legal facilities for entry and operations" (IFRC and PMI, 2014, 26). The sections of the framework dealing with disaster response and the facilitation of international assistance will be given special attention in the case studies. They are a foundation for evaluating the law's execution, impact, and associated regulations and guidelines. The IDRL Guidelines are broader than Indonesia's legal framework for emergency response and are recommended for extending the provision of some legal facilities to the stage of recovery assistance. This is because Indonesian Law only focuses on the emergency response period. It has been noted that international aid agencies faced many problems during the initial

recovery period. This is because Indonesian Law ensures that these international institutions continue to receive and/or begin to receive easy access by extending the emergency response phase (IFRC and PMI, 2014).

The IDRL Guidelines recognize that disaster response is primarily the duty of the impacted state. However, suppose the state decides that the disaster's impacts surpass the country's ability to respond effectively. In that case, it should seek regional or international aid. Furthermore, the IDRL Guidelines recognize that, in accordance with international law, the state has the sovereign power to coordinate, regulate, and monitor disaster relief and first recovery aid delivered on its territory (Red, 2003). International responders should follow appropriate national and international laws, coordinate with the government, and protect the dignity of those affected, according to the IDRL Guidelines. They also encourage states to provide disaster relief and initial recovery assistance in a nondiscriminatory, nonpolitical, non-proselytizing, noncommercial, and independent manner, according to the principles of humanity, neutrality, and impartiality nondiscriminatory, nonpolitical, non-proselytizing, noncommercial, and independent manner.

In addition, assistance should strive to fulfill minimal quality and accountability requirements such as addressing vulnerable groups' unique needs, facilitating coordination among actors, respecting local culture and customs, strengthening resilience, and being handled openly and transparently. On account of this, Indonesia's existing legal structure clarifies that disaster management is the responsibility of the national and regional governments, depending on the scale of the disaster. It establishes unique procedures for foreign institutions to participate in catastrophe management, including emergency response. BNPB is to offer approval to foreign institutions to engage in emergency response situations based on necessity (IFRC and PMI, 2014, 27). It is assessed by a timely and adequate study and disaster emergency status judgment. The national or regional government coordinates disaster management (depending on the severity of the disaster, as indicated above). The emergency response "command post" coordinates, controls, monitors, and assesses the numerous operations.

The government's purpose is reflected in the principles and objectives of Law 24/2007, which state that disaster management must correspond to the applicable concepts and standards outlined in the IDRL Guidelines. Appropriateness, coordination, transparency, nondiscrimination, and non-proselytism are some principles, while respect for local culture is one of the objectives (IFRC and PMI, 2014, 27). Furthermore, Chap. V of the Law establishes "community rights," including the right to participate in disaster management decision-making. Disaster management during an emergency response is required by law to include the provision of necessities and protection for vulnerable groups. International organizations can collaborate with governments to meet these fundamental needs for catastrophe victims under Government Regulation No. 21/2008. This is supported by BNPB Guideline No. 22/2010, which allows international institutions to participate in a broader range of emergency response activities, such as rapid assessment, rescue and

evacuation, essential needs provision, protecting vulnerable groups, and immediate rehabilitation of vital facilities and infrastructure (IFRC and PMI, 2014, 28).

International institutions can give disaster relief during an emergency response, according to Government Regulation No. 23/2008, providing they submit a list of persons, relief products, and other items for approval by the BNPB. In addition to the basic principles and other standards in the IDRL Guidelines, the list required by Government Regulations can ensure that the type of assistance provided is sufficiently responsive and in accordance with the real needs of the disaster-affected population. The law bars international organizations from intervening in politics or security issues. They must examine and respect diverse social, cultural, and religious perspectives. In addition, BNPB Guideline No. 22/2010 requires aid providers to adhere to and follow 17 principles, including respect for sovereignty, ensuring a good impact, providing qualified support, and aiding based on need (IFRC and PMI, 2014, 28).

While the legal framework considers the core responsibilities outlined in the IDRL Guidelines, it lacks a precise enforcement mechanism or ensures that such principles have complied with. This is aside from the procedures for approving international actors' participation in disaster management or emergency response. International institutions should include communities in the distribution process when giving international aid in relief products. Experts must meet the technical ministry's requirements when providing it in the form of experts. While the IDRL Guidelines are referenced, the framework does not link adherence to humanitarian values to legal facility eligibility, a method for sanctioning participation in emergency response.

Overall, it is evident that Indonesia's legislative system is heavily influenced by the IDRL Guidelines and has made significant progress so far. Many of the legal features found in the IDRL Guidelines are available inside the legal framework. There are notable distinctions, such as not speeding the quality and compatibility inspection process for all commodities, not lowering the rules for recognizing certifications, and not addressing particular goods and equipment such as automobiles and ICT. Likewise, Indonesia's legal framework is significantly more rigid in drug expiration (2 years rather than 1 year) and food sell-by dates (minimum of 6 months). Furthermore, it does not adequately address the granting of temporary domestic legal status nor provides for tax exemptions in other ways.

Finally, it excludes government support for lowering or covering critical expenditures such as transportation and storage. These services may be still delivered in practice. However, if not, it is worth looking into whether the legal framework may be changed to include them. Review and improvement in the legal framework, particularly in ensuring adequate coverage of the law into the recovery period and integrating initial and mitigation procedures into the law. This can certainly improve important aspects of the legal framework. In addition, another benefit is to ensure coverage of "easy access" facilities for all legal facilities as outlined in the IDRL Guidelines. In addition, the eligibility of foreign actors is conditioned to comply with important humanitarian principles and norms.

Impact of Disaster Management-Related Law, Policies, and Regulations on Business

This section will focus on how the COVID-19 pandemic has affected Indonesia's national economy. In addition to recent events, the impact felt by this national disaster was felt without exception in various regions in Indonesia. Subsequently, how the government issues various policies and legal products to minimize the negative economic impact and adapt and recover Indonesia's macro- and micro-economy will be observed.

Economic Impact of COVID-19 Disaster in Indonesia

The impact of the arrival of the COVID-19 pandemic was that almost 2 million people had lost their jobs in Indonesia (Mas'udi & Winanti, 2020). According to the Government of Indonesia, in 2020, a total of 1,943,916 workers lost their jobs from a total of 114,340 companies. These workers were mostly coming from the formal sector of 77% and the rest were coming from the informal sector of 23% (Ministry of Manpower, 2020).

In addition, economic activity has significantly decreased in line with the Large-Scale Restriction Policy (PSBB) as stated in Government Regulation No. 21 of 2020. This legal policy ensures a reduction in community mobility where everyone stays home unless necessary (Mas'udi & Winanti, 2020). With the PSBB, almost all everyday activities were forced to stop, both in the industrial and office sectors. The education sector, public services, all places of worship, shopping centers, restaurants, and tourism were also forced to stop their normal operations (Misno et al., 2020). This social or physical distancing influences the decline in overall economic activity (Iskandar et al., 2020).

As a result of conditions that reduce economic activities, people's purchasing power is also decreased. This will impact the circulation of money, and at the same time, the production of goods will be limited and cause a trade deficit (Kurniawansyah et al, 2020). The enactment of this PSBB policy in a relatively long period causes economic losses. The supply chain will also be affected, disrupting the production of goods and services (Misno, 2020). The people most vulnerable to the economic impact of this pandemic are people with daily income (Iskandar et al., 2020).

One sector severely affected was the tourism sector, namely, hotels, restaurants, and retail entrepreneurs. Hotels experienced a 40% reduction in occupancy. Tourists as consumers in this sector are having a significant impact on restaurants. Areas affected by the retail sector include Jakarta, Manado, Bali, Riau Islands, Bangka Belitung, and Medan (Hanoatubun, 2020).

In general, Indonesia's economic growth has been heavily impacted by the COVID-19 pandemic, as shown in Figure 1. Indonesia's GDP growth from 2010 to 2019 was stable at 5%. However, in 2019–2020, GDP growth fell to -2.5%. Along with improving conditions in general, in 2021, growth could rise to 3.69%.

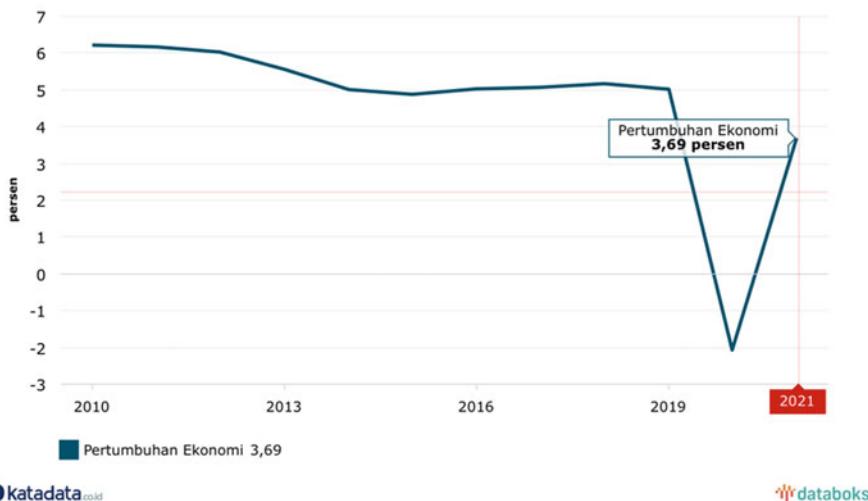

Fig. 1 Percentage of GDP growth in Indonesia. (Kusnandar, 2022)

Indonesian Government COVID-19 Policy Impact on Business

The government has three central policies for handling COVID-19. First, focus on the health sector against corona. The second is a social safety net to help the community. Lastly, economic survival for Indonesia's economic foundation (Mutiara, 2020). As previously mentioned, the COVID-19 pandemic has forced the Indonesian government to issue policy regulations related to its handling. The regulations/policies include four Presidential Decrees, two Presidential Regulations, one Government Regulation, one Presidential Instruction, and one Government Regulation in Lieu of Law. These regulations are an effort to solve problems in the Indonesian state's health, bureaucracy, and political and financial aspects resulting from the COVID-19 pandemic (Widianingrum & Mas'uid, 2020).

These nine regulations are the basis for policies on allocating, distributing, and stabilizing state conditions. The Indonesian government is focusing its policies on allocating appropriate resources to community groups affected by COVID-19, such as business actors who need mass gatherings, unemployed, farmers, daily-wage workers, and the poor (Eddyono et al., 2020).

In addition, the government adopted a policy of interest rates and discounted flight ticket prices due to the continuous movement of the exchange rate and contracting oil prices. This is done so that people are interested in making tourist visits. Amid this pandemic panic, the stock exchange authorities were forced to stop short-selling transactions, which were useful to reduce the pressure experienced and high volatility in the Indonesian stock market (Burhanuddin & Abdi, 2020).

Because of work-from-home and PSBB policies, the government provides tax facilities to relax individual income tax payments and annual tax reporting (Puspasari, 2020). In maintaining its commitment to domestic industry, the

Government of Indonesia issued Minister of Finance Regulation Number 30 of 2020 (PMK-30/2020). This regulation provides relaxation of excise payments due to logistical delays caused by circumstances related to COVID-19. In addition, fiscal and procedural incentives are provided in the field of customs and excise for goods needed to reduce the impact of the COVID-19 pandemic. These facilities consist of a temporary ban on the export of Medical Devices, relaxation of Free Alongside Ship Imports (FAS), exemption from excise duty for the procurement of alcohol-containing products needed for handling COVID-19, ease of import permits on Medical Devices, adjustment of import duties for export companies (KITE), efficiency of online services in handling COVID-19, adjustment of convenience for excise duty and cigarette production, accelerating logistics with National Logistics Ecosystems (NLE), and providing easy sales from KB/KITE companies (Puspasari, 2020).

Conclusion

Indonesia is a country that is geographically prone to natural disasters. With a large and dense population, the impacts and losses caused by casualties and economic losses can be enormous if a natural disaster occurs. To avoid this sizable loss, it is necessary to have a law and regulation regulating natural disaster management. Since the beginning of independence, Indonesia has had an organizational body tasked with helping the community when natural disasters occur, namely, BAKORNAS. However, the Indonesian government's mindset in dealing with natural disasters was initially only dealing with disasters after they occurred. The coordination chain in dealing with disasters by the government is still centralized. All disaster management, aid distribution, and other related matters mostly come from the central government. When a disaster occurs, the local government seems to give a response that tends to be slow. In addition, local governments also seem to depend on direct policies from the central government. Consequently, institutionally, disaster management seems to be designed based on a centralized government paradigm. Thus, the central government plays a significant role and has an instructional link with the regions.

The disaster management law in Indonesia developed only after the earthquake and tsunami in the 2000s. Whether it is the line of order or the more integrated delegation of authority between the regional and the capital, this progress is proven by Law 24/2007. All of this shows a paradigm shift in disaster management. This shift can be seen in managing all stages of the disaster management spectrum, namely, before, during, and after. This enactment of the law also established *Badan Nasional Penanggulangan Bencana* (BNPB), or National Disaster Management Authority, whose primary purpose is to minimize the damage inflicted by natural disasters on human casualty financial damage. Furthermore, by the final regulation mentioned above, Indonesia has finally opened to any participation from international institutions and NGOs. This only meant that Indonesia is also one of the nations globally that have taken a significant legislative reform to implement the International Disaster Response Law (IDRL) suggestion.

Abstract

Many studies have discussed the operations and development of co-operatives (co-ops). Nevertheless, their indispensability as an alternate business model during the COVID-19 pandemic has initiated further research on this topic as co-operatives in a digital economy have not been widely researched. Thus, this chapter aims to (i) discuss the benefits and challenges of digital platforms for co-operatives (co-ops) in the context of the COVID-19 pandemic and (ii) revisit Scholz's principles of platform co-operativism. It also assesses how platform co-operativism has been adopted using Singapore National Co-operative Federation's platform as a case study. The selected case is analyzed and assessed based on Scholz's principles of platform co-operativism, namely, broad-based ownership, democratic governance, co-design of the platform, and commitment to open-source development. Based on the findings and Scholz's principles, the following solutions are proposed, namely, development of multi-stakeholder partnership, building collaborative governance, and acknowledgment and encouraging the emerging roles of co-operatives and harnessing technology to support a transparent and accountable digital economy. Co-ops should focus on bridging the gaps between adopting new technologies and reducing the digital divide among members, especially during pandemics. In short, the findings provide insights into relevant stakeholders and will be useful for further research on this area to support the advancement of platform co-operative models given its importance in the digital economy, especially in turbulent times.

Keywords

Co-operative · Co-operativism · Platform co-operative models · Digital platform · Singapore · COVID-19 pandemic

Introduction

Background

Digital platforms have opened greater access to the economy. Digital platforms refer to businesses that use websites, mobile apps, or protocols to sell goods or service. It is a business model that creates value by facilitating connections and exchanges between multiple parties, such as product/service providers and users. The opportunities presented by such digital platforms have sparked business interest in them as they digitally enable business activities and social interaction (Kenney & Zysman, 2016; Bretos & Marcuello, 2017), and thus enable businesses to sustain their operations, especially during the COVID-19 pandemic. This digitally based new economy has been given a variety of "names" derived from its perceived attributes, such as "collaborative economy," "sharing economy," and "platform economy" (Kenney & Zysman, 2016). Organizations can adopt digital technologies to create value, transform their business, produce new products and services, etc. (Toh, 2021; Treutiger et al., 2017).

The Singapore government has provided an enabling environment for organizations to embark on the digital transformation journey by implementing many IT, ICT, and infotech national strategy plans. Such national infotech master plans have not only aimed to leverage ICT, technology, and digital as an enabler of national economic competitive advantage and sociocultural advancement, but they also strive for developing a “globally competitive infotech industry and a knowledge-based economy” (Toh, 2021, p. 6). This has contributed to facilitate the development of digital platforms in the country. Another national program, the Smart Nation initiative, was launched in 2014 to adopt digitalization for promoting better living, strengthening communities, and providing more opportunities to all. To support business, the government also launched the *Services & Digital Economy Technology Roadmap* that aims to energize the service sector with Service 4.0 (Toh, 2021). Platform co-operatives in Singapore do benefit from such strategies that will be further discussed in the subsequent section.

Although this economic paradigm has emerged as one of the alternative business models to help organizations sustain their business, it does result in some challenges to the society. According to Lovelock (2018), there is conflict between traditional business models and these emerging platforms because some of them may not comply with the same rules as other nondigital businesses in the same sector. This can be evident in prominent examples in the transportation sector, such as Uber and Grab whose operations cause anger and frustration to taxi drivers in many countries. Another pressing issue derived from these digital platforms is that they indirectly adopt technology to enter and monopolize the market, often called “platform monopolies” or “platform capitalism” (Smicek, 2016). For this reason, Scholz (2018) and Schneider (2018) began to debate the negative aspects of digital platforms and proposed how platform co-operative models can function in a more equitable manner by instilling the principles of a fair co-operative model.

However, ridding on the digital waves to create online platforms for collaborators to address the needs of society is still a relatively new concept in many countries. Furthermore, co-ops, businesses owned and run by their members that underpinned the principles of co-operative virtues of self and mutual help, democratic governance, and solidarity (Ministry of Culture, Community and the Young (Singapore), 2020a, b), in the context of a digital economy have not been widely researched. Thus, we are particularly interested in examining the concept of platform co-operativism and how it can be adopted to respond to the pandemics.

Specifically, this chapter aims to (i) discuss the benefits of and challenges of digital platforms to co-op and (ii) revisit the principles of platform co-operativism by Scholz (2018). It also assesses how platform co-operativism has been adopted and its significance during the COVID-19 pandemic using Singapore National Co-operative Federation’s platform as a case study. Finally, it proposes some policy recommendations to develop the potential of platform co-operativism and mitigate the risk associated with digital platforms.

Overall, the findings of this study provide insights to relevant stakeholders, including policymakers, businesses, and investors, and will be used for further research on this area to support the advancement of platform co-operativism given its importance in the digital economy.

Platform Co-Operatives

Types and Forms of Platform Co-Operatives

Co-ops are value-based organizations, based on the virtues of self and mutual help. Co-ops-owned and – operated digital platforms are referred to as platform co-ops. Platform co-ops refer to a movement that aims to co-operate digital platform that builds on the principle of co-operative model to regain control and address the governance issue of these digital platforms by changing the ownership structures of the corporate-owned sharing economy into a co-operative model, democratically operated by its employees, customers, users, or other key stakeholders (Scholz, 2016; Schneider, 2018).

Platform co-ops follow the co-operative ownership and governance to distribute ownership and share management of the enterprise to its participants with a mission to improve the common good, job security, and benefits (Cheney et al., 2014; Ministry of Culture, Community and the Young (Singapore), 2020a, b; Rixon & Duguid, 2018; SNCF, 2020).

There are various types and forms of platform co-operatives, and they are generally characterized based on the types of membership and unique features as summarized in Table 1.

Benefits of Digital Platforms for Co-Ops

No doubt the adoption of digital platforms has provided both economic and social benefits to businesses and individuals, especially during the COVID-19 pandemic given the strict measures to control the spread of the COVID-19 virus (Spear, 2000; Schmidt, 2016). From members' perspectives, such platforms provide on-demand services and job opportunities, e.g., Uber, Grab, and Gojek in the transportation sector. In the retail sector, sellers and buyers transact through the online marketplaces (e.g., Carousell and eBay). These digital platforms have enabled provision of affordable goods and efficient services, interaction and access to resources not otherwise accessible (e.g., Obike and AirBnB). Such platforms have also offered flexibility, temporary employment, and opportunities for income earning. JPMorgan Chase Institute (2018) explained that a key value proposition of the digital platform, in most cases, is that users can enter and leave the business freely, which means that there is no lock-in period per se. According to OECD (2021), due to the implementation of social distancing measures during the COVID-19 pandemic, many social and economic activities in many countries have shifted toward digital or online platforms. Many economic activities do not require physical proximity for commercial transactions, operations, and product delivery, e.g., online payment and online shopping, have been moved online. Thus, the use of digital or online platform has increased by about 20% and this has enabled "businesses and households to continue producing and working during lockdowns" (OECD, 2021, p. 3). This also applies to co-ops.

Table 1 The various types of platform co-ops

Type	Characteristics	Example	Source
Co-operative online labor brokerages and marketplaces	Belong to workers, freelancers, or online shop owners	In Germany: Fairmondo is a global marketplace owned by its users	(Zygmuntowski, 2018, p. 15)
Producer-owned platform co-operative	Geographically dispersed producers who collectively sell their produce through a digital platform. The producers are member-owners that drive the governance of the co-op but often do not work together	In the United States: Stocksy, a stock photography website, allows producers to co-own the platform to which they sell their work	(Borkin, 2019, p. 19)
City-owned platforms	Based on municipal providers who pool resources, such as rental spaces or shared transportation	In Korea: Sharing City is a city-operated taxi hailing system	(Zygmuntowski, 2018, p. 15)
Union-backed co-operative platforms	Based on the organizing power, resources, and know-how of occupational unions	In the United States: The Union Taxi Co-operative operates its own platform	(Zygmuntowski, 2018, p. 15; Arthur, 2015)
The institution as peer to peer protocol	Based on infrastructure advocating blockchain architectures rather than centralized ownership	In Singapore: KPMG Digital Village is an online platform that provides corporates with a platform to co-innovate with other corporates, start-ups, investors, etc., in a collaborative ecosystem to drive the adoption and integration of innovative solutions	(Arthur, 2015)

Crome and O'Connor (2016) highlighted that the intrinsic characteristics of the platform co-ops would help users in different sectors create competitive advantages in the digital economy. First, such co-ops enable creators (e.g., musicians, journalists, and photographers) to have more control over how revenues are generated and distributed. Thus, it could be a more sustainable business model given a lower degree of dependence on investors. Second, platform co-ops can provide a “commitment” mechanism to ensure various stakeholders have an equal stake in decision-making. Third, platform co-ops can be seen as a social movement by playing the role of the trade union outside of traditional trade union structures to ensure members’ welfare and equity are embedded in digital platforms. Platform co-ops usually achieve more effective collective governance as compared to traditional co-ops.

because technology (i.e., blockchain) has enabled members' contributions and interactions to be recorded/logged digitally and automatically (Borkin, 2019).

Other benefits of platform co-ops include their ability to respond to market demand through the six initiatives: "1) lower transaction and retention costs, 2) surplus revenues of co-ops are transferred to the members, 3) money flows within local communities, 4) protection from exploitation through ownership, transparency, control, 5) higher commitment of users disincentivizes short-termism and 6) prospect of data democracy" (The Platform Cooperativism Consortium, 2018).

Challenges of Digital Platforms for Co-Ops

Borkin (2019) and Graham and Anwar (2018) identified the challenges faced by the platform co-ops. Some of the most commonly discussed challenges include the difficulties in raising capital, leveraging on technology and getting the right people with the right skills to run the business, getting attention from the market, and finally the impact of network effects (see Table 2).

Algorithm, a set of instructions or decisions used by the digital platforms, is another concern. Algorithms could manipulate the operations in ways that may discriminate against some users, such as the gig workers, who rely on the digital platform infrastructure and customer network to earn a living (Yaraghi & Ravi, 2017; Yeganeh, 2019). Workers who rely on the digital platform infrastructure and customer network to work can be defined as the gig workers (Yeganeh, 2019).

Gig workers typically have less bargaining power than those in the traditional labor markets. They are not protected in terms of the minimum wage requirements, overtime pay, access to sick leave, insurance coverages, and other benefits (Yeganeh,

Table 2 Challenges faced by platform co-ops

Areas	Challenges
<i>Governance</i>	Organizational problems may arise due to (i) a lack of "geographically rooted community" since members can reside in different locations, and (ii) the divergent stakeholders' interests as different groups of stakeholders may have different interests
<i>Technology</i>	Lack of resources (e.g., physical, financial, and social capital) hinders owners' ability and capacity to develop current and new platforms and provide supporting infrastructure that are at the same standards as commercial platforms. Thus, they may not be able to meet their customers' demand and expectation pertaining to user experience
<i>Growth</i>	Platform co-ops may not adopt a "pure profit-driven business model," and thus their growth patterns and speed will not be the same as those of commercial entities
<i>Capital</i>	They may not be able to accept capital and other resources funded by venture capitalists and other financial institutions

Source: Adapted from Borkin (2019, p. 25)

2019). Sadly, gig workers are being described by Graham and Anwar (2018) as a commodity that are bought and sold in the market. This is because the work performed by the gig workers is often on-demand, thus gig workers can easily be replaced (Graham & Anwar, 2018). Bonoli (2019) predicted that as the number of gig workers in the labor force is likely to increase over the time, and the income level of the gig workers would be reduced in the long term. Yet, working conditions would be worsened, and the likelihood of unemployment would be high due to severe competition among themselves. Furthermore, as gig workers do not require a defined place to work or follow a regular work pattern, it would be a challenge to connect with them.

Platform Co-Operativism

“Platform co-operativism” refers to a movement that aims to co-operate digital platforms that are built on the principles of co-ops to regain control and address governance-related issues of such co-ops by changing the ownership structures of the corporate-owned sharing economy into a co-operative model that is democratically operated by its stakeholders (Scholz, 2016). Platform co-operativism refers to applying technology to a co-operative model involving several groups of stakeholders, such as employers, owners, and employees, who can exercise their collective political and socioeconomic power to govern the co-ops (Arthur, 2015).

Principles of Platform Co-Operativism

Scholz (2016) initially proposed the 10 principles of the platform co-operativism, e.g., “collective ownership, transparency and data portability, co-determined work, a protective legal framework, and the right to log off.” These principles have been adopted by several organizations and government bodies. With the emergence of platform co-ops in various forms in different sectors across countries, Scholz (2018) proposed to view platform co-ops as part of the broader co-operative ecosystem and established the four key principles of platform co-operativism, some of which overlap with the early 10 principles. The four key principles for platform co-operativism are broad-based ownership, democratic governance, co-design of the platform, and commitment to open-source development (Table 3).

Other Platform Co-Operativism Concepts

Apart from the concept of platform co-operativism by Scholz, there has been a growing interest in research on platform co-operativism. This is not a surprise as there is no single blueprint for an ideal platform co-op due to many factors. Recently,

Table 3 Four key principles of platform co-operativism

Principles	Features
1. Broad-based ownership	It should be owned by multi-stakeholders, including workers. Therefore, they have “direct control the technological features, production processes, algorithms, data, job structures of their online platform” (para. 14)
2. Democratic governance	The entity is collectively self-governed by stakeholders in a democratic manner, e.g., voting rights
3. Co-design of the platform	Various groups of stakeholders, including users and marginalized persons, “are included in the design and creation of the platform” in order to reduce the digital divide and meet the needs of users (para. 16)
4. Commitment to open source development	It promotes open-source development by using “a common of open source code” (para. 17)

Source: Adapted from Scholz (2018)

the newly launched Institute for the Co-operative Digital Economy has done research on the emerging platform co-op ecosystem to promote and support a co-operative platform economy (Sammallahti, 2019).

The “open co-operativism” concept by Bauwens is also in line with the common paradigm. The three aspects of this system are sustainability, openness, and solidarity (P2P Foundation, n.d.). The co-creation of the commons should be overseen by open and participatory governance that include all stakeholders (P2P Foundation, n.d.).

Schneider (2018) also proposed a democratic ownership to allow a process of open-ended choices and a co-ownership model based on open, interdisciplinary, and transdisciplinary co-operation to serve the platform economy.

Research Methods

The study adopts the case study method as it is appropriate to address the research objectives, namely, discuss the benefits and challenges of platform co-ops, revisit Scholz’s principles of platform co-operativism, and assess various forms of platform co-operativism based on these principles. Policy recommendations to develop platform co-operativism and mitigate the risk associated with such platforms are also proposed.

The case of the Singapore National Co-operative Federation (SNCF) in Singapore is selected for several compelling reasons. First, Singapore has an enabling environment and infrastructure for growth opportunities in the digital economy. Second, the Singapore regulatory framework is known for its “agility,” which allows the creation and piloting of new business models and technologies (Ng, 2018). Third, Singapore is determined to drive forward a resilient and innovative ASEAN community, where it brings several agreements designed to invigorate the region’s digital economy.

Co-Operatives in Singapore

There are around more than 80 registered co-ops in Singapore, but there is no official data on the number of platform co-ops or co-operatives that have offered a platform to serve their members (Ministry of Culture, Community and Youth, 2021a). Although the selected case might not be a true representation of the platform co-ops in Singapore, it provides an opportunity for a more in-depth understanding of the platform ecosystem as the basis to explore how businesses and existing co-ops can contribute to shaping a fairer platform economy.

Singapore National Co-Operative Federation (SNCF)

SNCF was established in 1980, adopting “The Co-operative from Within” type (Table 1). Its mission, similar to the co-ops formed by the National Trades Union Congress (NTUC), is to provide social safety support to the workers and their families.

SNCF is a collective body of the co-operative movement representing co-operative members in Singapore through its affiliated co-ops with millions of members (SNCF, 2018). There are four main sectors: Credit Co-operatives Sector, NTUC Sector, Service Co-operatives Sector, and Campus Co-operatives Sector. SNCF also represents the collective voices of the co-operative movement in Singapore. It provides co-ops and the general public with comprehensive information on co-operative society and programs for their members. SNCF also supports co-ops to strengthen their enterprises and better serve their members and the community.

SNCF acts as the contact network for collaboration among co-ops, businesses, and governments to address the needs of the members (SNCF, 2020). For instance, Silver Caregivers Co-operative Limited (SCCL), a social enterprise, aims to better the quality of life of caregivers via training and support groups. In 2017, SCCL partnered with Assurance Technology and launched their eHealthAssist mobile app to empower caregivers with digital services. This integrated patient health management app helps users monitor their health records and track appointments, request and monitor queue numbers from their health clinics, make appointment requests, etc. (SNCF, 2018).

SNCF’s operations have been assessed based on the four main principles of platform co-operativism as follows:

- (i) **Broad-based ownership:** It has a collective representation of the co-operative movement representing 99% of co-operative members through 66 affiliated co-ops and more 1.4 million members (SNCF, 2020).
- (ii) **Democratic governance:** Collaboration amongst co-ops that represent the collective voices of the co-operative movement in Singapore has been observed. SNCF is governed by members who “actively participate in setting their own policies and decision-making. This means members vote on policies

passed and vote for elected representatives" (Ministry of Culture, Community and Youth, 2020a, para. 6).

- (iii) **Co-design of the platform:** It serves as a platform for collaboration among co-ops, businesses, and government agencies to address the needs of the society. It also represents Singapore to be a member and/or have a working relationship with international organizations, namely, International Co-operative Alliance, the World Council of Credit Unions, the UN, and the International Labor Organization (SNCF, 2020).
- (iv) **Commitment to open-source development:** There is little evidence that SNCF focuses on open-source development. However, a Central Co-operative Fund (CCF) was set up under the *Co-operative Societies Act* and administered by the Minister for Culture, Community and Youth (2020b). The CCF is funded by co-op contributions, and it provides grants for various types of development to benefit the co-operative movement (SNCF, 2020).

Governance of Co-Operatives in Singapore

In Singapore, the co-ops sector is primarily anchored by the government's and SNCF's support, where the key priorities are enabling workforce transition alongside economic progress (SNCF, 2020). The focus of broad-based ownership structure is to ensure that ownership concentrates on those that participate in the business, rather than investors. There are very few platform co-ops owned by the customers and/or employers, where the members of the co-ops consist of various stakeholders. This can be explained by two observations. First, some e-platforms, e.g., DPS platform, are not formally registered as co-ops but adopted the co-operative principles in running the digital platform, and thus they can be classified as platform co-ops in Singapore. Second, most platform co-ops are either directed by ministries or supported by Singapore's Smart Nation initiative to become the leading digital economy through an inclusivity framework to include multi-stakeholders to co-develop and co-create innovation solutions for secured collaboration platforms (IMDA, 2018). As such, this could be the reason why the democratic governance principle is less demonstrated by the platform co-ops in Singapore (see Table 3).

The established platform co-ops are mostly formed by co-operation among the co-ops. Nevertheless, some are the joint effort by the co-ops, start-ups, and government. The platform co-ops demonstrated the broad-based ownership principle through the collaboration and inclusivity framework to include multi-stakeholders, regardless of the business model. Some examples include (i) GoGoVan, an app platform that connects thousands of drivers for on-demand delivery; (ii) Lendor, a free peer-to-peer-sharing app; and (iii) CrowdFarmX, the world's first co-operative farming platform using blockchain technology.

There is also an increasing use of blockchain technology in the design of the digital platforms for security and trust reason. In fact, researchers have been

exploring how the blockchain model could support growth in the co-op sector. In a similar vein, some even argued that blockchain technology would put co-ops at the front of the digital revolution because of its natural capabilities of shared and immutable ledger (Ertz & Boily, 2019).

Although different platform co-ops follow slightly different sets of principles, platform co-ops in Singapore have generally adopted the four principles of platform co-operativism, and promoted the values of self-help, self-responsibility, democracy, equality, and solidarity. A good example would be the lead taken by SNCF to champion the establishment of code of governance for co-ops and promoting greater self-regulation. SNCF provides the necessary guidance and education to co-ops in Singapore. Besides, members' feedback taken by the platform co-ops to forge consensus has also contributed to democratic governance.

In general, co-ops in Singapore have been governed by "Code of Governance for Co-operatives" set by SNCF, and co-op societies regulation and act administered by the Registry of Co-operative Societies (RCS) (SNCF, n.d.). There is also another set of code of governance applied to credit co-ops. Besides, SNCF and RCS have co-issued three sets of governance guides for credit co-ops with regard to how to manage internal controls, loans, and investments. In addition, the relevant act and regulation also require co-ops to promote good governance principles, promote members' welfare, as well as support activities and initiatives that help them achieve their mission and vision (Ministry of Culture, Community and Youth, 2021a, b). Good corporate governance has made Singapore co-ops different from others in terms of transparency, accountability, and security in terms of cyber security, data protection, and training and development, as well as financial support to members, especially during pandemics (Ministry of Culture, Community and Youth, 2021b; Tan, 2021). Finally, co-ops' principles and values are promoted among members, e.g., volunteering, openness, democracy, autonomy, independence, co-operation, and participation (SCF, 2022a).

Although digital platforms have been adopted mainly by for-profit business entities (e.g., KPMG Singapore Digital Village, DEX, and PwC Singapore blockchain-based platform), the Singapore government has encouraged and provided resources (e.g., grants, assistance) to enable organizations, including co-ops to adopt digital platforms. Many co-ops have utilized virtual meetings during the COVID-19 pandemic, virtual and/or hybrid modes of meetings post-COVID-19. During the pandemic, SNCF has provided its corporate members with digital support, e.g., supporting designing workshops for members to be familiar with the digital playground and manage their digital projects (SNCF, 2022b).

Nonetheless, platform co-ops in Singapore are lagging in terms of contribution toward sustainability development as most of them focus on economy and social dimensions. Lastly, from the case studies, platform co-ops in Singapore have adopted the platform co-operativism concept rather than other concepts as they oriented toward the common good and have governance models including all stakeholders (P2P Foundation, n.d.).

What Works for Co-Operatives

SNCF, a Singapore platform co-op, appears oriented toward the common good and includes all stakeholders. Thus, it reflects the need to achieve “cooperative essence,” i.e., truly co-ops (Gizman et al., 2019) for creating a co-operative network connectivity among such multi-stakeholders in the entire digital value chain, and for them to Hoover and Abell (2016). The following four interrelated components are proposed, in accordance with the platform co-operativism principles in order to build a holistic co-operative ecosystem.

Multi-Stakeholder Partnership

A robust co-operative digital ecosystem involves not just within co-ops’ members but must include multiple external stakeholders to achieve greater integration and sustainability. It is, therefore, imperative to create the co-operative network connectivity among the multi-stakeholders in the entire digital value chain (Hoover & Abell, 2016). To build a sustainable platform in the ecosystem, stakeholders need to have a neutral broker and co-creator to embrace joint innovation (Hensmans, 2019). A notable example is the KSDV platform, a co-operative ecosystem in which stakeholders consisting of start-ups, corporations, and government agencies that can scale the activity of the platform co-ops and foster sustainability.

Hoover and Abell (2016) had identified the stakeholders (“actors”) spanning across the private, public, nonprofit, and financial sectors (Table 4). The list is not exhaustive; however, the message conveys that each actor has its own roles and contributions to the co-operative ecosystem.

To facilitate collaboration among stakeholders, one way is to make them actively participate in the ecosystem by a collective approach so that every member will have the same opportunities and access to benefits from the ecosystem. Moreover, technology blurs the lines between sectors, and cross-sector problems are transient in nature, and thus, the involvement of multi-stakeholders through this collective

Table 4 Actors in a co-operative ecosystem

Financial sector	Public sector	Private sector	Non-profit sector
Financial institutions	Government Policymakers	Businesses, including co-ops	Colleges/universities Community-based organizations
Credit unions	Small Business Development Center	Local business groups	Co-operative developers
Foundations	Workforce development	Professionals Secondary co-ops	Labor and workers’ centers
Investors			

Source: Adapted from Hoover and Abell (2016, p. 14)

approach to ideas would likely open up the possibilities for innovative collaboration and co-creating of solutions that perhaps can benefit many other sectors.

Collaborative Governance

One of the challenges co-ops need to overcome is governance. Platform co-ops are almost unseen in the policy agendas for the digital economy. What is particularly concerning is that policy and regulations for co-ops are different from purely for-profit entities. The question, then, is how the co-ops can be constructively engaged for a more grounded view to shape public policy to benefit most stakeholders. Moreover, as societies are increasingly dependent on digital technologies, algorithms could sometimes become the “policymakers,” resulting in what is known as the algorithm basis (Yaraghi & Ravi, 2017).

Collaborative governance is a decision-making approach whereby multiple stakeholders are engaged in consensus-oriented decision-making (Ansell & Gash, 2008). To embrace collaborative governance, one possible way is to create a platform to turn co-op voices into concrete actions through collaborative implementation of regulations. Nevertheless, it is necessary to consider accountability, hidden agendas, power imbalances, and cultural barriers that would probably arise in collaborative government regimes. Therefore, it is important to ensure that a system is in place to regulate this challenge and establish a platform for formal discussion. This established system should not only identify the real needs of the stakeholders of the platform co-ops, but also create a more participatory governance that can provide greater clarity and flexibility to stakeholders.

Emerging Roles of Co-Operatives

In tandem toward building a co-operative ecosystem involving multi-stakeholder partnerships, co-ops will need to address and manage diverse groups of members. Therefore, co-ops’ roles need to be redefined for the creation of socioeconomic values in this digital era.

Social Dimension

Technological advancement had compelled social transformation with new demand from the workforce. The Straits Times (2018) reported that the number of gig workers is expected to increase with the expansion of digital platforms. Thus, it is recommended that the existing co-ops should address the issues of social safety net for the gig workers, specifically, access benefits typically enjoyed by traditional employees (Tan, 2018). In this context, co-ops can act as intermediaries to offer support to the gig workers, such as addressing disputes in the digital platforms and providing training and education to gig users (Hartung, 2019). Co-ops can help workers upgrade their skills to adapt to the changing demand of work in the digital

economy (Tan, 2018). This is also required to improve the post-COVID-19 working conditions for the workers.

Economic Dimension

Capital funding is a challenge to platform users. Hence, financial co-ops can take a more active role in providing capital and investment credit to their members as a viable alternative to commercial banks. To achieve economies of scale (known as “network effects”) in the digital economy, platform co-ops can focus on co-operation between co-ops and existing digital platforms. When platform co-ops collaborate with one another, efforts are synergized, resources are consolidated, and that is likely to reduce operational costs. In addition, collaborating with established digital platforms that have superior network effects would increase co-ops’ competitive stance in the marketplace. Notably, successful platform companies tend to operate multiple platforms due to economies of scales. Such collaborations could also offer opportunities to co-ops to venture into other sectors, and may also fuel the possibilities of corporations adopting the co-op business model (Yeganeh, 2019).

These platform co-ops are the enablers to transform Singapore from becoming a country as a platform, which offers the connectivity of the various shareholders. This is also in line with Singapore’s economic strategy in response to the COVID-19 crisis with the three-prong strategy of (i) innovation, (ii) inclusivity, and (iii) sustainability (Meah, 2020).

Harnessing Technology

Blockchain-based platforms are considered as the parallel movement of platform co-operativism because of their natural capabilities of decentralization and immutable ledger (De Filippi, 2017). Activities performed on blockchain-based platforms are open for stakeholders to view and to be accountable for their actions. Blockchain has great potential in many sectors and is a powerful tool for platform co-ops to create a platform architecture to mitigate the risks associated with the digital economy. At the same time, it upholds members’ trust and confidence in using a blockchain-based platform because it is based on the transparent ledger and information can be encrypted to protect data confidentiality if it is implemented in the correct manner (Mannan, 2019).

Conclusion

This study discussed the benefits and challenges of platform co-ops, and evaluated the platform co-ops in Singapore against Scholz’s four key principles of platform co-operativism. It also proposed four interrelated components that could positively influence the growth and development of a co-operative ecosystem to chart the co-operative movement forward. Apparently, platform co-op business models can be considered as one of the alternative models for the pandemic and post-pandemic economic activities.

The co-ops in Singapore have been blessed with the government's support. The key priorities are on enabling workforce transition alongside economic progress (SNCF, 2020). That said, platform co-ops must make use of these advantages to find opportunities for platform co-operativism movement to flourish. In the digital era, platform co-ops should not only focus on the ownership model but also anticipate change and harness the benefits of digital technologies. This suggests that co-ops must be open to changes to seize the opportunities offered by the digital economy (Hirsch, 2018). Building upon the concept of platform co-operativism, the future roles of co-ops should be bridging the gaps between adopting new technologies and reducing the digital divide, providing not only physical access to infrastructure but also cultivating social support and equipping people with necessary skills to participate in the digital economy Gurría, 2019). Lastly, it is essential to improve governance collaboration in a digital economy, which further echoes the need for a platform to facilitate users' dialogues and coordination in the management of the digital economy, As discussed earlier, platform co-ops have echoed the importance of the roles of each stakeholder as they act as the vital channel for providing the access to information and activity. They play the key role in ensuring information shared is reliable as well as other cybersecurity activities.

To conclude, moving forward, co-ops need to embrace and manage technology, and allow stakeholders to co-create values with the objective of preserving a high level of social cohesion and economic security.

Limitations and Suggested Further Research

This study only considers the case in Singapore and Scholz's four key principles of platform co-operativism. Therefore, the recommendations made are only partly extrapolated to other countries with similar contexts. Also, as this chapter uses only the case study method, it may not provide enough evidence to justify the viability of the proposed components.

Thus, future research can focus on the roles of the stakeholders in terms of contribution to the digital economy. With the changing nature of work in the digital economy, it is worth exploring the implications of the challenges faced by the gig workers and how to improve socioeconomic security for them. Finally, platform co-ops in Singapore are lagging in terms of environmental sustainability. Thus, it is proposed to investigate the roles that platform co-op can play in advancing environmental sustainability.

Abstract

The COVID-19 pandemic of 2020–2021 has devastated most economies. According to the latest forecast by International Monetary Fund (2020), a 5.4% contraction in global GDP in 2021 was projected. The global economy had been badly hit, as global trade declined and tourism was brought to a halt. With the shrink in the global economy and expected harsh conditions, Indonesia had reduced its 2020 GDP growth outlook to 2.3%, down from 5.3%. Indonesia is well-known among tourists for its iconic landscape and distinctive culture of both its big islands, such as Java and Sumatra, as well as small islands such as Komodo Island, Lombok, and Wakatobi Island. This main attraction had brought about significant growth in tourism in these islands over the years. However, with an

escalating number of COVID-19 cases and related deaths being reported in Indonesia, the country's immediate priority would inevitably be to mitigate the impact of the pandemic.

Thus, this chapter aims to shed light on the strategies adopted by the tourism industry in Indonesia as well as the experiences it has encountered during the COVID-19 pandemic and seeks to explore how the industry could recover from this difficult circumstance. The preliminary findings reveal that there is an increasing need for the government to improve the business environment by having proper policies and putting in place effective mechanisms for coordinating nationwide efforts to enable speedy recovery for a more resilient and sustainable tourism workforce.

Keywords

Tourism industry · Indonesia · Responses to the pandemic

Introduction

The COVID-19 pandemic first began as a health crisis and has quickly escalated into a global economic crisis, causing a chain effect of poor business performance on a global scale (KPMG, 2020a, b). Given the uncertainty of the global economy and when the economic situation could stabilize, there is a pressing need to explore alternative strategies that could pave the way for a road to recovery from the pandemic.

Companies all over the world have been severely impacted by the pandemic as it greatly disrupts business operations and personal livelihoods. With a reduction in wages in sectors that are directly affected by border closure, such as the aviation, hospitality and tourism, and recession fears, the main concern would be to mitigate damages caused to livelihoods of people. The willingness to adapt to the new normal caused by the pandemic has become paramount due to the severity of the COVID-19 situation.

The pandemic had also accelerated the implementation of digital transformation efforts, especially during the lockdown period. Digitalization of internal business operations and service delivery has boded well for most organizations. New work practices and norms, such as the frequent use of video conferencing and remote-working platforms for work from home (WFH) employees, are also evident as a global response to the pandemic (KPMG, 2020a, b).

Indonesia is selected as a case study for this study as it is well-known among tourists for its iconic landscape and distinctive culture of both its big islands, such as Java and Sumatra, as well as small destinations, such as Komodo Island, Lombok, and Wakatobi Island. This main attraction had brought about significant growth in tourism on these islands over the years (Hakim, 2020). Also, there were about 2,919,800 people employed in this industry in 2019, but this figure was reduced to 2,057,600 in 2020,

i.e., nearly 900,000 of them were out of the industry (Statista Research Department, 2022).

However, the onset of the COVID-19 pandemic had brought global travel, tourism, and leisure to a halt, and this has adversely impacted the country's economic system. The Indonesia government has projected that it would lose more than \$10 billion in tourism revenues (2020), because foreign tourist arrivals have been declining rapidly, by around one-third, as compared with the 2019's figures (Vivek et al., 2020).

The very nature, circumstances, and impact of the pandemic, being global and large scale, meant that the crisis has an intense and possibly long-term impact on the tourism industry (Sigala, 2020). As such, having strong and effective mechanisms are crucial for Indonesia's ability to respond to such a crisis and to recover post-pandemic.

The main objective of this chapter is to identify and examine the effectiveness of Indonesia's current strategies implemented by the tourism sector to mitigate the impact of the COVID-19 pandemic. It aims to identify gaps in the existing strategies and propose recommendations for improving the effectiveness of its framework in handling a similar crisis or pandemic situation. The findings in this chapter highlight the pressing need for Indonesia to improve the business environment by having a proper emergency plan and putting in place effective mechanisms for coordinating nationwide efforts to enable the speedy recovery of the tourism industry.

Secondary data was from reputable sources, such as peer-reviewed academic journal articles, reports from well-known international organizations, government and industry reports, and government documents.

Revisiting Strategies for the Tourism Industry

Given the uncertainties involved in the tourism industry during the pandemic, it is important to understand the existing strategies and their shortcomings in order to propose robust strategies that can combat a crisis. This would enable Indonesia and other countries with similar conditions to better prepare their emergency plan and put more effort to facilitate the recovery of the tourism industry.

As the tourism industry is highly interlinked with the global economy, such efforts to support this industry are scalable to neighboring countries with similar conditions in the region, enabling these countries to be more resilient in bouncing back from the outbreak.

Finally, this chapter begins with the introduction and the discussion on the background of the issue and factors affecting the tourism industry in Indonesia in a pandemic situation. The chapter then examines the possibility of rebuilding a post-COVID-19-ready tourism industry by focusing on local demand, i.e., expanding domestic tourism and developing new niche markets, such as nature-based tourism to adapt and cater to the change in tourists' behaviors (Vivek et al., 2020).

The Impact of COVID-19 on Indonesia's Tourism and Supporting Industries

Prior to the COVID-19 pandemic, flight traffic to Indonesia was brisk. Tourism is seen as one of the key drivers contributing significantly to Indonesia's economy as it creates many jobs for the local communities. Indonesia's tourism industry also contributes considerably to the regional development. According to Indonesia's travel statistics from 2017 to 2019, the contribution from neighboring Southeast Asian countries like Malaysia and Singapore to Indonesia's tourism was sizeable. The data from January 2020's travel records showed that about 206,532 tourists from Malaysia and 138,625 tourists from Singapore traveled to Indonesia. China is also one of the top contributors, with 181,281 tourists visiting Indonesia in January 2020. The most visited destinations in Indonesia by tourists are Jakarta and Bali (Hakim, 2020).

As traveling is perceived by medical experts as one of the main mechanisms for the spread of the disease, the Indonesian government has resorted to reducing and stopping flight traffic to various domestic destinations, for example, Bali. According to data from travel agencies, demand for tour programs declined drastically in the first quarter of 2020. This could be attributed to the restriction imposed by the government to prohibit tourist visitation to tourist attractions in order to contain and reduce the spread of the virus. Understandably, this led to a chain effect on other businesses, such as the transportation, food and beverage, and accommodation sectors. Many transportation companies were forced to shut down due to the huge decline in travel demand. Similarly, the accommodation sector has also been adversely impacted by the decrease in tourist arrivals. For instance, Bali has closed about 96% of its hotels since April 2020 (Hakim, 2020). Home-stay accommodations, such as Airbnb, have also taken a drastic hit. Food and beverage businesses that are geared toward catering to tourists' needs have also been affected, i.e., many restaurants and cafes had to close their businesses due to lack of demand. Tourism-related jobs such as drivers, tour guides, and tour planners were made redundant. Consequently, many travel agencies and SMEs related to tourism have been winded up, and their employees being laid off (Hakim, 2020).

Official data from Statistics Indonesia, a non-ministry government agency in charge of providing statistics to the public sector and the public, revealed that foreign tourist arrivals declined by 64.1% in March 2020 (Parama, 2020). It also unveiled that tourists' arrivals from China, which accounted for a major source of tourism revenue for Indonesia, dipped by 97% in March year-on-year in 2020 (Parama, 2020).

Total tourist arrivals from January to October 2020 were 3.72 million, and this presents a huge decrease of 72.35% from the same period in 2019 (Rahman, 2020). The number of tourists from around the world had drastically declined and this is a huge blow to Indonesia's tourism industry and its supporting sectors, such as hotels/accommodations and food and beverage sectors.

The spillover effect of the decrease in the number of tourists in the accommodation sector saw hotel occupancy rates drop to 32.2% in March 2020 (Parama, 2020). The huge decrease in international travel demand was the aftermath of the lockdown measures and border closure (Susan et al., 2020). The Indonesian Hotel and Restaurant Association reported a loss of about US\$1.5 billion since January 2020. The Indonesian Travel Agent Association also reported that there was no income for the travel agent sector since February 2020. The travel sector experienced a huge loss due to passenger cancellations and this is likely to sustain until the pandemic subsides (Djalante et al., 2020).

The Impact of COVID-19 on Indonesia's Economic Growth (GDP)

Indonesia's economic recovery is expected to take a slow pace as it has been adversely implicated by the prolonged COVID-19 pandemic. According to the latest data by Statistics Indonesia, Indonesia's GDP fell by 2.07% for the entire year 2020, and this full-year contraction was one of the worst recessions since the Asian financial crisis in 1998 (Al Jazeera, 2021).

The decline in GDP would inevitably translate into a higher employment rate for Indonesia. According to data from Statista, Indonesia's unemployment rate surged to 4.84% in 2020, the highest one since 2011. Statistics Indonesia reported that 2.67 million residents lost their jobs because of the COVID-19 pandemic (Statista, 2021).

The adverse impact on Indonesia's labor market should not be understated. The recession also caused a country-wide consequence where the number of formal workers declined, and the number of informal workers surged due to an unavoidable change in the labor market. Indonesians who lost their formal jobs had to rely on alternative unsecured sources of income, such as street vending (Borsuk, 2021). This paradigm shift from workers in the formal sectors into informal ad-hoc jobs is an unwanted and unintended consequence of the pandemic. The growing unemployment rate made it even harder for Indonesia to bounce back from the current crisis (Borsuk, 2021).

The delay in the Indonesian government's response to the COVID-19 health crisis had proven to be catastrophic for its population's health. Criticisms were levied on the Indonesian government for not responding promptly to the pandemic. Neighboring countries, such as Singapore and Malaysia, reported signs of the widespread of the COVID-19 virus in February 2020, but Indonesia only reported its first two confirmed cases in March 2020. The restricted measures in the form of containment and lockdown, in a bid to flatten the curve of the pandemic, came at a huge expense. Tourism, which heavily relies on social gathering and physical presence, took a hard hit, as the demand for such activities sharply declined. The Indonesian government initially ruled out lockdowns due to the severe economic impact associated with the decision, but eventually relented and declared a national health emergency. Indonesia then closed its international borders in response to the surge in the number of COVID-19-related deaths in the country. So far, the government allocated about 4% of GDP (Rp 641 trillion) toward combating COVID-19 (Susan et al., 2020).

The lack of data transparency in Indonesia at the initial stage caused misinformation in the form of underreporting the actual number of COVID-19-infected cases. This exhibits that the government's response measures were inadequate and not timely. As a result, the lack of information and lack of clear policy communication could further impede the government's ability to respond rapidly to such a crisis (Nugroho & Syarie, 2021).

The tourism sector has limited business continuity plans (BCP), and the lack of such contingency preparedness has been a longstanding issue. This issue has yet to be addressed by both the government and the tourism industry itself. The lack of clarity in surviving and recovering post-COVID-19 requires the public to adopt careful planning and thinking for a long-term recovery phase (Djalante et al., 2020).

However, the Indonesian government's ongoing efforts to combat the COVID-19 pandemic, and her aggressive financial stimulus to improve her economy enable some recovery to take effect albeit at an incremental and slow pace. Economic recovery, restoration of business activities, and financial market stability would largely depend on the government's efforts and responses to effectively curtail the spread of the virus (Manggi & Wisnu, 2020).

Increased Environmental Consciousness in Tourism Norms

Back in 2018, Indonesia tried to push toward boosting tourist numbers, and this was met with much concern and criticism raised by environmental activists. These activists argued that the massive push for tourism came with social and environmental costs as the natural ecosystems and traditional livelihoods became diluted through such commercialized activities. The reclamation projects comprising the building of luxury hotels and theme parks were both a boon to boosting its economy and a bane to its natural environment (Hewson, 2018).

Environmental activists have also highlighted that the tourism industry has a substantial negative impact on its environment. This is due to the added pressure on natural resources when there's over consumption happening in tourism leading to depletion of natural resources, and an increase in pollution and waste problems could occur when tourists overconsume and do not conscientiously make efforts to keep the attractions clean (Budeanu, 2005; TheWorldCounts, 2021).

To this end, the Indonesian government has made some shift toward being environmentally friendly by implementing a ban on single-use plastic bags to reduce the amount of plastic waste. The implementation is still difficult to enforce at traditional markets and shopping centers as tourists and customers are not accustomed to using and bringing their own bags (Yulisman, 2020). Thus, much more can be done to convince and persuade the majority of the customers and tourists to switch to being more proactive in contributing to a more environmental-friendly and sustainable environment. This can be done by organizing more educational campaigns for the public, including tourists, and using social media to reinforce the importance of such initiatives.

Findings and Solutions

Key findings showed that the COVID-19 pandemic had made Indonesia and the rest of the world more conscious of the need for effective prevention measures for the population's health safety. Indonesia could use the lessons learned from the pandemic to formulate relevant strategies to better counter the spread of a future pandemic. Indonesia could also benefit from adopting the best practices implemented in other countries in terms of effective self-containment measures to flatten the pandemic curve.

As the public sector does not have all the resources to massively campaign COVID-19 prevention alone, it could liaise with the private sector and civil society organizations to mobilize their resources to further disseminate the importance of mitigation measures and educate the uninformed on the need to adhere to safe distance measures that can collectively combat the crisis as a nation. Beyond broadcasting information through the traditional and social media, communities' responses should be galvanized, as part of the mass movement to spread educational content on combating the spread of the COVID-19 virus (Djalante et al., 2020).

To effectively handle the COVID-19 crisis collectively, Indonesia needs to develop effective containment policies and enforcement mechanisms, as well as implement effective stimulus and financial assistance packages for people and businesses, who are affected by the pandemic, while attempting to stabilize the financial system. Policymakers worldwide have already proposed an exceptional level of stimulus, which is more than 10% of the global GDP, and this has been implemented in many countries. As there is uncertainty on how long the pandemic will last, such stimulus measures will need to be implemented, evaluated, and reviewed with a view on long-term approach for fiscal sustainability (Susan et al., 2020).

In the first stage of Indonesia's tourism recovery, domestic tourism could be ramped up to partially compensate for the huge losses incurred for global travel revenues. Indonesia could take the opportunity to further capitalize on local demand by promoting the lesser-known attractions and destinations to its local and domestic tourists. The government and the tourism industry could take more initiatives to spur domestic demand by encouraging local residents to take breaks and short trips within Indonesia to rediscover and explore new site visits while combating fatigue due to lockdown. Indonesia could also make full use of the lull period in global travel to further improve its infrastructure for tourism and enhance the service standards of the tourism industry (Vivek et al., 2020).

Bali, which is probably the best-known travel destination in Indonesia, has been badly affected by the environmental effects of over-tourism. The pandemic could be a turning point for Indonesia to commence the practice of sustainable tourism in Bali and other destinations (Mulyanty, 2020). It is estimated that Bali's ecosystem has suffered, especially with the sharp rise in the number of domestic and foreign tourists between 1996 and 2018, as tourists were said to generate 34 times more waste than local residents (Vivek et al., 2020). Generally, the growth in tourism is a

double-edged sword as the increase in waste, especially plastic waste, has somehow damaged the country's reputation for its attractiveness (Vivek et al., 2020).

Thus, implementing nationwide initiatives to clean up the waste, and strongly advocating the use of recycling may contribute to providing a better overall experience for foreign tourists since global travel has progressively resumed. This would enable long-term sustainable environmental development and would also aid in Indonesia's economic development as a country with clean and beautiful natural tourist attractions.

Recommendations

Overall, Indonesia could consider adopting the following approaches as strategic measures to support the recovery of the tourism industry from the pandemic.

Rebuilding and Revitalizing Tourism Industry

In order to revitalizing the industry, Indonesia's tourism industry players will have to strike a fair balance between attracting tourists and cooperating with the government and health authorities to mitigate health risks. Apart from the immediate devastating effects, the COVID-19 pandemic is likely to have long-term effects in a country like Indonesia, where its main cities and provinces are heavily dependent on tourism. Her borders have been shut down since April 2020, along with the closure of many tourist attractions. Industry experts and critics posited that Indonesia should rethink its tourism master plans and embrace major changes as the world progressively recovers from the COVID-19 pandemic (Mulyanto, 2020). Tourism, being a major revenue source for Indonesia, has more than 16 million tourist arrivals in 2019. Bali alone accounted for more than 6 million tourist arrivals. However, due to the COVID-19 pandemic, potential visitors will be more cautious when it comes to interacting with Indonesian dwellers and their preference will be geared towards the concept of private travel and wellness. Therefore, there is a need for enhanced health and safety protocols to facilitate communication for combating the virus. A good example is the case of Traveloka, an Indonesia's travel and lifestyle booking platform. Traveloka is adapting to the crisis by collaborating with business partners to promote safe health and hygiene protocols for travel (Mulyanto, 2020).

Develop Alternative Strategies to Gain and Increase Revenue by Redirecting the Focus on Local Tourism

Once the situation is safe for travel, Indonesia could promote its various unique and less popular tourist attractions to its local residents. Similar to Singapore's attempt to encourage local tourism through its "SingaporeRediscover Vouchers" campaign when Singapore citizens were given vouchers for spending on rediscovering the city and supporting local tourism businesses, i.e., vouchers could be used to purchase tickets for attractions, pay for hotel stays and local tours (Tay, 2020). Promotion of local tourism is also in line with OECD countries (OECD, 2020). Thus, Indonesia can adopt similar initiatives to spur local demand and encourage local residents to

take short trips within the country as part of a well-being campaign to reduce the fatigue from the prolonged restricted measures due to the pandemic (Agarwal et al., 2021).

Improve Tourism Infrastructure during Full Period

The lull period in travel also presents opportunities for Indonesia to improve its tourism infrastructure, such as airports and service standards in the tourism industry and related sectors. Customer sentiment analysis on past customers' surveys could be conducted in order to know which areas have fallen short in the eyes of tourists in order for the industry to fill the gaps (Soshkin, 2019).

Promote an Environmentally Sustainable Lifestyle

Environmental pollution resulting from waste, such as plastic trash (apart from air, noise, and water pollution), has been negatively attributed to the rapid growth in tourism and the lack of tourists' consideration in helping to keep the attractions clean (UNEP, 2019). The consequence is dire as it tarnishes the beauty of Indonesia's natural attractions. Hence, the tourism industry can take the lead to promote greater tourists' awareness through environmental campaigns and marketing outreach efforts via traditional and new media. This can also be done by collaborating with major corporations and educational institutions to educate tourists and local residents to move away from single-use plastics and advocate the collection and recycling of plastic waste in a bid to become more environmentally friendly and sustainable.

Repurpose the Affected Sectors Supporting the Tourism Industry for Alternative Revenue Sources

The affected sectors, such as hotels and accommodations, supporting tourism could be repurposed to provide co-working office spaces (like WeWork's business model). From a business viewpoint, these affected sectors could collaborate with companies to provide co-working spaces for employees with the necessary safe management measures that are in compliance with government's guidelines. This could help the relevant sectors better unlock the potential of such resources, instead of leaving them intact to suffer financial losses.

Some organizations operating in the transportation industry, which is providing ancillary support to the tourism sector, could be repurposed to provide food and parcel delivery services to better meet the current needs of the public during the pandemic. The government could also provide more support to delivery companies with regard to digital transformation efforts, i.e., bring technologies to such companies, so that they can cope with the increasing demand for delivery services, for instance, provide transitional subsidies to delivery workers and companies to support the expansion of manpower and resources in response to the rising demand for such services (pandemic (Agarwal et al., 2021).

Also, there is a huge mismatch between the jobs available in the labor market and the skills required. Therefore, to remain relevant in the global economy, Indonesia could consider focusing on harnessing its digital capabilities to aid its tourism industry and its supporting sectors to cope with the transition and the new normal

after the COVID-19 pandemic. More jobs focusing on digital capabilities could be designed to partially address the unemployment situation (World Bank, 2021).

Conclusion

This study discussed the benefits and challenges of platform co-ops, and evaluated the platform co-ops in Singapore against Scholz's four key principles of platform co-operativism. It also proposed four interrelated components that could positively influence the growth and development of a co-operative ecosystem to chart the co-operative movement forward. Apparently, platform co-op business models can be considered as one of the alternative models for pandemic and post-pandemic economic activities.

This study hopes to provide a better understanding of how Indonesia has handled the COVID-19 pandemic and how Indonesia's public sector can work with various stakeholders to better control and manage the national health crisis. The impact of the COVID-19 pandemic situation has reinforced the need for having proper and viable strategies to counter such a situation. As such, there should be a greater emphasis on rapid and sound decisions that can be implemented at the national level to swiftly respond to the global pandemic in real time. This would include collaboration among the public and the private sectors and civil society in order to prepare an effective action plan to execute its containment and ring-fencing strategy successfully in the case of a pandemic situation.

Tourism is one of the most important "employers" in Indonesia and other countries with one in 10 jobs relating to tourism, and is also a major contributor to most countries' GDP (Sigala, 2020). And technology is one of the key approaches to combat the COVID-19 crisis, and acts as an enabler to rebuild tourism and the economy, for example, contact tracing mobile applications, digital identities, etc. The use of technology in tourism has also been necessitated. This includes e-broadcast and e-circulars for information on worldwide travel restrictions, online COVID-19 alerts, COVID-19 control measures, and hygiene practices. Technology can be deployed as a measure for alternative revenues, for instance, the introduction of virtual tours, events, and festivals (Sigala, 2020).

Lessons Learned

First and foremost, a country's adequate preparation and the ability to respond quickly in a complex situation is paramount, and this is evidenced by the resulting damage and fatalities when governments are slow to respond to the COVID-19 pandemic situation.

Secondly, apart from implementing effective policies in response to the pandemic, the public sector needs to work closely with major stakeholders in various organizations, including civil society, religious organizations, prominent educational institutions as well as community leaders (Ikhwan & Yulianto, 2020). Strong collaboration would enable the government to utilize existing manpower and

resources to formulate an effective strategy and put it into action with the help of all involved stakeholders. The collaborative efforts would better enable all, including the public, to do their part to adapt in response to the pandemic.

Limitations and Suggested Future Research

The main limitation of this chapter would inevitably be the coverage of the issues linked to the COVID-19 pandemic and tourism industry in Indonesia, as not all issues would be covered and addressed due to certain constraints, such as time and resources. To overcome the limitation, future research studies could focus on all relevant issues and challenges at the national level, the industry level, and the corporate level. Adopting a quantitative research method would also enable a more comprehensive analysis to be conducted to validate the key indicators and factors relating to effective responses to the COVID-19 pandemic, as well as to deduce and find out the best practices to enable a resilient workforce and nation in the midst of the pandemic.

Abstract

In modern days where the world is well connected with a high volume of people-to-people exchanges and transactions, the occurrence of a pandemic is expected to cause widespread impact, including impact on food security. Past and present pandemics, such as H1N1 swine flu (2009), SARS (*severe acute respiratory syndrome*) (2013), and COVID-19 (year 2019), saw many countries being forced to close their borders to curb the spread of the virus. Such border closure has affected food production and the operations of food suppliers globally that led to the rise of food prices across countries.

This chapter focuses on the impact of the COVID-19 pandemic on food security, using Singapore as a case study. It aims to examine (i) Singapore's current strategies to attain food security; (ii) the extent of the impact of the pandemic on food acquisition, the fluctuation of food prices, and people's panic buying behavior during the pandemic; and (iii) how the current strategies can be further improved to strengthen Singapore's food resilience. Some lessons learned from the Singapore's experience are also discussed. It is essential to review

approaches to ensure food sufficiency so that proper adjustments can be recommended to enhance the country's food resilience, especially under the shadow of the pandemic.

Keywords

Pandemic, Food security, Food supply chain, Food resilience, Singapore

Introduction

Food security is one of the key aspects of human beings' survival. It emphasizes the importance of ensuring adequacy of food supplies that are sustainable, reliable, and nourishing to sustain people's healthy life. Food security is attained "when all people, at all times, have physical and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life" (Committee on World Food Security, 2012, pp. 6–7). People should have physical and economic access to food (Simon, 2012). The increase in food produced domestically, innovation, and technology adoption are considered as some enablers for countries to attain food security (Singapore Food Agency, 2020). From the perspective of a country that can produce food products, the emphasis of food security is on satisfying the needs of food consumption of its people, followed by its ability to export food products to other countries in order to generate revenues. As for countries that are dependent on food imports to feed their population, diversity in food sources is critical to ensure stability of food supplies. Apparently, food security of a country is inevitably linked to its political and economic stability, and thus dedicated management of food security is paramount.

Food security may be subjected to disruption, caused by three scenarios or a combination of these scenarios. These scenarios include nature, man-triggered, and force majeure. Nature scenarios refer to the occurrences of natural disaster or harsh weather conditions, which include droughts, the infestation of pests that destroy crops, etc. Man-made scenarios refer to wars between countries, civil unrest, political instability resulting in reduction/cessation of food production capabilities, disruption to food supply chain operations, etc. Occurrences of force majeure refer to unprecedented events that may probably go beyond control, such as the occurrence of a pandemic among livestock or human beings. These scenarios threaten health and the survival of mankind. Under such circumstances, the absence of stable food supplies and surge in food prices would have devastating effect on a country's population. Hence, there is a need to anticipate, prepare, and mitigate the likelihood of such scenarios in order to reduce their impacts on food security, in particular (Independent Task Force on Global Food Security, 2017).

Singapore is an island nation in the Southeast Asia region with a land size of approximately 728.3 square kilometers (2020) (Open Government Products, 2022) and a population of approximately 5.45 million people (June 2011) (Singapore Department of Statistics, 2022). The country comprises of Chinese, Malays,

Indians, and other residents, with a diverse food culture setup and needs. Being a nation constrained by its small land size, Singapore depends largely on food imports from countries around the world to satisfy the consumption needs of the population (Singapore Public Service, 2021). A strategy of food supply chain continuity has been put in place to ensure food security by the government. It involves a two-dimensional strategy of domestic and international sourcing. The former refers to the domestic production of food products to increase the ability for self-sufficiency, while the latter focuses on diversity in food sourcing internationally to achieve supply chain sustainability and cushion the impact of import disruption in the event when some of these countries are unable to export food products to Singapore due to unforeseen circumstances (Agri-Food and Veterinary Authority of Singapore, 2020).

Thus, this chapter will focus on the impact of the COVID-19 pandemic on food security and approaches to attain food security, using Singapore as a case study. Singapore was selected as Singapore has performed very well in terms of ensuring sufficient food for her population although she depends heavily on food imports to feed her population. Data for this chapter were gathered from open sources, such as government reports, news articles and publications by renowned organizations, and academic journals.

This chapter will briefly discuss the literature review followed by case study analysis. The case study will examine the current strategies of food supply chain management in Singapore. It will assess how the COVID-19 pandemic has disrupted the food supply chain Singapore and the current suite of mitigating measures to cushion the impacts. Finally, the chapter will make some recommendations to strengthen Singapore's food security approach to improve its resilience against future outbreaks.

Background

Singapore, being land scarce, depends on overseas suppliers for majority of her food supplies to meet the needs of her population (Thai, 2021). However, the country has managed her food security, including food production, food safety, food quality and pricing, etc., well. The country acknowledged the need for a framework to manage and improve food security and thus has implemented a food security management plan. This plan placed emphasis on (i) ramping up domestic outputs to become more self-sufficient, (ii) conducting a contingency planning process, and (iii) further strengthening overseas sourcing (Agri-Food and Veterinary Authority of Singapore, 2020).

With the ongoing changing external environment and socioeconomic landscape, such as climate change and the COVID-19 pandemic and change in dietary requirements, food shortage and food security would continue to be an issue to countries around the world, including Singapore. Therefore, emphasis on the need to have future-proof of food security through various initiatives, such as research and development (R&D), technology innovation and adoption, and stronger

collaboration among stakeholders, such as the public sector and food-producing businesses, etc., would be worth to be studied (NTU, 2021). Also, several aspects concerning food security management and how a pandemic can result in panic buying behavior among people are briefly discussed in this section.

Food Security Management

Food security is characterized by food availability, food accessibility, and the level of food supplies by the producers as well as the level of food consumption by people (Committee on World Food Security, 2012). The volatility of food prices affects the population and results in uncertainty among people, in particular, lower-income families where such impact would be more severe (Timmer, 2012). Timmer's (2012) study on human behavior and food security proposed that when a crisis occurred in a country, such as a pandemic, it would most probably result in the country's administration imposing regulation and policies to safeguard the domestic interests first. These policies could include accumulating food stockpiles for domestic consumption, while food exports to other countries would likely be stalled or suspended. For the importing countries, depending on the importance of the types of food imported and the ability to find alternative sources, an increase in food prices would likely take place during such a crisis. An atmosphere of panic among people for fear of not being able to access to these food supplies would emerge if such fear is not addressed timely. There were past instances in 2007 and 2008 where people residing in several countries experienced panic buying due to a spike in rice price (Timmer, 2012). Timmer's study also highlighted the importance of fostering better connection between food producers and consumers via a competitive food market model and more international trade among countries (Timmer, 2012).

The COVID-19 Pandemic and Panic Buying Behavior

During the peak of the COVID-19 pandemic, countries around the world imposed lockdowns and border closure in an attempt to contain the spread of the COVID-19 virus. There were cases that essential hygiene items (e.g., toiletries, toilet papers, detergent, masks, etc.) and food items (e.g., instant noodle, rice, canned food, etc.) were emptied from supermarkets' shelves at lighting speed.

McKeever (2020) explained that when people feel uncertain during a pandemic, people would turn to panic buying supplies as a response to such uncertainty, and this has happened in the past, for instance, during the Spanish flu in 1918 and the 2003 SARS outbreak (McKeever, 2020). Billiore and Anisimova (2021) elaborated that panic buying has been originated from herd mentality and mass behaviors that may be socially undesirable. As highlighted by experts, such behaviors occur as the resultant of the reaction of humans' brain and humans' instinct to survive. These behaviors could move along the spectrum of responses to uncertainty, and the behaviors can reach the two extreme ends, either exhibiting a state of panic or

undermining the risks that are present or may occur (McKeever, 2020). For the former, it was an attempt to demonstrate the level of control over the situation to address the fear within individuals. The state of lack of information or misinformation about the pandemic was one of the causal factors behind such behavior among the people. For the latter, it was the mentality and belief of individuals that they would unlikely be affected, thus reducing their level of vigilance against the seriousness of the pandemic, despite numerous sources stating otherwise (McKeever, 2020).

Li et al. (2021) also found that environmental factors trigger change in people's behavior, i.e., panic buying behavior. These authors also suggested that "perceived scarcity, affective response and perceived lack of control could directly shape panic buying" (Li et al., 2021, p. 8). Overall, there is a need to contain the level of uncertainty among people in order to tackle their panic buying behavior and facilitate the effort by the authorities in order to deal with the pandemic more effectively (McKeever, 2020).

Case Study

This case study briefly discusses Singapore's strategies to ensure food security for the population, the impact of the COVID-19 pandemic on food security, and the way forward to self-sufficiency in Singapore.

Singapore's Approach to Food Security and Resilience

As an island nation, land scarcity does not allow Singapore to establish many large-scale food production facilities. Currently, only 1% of the land had been set aside for such facilities. Hence, Singapore relies heavily (more than 90%) on food imports to satisfy the needs of the population (Thai, 2021). The reliance on food imports poses a challenge in ensuring food safety, quality, pricing, and supply continuity. Thus, a structured approach toward achieving food security is crucial in an ever-changing environment filled with uncertainties. As such, Singapore has long embarked on a three-pronged strategic framework, covering (1) core strategies, (2) supporting strategies, and (3) enabling strategies as depicted in Table 1 (Agri-Food and Veterinary Authority of Singapore, 2020).

Core strategies acknowledge the importance of diversity in food imports, the need to venture into local food production, and establishing an inventory system of necessary food, such as rice, for unforeseen situations that may arise food supplies. This aims to mitigate any disruption of food imports in order to ensure that consumers continue to have access to food supplies and maintain food prices. *Supporting strategies* focus on research and development (R&D) and reducing food wastage via public education. These strategies also aim to improve infrastructure for food production. Finally, *enabling strategies* require strong coordination among different government agencies that need to work closely with one another to

Table 1 A framework for food security for Singapore

	Key points	Enabling strategies
Core strategies	Search for diversity sources of imports Invest in related food production facilities abroad Focus on industry development Strategies to complement limitations in diversification Improve food local production Maintain stockpiling of food	Foster coordination among government agencies Improve emergency planning Effective communication channels
Supporting strategies	Focus on R&D Reduce food wastage Strengthen infrastructure Use of financial instruments Take care of welfare/affordability aspects	Monitoring market Have a clear fiscal, legal, and regulatory framework

Source: Adapted from Agri-Food and Veterinary Authority of Singapore, [2020](#)

plan for emergencies, regulate, and monitor the market to ensure food security (Agri-Food and Veterinary Authority of Singapore, [2020](#)).

Impact of COVID-19 Pandemic on Food Security in Singapore

The occurrence of the COVID-19 pandemic in 2019 is a classic example of how food security came under threat due to import restrictions (Thai, [2021](#)). At the initial stage of the pandemic, there were worries of the likelihood of food supply disruption as border closure and import restrictions were imposed. In Singapore, panic buying and food hoarding occurred which resulted in empty shelves in the supermarkets as consumers, who were overconcerned about the scenario of food supplies running out, tried to buy whatever they could get in case of emergency (Ng, [2020](#)). However, the government has ensured that such a scenario would not become a reality. The food security framework of Singapore stands up to the test of time and ensured the continuity of food supply.

As a developed country, the majority of Singapore's population, both adults and children, have been able to easily gain access to food necessities and consume more than enough food, exceeding the dietary requirements stated in the FBS data. Being land scarce and having a multiracial society with diverse food needs, Singapore has obtained much-needed food sources from around the world, i.e., Singapore imports about 90% of the total amount of food required to feed her population. The occurrence of the COVID-19 pandemic entails prolonged border closure and import restrictions by many countries that have tried all means to curb the spread of the virus. The food security framework implemented by Singapore enables relevant government agencies to activate the contingency plans, for example, stockpiling of food necessities has been released into the market timely to balance the supply and

the demand of food, and the availability of locally produced products to close the gap of import restrictions. Such strategies have produced positive results, i.e., food prices were stabilized (Singapore Department of Statistics, 2020).

Despite the comprehensive framework, Singapore has still experienced panic buying and food hoarding among her population at the initial stage of the COVID-19 pandemic. People's concerns about the ability of Singapore's respective government agencies to maintain a stable food supply chain to meet their dietary needs are valid since the majority of food products come from overseas. This scenario illustrates the critical need to continue raising public awareness of Singapore's food resilience. This can be done through education campaigns and publishing sufficient information to keep the population informed and assured about the stability in the food supply chain in Singapore.

Beyond having stockpiling of food for contingency purposes, Singapore has sought a wide range of food sources from overseas and has invested in food production facilities abroad. Yet, the COVID-19 pandemic has proved to be a challenge for Singapore to manage such overseas food production facilities. With prolonged border closure and export restrictions, operational disruption in the logistics and the transportation industries has also posed challenges to deliver food products from overseas to Singapore (Ellyatt, 2021). This situation could potentially deplete the stockpiles of food that Singapore has set aside since the new batches of food imports would be delayed or not be able to arrive in Singapore at all. Being a global crisis, the COVID-19 pandemic has impacted many countries, and such impact became noticeable over time. Thus, it is important for Singapore to rethink her current strategies on food security and make proper adjustments to emphasize certain aspects, i.e., ramping up local food production and food related R&D. Firstly, ramping up local production in Singapore beyond the target of 30% of the total food supply by 2030 would be important as it can help Singapore achieve sustainability of food supply chain in the future (Thai, 2021). Ramping up local production would serve as a more tangible buffer as Singapore would have direct and immediate access to much-needed food necessities domestically. Secondly, strengthening R&D into food production could potentially open another sustainable food supply source for Singapore. In recent years, Singapore has supported the development of alternative food sources. The country also saw the growth in number of establishments focusing on lab-grown meat, cell-based protein products, and plant-based food products (Nielsen, 2021). These food products are strictly regulated to meet the requirements of being safe for human's consumption (Steffen, 2021). In a time of pandemic where food imports hit a roadblock, access to nutritious alternative food products would not be an issue since these lab-grown products would be readily and easily available for the consumers in Singapore. Calibration of focus in the food security framework, where more emphasis would be placed on ramping up local production and R&D, would strengthen the food security safety net for Singapore and would place the country in a better position to handle crises like the COVID-19 pandemic in the future.

The Way Forward to Achieve a Higher Level of Food Self-Sufficiency

Singapore has long acknowledged the importance of adopting a contingency mindset toward food security. Thus, she has embedded local production as part of the core strategies for this purpose. Singapore aims to achieve up to 30% of the total amount of food required to meet the population's needs from local production by 2030. In order to achieve this goal, various government agencies have been ramping up efforts through tapping on innovation and technology enablers. Apart from traditional food production facilities, Singapore has also explored new facilities, for example, those that enable the production of food in a manner that is not affected by weather conditions. Creative approaches, such as utilizing rooftops of residential areas for the purpose of establishing farming facilities, were piloted. These local products came in timely to cushion the impact from import restrictions to Singapore during COVID-19 pandemic (Thai, 2021). To prepare for the future, more initiatives, such as vertical farming of rice, have been on trial to explore the possibilities of novel approaches to food production. This will help Singapore push toward to achieve 30 percentage of local food production (Zheng, 2022).

The adjustments of the emphasis toward increasing local food production and food-related R&D would serve as a feasible move by Singapore to attain its food security sustainability when a pandemic like the COVID-19 occurs in the future. However, practical implications cannot be neglected as they contribute to justifying the reasons why adjustments to the food security framework are necessary to make it more effective and efficient.

Firstly, it would require more land to build bigger food production facilities that enable producers obtain a higher output of local food production. In the context of Singapore, it would not be easy to achieve this target since most of the land has been allocated to use in a manner that can enable the population “to live, work and play in a high quality environment” (Ministry of National Development, 2013, p. 3). As such, innovative ideas and implementation of technology and innovative solutions to allow better land utilization and tapping on the existing spaces available within housing areas to generate food produces would help Singapore overcome this constraint (Ministry of National Development, 2013). Better land utilization would include the use of the available underground space to establish controlled food production facilities that are not affected by weather conditions. As mentioned earlier, tapping on existing spaces including transforming rooftop of HDB blocks and carparks into agriculture facilities has already been explored (Thai, 2021). The establishments of such facilities may be costly for businesses to bear alone due to the complexity in constructing and operating such facilities. Thus, a joint investment by the public sector and the private sector, for example, interested food production businesses, would be a more feasible approach. The third sector (civil society organizations) and the public can also play an important part in reducing food waste. Röös et al. (2017), Springmann et al. (2018), and Bajželj et al. (2020) explained that reduction of food waste could save scarce resources since less land, water, etc. will be used, and GHG emissions associated with food production would

also be reduced. As highlighted by Bajželj et al. (2020), sustainable use of scarce resources can improve food system resilience.

Secondly, R&D of food production would be successful if two criteria can be met. These criteria include food prices and acceptability. Prices of food products produced by new approaches should be competitive with those produced through conventional methods. Lab-grown food products and their safety and quality should be accepted by consumers. The competitive advantage of lab-grown food products will be dependent on the ability to mass produce them to achieve economies of scale in order to match the cost of food products produced by conventional methods. The acceptable level of the consumers will be dependent on the public education and product publicity to raise public awareness of alternative food sources (Steffen, 2021). In addition, regulation and stringent law enforcement should be in place to ensure that lab-grown food quality and food safety as well as food nutrition level meet international standards. This will increase the degree of acceptability by the public (Chua, 2020).

Conclusion

The COVID-19 pandemic sent shockwaves around the world over access to food supplies and witnessed panic buying by people across countries. Border closure and import restrictions could potentially deny the population access to food supplies over time. Even in Singapore, a country with an established food security framework, panic buying and food hoarding did occur during the lockdown period. The fear of lack of food was an understandable one, considering that Singapore imports the majority of food products from overseas. However, it is heartened to know that Singapore has been able to overcome the food supply disruption due to contingencies in place, such as having stockpiles of food and improving local food production to cushion the impact of the COVID-19 pandemic as well as ensuring continuous access to food necessities for all.

Apparently, food security is critical to ensure political and socioeconomic stability in a country, and it provides assurance to the population with regard to their rights to access to sufficient and quality food sources to meet their basic dietary needs. Having a sound food security framework is important as it can provide relevant government agencies and businesses with a structured approach toward handling food supply disruption caused by crises like the COVID-19 pandemic. Well-prepared contingency planning to ensure the integrity and sustainability of food supply chain can reduce the anxiety and fear of the public pertaining to food security during the COVID-19 pandemic. Singapore has done extremely well in these aspects.

The current Singapore's food security framework has presented new areas to improve food resilience, such as R&D into food production, and new methods to produce food locally. Yet, as the food security landscape continues to evolve, Singapore should continue with her forward planning approach. Assessment of the potential internal and external risks that can threaten the country's food security and

affect the population would be crucial. Relevant government agencies can further engage and educate the population to raise their awareness on the food security framework that can help to reduce the likelihood of panic reaction when new crises occur in the future.

The Singapore's framework would be deemed comprehensive for countries with similar conditions that recognize the importance of food security and food system resilience. Thus, it would be worth examining and emulating by such countries that also face big challenges in terms of food security and food self-sufficiency. Finally, the COVID-19 pandemic may continue to impact the world, given new variants. Given the possibility of emerging pandemics in the future, further research should be carried out to explore how food security can be further improved given limited resources.

In general, the chapter discusses the Singapore's framework for food security and feasible solutions to enhance the overall food resilience, especially during the COVID-19 pandemic. It brings merits to the Singapore's framework through food waste reduction, in addition to ramping up local food production and R&D on food production.

Abstract

The role of the private sector during national disasters is becoming increasingly important. Specifically, the essentiality of this sector's engagement with communities in overcoming a national crisis has manifested during the pandemic caused by COVID-19 (coronavirus disease 2019). This chapter describes how the private sector factors in the creation of a sustainable society and documents the investigation of the behaviors exhibited by companies in South Korea amid the global outbreak. The results showed that the Korean large enterprises commit to society by implementing corporate social responsibility (CSR) activities revolving around disaster relief and adopting a problem-discovery, targeting, and solving approach to tackling the socioeconomic problems caused by the pandemic. This study illuminated that these companies pursue sustainable coexistence with society by modeling the citizenship and contributing to the creation and reinforcement of social value, benefiting society.

Corporate social responsibility (CSR) · COVID-19 pandemic · Social value · Sustainable coexistence · South Korea

Introduction

Business and society are inseparable, and this close interconnection dictates that they should coexist in a sustainable way. Businesses are encouraged to engage with society primarily by creating economic benefits, but the boundaries of this corporate involvement have been considerably expanded. The emergence of the popular term “corporate social responsibility” (CSR) means that the social obligations of corporations now transcend the economic and legal domains to encompass ethical and philanthropic responsibilities (Carroll, 1979). CSR highlights the role of companies as good “citizens” who exhibit citizenship to create healthy and sustainable communities. Given that more active social engagement is currently expected from these entities, their activities are anticipated to improve social benefits and eventually create social value. Most enterprises have been implementing various CSR activities through different practices and programs designed to deal with economic, social, and environmental issues that may or may not directly influence their businesses. Specific CSR initiatives include donation, the provision of services and products at no charge, the sponsorship of individuals and non-profit organizations, and the establishment of partnerships.

Social engagement through CSR activities is particularly necessary during disasters (Ballesteros et al., 2017). Disaster relief is perceived primarily as a domain for which governments are responsible (Johnson et al., 2011), but the participation of the private sector in this area surpasses the coverage achieved by administrations. The business activities of companies are influenced directly by risks, such as those posed by the COVID-19 (coronavirus disease 2019) pandemic. If company stakeholders (which include business partners, employees, and the immediate communities where their facilities are located and customers reside) are infected by the coronavirus, activities such as procurement, production, and sales are delayed or terminated. Given these direct and indirect effects, companies should devise and practice appropriate measures for recovering from risks. Such entities capably manage the risks deriving from unexpected disasters because they are experienced in risk management and have resources that can be rapidly mobilized and directed toward people and communities in need (Ballesteros et al., 2017). Correspondingly, their prompt response to a disaster helps reduce the time it takes for communities to recover from adversity and return to normal living.

This study recognized the important role of corporations during disasters and investigated the disaster relief-related CSR activities of companies in South Korea during the COVID-19 pandemic. It also formulated recommendations for appropriate CSR directions and strategies in response to the global crisis. This chapter is structured as follows. First, the chapter describes the general CSR situation in South

Korea, with focus on its adoption, the approach with which it is carried out, and its function in South Korean society. Second, it introduces the CSR activities that companies carry out during disasters and the COVID-19 pandemic. Third, it discusses the CSR activities conducted in Korea during the global outbreak before ending with concluding remarks.

CSR in South Korea

Its Adoption and Approach

CSR is defined as the “actions on the part of the firm that appear to advance or acquiesce in the promotion of some social good, beyond the immediate interests of the firm and its shareholders and beyond that which is required by law” (Waldman et al., 2006, p. 1703). This concept, which underlines the righteous and moral deeds of corporations, received attention in Korea during and after the 1997–1998 financial crisis. Going through this nationwide economic catastrophe, Korean companies were pressured by focal actors, mainly from the government, to restructure their organizations by adopting and complying with Western governance and management systems (Choi & Aruilera, 2009). Since then, Korean companies have endeavored to review and redefine their roles and relationships with society by reinforcing their CSR engagement. For example, the majority of large enterprises have created in-house CSR departments through which to establish and systematically implement CSR programs. This movement led to the ongoing practice of CSR, which has caused a gradual increase in corporate CSR expenditure. In its annual report on such expenditure, the Federation of Korean Industries ([FKI], 2021) indicated that the CSR expenses of the 500 largest Korean companies have considerably increased since 2000. That year, companies spent an average of KRW 3.6 billion (193 surveyed companies) – a figure that grew fourfold in 2020 to KRW 13.6 billion (191 surveyed companies).

The main beneficiaries of CSR in Korea are the education, environment, and art sectors, and the pattern of implementation in the country has evolved from reactive to proactive. Initially, companies were driven by philanthropic reasons, donating money and supplies to socially disadvantaged individuals and communities, because of the convenience of these endeavors and the instant cosmetic effect produced by them. These days, they carry out CSR activities by actively solving social and economic problems together with society, which in turn enables them to create values for communities and populations. The FKI study reflected such a change in CSR activities (FKI, 2021).

The survey results (FKI, 2021) also indicated that Korean companies perceive their CSR programs as initiatives that should address the social problems confronting local communities, and they regard engagement as an activity that should persist under structured planning and continuous investment. Good examples of long-term, problem-solving CSR programs are world steel manufacturer POSCO’s Venture Platform (This is a project that involves discovering, nurturing,

and investing in new ventures. POSCO supports venture companies in both financial and nonfinancial ways. From 2011 to 2019, POSCO invested KRW 16.8 billion in 99 venture companies (<http://corporatecitizenship.posco.com/citizen/eng/brand/s919e10004200c.jsp>).) and Samsung Electronics' C-Lab Outside. (This project was launched in 2018 to support young start-ups and contribute to revitalizing the start-up ecosystem. Samsung Electronics discovers potential start-ups and supports them by providing work spaces, business funding, technical and managerial consultations, and business opportunities for collaboration (<https://www.claboutside.com/>).) Concerned about imbalance in the business ecosystem and the lack of new business entrants, the companies designed the programs to nurture individual and small-scale entrepreneurs by providing financial and nonfinancial support. Through this support, they can resolve the problems existing in the current business ecosystem and contribute to revitalizing communities. These endeavors are another reflection of the changing approach to CSR in Korea.

Function of CSR

Given the broad social engagement of companies through activities that reflect social accountability, CSR is no longer considered simply an annex to companies. Rather, it is regarded as an inevitable and important function for business success. Arguments continue to be raised as to the effectiveness of CSR in advancing business profitability (Godfrey et al., 2009; Oh & Park, 2015; Orlitzky & Schmidt, 2003). Although CSR activities may be unrelated to direct and short-term business performance, they are expected to moderate company risks and pay off sustainably in the long run. Studies contended that CSR helps companies achieve their intended business purposes, thus increasing the possibility of enhancing profitability, growth, and stakeholder values during managerial changes and crises (Deng et al., 2013; Lins et al., 2017). This is because the implementation of CSR activities amid risk increases the social capital of stakeholders who are directly related to companies' business activities. Social capital is associated with trust and reciprocity between parties and is viewed as "an enabler of collective action and cooperation, and thereby leading to positive outcomes" (Lins et al., 2017, p. 1790). That is, high CSR engagement in the presence of risk sends a good signal to stakeholders and aids companies in establishing a reputation as good and trustworthy entities. This reputation determines stakeholders' attitudes toward a company and motivates them to exercise reciprocity and cooperation.

In Korea, large-sized companies take the social capital-accruing function of CSR seriously. They perceive CSR activities as contributory to the improvement of corporate reputation and image, which they regard as stemming primarily from the trust gained from communities and employees (FKI, 2021). This observation is supported by Kang (2021), who investigated the relationship between people's perceptions of the CSR initiatives carried out by three Korean conglomerates (Samsung Electronics, Hyundai Motors, and SK) and their attitudes toward these companies. The author found that people view the corporations as socially

responsible and that such an impression builds trust, consequently contributing to shaping favorable attitude toward the companies. Similarly, Hur & Choi (2014) discovered that CSR engagement increases consumers' trust in a company, which, in the end, is linked to customer loyalty. The authors argued that CSR activities should be authentic, as this is the key to gaining the trust of stakeholders, including customers. Another study indicated that stakeholders are aware of responsible behaviors among businesses (Kim, 2015) and that they are smart enough to discern genuine motives behind CSR activities (Alonso-Almeida et al., 2019). Companies should therefore satisfy CSR requirements proactively and persistently to secure certification as authentic.

CSR During Disasters and COVID-19

Generally, disaster management and disaster relief activities are closely related to government organizations (Johnson et al., 2011), but this notion changed with the emergence of CSR and corporate citizenship; the private sector is now expected to engage in the aforementioned initiatives (Johnson et al., 2011; McKnight & Linnenluecke, 2016). This orientation is attributed to the fact that CSR involvement has expanded to include the resolution of social problems and the display of righteous citizenship behaviors by corporations in the societies where they operate, thrive, and sustain themselves. Furthermore, governments are unable to handle the socioeconomic risks occurring during disasters because of their rigid and bureaucratic organizational structures, which impede immediate action (Edwards, 2007; Kusumasari et al., 2010; Neal & Phillips, 1995; Waugh & Streib, 2006) – a deficiency that has compelled society to turn to the private sector as an effective problem solver (McKnight & Linnenluecke, 2016).

Dynamic capability theory (Teece, 2007) maintains that companies adeptly, effectively, and efficiently seize and solve the problems that plague communities by mobilizing their resources during disasters; this proficiency paves the way for companies to help communities extricate themselves from risks and increase their resilience (McKnight & Linnenluecke, 2016). During disasters, therefore, corporate engagement as a means of solving problems is a critical measure that significantly affects society (Ballesteros et al., 2017). Even if such engagement is not cost-effective in the short term, exercising corporate citizenship during difficult times accrues and increases a corporation's social capital (Madsen & Rodgers, 2015). For instance, they elevate their reputation as good and trustworthy companies and the awareness of them as such, thereby benefiting them in the long run and adding to their sustainable business success and prosperity (Madsen & Rodgers, 2015). Also, the recent study shows that companies' disaster-relief CSR activities enhance their long-term financial values (Qui et al., 2021). This is why social contributions, particularly during disasters, should be carefully managed by companies (This term refers to "how communities address adversity and return to 'normal' functioning following catastrophe" (McKnight & Linnenluecke, 2016, p. 3).).

Large enterprises have actively involved themselves in efforts to cope with the COVID-19 pandemic. Recent research highlighted the vigorous and immediate response of the private sector when this catastrophic event occurred, with companies exhibiting commitment to society by implementing various CSR activities centered on disaster relief (García-Sánchez & García-Sánchez, 2020; Kim, 2022; Mahmud et al., 2021). They identified areas with emergent needs and provided them with assistance through philanthropic projects, such as offering financial aid, providing supplies, and building partnerships with non-profit organizations. Adding to this speedy reaction, companies have attempted to solve pandemic-engendered socio-economic problems.

The COVID-19 pandemic differs from other episodic and short-term natural disasters in that it is a long-term catastrophe that has exerted national and global effects, thus giving rise to serious social and economic problems and creating a striking social divide between the “haves” and the “have-nots” (Carroll, 2021). Recognizing these social issues, companies have taken the initiative to support small-scale and individual entrepreneurs, suppliers suffering from lockdowns and social distancing restrictions, and children enduring limited educational and digital access during the transformation to online education (Kim, 2022). This proactive action of privately owned companies indicates their clear understanding of their relationship with society and their role as good “citizens.”

COVID-19 and Coexistence with Society in Korea

Since the occurrence of the COVID-19 pandemic on January 20, 2020 in South Korea, the private sector has conducted disaster relief activities (Kim, 2022; Park & Chung, 2021). Large corporations’ CSR expenditure on disaster relief and emergency response in 2020 accounted for a large proportion of their total CSR expenses because of the COVID-19 crisis: KRW 29.8 billion was spent on such endeavors, which is five times greater than the expenses incurred in 2019 (FKI, 2021). This difference points to the private sector’s proactive engagement with society. As revealed in Kim’s (2022) case study on representative Korean firms, disaster relief action has been very prompt and anticipatory, with specific directions aligned with CSR strategies. Companies have taken a problem discovery, targeting, and resolution approach to dealing with the issues arising from COVID-19. They observed the various social problems experienced by vulnerable individuals and groups and identified target populations for CSR support. As these enterprises support and fulfill the needs of the vulnerable, they also try to solve social problems, thus enhancing social benefits. Table 1 lists the disaster relief CSR activities implemented by selected large Korean companies (Samsung Electronics, LG Electronics, and Hyundai Motors) during the COVID-19 pandemic. It shows that the enterprises discovered the emergent problems that their respective target beneficiaries faced and

Table 1 Disaster relief CSR activities of Large Korean firms during the COVID-19 pandemic

Company	Target beneficiaries	Activities
Samsung electronics	Suppliers	<ul style="list-style-type: none"> Providing emergency financial aid, supplies, and management consulting through the operation of a supplier support center and fundraising.
	Employees	<ul style="list-style-type: none"> Distributing relief supplies to employees and their families in quarantine. Expanding flexible work arrangements. Serving special meals to employees for health improvement.
	Communities	<ul style="list-style-type: none"> Providing relief supplies, such as masks and sanitizers, to vulnerable individuals and groups. Donating money to national relief organizations. Supporting traditional markets and farmers in need by purchasing their produce and distributing gift certificates.
LG electronics	Suppliers	<ul style="list-style-type: none"> Providing emergency financial aid and supplies and increasing the <i>sang-Saeng</i> cooperation fund.
	Employees	<ul style="list-style-type: none"> Giving relief supplies to employees and their families in quarantine. Expanding flexible work arrangements.
	Communities	<ul style="list-style-type: none"> Providing relief and food supplies to children in need. Donate money and blood donor card. Supplying artificial intelligence products (Chloe-subbot) to medical centers to assist in deliveries and minimize human contact.
Hyundai motors	Suppliers	<ul style="list-style-type: none"> Using emergency disaster relief funding to support suppliers.
	Employees	<ul style="list-style-type: none"> Strengthening the safety and health management of employees. Expanding flexible work arrangements.
	Communities	<ul style="list-style-type: none"> Implementing <i>sang-Saeng</i> campaigns to support individual and small business owners by purchasing their products. Donating money to national relief organizations and conducting campaigns to prevent the spread of the coronavirus. Providing facilities for use as temporary quarantine lodgings for people traveling to Korea.

initiated prompt and appropriate projects to help those with an attempt of solving the issues.

As argued by Kim (2022), the CSR activities of Korean large firms during the COVID-19 are distinguished by the companies' agility in carrying them out; they promptly identified and responded to prevailing social needs while they sustained their CSR involvement. Engaging with communities, they pursued sustainable coexistence with society as an important value. The term "coexistence" (*Sang-*

Saeng [상생] in Korean), which has its roots in biology, is often referred to as the founding value behind the CSR activities of Korean firms. It represents the close, interdependent, and complementary relationship between parties, denoting their obligation to cooperate with each other for the betterment of mutual benefits. Korean firms believe that they should operate in harmony, as well as healthily and sustainably, with society because they cannot exist without the actors composing it. Accordingly, they have practiced active and immediate action during the COVID-19 pandemic, advancing community recovery and rebuilding. The projects illustrated in Table 1 such as *Sang-Seang* fundraising for suppliers, the expansion of flexible work arrangements for employees, and the donation of money and supplies to communities represent this case.

Having a sense of community is embedded in Korean companies' pursuit of CSR activities. They are convinced that the risks and problems confronting society should be addressed by enhancing their sense of collectivity. Importantly, community resilience determines company resilience and vice versa (McKnight & Linnenluecke, 2016), implying that a company's continuity hinges on whether a community can survive a disaster and how well and how fast the community can recover from this occurrence. If companies behave for self-serving and economic interests (Crane & Matten, 2020), their continued and sustained operation would be difficult to achieve. The notion of cultivating sustainable coexistence between companies and society suggests implicit cooperation and reciprocity during times of need. This rationalizes why companies should direct endeavors to relieve society of its burdens during disasters. In turn, these deeds will be reciprocated by trust from society, which will increase the likelihood that their businesses will be sustained.

Discussion

The International Institute for Management Development (IMD, 2021) recently reported that Korea's competitiveness has gradually increased over the past 5 years. In fact, Korea was ranked 23 out of 64 countries for competitiveness in 2021. The study noted significant improvements in management practices, as Korean companies were considered "agile" (ranked 18th), business leaders were lauded as "socially responsible" (ranked 29th), and the business environment was deemed "entrepreneurial" (ranked 15th). This finding projects an optimistic outlook for the future of Korean business. The country's environment is characterized by a distinctive, dynamic culture; an affluent, talented, and educated population; and a reliable infrastructure that provides a social safety net. These attributes serve as favorable stimuli that improve the direction of business in Korea. Globalization and changes in institutional norms, regulations, and stakeholders' attitudes have led to a volatile and complex business environment in which business sustainability cannot occur without active social engagement. As this study highlights, Korean companies, particularly large-sized enterprises, should pursue sustainable coexistence and build a strong relationship of trust with society to ensure business continuity, particularly during national disasters.

This finding is valid, considering that CSR positively affects businesses by allowing companies to accrue social capital (Lins et al., 2017; Madsen & Rodgers, 2015). However, companies encounter potential risks when they manage disasters by engaging in CSR activities. In fact, shareholders may not welcome CSR activities during a disaster. CSR expenses can financially burden companies and threaten their cash flow, which may disappoint shareholders and create conflicts with them (Nguyen & Nguyen, 2015). These potential conflicts challenge companies as they implement disaster-relief CSR activities. Adding to this, stakeholders including consumers and communities have increased expectations for the CSR activities of firms, particularly large firms, and they typically expect these activities during disasters. So, CSR activities during disasters may not be reciprocated by their actual behaviors of purchasing products and services and investing in companies' businesses, the behaviors that benefit companies practically. Therefore, companies should manage potential conflicts with shareholders and find ways to leverage their social capital.

To overcome these potential challenges, companies should communicate their CSR activities effectively during a crisis with shareholders and target stakeholders. Effective CSR communication raises the awareness of shareholders and stakeholders and maximizes the benefits of companies' CSR activities (Du et al., 2010). Companies should continuously and candidly explain their long-term vision for CSR and the value of their CSR activities to stakeholders to enhance their confidence and trust in the current and future values of the company. The Korean companies investigated in this study communicated their CSR activities openly and regularly using their separate websites and media exposure. Along with strategic CSR activities, companies' continuous communication with stakeholders builds a strong rapport with stakeholders whose decisions benefit the sustainability of the companies.

Companies must also use an agile approach to their CSR activities. The extended crisis of COVID-19 has arguably changed the mindset and decision-making of stakeholders, and they are now more conscious of CSR (He & Harris, 2020). Thus, stakeholders' perspectives and decisions about companies depend considerably on companies' CSR visions and activities, which are now more important for their success and sustainability. Considering these changes in the attitudes and behaviors of stakeholders, companies should strategically design their CSRs by predicting the social needs of the target stakeholders and incorporating them into their CSR plans. As this study indicates, the CSR activities of large Korean companies during the COVID-19 pandemic showed strategic and agile characteristics. These companies discovered the social problems that surfaced during the pandemic or that the pandemic exacerbated, included these problems in their CSR agendas, and implemented CSR activities to solve the problems by using a long-term perspective. Other large companies, as well as small and medium-sized enterprises (SMEs), should also adopt this agile approach. Because SMEs are closer to the local community and promptly make decisions with their informal organizational structure and entrepreneurial character (Fassin, 2008), they should be adept as well at implementing agile CSR activities that benefit their businesses.

Conclusion

Korea has a distinctive history and characteristics in terms of CSR adoption and implementation by companies (Choi & Aguilera, 2009; Kim et al., 2013). This distinctiveness may raise questions on the CSR direction and mindset of enterprises: Are the CSR initiatives of these entities strategically designed, authentic, and sustainable? Investigating the CSR engagement of selected large Korean companies and their behaviors during the COVID-19 pandemic and reviewing the Korean literature (even if they are confined to only some large companies), this chapter attempted to address the issues of interest and provided suggestions regarding the directions to be taken in implementing CSR initiatives. The study showed that the CSR involvement of Korean large companies has evolved into a proactive process. They engage with society using a long-term and problem-solving approach. Companies identify and define the social problems that socially vulnerable individuals or groups face, and initiate long-run and systemic CSR programs to solve these problems. The value behind these initiatives is sustainable coexistence with society. The interdependence and reciprocal relationship between businesses and society enables companies to vigorously fulfill their CSR via disaster relief activities.

Undoubtedly, social engagement through CSR is important, and CSR is a business norm to which companies should comply. It should be a part of their daily operations and closely connected to their business strategies. As highlighted, “companies’ CSR strategies should be incorporated into their business strategies, and they should be improved and evolve corresponding to the anticipations of social needs and expectations. Such an agile and systemic approach to businesses’ CSR activities will benefit society, contributing to creating social values and sustained coprosperity with society” (Kim, 2022, p. 9). The COVID-19 pandemic has tested the commitment of companies to CSR and risk management (Carroll, 2021). How they respond to this crisis will determine the current and, significantly, future sustainability of their businesses. They are advised to espouse an authentic and agile approach to social engagement, as this authenticity – consistent, persistent, and proactive – is expected to reinforce community resilience, which will consequently accrue social capital for their businesses.

Abstract

The agricultural sector plays various important roles such as supplying food to people, mitigating damage caused by disasters, and conserving the landscape. Food supply, which is essential in daily life, becomes even more significant during times of emergency. Due to the spread of COVID-19, many countries face challenges in ensuring a steady food supply.

In Japan, the spread of COVID-19 caused a great deal of damage to the agricultural sector due to the stagnation of food distribution and labor problems. For instance, farmers who supplied school cafeterias and restaurants had to stop their distribution due to schools and restaurants being closed. On the other hand, the lack of labor is also a significant issue since Japanese farming enterprises were forced to cease employing several foreign workers. In addition to these problems, the decrease in the food self-sufficiency of Japan makes it difficult to ensure a steady supply of food.

e-mail: oki.misa@cc.nara-wu.ac.jp

The purpose of this chapter is to show the effects of COVID-19 on agricultural business in Japan and to determine what caused the unstable situation of food supply, with a focus on a short history of agricultural policy in Japan. Based on evidence and the lessons learned from COVID-19, this chapter suggests that restructuring the food supply chain in such a way that will foster trust between producers and consumers is significant for the future food supply. This means that thoughts of community-based disaster risk management could be important even in the aspect of food supply.

Keywords

Agriculture · Food distribution · Food and agriculture policy · Community-based food supply chain · Japan

Introduction

The agricultural sector plays various important roles, such as supplying food to people, mitigating damage caused by disasters, and helping people relax. Food supply, which is essential in daily life, becomes even more significant during times of emergency. Due to the global spread of COVID-19, many countries face challenges in ensuring a steady food supply. According to “Impact of COVID-19 on people’s livelihoods, their health and our food systems,” a joint statement by the ILO, FAO, IFAD, and WHO, the number of undernourished people, which is currently estimated at around 690 million, could increase by up to 132 million by the end of 2020 due to the pandemic. In addition, the Food Security Information Network (2020) reported that more than 800 million people around the world could not properly secure food before this crisis and that an additional 200 million would lose access to basic food and nutrition. Low-income countries or nations that rely on remittance or tourism may encounter more serious problems with regard to food shortages (FSIN, 2020).

Though the concerns regarding food which arose due to COVID-19 are often framed in the context of low- and middle-income countries, developed countries are also facing problems in the food supply. FAO showed that higher-income countries are more likely to face disruptions stemming from the supply side because of their highly integrated global supply chains and agricultural systems, which is based on capitalism. Agricultural production in many European countries and in North America relies on global supply chains to access agricultural inputs and to market their outputs (CCSA, 2020).

Under fear of food shortage and a food crisis, some countries attempted to prevent exporting their crops in order to secure food for their own nations, while others attempted to transfer labor from the third sector to agriculture in order to produce their own food. For instance, Vietnam granted rice export certificates at the end of March 2020 for the purpose of securing domestic demand (Glauber et al., 2020). FAO’s website showed that around 20 countries began imposing food export

restrictions from March to June 2020. Furthermore, the agricultural sector in most countries is also exposed to labor shortages due to mobility limitations (CCSA, 2020). The French government hired jobless people to help farmers in order to cover for foreign laborers who could not enter the country (RFI, 2020).

Japan, which highly depends on imports and foreign labor in its agricultural sector, is also facing various problems regarding food supply and labor, similar to other countries. Though Japan is a high-income country, domestic food production has been in danger of food shortage due to the decrease in the number of farmers. The purpose of this chapter is to show the effects of COVID-19 on the agriculture and food supply in Japan with reference to newspaper articles and short interview surveys and to come up with an alternative food system which will protect food security.

As for disaster management, community-based disaster risk management (CBDRM) is thought to be one of the approaches to reduce damage from any disaster. Van et al. (2018) defined CBDRM as an inclusive, active, and owned community-driven process aimed at addressing the drivers of disaster risk creation, disaster risk reduction, and societal resilience building, within the context of local and indigenous knowledge and wisdom. Though studies on CBDRM focus mainly on earthquake, tsunami, or flood, few mentioned on food supply management from the view point of CBDRM. The evidence this chapter shows from Japan would suggest the necessity of thoughts of CBDRM for food supply under disasters for any nations.

Agricultural Policy for Food Security and the Actual Situation in Japan

According to the Ministry of Agriculture, Forestry and Fisheries (MAFF), the Food, Agriculture and Rural Areas Basic Act issued in 1999 defines food security as ensuring a minimum stable food supply for citizens through increasing domestic food production and mixing the amount of imports and stock. In order to achieve this, MAFF intends to continuously analyze risks in food security in order to increase and ensure domestic food production and to prepare for emergencies. With regard to increasing domestic food production, MAFF highlights the importance of promoting domestic products through food education and the production of high value-adding food mainly for export and to expand agricultural fields which grow wheat, beans, or feed for livestock. During the Abe administration, MAFF prioritized intensifying and integrating farmland use and expanded the demand for Japanese agricultural products at home and abroad (MAFF, 2018). Through these strategies, MAFF set each self-sufficiency ratio targets at 45% for a calorie-based value and 75% for the production value to be achieved by 2030 (MAFF, 2020).

However, the food self-sufficiency ratio in Japan continues to decrease (Fig. 1). The calorie-based ratio was at 37%, while the production value-based ratio was at 66% in 2019, indicating no increase. As the calorie-based self-sufficiency ratio includes feed for livestock, the importation of feed had not declined and the

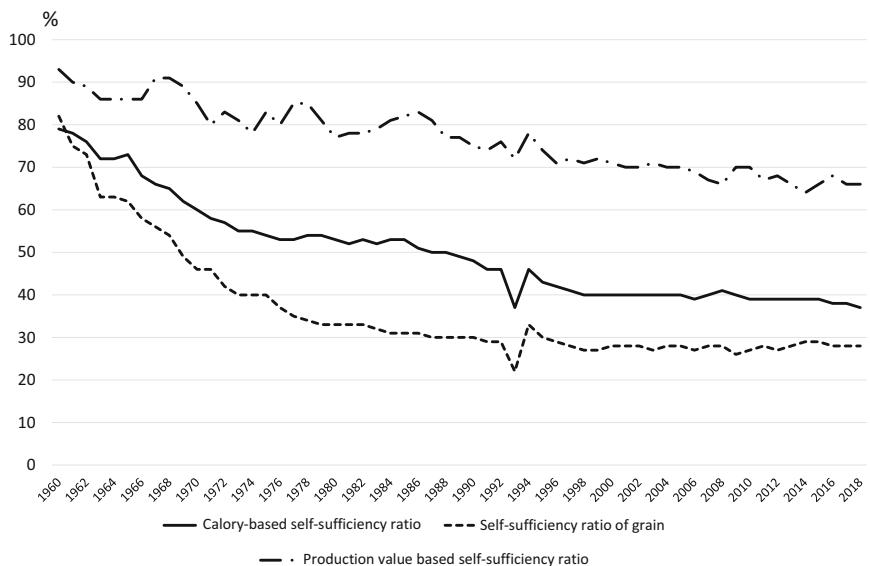

Fig. 1 Transition of self-sufficiency rate of food in Japan (%). (Source: Author created based on Food Balance Sheet of MAFF)

self-sufficiency ratio of grain is still very low. Though the MAFF and Japanese government strongly promote exporting products, the total export values of agricultural and aquacultural products have not increased significantly. Rather, the total import value of those products is much higher than their export value (Fig. 2). Japan's participation in the Trans-Pacific Partnership Agreement or other economic partnership agreements has not helped increase the export values or farmers' income. A fruit farmer in northern Kyoto said that their income from exporting fruits is almost the same as selling their fruits in Japan because exporting fruits is very costly. Despite these difficulties, the Japanese government set a goal of achieving a food export value of up to 5 trillion yen by 2030. The failure of this agricultural policy is accelerating the decrease in the number of farmers and an increase in the average age of farmers because most farmers cannot cover their living expenses by farming alone. According to MAFF (2020), the number of farms decreased to 1.189 million farms, which was lower by 2.6% compared to the previous year and by 19.2% compared to 2014, and the average age of farmers stood at 67 years old in 2019.

Due to this decrease in the number of farmers, particularly young farmers, the Japanese government began promoting the employment of foreign laborers as technical intern trainees (The Technical Intern Training Program was established as a formal program in 1993 based on the good evaluations of training programs conducted by overseas local companies and others in the form of employee education starting in the late 1960s. The objectives and purpose of the Technical Intern Training Program are to transfer skills, technologies, or knowledge ("skills, etc.")

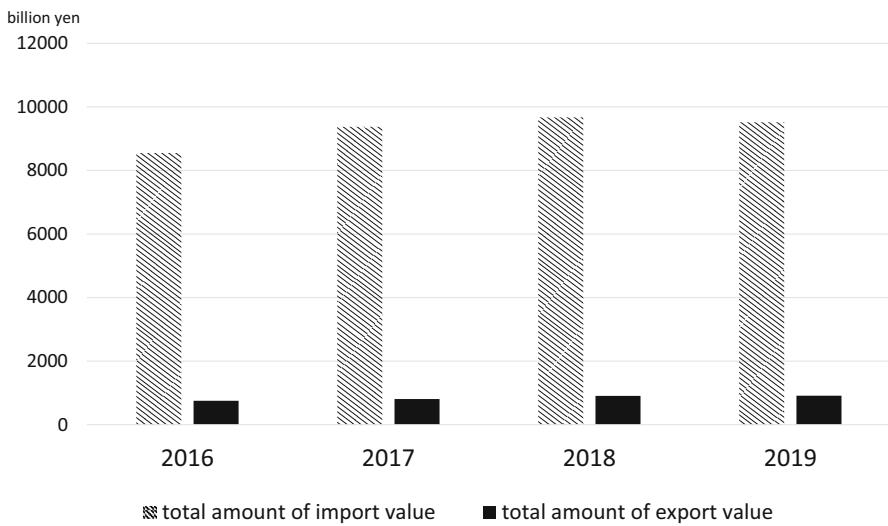

Fig. 2 The import and export values of agricultural and aquacultural products in Japan. (Source: Data was taken from the Trade Statistics of Japan, Ministry of Finance)

accumulated in Japan to developing and other regions and to promote international cooperation by contributing to the development of human resources who can play roles in the economic development of those developing regions (Source from Japan International Trainee & Skilled Worker Cooperation Organization) by deregulating policies regarding foreigners working in Japan. As a result, the number of foreign workers in agriculture is increasing rapidly, and about 90% are technical intern trainees (Fig. 3). In 2018, 27,871 trainees worked in Japan's agricultural sector, which is more than double of that of 2011.

In a way, the Japanese government has shifted agriculture to rely on the global market, which did not aid in achieving MAFF's goals for domestic food security.

Effect of COVID-19 on Agriculture in Japan

High Value-Adding Products

As the number of foreign tourists increased and high value-adding crops were expected to increase farmers' income, the Japanese government promoted farmers to shift to producing high value-adding crops to meet their demand rather than producing these as a daily domestic commodity. However, the COVID-19 pandemic directly damaged these farmers directly since many restaurants and hotels had to be closed under the declaration of emergency, and fewer foreign tourists came to Japan

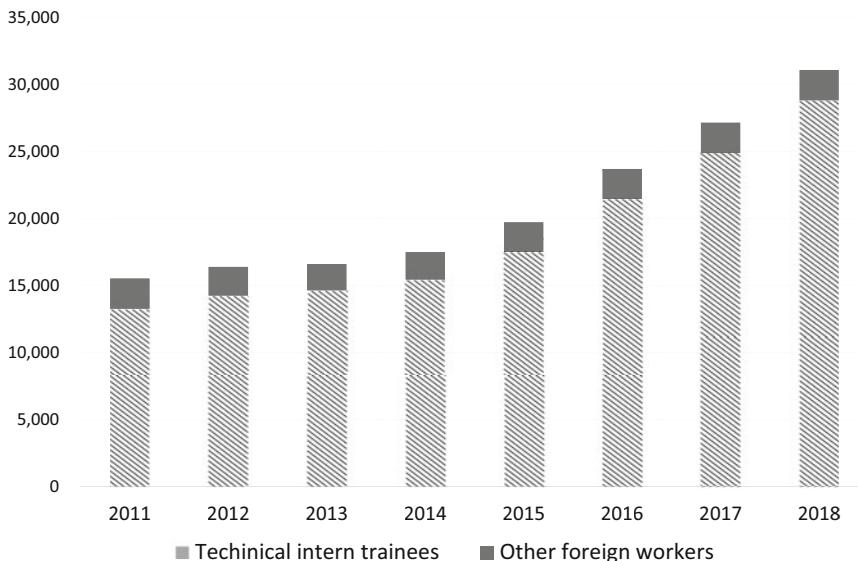

Fig. 3 The transition to foreign workers in Japan's agricultural sector. (Source: Data was taken from the Ministry of Health, Labour and Welfare)

since the Tokyo Olympic games were postponed. In particular, a lot of farmers raising Wagyu are in danger of their businesses failing.

According to MAFF's "Japanese Beef Products Guide Book," (This guidebook was issued by MAFF for the purpose of promoting the export of Wagyu) Wagyu is defined as a variety of beef that satisfies a set of stringent conditions and is incorporated into a traceability system. Though producing Wagyu was expected to increase farmers' income due to the rapid increase in the demand from inbound tourists, the pandemic shut down the distribution of Wagyu both overseas and within Japan. This reduced the price of Wagyu to 1665 yen (about 15 USD) per kg in March 2020, which was more than 700 yen (about 6 USD) less than the price during the same season last year. This means that over 300,000 USD per one Wagyu cattle was lost considering that each cow could provide up to 500 kg of beef (JAcom, 2020).

A Wagyu farmer was disappointed and said that it would be difficult to purchase calves for the next year unless one cow could be sold at over 100,000 USD (Shimotsuke Shimbun, 2020).

Aside from Wagyu, high-grade fruits for export and gifts could not be sold and resulted in losses. For example, the demand for high-grade cherries produced in the Yamagata prefecture rapidly decrease due to the pandemic, so farmers began to develop a new variety to sell as an ordinary domestic commodity. A farmer in the Okayama prefecture who produced large grapes for export mainly to Taiwan and Hong Kong thought of producing grapes for domestic demand (The Japan Agricultural News, 2020a).

Crops and Milk for School Lunch

As the demand for rice, vegetables, and milk for school lunches is usually stable, farmers who produce sufficient amounts of these foods tend to supply and distribute to schools for school lunches. The COVID-19 pandemic seriously affected these farmers since all schools were closed for a few months after a state of emergency was declared by the Japanese government.

Dairy farmers were severely impacted because almost all school lunches are served with milk and many local dairy farmers supply milk to students. For instance, in the Niigata prefecture, the amount of milk production for school lunches abruptly dropped down to 18.5 tons in March 2020, which was only 20% of production from the previous year (The Mainichi, 2020). Similarly, a middle-scale dairy producer in the Fukushima prefecture distributed 40% of their milk for school lunches but lost more than 100 million USD during March and April 2020 (The Japan Agricultural News, 2020b). The effects from the pandemic resulted in the loss of demand for tons of milk; however, farmers could not cease their production in order to meet the demand after schools reopen. While milk plants and the dairy farmers' association tried to use the milk in processed food such as cheese or butter, the MAFF encouraged consumers to purchase one more container of milk for their everyday life.

Besides dairy farmers, vegetable farmers, especially those who distributed their crops to school lunches, encountered difficulties in selling their crops. A farmer who produced Japanese mustard spinach in Tokyo usually supplied three tons of this product, 85% of which went to school lunches; however, he had to dispose of this product until schools reopened. Despite his losses, he had to keep producing these vegetables in preparation for school lunches soon after schools opened again (Sankei Biz, 2020).

Labor Problems

The labor shortage in agriculture and livestock industries is also a serious problem caused by the pandemic. More and more agricultural enterprises started to employ foreign technical intern trainees prior to the pandemic in order to secure a labor force after the Japanese government deregulated foreign labor in Japan. In 2019, the Japan Agricultural Cooperative accepted about 3200 technical intern trainees, and 2200 of them were from China (JAcom, 2020). However, the pandemic prevented about 1900 technical intern trainees from entering Japan (NHK, 2020).

In order to mitigate these problems associated with labor shortage, people who lost their jobs began to help farmers. Some staff of an old hotel in the Hiroshima prefecture went to help the farmers whose vegetables are served to guests at the hotel. They would harvest vegetables after closing the hotel. The president of the hotel thought that this was a good chance for chefs who usually cook the vegetables to appreciate farmers' jobs and their feelings (The Japan Agricultural News, 2020c).

Some private companies also sent their employees to farms in order to help farmers who faced difficulties due to the labor shortage. Japan Airlines (JAL) had to reduce the number of flights due to travel restrictions, so seven members of the Hakodate airport staff aided in harvesting asparagus for about 1 month. One of the JAL staff said that it was good to have a chance to contribute to their region. A farmer who accepted the staff acknowledged their support since few came to help as a part-time job (NHK WEB NEWS, 2020).

Likewise, some local governments supported the laborers in regional agriculture. The Shiga prefecture created jobs in the agriculture and fishery sectors for people who lost their jobs under tourism and restaurants due to the pandemic. The government provided funds for agricultural enterprises to employ temporal workers (NIKKEI, 2020). The Tsumagoi village government in the Gunma prefecture decided to fund cabbage farmers to employ domestic workers instead of foreign technical intern trainees (Jomo News, 2020).

Programs for Solving the Problems Brought on by COVID-19

Direct Transaction of Crops Between Producers and Consumers

For the farmers who suffered losses in distribution due to the pandemic, direct transactions are becoming more important. More farmers shifted to selling their crops in farmers' markets, local super markets, or over the Internet.

Some organizations including MAFF set special websites to connect consumers who would like to support local farmers with farmers who could no longer export their products or distribute to hotels or restaurants. For example, "Tabetyoku" is a website wherein farmers can directly sell their agricultural and aquacultural products with messages to their consumers. From March to July 2020, the number of farmers using the website increased from 750 producers to 2200 producers, and monthly sales also increased to 35 times its original value. This means that direct transactions are attractive for both farmers and consumers especially during the pandemic. Farmers can display the strengths and weaknesses of their crops directly to consumers and also get feedback from consumers. On the other hand, consumers can support farmers with some messages and buy the products they usually do not get from supermarkets. There are some similar websites with an increasing number of users. Toyosu Shijo, which is a wholesale market run by Tokyo City, also directly sells luxurious agricultural and aquacultural products to consumers through the Internet. In order to support these activities, MAFF funded the delivery costs of the transactions for a few months.

Producers also began to sell their crops at farmers' markets. A strawberry farmer who started to sell their product over the Internet said that many consumers who were worried about the future food supply purchased in order to support these farmers. He also set up a temporary farmer's market in front of his strawberry farm, and more consumers came to buy the fruits than was expected (The Japan Agricultural News, 2020d). Many strawberry farmers earn not only from selling

their crops but also through tourism by allowing tourists to experience harvesting strawberries. While this normally boosts farmers' income, the income is much less than before the pandemic. Therefore, the farmers tried to find consumers and local food processing enterprises to sell strawberries at discounted prices (This data is from short interview to a member of farmers' group in Asuka village of Nara prefecture on 24 November 2020).

To promote direct transactions and to distribute crops in order to reduce food disposal, MAFF and some local governments also gave information of farmers and fishermen who had to stop selling their product to their usual consumers and want to sell their products instead of throwing them away. This system benefits not only farmers and consumers but also contributes to building a sustainable food system.

Transaction Based on Solidarity

The ILO, FAO, IFAD, and WHO mention the importance of solidarity to overcome food problems caused by the pandemic in their report on the "Impact of COVID-19 on people's livelihoods, their health and our food systems." The following are examples of how solidarity helps overcome food problems.

The first is "Sanchoku," which is the direct transaction of food between the farmers' cooperative and consumers' cooperative. Most consumers' cooperatives have conducted these transactions for decades in order to deliver healthy food such as organic food, processed food with less food additives, or environmentally friendly food in a stable manner. The farmers who took part in this transaction also wanted to supply safe food produced with less chemical substance and environmentally friendly food to consumers who understood the farmers' business and lives. These cooperatives started making direct transactions at around the 1960s and have established a reliable food supply chain without distributing through the mainstream market (Kwaguchi, 1993). The members of the consumers' cooperative purchase the contracted farmers' products at a slightly higher price than that in surrounding supermarkets. In addition, consumers' cooperatives deliver products to members' houses only once a week, which enables producers to plan well and reduces losses in production. This solidarity of transaction and the delivery system played an important role during the time of the pandemic.

For example, the Ouchiyama dairy farmers' cooperative, which usually delivers milk to local schools for school lunches, could sell most of their milk to members of the Nara consumers' cooperative even though schools were closed (This data is based on short interview survey for staffs of Ouchiyama dairy farmers' cooperative and Nara consumers' cooperative on 27 November 2020). This is because the members of the Nara consumers' cooperative purchased their milk as much as possible to support the dairy farmers who had been consistently supplying milk to the members for more than 40 years. The Daisen dairy farmers' cooperative, which has made direct transactions with the Kyoto consumers' cooperative for almost 50 years, also faced similar challenges due to schools being closed, but were able to sell most of their milk through direct transactions (This data is based on short

interview survey for staffs of Kyoto consumers' cooperative on 4 December 2020). Besides dairy products, farmers producing vegetables or fruits could also consistently sell their product to consumers' cooperatives even during the pandemic without having to decrease their prices.

However, another problem arose. The number of members of consumers' cooperatives suddenly increased which affected the stable food distribution through the cooperative's delivery system. In addition, existing members consumed more products than usual during the pandemic. According to the Japanese Consumers' Co-operative Union (2020), 562,000 people became members of consumers' cooperatives from March to August, which was double than that of the previous year. Furthermore, the total sales amounted to around 226 billion yen from April to September of 2020, which was 115% higher than those of the previous year. This rapid increase in participation resulted in cooperatives not being able to distribute some food products and commodities such as masks or tissue paper to all members who ordered. This means that the continuous direct transaction and the use of this system even though it is slightly more expensive than purchasing the products elsewhere during normal times play important roles in ensuring a stable supply of products during emergencies.

Efforts of Private Social Enterprises

Some private companies aided farmers or fishermen who lost their usual places of distribution due to the pandemic.

MOS Food Services, Inc., which originated in Japan, runs about 1700 hamburger shops in Japan and abroad. The company usually sources the vegetables used in their hamburgers in Japan from domestic farmers. In order to differentiate their hamburgers from those of foreign-oriented establishments, the company has continued to engage in direct transactions with about 2700 domestic farmers who produce organic or environmentally friendly vegetables. The staff of the company and farmers sometimes interact with each other. COVID-19 pandemic damaged these farmers' management as well. The amount of shipments suddenly decreased because they had to cease their distribution to restaurants. In order to support them, the company decided to sell boxes packed with their vegetables and fruits to consumers directly through the Internet. The purpose of this program was to support contracted farmers' management and livelihood in order to ensure a future stable supply and continued customer support (Ryutsuu Biz, 2020).

Conclusion

As stable food supply and food security became a point of focus in many countries following the COVID-19 pandemic, strategies to maintain food security in each country should be considered especially under the expansion of the global market. This chapter showed that food and labor in the agricultural sector have been

globalized mainly due to government policy; however, the pandemic brought on various problems related to food supply in Japan. Evidence of damage caused by the unbalanced supply and demand of domestic food, relying too much on foreign labor, and promoting the exportation of high value-adding food taught us lessons and showed how vulnerable globalized agriculture is especially during times of emergency, even in a developed country.

On the other hand, there are various kinds of activities or programs which help farmers or fishermen who encountered difficulties in distributing their products or securing labor. There are some common features in the examples this chapter discussed. The continuous relationship among farmers and fishermen, retail, and consumers in the local food supply chain enables them to help each other even during this time of emergency. If this relationship made regular in people's daily lives, we can ensure a stable supply chain despite emergencies based on usual production and trust among the people. Therefore, policies for increasing the domestic supply and demand for usual food produced by farmers and those which support the local food system will be more important in countries such as Japan, which relies highly on imported food despite having a good potential for domestic food production.

From the aspect of disaster management, the lessons from Japan suggest that community-based disaster risk management could be significant for food supply management in order to supply food stably even in the pandemic such as COVID-19. To achieve this, participation of various stakeholders including producers, consumers, policy makers, cooperatives, or any social enterprises for restructuring the local food system would be crucial. Sharing information on local food and risks, providing education of food and food system, and building networks among various stakeholders play important roles in supplying food not only at the time of disaster but also at peacetime.

Abstract

The Covid-19 pandemic has demonstrated that countries with greater women's rights and support for female leadership exhibit more socially progressive policies and competencies when managing crisis. Throughout this tumultuous time, headlines celebrating the success of female leaders' abilities to manage the spread of Covid-19 dominated popular media prompting a reexamination of gender and leadership during times of crisis. Unique to times of crisis, those traits associated with femininity are welcomed and deemed appropriate by communities and corporations alike and are associated with strong leadership abilities. At a time when the likelihood of failure is heightened, women are often promoted into leadership positions (glass cliff). This suggests that they are being set up to fail. Whether the act of setting women up for failure is true or an unconscious gender bias, it must not be assumed that female leaders are ill equipped for the task at hand nor are they naively accepting these fallible roles. Women show a natural tendency for transformational leadership which means

they have the ability to lead with empathy and integrity and inspire followers to act selflessly for the greater good. These are the very traits that are appropriately suited for leadership roles during crises. This ability to understand followers' needs at a deeper level and act accordingly explains actions that female transformational leaders have made. The barriers in place preventing the rise of women into higher-level leadership positions in business are based on outdated concepts of gender roles. They are not based on merit. Further research needs to investigate the effectiveness of women in leadership roles during crisis situations.

Keywords

Women · Leadership · Crisis · Covid-19 · Transformational leadership

Introduction

In early 2020, the Covid-19 pandemic gripped the business world as lockdowns were launched and stay-at-home orders were commonly issued. Businesses suffered and the threat of economic downturn was felt by many organizations around the world. Throughout this tumultuous time, headlines celebrating the success of female leaders' abilities to manage the spread of Covid-19 and the effects that the pandemic was having on organizations dominated popular media prompting a reexamination of gender and leadership during times of crisis. Despite years of literature that suggests that women are equally fit for positions of leadership to their male counterparts, it is only now during the Covid-19 pandemic that female leadership traits and styles are capturing the spotlight and being applauded. But why?

A McKinsey consulting report, Women in the Workplace 2021, states that “women are rising to the moment as stronger leaders and taking on the extra work that comes with this: compared to men at the same level, women are doing more to support their teams and advance diversity, equity, and inclusion efforts” (Thomas et al., 2021, p. 5). According to the report, women are increasing their representation in corporate offices but are primarily being promoted to comparatively lower levels of management than men. It is likely that this “broken rung” in the employment ladder lies at the heart of the misrepresentation of women in senior positions (Thomas et al., 2021). The story is worse for women of color. Yet, it is female leaders who appear to be strong and vibrant leaders during times of crisis.

Although this chapter focuses on women in business, women political leaders play an equally important role and should not be ignored. Women in both sectors are faced with similar challenges when jockeying for leadership positions, and many political bureaucracies often mirror the structures of large businesses. Therefore, the impact that leaders like Margaret Thatcher, Angela Merkel, and Jacinda Ardern have during times of crisis supports this analysis of women leaders in business during these tumultuous times.

Currently there are 21 women serving as heads of state out of 193 nations globally; and there are only 41 female CEOs of Fortune 500 companies, up from

2 in the year 2000 (Spencer Sairam, 2021; Hinchliffe, 2021). Disturbingly, these numbers highlight an overarching gender imbalance and how slow the progress has been in achieving greater female representation in higher-level leadership roles.

The intent of this chapter is to shed light on why women are rising as exemplars of leadership during times of crisis. To accomplish this we will explore the concept of the double-bind, which explains how perceived gendered traits both cause the aforementioned imbalance based on gender and also how these traits paradoxically propel women into leadership positions during times of crisis. This then leads to a discussion on how women's predispositions for transformational styles of leadership are often welcomed during crisis management efforts. Finally, we will examine how a feminine society can support a greater level of organizational sustainability overall but specifically during times of crisis.

Double-Bind

Mainstream gender discourse is responsible for shaping beliefs and expectations about how men and women should speak, act, and behave (Sunderland, 2004). Traits that are believed to be inherently female are often criticized in business and government, resulting in female leaders finding themselves in what is called a double-bind. Masculine traits such as assertiveness, self-confidence, and ambition, are associated with leadership (Baxter, 2015; Haugen & Pigott, 2017), while those associated with femininity such as getting along with others, being helpful and supportive, and nurturing are seen as being weak and therefore undervalued in leadership settings (Baxter, 2015; Elliott & Stead, 2018; Zenger & Folkman, 2020). The double-bind occurs when female leaders who exhibit traits associated with femininity are seen as having inferior leadership capabilities and those who exhibit traits associated with masculinity are seen as unlikeable, mean, and unfeminine.

Yet, unique to times of crisis, those traits associated with femininity are welcomed and deemed appropriate by communities and corporations alike and are associated with strong leadership abilities (Vroman & Danko, 2020; Windsor et al., 2020). Examples of these inherently female traits have been demonstrated by numerous female political and business leaders during the Covid-19 pandemic (Luoto & Varella, 2021). Erna Solberg, Prime Minister of Norway, held a Facebook Live to explain the pandemic and answer questions from Norwegian children (Johnson & Williams, 2020). New Zealand Prime Minister, Jacinda Ardern, promised an "empathetic government" and urged citizens to be kind and caring (Johnson & Williams, 2020). Ardern has also been seen in Facebook Live addresses in casual attire with her daughter in the background, thus creating a relatable image to public viewers who are also working from home (The Guardian, 2021). Even German Chancellor Angela Merkel, who is known for her fact-based approach, showed emotion during her Covid-19 addresses (Mayer & May, 2021). On the business side, Karen Lynch, chief executive officer of CVS Health Corporation, spoke of the company's mission to be there for individuals, to improve the health of local communities and the nation, and to "[try] to help America prevail against the pandemic" (U.S. News & World

Report, 2021). Mary Barra, chief executive officer of General Motors (GM), shifted the automaker's production lines to help Ventec Life Systems make ventilators. In the company's return to work strategy, Barra asked GM's 155,000 global employees to "work appropriately" (Jones & Burho, 2021; Wayland, 2021).

Women and Leadership in Crises

Despite there being a double-bind for female leaders, in times of crisis women are often promoted into leadership positions (Barratt, 2021). Ryan and Haslam (2005) coined this phenomenon the glass cliff. A glass cliff suggests that women who are promoted to positions of leadership during times of crisis, a time when the chance of failure is highest, are being set up for failure. This can be seen as an act of scapegoating so that poor organizational performance can be blamed on poor leadership, thus providing fuel for the fire that women are not suited for leadership. Whether the act of setting women up for failure is intentional or because of unconscious gender bias, it must not be assumed that female leaders are naively accepting these potentially ill-fated roles or that they are poorly equipped for the task at hand (Barratt, 2021).

A case study conducted by Cosentino and Paoloni (2021) identified female managerial skills as major drivers of success during times of crisis and organizational resilience. Women's attitudes toward change, abilities to promote new initiatives, and abilities to maintain and create strong relationships with stakeholders were cited as being the key characteristics that helped deliver favorable outcomes. Similarly, a survey conducted by Zenger and Folkman (2019) on gender differences in areas of leadership yielded results that indicated that women were rated higher than their male peers in 12 out of 16 areas of leadership. Specifically, they noted that females most greatly outscored males in the areas of taking initiative and driving results, two skills that are required of leaders during times of crisis in both government and business. These results are supported by effective leadership research which also identifies direction-giving, meaning-making, and empathy as being essential for leaders to motivate followers (Mayfield & Mayfield, 2017).

A McKinsey consulting study during the 2008 financial crisis pointed out that organizations with three or more female senior executives scored higher in two key characteristics deemed necessary to successfully come through a crisis. The "leadership team," defined "as the ability of leaders – collectively and at whatever level – to guide and inspire action," was seen as the most important factor (Desvaux et al., 2010, p. 12). "Direction," defined as "the ability to define where a company is heading and the resources needed to get there, and unite its people in achieving this vision," ranked a close second (Desvaux et al., 2010, p. 12). When they asked what types of leadership behaviors would be necessary to propel them through a crisis, nine (9) behaviors emerged – people development, expectations and rewards, role model, inspiration, participative decision-making, intellectual stimulation, effective communication, individualistic decision-making, and control and corrective action. Of these nine (9) behaviors, their study showed that women applied people

development, expectations and rewards, role modeling, applied inspiration, and participative decision-making more than their male counterparts. The report further discovered it was those very types of leadership behaviors displayed by women that were “critical” in guiding an organization not only through a crisis but beyond it (Desvaux et al., 2010).

Despite the existence of a glass cliff and in support of the above findings, there are numerous examples when female leaders prevailed in the face of adversity. Unsurprisingly, the recent Covid-19 pandemic has produced many more. For instance, just a few months into Karen Lynch’s role of managing CVS’s Covid response as executive vice-president, it was announced that she would be promoted to chief executive officer (Peebles, 2021). Under Lynch’s leadership, CVS continues to “outperform expectations” and reported a third quarter sales increase of 10% (Japsen, 2021). In June 2020, Carol Tomé came out of retirement to assume the appointment of chief executive officer of United Postal Service (UPS) (Jones & Burho, 2021). Tomé focused on strengthening logistics for the 2020 holiday season and then later on the delivery of Covid-19 vaccines in the United States (Jones & Burho, 2021). Since the start of the pandemic, UPS has experienced double-digit percentage growth in delivery volumes annually (Jones & Burho, 2021). In February 2021, Jane Fraser was promoted to chief executive officer of Citigroup and is the first female CEO in history to run a major Wall Street bank (Hinchliffe, 2021). Previously, Fraser leads the company’s corporate strategy and mergers and acquisitions during the 2008 financial crisis (Citigroup, 2021). In the political realm, Samia Suluh Hassan was elected president of Tanzania in 2021 whereby she reversed her predecessor’s stance on Covid-19 by acknowledging it as a serious public health threat, encouraging masking, testing, social distancing, and securing vaccinations (Juma, 2021).

Transformational Leadership

Just as traits can be interpreted as being gender specific, they also align with characteristics of leadership styles. Female traits like empathy and nurturing are present in transformational, democratic, and authentic styles of leadership, whereas male traits of confidence and assertiveness are present in transactional and situational styles of leadership (KPMG, 2019). The McKinsey report similarly found that male leaders were most likely to utilize individualistic decision-making, control, and corrective action (Desvaux et al., 2010). Kotter (1990) warns that leadership styles that are aligned with rewards, like transactional leadership, become ineffective during times of crisis (Brown & Nwagbara, 2021). The parallels between gendered traits and styles extend beyond theoretical discourse as practitioner-based reports from McKinsey consulting and KPMG displayed similar findings. KPMG surveyed female executives who described their own leadership styles as being authentic, democratic, or transformational, and 58% believed that transformational leadership was required to reach senior executive levels (KPMG, 2019).

Women show a natural tendency for transformational leadership which means they have the ability to lead with empathy and integrity and inspire followers to act selflessly for the greater good. These are the very traits that are appropriately suited for leadership roles during crises (Bass, 1985; Bass et al., 2003). This is because transformational leaders often understand followers' needs at a deeper level which stems from the fact that the leaders' personal values often mirror the values held by those they lead (Brown & Nwagbara, 2021). This connection explains the actions that female transformational leaders have made (Howell & Avolio, 1993).

New Zealand Prime Minister Jacinda Ardern identified school closures as a "last resort" citing that not only do these public health measures disproportionately affect women and low-income families but also that there are negative health and educational consequences that school closures can have on children (Trevett, 2022; Aldrich & Lotito, 2020). As a woman and mother, herself, this was a decision that was likely made to help working mothers remain active in the workforce and to curtail the widening inequities between households (Aldrich & Lotito, 2020; Trevett, 2022).

This deeper level of understanding both stakeholders' and organizations' values is why we see transformational leaders in business, like Karen Lynch and Mary Barra, excel in their roles as CEOs. Karen Lynch of CVS, who as a young child lost her mother to suicide and later her aunt and guardian to failing health, is dedicated to providing access to healthcare for millions of Americans (U.S. News & World Report, 2021). Mary Barra, who started at GM in 1980 as a co-op student, has worked her way up through the ranks to the top position as CEO (GM, n.d.a, b). Due to her technical training as an engineer and years of experience understanding the company, its people, and its stakeholders' needs, it is clear why Barra continues to drive GM's success. This notion is exemplified in her simple and empowering directions for employees to "work appropriately" and "dress appropriately" (Duke Fuqua School of Business, 2021; also see Wayland, 2021). Finally, research supports that transformational leaders, as a whole, tend to deliver the best organizational outcomes (Brown & Nwagbara, 2021).

Feminine Societies

What the Covid-19 pandemic has demonstrated is that more feminine societies fare better overall (Windsor et al., 2020). Countries with more socially progressive policies, healthier citizens, greater women's rights, and support for female leadership have demonstrated greater competencies when managing crises (Windsor et al., 2020). For instance, proactive policy implementation allowed Taiwan's Tsai Ing-wen to take swift action to prevent the spread of Covid-19 early in the pandemic because of the country's experience managing the 2003 SARS outbreak (Cheng, 2021). She was also able to appeal to cultural values of citizens by stating that Taiwan would be playing an important role during this pandemic by manufacturing masks and medical supplies for the global community (Mayer & May, 2021). Nordic countries (Iceland, Finland, Denmark, Norway, and Sweden), which are known for

their progressive-social policies and world-class healthcare systems, represent 4 out of the 21 female-led countries in the world (Spencer Sairam, 2021). All of the Nordic countries have been applauded for their management of the pandemic, with the exception of Sweden which received criticism early on, as then Prime Minister Stefan Löfven opted for a herd immunity approach to managing the disease. It is estimated that this approach resulted in a death rate 3 to 10% higher when compared to other Nordic countries (Guenot, 2021). From a corporate perspective, Mary Barra (GM) advocates that by providing employees with a place of employment which allows them to feel respected and valued and provides equitable access to all opportunities, GM will be more competitive on the global scale (Duke Fuqua School of Business, 2021). Notably, GM is a leader in diversity, equity, and inclusion in the workplace and is one of the most diverse automakers globally (GM, n.d.a, b). Barra is the only female CEO of a major automaker in history, and nearly half of their Board of Directors are women. The takeaway here is that these societies and organizations are better equipped to manage crises precisely because of the diverse perspectives and skills that have resulted from equitable opportunities for women in leadership roles. It is evident that societies and organizations who wish to perform and achieve a greater level of sustainability in times of crisis would be wise to embrace female leaders, their voices, and attributes that are feminine and egalitarian.

Conclusion

Throughout the twentieth and into the twenty-first century, women have struggled to break through the glass ceiling that has kept them from executive positions in business. Gender discourse and social norms about women's abilities to lead are antiquated and continue to stifle opportunities for women to fulfill their leadership potential. In spite of the glass cliff phenomenon and the heightened chance of failure, women are highly competent leaders when presented with leadership opportunities. This may be in part due to women's natural tendency toward a transformational leadership style, a style that is ideal during times of change and uncertainty. Therefore, it is only logical that businesses should actively invite women into leadership roles especially during times of uncertainty that are brought about by crises. Upon further contemplation of this topic, we must ask, if women have the abilities to be successful leaders when the odds are against them, why are organizations still failing to provide them with opportunities for higher-level leadership under normal circumstances?

Abstract

Countries across the globe have been struggling hard to fully recover from the COVID-19 pandemic fallouts. The economies, including global supply chains at international level, are yet to stabilize and are still grappling with serious disruptions in the production of goods. Several UN reports of 2020–21 have corroborated the fact about a serious deterioration in socioeconomic conditions of diverse communities in many parts of the world, including India. India, with a population of 1.4 billion, had been caught unprepared on multiple fronts during the two waves of the COVID-19 pandemic; such as poor health infrastructure, complete

failure in preventing the death of more than half a million citizens, stopping the spread of the pandemic despite prolonged lockdown, leading to a serious breakdown in production and approximately 40 million job losses (ILO Report, 2020), and delay in procuring and rolling over supplies of vaccines in time across the country despite invoking of disaster laws in the country. This chapter provides an understanding of the Indian government's capabilities in handling the COVID-19 pandemic disaster. This work presents public policy perspectives and examines the impact of the disaster on business and traders, and decline in socioeconomic status of masses because of job losses and prolonged lockdowns. It analyzes various factors leading to awarding of financial stimulus packages for improving overall business atmosphere and schemes like free-food grain schemes and vaccination to eligible masses. The principal aim of this work is to explore the disasters providing a chance for India to turn the challenges of the pandemic into opportunities. On the whole, it highlights policy analysis, implementation slippages, political intent, and capacity to deliver. The chapter was completed under the assumption that disasters of any nature are likely to compound the problems of government agencies in a populated country like India. The qualitative research methods like case studies and content analysis of literature available in the public domain were used in the completion of the study.

Keywords

Lockdown in India · COVID-19 pandemic · Free-food scheme · Job losses in India · Aatma Nirbhar Bharat · Vaccination in India

Introduction

Countries across the globe have been struggling hard to fully recover from the consequences of three consecutive waves of the COVID-19 pandemic for two long years that engulfed the world from March 2020 to as late as March 2022. The economies world over are yet to stabilize fully even as of today, in the aftermath of serious disruptions in the production of goods and global supply chains. One of the fallouts of the COVID-19 pandemic disaster as per the UN and Indian government reports of 2020–22 has been serious deterioration in socioeconomic conditions of diverse communities in several parts of the world, including India (ILO, 2020). Manufacturing activities, along with transport movements, public or private, came to a grinding halt because of prolonged shutdowns and invoking disaster laws for effective handling of pandemic fallouts. The job losses of millions of workers because of financial instabilities, often attributed to the enforcement of stringent lockdown conditions during the pandemic disaster, resulted in the eruption of a massive migration crisis involving around 50 million workers from Mumbai in Maharashtra and Delhi to states like Uttar Pradesh, Madhya Pradesh, Odisha, West Bengal, and Bihar, thereby handling of health safety measures for masses and stopping the spread of pandemic to many other parts of the country became very difficult for the administration that precipitated the existing crisis as the road

transport sector, along with railways, was completely shut down on a countrywide basis (ILO, 2020).

India, as the second largest populated country of the world, had been caught unprepared on multiple fronts during the second wave of the COVID-19 pandemic; such as poor health infrastructure, complete failure in preventing the death of more than half a million citizens, stopping the spread of the pandemic despite prolonged lockdown, leading to a serious breakdown in production and approximately 40 million job losses (ILO, 2020), and delay in procuring and rolling over supplies of vaccines in time across the country despite invoking of disaster laws in the country.

The impact of two consecutive years (2020–21) of the pandemic disaster and devastating lockdowns in India resulted in the imposition of indefinite curfews, forced closure of schools, colleges, universities, and courts, besides businesses and other recreational places. The losses on the part of average masses in a country like India having a 1.4 billion population have been colossal on multiple accounts such as unemployment; serious disruptions in businesses; second highest number of COVID-19 deaths at the world level; loss of education; and millions slipping back to below poverty line levels.

The precipitation of a huge humanitarian crisis leading to the second highest COVID-19 deaths of children and adults attributed to the COVID-19 pandemic disaster is analyzed here by focusing on government's efforts in mobilizing men and material resources for the protection of basic human rights of masses and their right to life and personal liberty based upon dignity.

The main objectives of this research chapter are

1. To provide public policy perspectives and examine the impact of biological disaster on business and traders and decline in socioeconomic status of masses
2. To analyze various factors leading to awarding of financial stimulus packages for improving overall business atmosphere and schemes like free-food grain schemes and vaccination to eligible masses
3. To provide an understanding of the Indian government's capabilities in handling the COVID-19 pandemic disaster
4. To explore the disasters providing a chance for India to turn the challenges of the pandemic into opportunities

The chapter was completed under the assumption that disasters of any nature are likely to compound the problems of the government agencies in a populated country like India. The qualitative research methods like case studies and content analysis of literature available in the public domain were used in the completion of the study.

Prolonged Lockdowns and Colossal Business Losses

It was on March 25, 2020, that a complete lockdown was ordered in the country and a curfew-like situation was imposed throughout the length and breadth of the country. As India is a federal country, the union government invoked the provisions

of National Disaster Management Act (NDMA) 2005 in enforcing the social distancing norms as a measure for controlling the pandemic disaster on a countrywide basis. Realizing the gravity of the spread of the pandemic, the Government of India took immediate measures to prevent the spread of the COVID-19 pandemic, which included marking of containment zones; self-isolation or self-quarantine for COVID-19 patients; travel restrictions; restrictions at interstate borders; screening at airports; establishment of COVID Test centers; and lockdown of cities, districts, and rural areas; complete closure of schools, colleges, temples, malls, shopping complexes, local bazaars, gymnasiums, cinema halls, and other important facilities of public nature (The Indian Express, 2022). One positive outcome of the COVID-19 pandemic was a new innovation of allowing employees of both public and private sectors to avail work-from-home (WFH) options. This led to the birth of several new digital platforms. It also proved that digital platforms helped the government immensely in getting the right kind of information disseminated among the public so as to avoid misinformation from getting spread to the masses.

As discussed, the lockdown imposed several restrictions on the country, which included the closure of nonessential businesses in the country. It halted the movement of road transport completely, leading to serious disruptions in supply chain. India's overall economic problem got worsened because of the beginning of a year-long farmer's agitation parallel to the COVID-19 lockdown period demanding repealing of three federal farm laws, also, leading to complete rail and road blockades in and around India's capital city of Delhi. Government reports pointed out that India's real GDP growth decelerated to its lowest in over 6 years in third quarter 2019–20, and the COVID 19 pandemic posed serious difficulties to the country's economy. One of the most important steps that were taken to stop the spread of the pandemic was the imposition of national lockdown (Government of India, 2020) that was sufficient to have brought all kinds of economic activities throughout the country to a grinding halt. As a result of the pandemic disaster, very few sectors of the economy could protect themselves from the disruptions in global supply chain.

It is important to have a broader classification of essential and nonessential businesses, in general, and India, in particular.

COVID-19 Pandemic and Its Fallout

The Indian society saw a considerable impact of COVID-19 in the socioeconomic scenario. According to the International Labour Organization (ILO), almost 2.7 billion people were affected around the globe due to lockdown measures undertaken by various governments till May 2020. The ILO report identified some economic sectors that were labor intensive and employed millions of often low-paid, low-skilled workers as among the worst affected. As a result, there was a drastic reduction in working hours, wages, and layoffs, which affected around 1.25 billion workers worldwide (ILO, 2020). A high proportion of these informal workers were without access to healthcare and social protection, particularly in low- or middle-income countries, and India was no exception.

Soon after the imposition of lockdown instructions on March 25, 2020, on the basis of TV news channels reporting, one could ascertain the closure of nonessential businesses, and a large number of businesses, including industries, began experiencing a heavy decline in their sales and daily turnover. Income losses became a common feature on part of most of the businesses. As the COVID-19 pandemic showed no signs of getting controlled during the months of March–May 2020, the Indian administration had the only option of continuing with the imposition of prolonged national lockdown by invoking NDMA 2005 on a countrywide basis for preventing the spread of the pandemic (Vyas, 2020). The net result of the lockdown was forced closures of businesses without having the option of any government-supported policy programs for reversing their business losses.

Invariably, business owners had the option to either close down or remove their workers from their work till the pandemic situation was to normalize. It is pertinent to mention here that businesses like healthcare, pharmaceuticals, e-commerce, information and communications technology (ICT) services, and essential retail witnessed a considerable rise in their revenues. The digital companies were the largest beneficiaries of office work switching over to “Online Meeting” mode for decision-making across organizations. Another biggest impact of the ICT businesses was experienced when education through “online mode” was implemented all over the world in view of the safety of children during the COVID-19 pandemic. The pandemic disaster threw up opportunities for companies that were ready to develop capabilities to adapt to new challenges of a data-driven world (Hoyne, 2022). However, this chapter does not dwell upon the business prospects in terms of revenue earnings or losses as it largely focuses on pandemic disaster policy analysis, implementation slippages, political intent, and capacity to deliver.

Migrant Workers and Job Losses

A community that took the largest hit because of the prolonged lockdown while handling the pandemic disaster has been the “migrant workers” community. The problems of the “migrant workers” community are discussed next. As per one of the leading national dailies of the country, 18 lakh migrant workers had registered officially with the Punjab government during the lockdown in 2020 for going back to their native states like Uttar Pradesh, Bihar, West Bengal, Odisha, and Madhya Pradesh. However, only 5.64 lakh out of these registered migrants returned back to their native states. The most important fallouts of this pandemic disaster were that around half a million migrant workers lost their jobs and daily wages as they left Punjab and moved to their native states.

The scenario was much more fearful in the states of Maharashtra and Delhi. The business people irrespective of being big or small were faced with the problem of raising money and making salary payments to their employees. In order to compensate their losses, they had started retrenching their employees in large numbers. The consequences of job losses had serious repercussions for daily wage workers as their daily/monthly incomes evaporated fast as they could not reach up to the places of

their work because of the imposition of curfews, leading to complete transport shutdown and extension of curfews in towns and cities all over the country. The retrenchment of workers on a massive scale during the pandemic disaster resulted in the eruption of a massive migration crisis involving around 50 million workers from Mumbai in Maharashtra and Delhi to states like Uttar Pradesh, Madhya Pradesh, Odisha, West Bengal, and Bihar (*The Hindu*, 2021). This resulted in the mass exodus of migrant workers from the states of Maharashtra, Delhi, and Punjab to their native states, thereby precipitating the crisis of migrant workers on a large scale. All such negative developments were sufficient to eclipse any economic growth in the country in months to come.

The exodus of migrant workers on a large scale resulted in the raising of a hue and cry over the assembly of lakhs of workers along with their families and small children who remained stuck in the middle of national highways and expressways. The problem remained unresolved for weeks because of complete failure of the administration in arranging any type of road or rail transportation for safe exit of migrant workers because of stringent lockdown conditions. The crisis had snowballed into a humanitarian crisis, resulting in the deaths of several workers on roads and rail tracks as they were forced to undergo hardships in summers and were left to suffer by spending several nights in the open on highways without proper food and water. The precipitation of a humanitarian crisis exposed the serious weaknesses of federal as well as state administrations in the handling of a pandemic disaster in a country that is world's second largest populated country. It resulted in inviting severe criticism at the domestic as well as international levels. The problem took an ugly turn when thousands of workers began walking down to their villages covering a distance of more than a thousand miles, often involving several weeks of on-foot journey, at times without water and food. An Indian national leading daily *The Hindu*, dated November 24, 2021, highlighted the severity of hunger problem during the pandemic disaster and stated that 80% of India's population is solely dependent on federal schemes for free distribution of food grains till March 31, 2022 (*The Hindu*, 2021). One of the consequences of the prolonged losses to business and industries since the outbreak of COVID-19 was the rise in demand for an economic package being given to businesses comprised of micro-, semi-, and medium enterprises (MSMEs) by the government.

Government of India Measures for the Handling of COVID-19 Pandemic Disaster

Administrative and Financial Measures

The Government of India had operationalized the important provisions under Section 10(2)(h) and (i) of the National Disaster Management Act (NDMA) 2005 for containing of pandemics in all 28 states and 8 union territories of the country. The Indian government, since the invoking of NDMA 2005, introduced an “all-of-the-government approach” for handling of the pandemic. The Prime Minister’s Office

(PMO) reviewed the situation on a regular basis and made constructive interventions whenever the need arose. An innovative approach was adopted by the formation of 11 Empowered Groups for taking up speedy decisions and ensuring effective implementation of various response measures (NDMA, 2020). The immediate measures in response to the pandemic included the announcement of financial package for mitigating the problems of masses by the federal government besides enforcing lockdown provisions, social distancing norms, self-isolation, self-quarantine, declaration of containment zones, and putting in place adequate health infrastructure. As a result, to the hue and cry raised by opposition political parties and civil society organizations over migrant workers crisis on a countrywide basis, the Government of India announced a fiscal stimulus to a tune of Rs. 1.75 lakh crore besides other measures like reduction in corporate tax and extension in moratorium period to business houses and traders (NDMA, 2020). Some important policy measures announced are discussed subsequently.

- The financial package titled *The Pradhan Mantri Garib Kalyan Yojana* (PMGKP) announced by the federal government was targeted largely toward the poor migrant workers who had become jobless during national lockdown as a welfare measure. *The Pradhan Mantri Garib Kalyan Yojana* (PMGKP) package was an important financial intervention involving a sum of Rs. 1.70 lakh crore for the poor to help them fight the battle against the Coronavirus (PIB, 2020). The package that was announced in March 2020 was expected to help the poor by giving them the much-needed food and instant cash for meeting their other essential expenditure. The other highlights of the package announced on March 30, 2020, are as follows (PIB, 2020):
 - The government announced an insurance cover of Rs. 50 lakh for health workers in case of their death while on duty till April 2021.
 - The federal government decided to provide 800 million poor people 5 kg of food grains under the *Pradhan Mantri Kalyaan Anna Yojna* besides 1 kg of pulses free of cost from March 2020 till March 2022, with three extensions in November 2020, and May and June 2021.
 - Providing free food grain to 800 million people for close to 24 months continuously by the federal government was one of the largest food relief programs announced ever since India's independence in 1947. It must be mentioned here that this single measure of the federal government saved the lives of thousands of people across the country that helped the poor in maintaining their immunity level against the COVID-19 infection.
 - Another highlight of the grand package announced was the decision to transfer Rs. 500 directly to the bank accounts, known famously as the *Jan Dhan Account*, of poor needy females numbering 200 million in the entire country for six consecutive months.
 - The federal government also announced an increase in *Mahatma Gandhi National Rural Employment Guarantee Act* (MNREGA) wage to Rs. 202 a day from Rs. 182, which was to provide immediate help to 136.2 million families.

- The announcement of a relief of Rs 1000 to 300 million poor senior citizens, poor widows, and poor disabled was another hallmark of the financial package that was announced by the federal government.
- In order to provide relief to the farmers of the country, the government also paid Rs. 2000 in cash as a direct benefit to transferee (DBT) to farmers in the first week of April 2020 under the existing PM Kisan Yojana to benefit 87 million farmers.
- The federal government gave strict orders to the state governments to use the Building and Construction Workers Welfare Fund to provide relief to the construction workers.

The decision of providing food grains to the masses on account of the COVID-19 pandemic has been the most successful policy measure that paid rich political dividends to a political party that has been ruling at the center as well as state level in the recently concluded state assembly elections of February–March 2022.

Shielding Businesses: Government's Action Plan for Micro, Small, and Medium (MSMEs) Enterprises

In the light of negative fallouts on account of the exodus of workers and forced lockdown leading to a prolonged closure were sufficient for making a huge dent in the output of MSMEs, which are known for acting as a bulwark for the Indian economy. The MSMEs in India faced closures largely because of the reduction in orders, besides staff suffering on the account of COVID-19 infections and isolations. Many MSMEs experienced reduction in revenues through 2020–2021. Most of the MSMEs in India experienced lower productivity because of the nonavailability of temporary workers on a daily wage basis as most of the migrant workers working in MSMEs had left for their villages. As a result, MSMEs were forced to shut down their plants and run them at half capacities so as to match with reduction in demands or overcome shortage of workers. The International Labour Organisation Report highlighted the problems being faced by 1000 MSMEs surveyed from eight countries across four continents (ILO, 2020).

On demands being made from several quarters like industrial houses, various industries, and commerce chambers of the country, the union government announced a series of measures for the MSMEs only. The Ministry of MSMEs, Government of India, released a policy guideline document titled “Efforts to Fight COVID-19 by Ministry of MSME & its Attached/Subordinate Organisations” containing several measures for the affected businesses. The measures taken by the Government of India in this direction covered issues like improving cash flows by providing interest-free loans; payment of cash for loss of wages to workers; and dissemination of information to MSMEs for dealing with the COVID-19 pandemic besides training MSMEs for producing new products such as sanitizers, PPE kits, face masks, and other essential medical equipment for which demands during the pandemic had increased (MSME Report, 2020–21). The measures announced by the Government of India for the MSMEs were expected to help MSMEs to sustain their businesses on

a medium- to long-term basis. It is important to mention here that one of the important positive fallouts of the COVID-19 pandemic disaster on Indian MSMEs was that many of the MSMEs with government support switched over to manufacturing medical products such as N-95 face masks, PPE kits, sanitizers, gloves, and face shields for which there was a huge surge in global demands for such medical products besides pressure for meeting domestic demands. The net result has been that many innovations were experienced on the part of Indian business houses that had a positive impact on sustenance of business on a long-term basis besides an increase in their business turnovers.

The role of the Reserve Bank of India also has been important for the sake of fighting COVID-19 fallouts. The RBI Governor Shaktikanta Das introduced new measures to tackle the second wave of COVID-19 on May 5, 2021. The governor announced on-tap liquidity funding of Rs. 50,000 crore as a credit facility to be offered to banks, non-banking finance companies (NBFCs), and other lending institutions. This funding support has been in the form of incentivized loan schemes that was offered to the enterprises engaged in the healthcare, manufacturing, and logistics sectors. It was added that vaccine manufacturers, hospitals, medical equipment makers, as well as patients shall be offered loan schemes by the private and public sector banks, NBFCs, micro finance institutions (MFIs), and small finance banks (SFBs). As analyzed in the preceding paragraphs, the government had enough reasons to remain satisfied that losses to the economy will be halted after the disbursal of relief package to the business houses and other entrepreneurs. However, the overall predictions about the economy were not very satisfactory as discussed subsequently.

Repercussions of Prolonged Lockdown on Businesses (Post-Financial/Relief Package)

Reports of economic think tanks like the Centre for Monitoring Indian Economy (CMIE) cast serious doubts about the resumption of normal operations on part of a large number of companies expected to be capital-intensive sectors such as real estate, consumer durables, and jewelry were to see a considerable decline in their demand for several months to follow. Data from the Consumer Pyramid household-level survey of the CMIE showed a loss of 122 million jobs in India during the first month of the pandemic. “The employment rate was 39.1% on 22nd March, 2020 which declined to 26.4% on 3rd May, 2020 before improving to 37.8% on 21st June, 2020. A survey by Azim Premji University showed that 57% of rural workers and 80% urban workers lost work during lockdown. Around 77% of the households consumed less food than before. Thus, livelihoods of millions of workers were affected and it would take longer time for them to recover from this economic shock” (Vyas, 2020).

Mahesh Vyas, a noted economist, further added that “a large number of firms will however struggle to survive. They have to pay rents, salaries, debts etc., even as their revenues will steadily keep falling as people change lifestyles and cut back on expenditures. Many of these firms will end up defaulting on their loans due to

persistent fall in revenues" (Vyas, 2020). Going by the forecasts made by CMIE, one could conclude that besides domestic problems, the Indian economy was to continue to get affected by the disruptions in global supply chain, leading to recession for the next several months to follow.

Major Policy Interventions for Sustaining of Business

India's Resolve Under "Self-Reliant India" (*Aatma Nirbhar Bharat*) Program

Despite the continuance of border crisis with China, India in tune with its foreign economic policies undertook several federal legislative measures so as to emerge as an alternative global supply chain hub, and it announced "Self-reliant India" (*Aatma Nirbhar Bharat*), a policy framework for making India a self-reliant country. There was a line of thinking that COVID-19 has thrown up important opportunities for the country. India has the potential to emerge as an alternative to China against whom the Western world was skeptical because of its alleged role in not alerting the world about the leakage of Coronavirus from Wuhan Lab in October/December 2019. As discussed in the earlier MSME section that the Indian government gave a number of incentives to companies for switching over to producing face masks, PPE kits, and sanitizers for which there was a surge in global demand. The pandemic disaster mitigation plan provided the federal government an opportunity to get a series of economic, banking, and labor laws enacted, including the farm laws, during the pandemic despite opposition parties accusing the government of bypassing parliamentary norms of not having carried out intense discussions over important bills inside the parliament.

Prime Minister Narendra Modi on May 12, 2020, announced the special economic and comprehensive package of Rs. 20 lakh crore, whereby he called for *Aatma Nirbhar Bharat* or Self-Reliant India Movement. The five pillars of *Aatma Nirbhar Bharat* – Economy, Infrastructure, System, Vibrant Demography, and Demand – were also put forward by the prime minister (PIB, 2020). However, prolonged lockdown and shutting down of several MSMEs, tour, travel and entertainment industry, including job losses on part of millions of people, resulted in a major embarrassment for the federal government.

Challenges for Policies Dealing with Pandemic Disaster

Policy Slippages

Things happened contrary to the Indian government's line of thinking as it was upbeat after the announcement of a big relief package for the micro, small, and medium sector under the impression that relief package will lead to turning around of MSMEs. The government was also hopeful that any turning around in the MSME sector has the potential to strengthen the socioeconomic growth of the nation by

providing solution to the unemployment problem of the country at local level. The policymakers were of the view that such measures will decrease the inequalities between the geographic areas in terms of economic imbalances. Further, the inclusive pattern of sustainable growth of the MSME sector will provide employment opportunities at the local level, which will lessen the population load at megacities. It would not be wrong to say that the COVID-19 pandemic preceded slowing down of India's overall GDP growth, and unemployment had emerged as one of the worst challenges to the country's economy.

While governments world over, including the Indian government, were busy mitigating the challenges of COVID-19 by announcing a series of measures for stopping the spread of the pandemic and getting the rehabilitation program for migrant workers implemented, India got stuck with its largest northern neighbor China over precipitation of a border crisis in East Ladakh in May–June 2020, leading to the deaths of more than two dozen Indian soldiers in June 2020. The crisis in the Line of Actual Control (LAC) area continues even as of today in April 2022. The crisis in the LAC area has witnessed mobilization of more than a hundred thousand Chinese soldiers faced with around 60,000 Indian soldiers with heavy weaponry and setting up of several hundred permanent structures on both sides of LAC, thereby turning the Line of Actual Control (LAC) area into a permanent battle front as of April 2022. It can be added here that even after 22 months of Galwaan crisis and the culmination of 15 rounds of talks for de-escalation and disengagement of forces from the LAC, stalemate continues between India and China over complete withdrawal of forces pre-May–June 2020 period that has not taken place yet. The developments in Afghanistan after the exit of US forces in August 2021 have also contributed to disturbing the peace and security in the South Asian subcontinent.

All these developments severely curtailed India's capacity of handling the COVID-19 pandemic for the next several months to follow. It is unfortunate to mention here that while governments are today still busy handling the third phase of the COVID-19 pandemic in January–February 2022, another war between Russia and Ukraine had started in March 2022, raising a serious disruption in international order. A vertical split has taken place between countries having faith in the maintenance of a liberal international order versus those opposed to the existence of a liberal international order as champions of authoritarian policies. The ongoing war between Russia and Ukraine has led to the announcement of imposition of several economic sanctions by the United States and its western allies against Russia, which in turn has resulted in a panic situation in stock markets world over besides raising the prices of oil and gas across the world.

Election Results in Five Indian States Validated the Satisfaction of Beneficiaries of Government Measures in Post-COVID-19 Situation

It is pertinent to mention here that a prominent think tank of India, the Centre for Study of Developing Societies-*Lokniti* (CSDS-*Lokniti*), which is known for conducting pre-poll and post-poll surveys in India for the past several decades,

validated the satisfaction of average beneficiaries of government measures implemented during and after the COVID-19 situation in all five states of India that underwent State Assembly Elections in February–March 2022. Going by the media reporting for the past several months, there was a strong undercurrent that the ruling Bhartiya Janata Party (BJP)-led governments in at least four Indian states – Uttar Pradesh, Uttarakhand, Manipur, and Goa – will lose State Assembly Elections in February–March 2022 massively because of anti-incumbency factor attributed to the mishandling of the COVID-19 pandemic. However, as per the post-poll survey conducted by CSDS-Lokniti in the largest populated state of India, i.e., Uttar Pradesh having a population of 230 million, where the highest number of COVID-19 deaths took place, the ruling BJP party won elections and formed government again by overcoming anti-incumbency factor in all four states – Uttar Pradesh, Uttarakhand, Goa, and Manipur, except Punjab state (*The Hindu*, March 12, 2022). As per the CSDS-Lokniti post-poll survey, people in all five states expressed their satisfaction with the union government's measures of cash transfer and distribution of food grains to almost 80% of households in the country, including states where elections were held in February–March 2022. It was surprising to know from the CSDS-Lokniti survey that people exonerated the government of its mishandling of the COVID-19 pandemic disaster, telling that it was divine force that was responsible for the outbreak of the pandemic for which no government can be blamed (*The Hindu*, 2022). Hence, the majority of people voted for the same ruling BJP party. Going by the outcomes of March 2022 elections, it can be inferred that the people of the country are ready to forget the past mistakes of government agencies and once again are ready to refocus their energies on building a safer, economically sound, and disaster-resilient India.

Conclusion

The COVID-19 pandemic resulted in major disruptions in a country, which is the world's second largest populated country. The disruptions were attributed to the mass exodus of migrant workers resulting in a huge shortage of workforce all over the country. The largest sufferers were those working in the construction sector, transportation sector, and unskilled manufacturing sector. The prolonged lockdown broke the financial spinal cord of most of the MSME sector. There has been a long spell of instability in the stock market. A large amount of FII investment left the country. Even the foreign exchange reserve of the country came down by several billion dollars. Different restrictions on international trade also led to a massive disruption in global supply chains. On the whole, economy got badly affected, and it aggravated the unemployment crisis besides the demand problem. Government agencies tried their best to cope with the situation but the problem was monstrous and corresponding relief measures were inadequate. The personal losses on part of the average masses were immense. To date, masses are passing through the psychological trauma of COVID-19 pandemic in the country. People are guilt-conscious about having failed in saving precious lives of their family members/relatives, but

because of inadequate health infrastructure in the country millions of lives could not be saved. At times, even a dignified burial could not be given to the departed souls.

Things might be getting normalized as we approach April 2022, but the memories are still fresh. Innovation in the case of digital platforms besides development of several versions of COVID-19 vaccines has been the highlight of the entire pandemic period. However, children world over have lost immensely as they remained out of school education process for almost 2 years, thereby crippling their several learning abilities on a long-term basis. The pandemic disaster mitigation plan provided the federal government an opportunity to get a series of economic, banking, and labor laws enacted, including the farm laws, during the pandemic despite opposition parties accusing the government of bypassing parliamentary norms of not having held intense discussions over important legislative bills. India's problem had got further worsened because of the beginning of a year-long farmer's agitation demanding repealing of three federal farm laws also leading to complete rail and road blockades in and around India's capital city of Delhi. It can be concluded that the COVID-19 pandemic was indeed a disaster of the twenty-first century that must have reminded humanity across continents to still remain awakened to the idea of not destroying the planet before we ourselves get destroyed.

Abstract

The food and beverage (F&B) industry in Hong Kong has faced a very difficult situation during the pandemic. Dining in F&B establishments is considered one of the major channels to spread virus as people must remove face masks when they are having meals. Lockdown's direct impact on F&B industry has been phenomenal. Thus, there have been much restrictions to the F&B industry during this time. In 2020, the receipt value index of F&B establishments dropped by nearly 30%, but the receipt value index increased by 43% in Q3 of 2021 as social distancing measures have been relaxed. It showed that the industry could overcome the impact of the COVID-19 pandemic by implementing appropriate approaches. Thus, this chapter aims to review the COVID-19 impacts on the F&B industry and the measures imposed by the Hong Kong SAR Government on the operations of the F&B industry. It also discusses how the F&B industry in Hong Kong responds to the impacts of the COVID-19 pandemic. Secondary data

used in this chapter were collected from government reports, publications by public agencies and trade associations, etc. Overall, it is important to analyze how the F&B industry in Hong Kong has responded to the pandemic to stay afloat and what factors can contribute to help F&B establishments recover from the COVID-19 pandemic.

Keywords

F&B industry · COVID-19 pandemic · Disaster risk management · Crisis · Hong Kong

Introduction

The COVID-19 pandemic first started in late December 2019 and quickly spread all over the world in 2020. It has not only been a health issue but has also caused much adverse impact on the global economy as well as the daily life of people across countries. It has been a “disaster” to the whole world.

Hong Kong, as an international city, has been inevitably affected by the unfavorable impact on the global economic environment. The economy in Hong Kong was contracted by 5.5% in 2020 (Hong Kong SAR Government, 2021a). It was noted that the impact of the COVID-19 pandemic on the economy of Hong Kong was across all industries and sectors and at both national and international levels.

In order to prevent the spread of COVID-19, the Hong Kong SAR Government has implemented various social distancing and safe management measures, for example, prohibition of large group gathering, etc. (Hong Kong SAR Government, 2021b). Most of the business sectors have been greatly affected by the pandemic situation. Food and beverage (F&B) establishments (e.g., restaurants, food courts, etc.) have been considered as one of the major platforms in spreading virus as people could not wear face masks when dining at F&B establishments. Hence, some strict measures have been imposed on the operations of the F&B industry, including limited number of customers per table, limited total number of customers, and also restriction of the opening hours for dine-in services, etc. Thus, the value of receipts or the revenue in the F&B industry decreased by 29.4% in 2020 (Hong Kong SAR Government, 2021c).

The pandemic situation in Hong Kong was alleviated in the second half of 2021. The number of confirmed cases mainly was imported cases since 1 July 2021. There were only a few local cases from 1 July to 13 November 2021 (Hong Kong SAR Government, 2021d). These cases were discovered early, and they were under quarantine, and thus the possibility of spreading the virus to others was not high. Given the situation, F&B establishments have taken several measures to manage the adverse impacts caused by the pandemic in order to stay sustainable. As a result, the value of receipts in the F&B industry increased 10% and 43.8% in Q2 (the second quarter) and Q3 (the third quarter) of 2021 (comparing with those in 2020), respectively. The actual value of receipt in Q3 of 2021 was just 5.6% less than Q4 of 2019

(i.e., before the outbreak of pandemic) (Hong Kong SAR Government, 2021d). It showed that the F&B industry has gradually recovered from the impact of the COVID-19 pandemic.

The following sections are intended to illustrate how the Hong Kong SAR government has prepared for disasters and crises and the measures stipulated by the government to respond to the COVID-19 pandemic. It is important to discuss such measures as they have affected the operations of the F&B industry. Specific measures taken by the F&B industry to mitigate the negative impact of COVID-19 pandemic are also discussed. In addition, this chapter also proposes some recommendations for the industry to deal with future crises or pandemic situations.

In general, the global economy and Hong Kong's economy become uncertain under the current situation when Hong Kong is overwhelmed with new waves of COVID-19. Thus, it is important to understand the effectiveness of current measures taken by the F&B industry in order to propose how the industry can better prepare for the current and future outbreaks.

The COVID-19 Pandemic and Hong Kong's F&B Industry

The F&B industry plays an important role in Hong Kong's economy. Although the contribution of the F&B industry to the GDP was around 1.9% in 2019 (Hong Kong SAR Government, 2021e), the percentage of employees in accommodation and food services sectors was 7.6% of the total employees in 2019, which was higher than the number of employees in the finance industry and the top five industries (Hong Kong SAR Government, 2021f). Thus, when the F&B industry faced difficult phase in the pandemic and decreased its revenue, it had a great impact on the unemployment rate in Hong Kong. After the outbreak of the COVID-19 pandemic, the number of employees in the industry was reduced to around 52,000 from 2019 to 2020, which was around 1.5% of the total number of employees in Hong Kong (Hong Kong SAR Government, 2021f). In other words, the F&B industry is a major player in the labor market in Hong Kong.

Due to the measures taken by the government and customers' declined incentives to dine in F&B establishments, the total revenue of the F&B industry declined from HK\$26,001 million in Q4, 2019, to HK\$19,729 million in Q1, 2021, and the F&B industry's unemployment rate increased from 5.2% to 11.3% (Hong Kong SAR Government, 2021c). This reflected that the F&B industry has faced many challenges in the pandemic.

Measures Taken to Address Issues Associated with the COVID-19 Outbreak

Since the confirmed case was reported on 23 January 2020 (Hong Kong SAR Government, 2021h), the Hong Kong SAR Government has taken various measures to prevent the spread of the virus. Due to the unfamiliarity with the virus and the

scale and the prolonged pandemic, Hong Kong people felt stressful and anxious (Kwok et al., 2020), and they have taken many measures, at the personal level, to mitigate the impact of the virus. As mentioned earlier, the measures taken by the Hong Kong SAR Government deemed effective as of the end of 2021 as the number of local cases were three only from 1 July to 13 November 2021 (Hong Kong SAR Government, 2021d).

The Hong Kong SAR Government has imposed several measures to restrict the operational mode and working arrangements, including the operations hours of dine-in services, the number of customers per table, and the total number of customers in each outlet (Hong Kong SAR Government, 2021g). Those measures have been changed from time to time based on the pandemic situation in Hong Kong. As a result, the F&B industry has tried to adapt to government regulations in terms of changing the operational arrangements, and it has become more flexible and agile in the last two years.

One of the objectives of the preventive measures is “to clear infected case” in Hong Kong. Therefore, some of the measures were very strict and mandatory. For example, the period of quarantine measures for inbound travelers is around 14–21 days based on the place where travelers board the plane (Hong Kong SAR Government, 2021i). This is one of the longest quarantine periods in the world. In addition, the Hong Kong SAR Government has also imposed restrictions on dine-in services at F&B establishments in Hong Kong, including the operating period for dine-in services, the maximum capacity of customers for dine-in services, the number of customers per table, and the requirements for air-conditioning systems, because a number of confirmed cases were considered as being infected when dining in F&B establishments. However, in some periods of time, some strict measures were imposed that aroused a lot of negative comments and objection by stakeholders, for example, no dine-in service provided by F&B establishments. However, the Hong Kong SAR Government immediately lifted the ban (Yu, 2020). Yet, many preventive measures, including limiting the maximum capacity of F&B establishments, vaccination requirements on customers and staff, the number of diners per table, the functions and setup of air-conditioning systems, and others, still affected the operations and revenue of the F&B industry during the pandemic period.

F&B establishments have been considered one of the major channels to spread the virus of COVID-19 because customers must remove face masks in the F&B outlets when having meals. As a results, some customers have not been willing to dine in. To respond to the current situation, some F&B establishments took initiatives to implement several specific measures to mitigate the impact of the government’s safe management measures. For instance, F&B establishments’ owners and managers put some plastic boards on large tables to subdivide the large tables into several small tables in order to accommodate more customers as well as minimize contact among customers. Customers were encouraged to use hand sanitization when entering the premises. In addition, they provided more discount for take-away orders in order to attract customers who feared dining in the premises. Some F&B establishments provided instructions on how to cook at home as their food could only be served and consumed immediately right after being cooked.

Disaster Risk Management Framework

Disasters, including unexpected and unavoidable events, could be man-made or natural. Both types of disasters would produce huge negative impact on society (Faulkner, 2001; Ha, 2014a, b; Ha et al., 2019, 2020; Moore & Lakha, 2006). In view of the great damages caused by disasters, academics, researchers, and industry practitioners always ask stakeholders for better preparation and readiness to deal with such disasters. Khorram-Manesh (2017) suggested that preparation, damage mitigation, rehabilitation, relief, and reconstruction could be included in the disaster risk management cycle. Other scholars suggested similar stages and elements in the disaster risk management cycle (Oktari et al., 2020; Alexander, 2019; Pheng et al., 2006), for example, disaster preparation, relief, reconstruction, and damage mitigation. The United Nations (2004) also developed a framework for disaster risk reduction, including preparedness, early warning, risk assessments, recovery, knowledge development, and responses. International professional bodies, such as the International Organization for Standardization (2021), also developed standards, for example, ISO22320:2018 (Guidelines for Incident Management), for organizations to adopt and to prepare emergency management. This chapter adopts the simplified four-stage framework of disaster risk management, namely, mitigation/prevention, preparedness, response, and recovery, discussed by the World Health Organization (n.d.) (Fig. 1).

It is important for the governments, industries, and organizations to well prepare for risk and managing disasters because individuals rely on the instructions and advices from the authorities and relevant organizations during the occurrence of disasters. It was highlighted that individual preparedness could help to reduce the damages caused by disasters (Adams et al., 2019; Sawalha, 2020).

Hong Kong went through the outbreak of severe acute respiratory syndrome (SARS) in 2003, and thus the Hong Kong SAR Government and the Hong Kong people have vast experience in handling the issues of containing the spread of virus. However, the speed, COVID-19 variants, and the channels of spreading of the COVID-19 virus are unconventional and thus have affected the effectiveness of the preparation taken by the respective stakeholders.

In this chapter, secondary data was collected for analysis. The data was gathered from the publications of the Hong Kong SAR Government, international organizations, public agencies, and trade associations. All data is available to the public. Special care was taken to avoid ethical issues arising from data collection, use, analysis, storage, and retrieval.

Fig. 1 Four stages in disaster risk management

Findings and Discussion

Since the outbreak of the COVID-19 in early 2020, Hong Kong's economy has suffered, and the gross domestic product (GDP) decreased by 5.5% in 2020 (Hong Kong SAR Government, 2021a). The private consumption in 2020 decreased by 9.4% which, in turn, greatly affected the F&B industry. In addition, the preventive measures imposed on the F&B industry has heightened the burden of the industry as the capacity and operating hours have been greatly reduced besides a small demand. Thus, the revenue of the F&B industry decreased by 29.4% in 2020 (Hong Kong SAR Government, 2021c).

Even though the measures taken by the Hong Kong SAR Government seem strict, they were considered effective with regard to managing the pandemic situation. Most of the confirmed cases were from inbound travellers, and there were just a few local cases (Hong Kong SAR Government, 2021d). Given the stable situation, the Hong Kong SAR Government removed some of the preventive measures on the F&B Industry with some conditions, for example, F&B establishments' employees must be fully vaccinated, employees and customers must use the "LeaveHomeSafe" mobile application, etc. When the F&B establishments fulfilled the stipulated conditions, the operating time and the maximum capacity can be restored.

Four Stages of Disaster Risk Management

The disaster risk management framework (Fig. 1) discussed previously is used to analyze the measures and responses by the Hong Kong SAR Government to the COVID-19 pandemic.

In the first stage of risk mitigation or prevention, the Hong Kong SAR Government has taken actions in advance. The preventive measures might not be very effective in the early stage. Thus, the government has adjusted the respective policies and imposed more restrictive measures in order to reduce the number of confirmed COVID-19 cases in Hong Kong. Some of the restrictive measures might affect the life of many people in Hong Kong, both locals and foreigners, for instance, the extension of quarantine period for inbound travellers and those who have close contacts with infected cases, the requirements to undergo COVID-19 testing, the introduction of the vaccination program, etc. (Hong Kong SAR Government, 2021b, 2021i). This aimed to mitigate the impact of the COVID-19 pandemic in Hong Kong. This demonstrates the ability and willingness to fulfil one of the stages of the disaster risk management process which is risk mitigation. Therefore, the number of confirmed cases and death cases did not increase significantly comparing with those in other countries (World Health Organisation, 2021). As the situation became stable and normal in Hong Kong, the Hong Kong SAR Government relieved some of the measures, and the life of Hong Kong people returned to the normal situation, except outbound travel. As a result, private consumption in Q2 and Q3 of 2021 increased by 6.3% and 6.5%, respectively (Hong Kong SAR Government, 2021c), and the F&B industry started picking up in sales.

The second stage in the disaster risk management framework is preparedness. Even though the outbreak of the COVID-19 pandemic was unexpected, Hong Kong had already prepared for the outbreak of similar situations after the SARS outbreak in 2003. Such preparation includes the establishment of an infection disease control center, investment in manpower, training for infection control, and increase in the stock of personal protective equipment (Hong Kong SAR Government, 2003). This aims to help Hong Kong to combat with the COVID-19 pandemic. Other than the government's measures, having gone through the SARS outbreak, F&B industry's employees have taken proactive measures to maintain personal hygiene during the COVID-19 outbreak, including wearing face masks whenever necessary, using hand sanitizer, keeping social distances, etc.

In the third stage of response, the Hong Kong SAR Government has addressed the issue promptly by the implementation of social distancing measures and the restriction of inbound travellers. In addition, the Hong Kong SAR Government has searched and purchased medical equipment from around the world as well as provided subsidy for local manufacturers to produce epidemic preventive necessities such as face masks.

In the last stage of recovery, to revive the economy from the outbreak of COVID-19, the Hong Kong SAR Government has introduced several policies to stimulate private consumption and protect jobs, including *Consumption Voucher Scheme* and *Employment Support Scheme* (Hong Kong SAR Government, 2021j, k). The effectiveness of these two schemes could be reflected via economic growth. The GDP in the first three quarters in 2021 increased to 7.7%. At the same time, the unemployment rate in 2021 decreased from 7.2% to 4.1% (Hong Kong SAR Government, 2021l, o). It exhibited that Hong Kong's economy has been rebounding after being hit by the *COVID-19* pandemic (Lee, 2021).

F&B Industry and the COVID-19

Besides measures introduced by the Hong Kong Government, the F&B industry has also taken industry-specific measures to mitigate the impact caused by the COVID-19 pandemic. As dine-in service has been restricted by safe management measures and other government policies, and the demand for dine-in has also declined, the F&B industry has tried to expand their take-away services in order to sustain their business. Due to manpower shortage, food quality, and cost considerations, few F&B establishments focused on take-away service in the past. However, they had to look for alternative ways to maintain their business. Recently, online shopping has become a popular trend, and more Hong Kong people have made online purchases, especially during the pandemic. More than 2.6 million Hong Kong people have experienced in online shopping, and around 650,000 people have purchased and/or ordered food online (Hong Kong SAR Government, 2021m). In addition, some online food delivery companies, such as Foodpanda and Deliveroo, have expanded their operations in Hong Kong. This has helped F&B establishments deliver their food to their customers and to reduce the manpower requirements.

F&B establishments have also rearranged the setup and layout of their outlets/premises to fulfil the requirements stipulated by the government and cater to the needs of customers as well as create a safe dining environment for their customers and employees. Moreover, many establishments have modified their cooking styles and food packaging in order to maintain food quality for take-away service. Some establishments have reduced the floor areas and the size of the tables in order to contain costs. The number of licences issued to general restaurants and light refreshment restaurants increased at the end of 2020 (Hong Kong SAR Government, 2021n). It demonstrated that the F&B industry has gradually recovered. The recovery of the F&B industry from the impact of the COVID-19 pandemic is supported by the statistics published by the government. The revenue of F&B establishments in Q3, 2021, was around 5% less than the one in Q4, 2019 (before the COVID-19 outbreak) (Hong Kong SAR Government, 2021c). It was expected that the F&B industry would reverse to the normal situation by the end of 2021 (Magramo, 2021).

Overall, the Hong Kong SAR Government has prepared for future pandemics after the SARS outbreak in 2003. As the preparation for risk and damage mitigation was in place and well organized, the implementation of relevant policies was more effective. Importantly, the F&B industry has demonstrated their resilience and adaptability in terms of changing their operating mode, cooking styles, food packaging, and other arrangements to respond to changes in the external environment. It should be noted that technology adoption and the internet have greatly contributed to building the F&B industry's capabilities that enable it to stay competitive and be sustained. The emergence of online food delivery applications and the trend of online shopping have also helped the industry expand their take-away service. However, the effort and activities of the F&B industry have centered around the response and the recovery stages (the third and the fourth stages) in the disaster risk management framework.

Managerial and Practical Implications

Disasters and crises could occur anywhere and at any time. It is very difficult to predict the occurrence and reoccurrence of such incidents. A good understanding of disaster risk management would help government officials, managers, and other stakeholders well prepare for disasters and crises. Even though preparation might not be able to prevent damages, it could help countries and industries mitigate the damages caused by such disasters or crises. At the industry level, the F&B industry needs to prepare for future disasters in a more proactive and effective manner. The industry needs to start the preparation from the mitigation state (the first stage of the disaster risk management process), and it should be ready to respond to disasters and crises any time.

In addition, the adaptability and flexibility of an industry and its members are very important in today's business environment. Technology innovation and implementation, including AI, big data, and data analytics, could help organizations to adapt to changes in the external and internal environment (Ha, 2014a, b). Thus, the

industry should encourage F&B establishments to increase technology adoption in order to lighten their manpower needs in terms of acceptance and delivery of orders, creating new menus to provide more options for take-away orders, etc. Operational analytics should also be applied to help them improve their operational efficiency, especially during times of crisis.

In order for F&B establishments to adopt technology to respond to adverse situations in an innovative manner, for example, improving packaging which can help to maintain the quality of food when delivering to a remote destination, improving the customer queueing system, calculating the duration required for dining in by each customer, etc., trade associations in the F&B industry can help to coordinate and support the development and implementation of industry-specific technology. Importantly, training and education can help operators of F&B establishments to be ready for change and be more confident in operating new technology. Training and retraining employees are also critical in improving employees' competency and skill sets that, in turn, can help them improve their employability.

Finally, some big establishments faced more difficulty during the COVID-19 pandemic because their operational costs were too high and take-away services could not cover the sharp decrease in their revenues in dine-in services. As a result, it is important for F&B business owners and managers to look for alternative business opportunities as well as become more adaptive and flexible in doing business, i.e., exploring business diversification.

Conclusion

Disaster risk management is very important in today's business. This chapter discusses how the F&B industry has been impacted by the COVID-19 outbreak and safe management measures. It also elaborates how the F&B industry has responded to the COVID-19 pandemic by complying with the measures stipulated by the Hong Kong Government as well as adopting measures that are specific to the industry. It should be noted that early and ongoing preparation for all the four stages of the disaster risk management framework could help the country and the industry to combat the pandemics and stay competitive during the turbulence.

One of the limitations of this study is data collection. The data collected in this chapter was up to the end of 2021. As the COVID-19 pandemic situation has been ongoing, new situations will emerge, and new data need to be gathered. This limitation can be addressed by longitudinal research studies in this area. Another limitation is the measurement of the effectiveness of the measures adopted to respond to the pandemic. Safe management measures have been implemented across F&B establishments and across sub-sectors (e.g., food delivery, food catering, etc.) in the F&B industry. However, each sector may require specific measures. A measure may be effective in one sector, but it may not take effect in others. Thus, further research should examine the suitability and effectiveness of common measures implemented across sectors and specific measures implemented by individual sectors.

Finally, it is critical to frequently review the measures adopted by the F&B industry in a country and to examine the effectiveness of the measures as such review can help the government, the industry, and other stakeholders to revise them in order to deal with the latest development of the pandemics. Due to the ever-changing nature of the disasters and crises, the measures which have been effective in the past or at the present may not be relevant to address the situations in the future. Therefore, continuous evaluation and revision of the policies and measures could help all stakeholders to effectively respond to disasters and crises as well as mitigate potential and actual damages to people, business, and industry.

Abstract

Massive and unpredictable business disruptions caused by waves of conflict, crises, and disasters reinforce the need for businesses to take on a proactive approach to disaster preparedness. Failure to do so will result in a loss of market share and customer goodwill, damaged reputation, and regulatory and legal liabilities. Considering that high-stake and difficult business decision-making often relies on mental shortcuts or heuristics, behavioral approaches to enable businesses to prepare for disasters are required. Behavioural Insights' use of behavioral science to explain and alter patterns of behavior can be an important tool in business disaster preparedness. In the business context, the use of Behavioural Insights has been found to increase employment rate, retirement savings, emergency agency response effectiveness, workplace flow, and acts of

prosociality. In this chapter, we focus on how BI can help businesses build greater organizational resilience through interventions and nudges before, during, and after a disaster. We conclude by calling for the need to consider the types of business (e.g., SMEs versus MNCs) when planning BI interventions for disaster preparedness.

Behavioural Insights (BI) · Business continuity (BC) · Disaster preparedness · Nudging · Organizational resilience

Introduction

The *Global Crisis Survey 2021 Singapore Report* by PwC (2021) found that 15% of organization respondents had no plans for crisis response or business continuity and only 26% of them had a pandemic response plan. Furthermore, only 56% of organizations had a crisis response plan (PwC, 2021). When polled about the COVID-19 pandemic, only 35% of Singapore organizations felt that their organizations had a crisis response plan that was “very relevant,” i.e., most of them did not have plans that can help them effectively weather the crisis (PwC, 2021).

Businesses are increasingly subjected to disruptions (Worley & Jules, 2020). Due to the accelerated globalization of business activities and its accompanying complexities and uncertainties, it is often not possible to predict the nature, frequency, scale, and time of such disruptions (Park et al., 2016). To protect themselves against the outcomes of disruptions, businesses need to adopt proactive approaches that are informed by decision support frameworks (Sahebjamnia et al., 2015).

Having a well-prepared crisis management plan and up-to-date technology can help businesses reduce negative impact, minimize costs during crisis, as well as sustain their business operations (PwC, 2021). On the contrary, a lack of proactive business continuity and disaster response planning may lead to loss of reputation and market share, poor customer service, business process failure, increased regulatory liability, and increased resumption and restoration periods (Duchek, 2020; Sahebjamnia et al., 2015; Thun et al., 2011).

Central to the successful execution of crisis response plans is optimal decision-making (Duchek, 2020). Yet, research suggests that in time pressure situations (Blair & Mumford, 2007) and in the absence of complete information, people often resort to mental shortcuts, or heuristics, when making high-stake and difficult decisions, such as those relating to a disaster (Zhao & John, 2021). While we use heuristics most of the time (Marchiori et al., 2017) because of our lack of time, motivation, and mental resources to deliberately think through day-to-day decisions (e.g., what to eat for lunch), we have long known (e.g., Tversky & Kahneman, 1974) that heuristics can lead to cognitive biases and suboptimal decision-making.

More recently, the prospect of exploiting cognitive biases to enhance decision-making during disasters has been proposed (e.g., Linnemayr et al., 2016). Cognitive

biases can be utilized to change business leaders' perceptions and behaviors, which, in turn, can improve the quality of decision-making. This takes on the behavioral science approach, a growing effort to examining behavior through the combined lens of multiple fields such as economics, psychology, sociology, and neuroscience (Ruggeri et al., 2021). Findings from behavioral science are referred to as Behavioural Insights (BI).

According to Linnemayr et al. (2016), while BI has been adopted to make behavioral changes in a wide range of contexts, it has not been widely used in disaster preparedness and response. This is surprising as we have known since the 9/11 event that while dealing with, or replacing, lost and damaged equipment and infrastructure may be difficult, the largest loss involves people and their psychology (Castillo, 2004). The loss of key personnel due to the 9/11 event, either through death, injury, trauma, shock, or grief, made resuming business operations extremely difficult. Howe (2011) found, in a study of community businesses adapting to storm surge floods, that business leaders' responses to psychological questionnaire items measuring risk perception and information-seeking behaviors explained more than 50% of the business' current state of disaster preparedness. Indeed, the World Bank (2020) asserted that a behavioral approach could help countries understand and identify barriers to people's decision in terms of disaster preparedness, communication, evacuation, etc. Clearly, BI offers the potential to help businesses better prepare for and respond to disasters.

This chapter (i) provides an introduction to BI and nudging and (ii) discusses how BI and nudges can be used to aid business disaster preparedness through greater organizational resilience. This chapter seeks to provide insights to relevant stakeholders, including policy makers, businesses, investors, researchers, etc., and encourage further research into the use of BI to support business disaster preparedness.

BI and Nudging

Beyond explaining behavior, BI has been used to alter behavior patterns, often through *nudging* that was first defined as "any aspect of the choice architecture that alters people's behaviour in a predictable way without forbidding any options or significantly changing their economic incentives" (Thaler & Sunstein, 2008, p. 6). Multiple definitions of nudging have since been proposed (Zimmermann & Renaud, 2021). At its core, nudges are deliberate attempts to change behavior by "modifying the cues in the physical and/or social context in which they act" (Marchiori et al., 2017, p. 3). To qualify as a nudge, no options can be forbidden. Nor can economic incentives, such as rewards or penalties, be changed significantly.

This preservation of free choice, while steering the decision-maker toward a beneficial action, is known as *libertarian paternalism*. Libertarian paternalism is regarded as one reason why cross-cultural research have found evidence that nudges are widely supported and trusted internationally (Sunstein et al., 2018). It should be pointed out that BI is not just nudges (Hansen, 2019). Unlike nudge's libertarian

paternalism, BI interventions can involve forced choices and significant changes to economic incentives (e.g., rewards and punishments). BI interventions may also go beyond the Type 1, automatic thinking and decision-making processes that nudges are often dependent on (Banerjee et al., 2021).

BI interventions, which crucially are properly considered and implemented (de Ridder et al., 2020), may deliver results more quickly, potentially less expensively, and more effectively than traditional methods (Sunstein, 2014). Hummel and Maedche's (2019) quantitative review found a median effect size of 21% for nudges. Wu and Paluck (2021) found that the pasting of golden coin decals on the production floor of a Chinese factory led to an immediate and enduring drop in production floor clutter. Gosnell et al. (2016) found that giving fuel consumption feedback to Virgin Atlantic pilots led to a saving of \$553,000 over 8 months. Considering that the feedback system cost less than \$1000, the authors described the cost, relative to the benefit, as "astonishingly low" (Gosnell et al., 2016).

For disaster preparedness, BI offers the potential for more practical interventions. For example, one of the most consistent findings on disaster preparedness is that larger firms tend to be more prepared than smaller ones (Ha et al., 2022). Yet, this finding has no practical implication – changing the size of the firm is not a feasible way to better prepare companies for disasters. A more practical and actionable intervention for businesses might be to change risk perceptions (Howe, 2011), something we discuss in the second half of this chapter.

While BI intervention research is relatively new (Leong & Howlett, 2022), a considerable body of BI intervention research has already accumulated in the domains of health, environment, personal finance, energy use, and policy making (Hummel & Maedche, 2019). Following Linnemayr et al.'s call (2016), this chapter contributes to BI intervention research in the domain of disaster preparedness.

Disaster Preparedness

Countries worldwide have witnessed a multitude of natural and man-trigger disasters varying in types and scales. Such disasters have caused huge damages and disruptions to businesses and communities and resulted in loss of human life, as well as socioeconomic and environmental losses (Torani et al., 2019). Many researchers have observed that the lack of disaster preparedness has contributed to ineffective responses to disasters (Hoffmann & Muttarak, 2017; Kohn et al., 2012). Crucially, it is important to promote disaster preparedness to individuals, organizations, and countries as such multilevel preparations can facilitate individuals' and organizations' capability and resilience to respond effectively to disasters, in turn saving lives and resources (OECD, 2017; Paton, 2003).

In his book *Disaster Management: A Disaster Manager's Handbook*, published by the Asian Development Bank, Carter (2008) defined disaster preparedness as various "measures which enable governments, organisations, communities, and individuals to respond rapidly and effectively to disaster situations. Preparedness measures include the formulation to viable disaster plans, the maintenance of

resources, and the training of personnel” (p. 215). Dahlhamer and D’Souza’s (1997) definition is simpler: any activities that can save lives, and mitigate the adverse effect of disaster events, especially in the context of business preparation for disasters. Evidently, these processes require an all-of-company effort which involves all stakeholder groups and organizational functions (e.g., policies, strategy, human resources).

Specific types of problems that have been found to occur during the process of disaster preparedness include (Carter, 2008; UNDP, 2013):

- *Organization and planning problems:* Having a poor organizational structure, lack of policy direction, and absence of counter-disaster plans and strategies for disaster risk management are examples of organization and planning problems. In many cases, organizations may have plans but they are not up-to-date. For instance, PwC’s (2021) Global Crisis Survey 2021 found that only 56% of the organization respondents felt that their business had a very relevant crisis response or business continuity plan. A key organization and planning issue is the lack of a relevant disaster response plan.
- *Resource problems:* Having adequate resources, high levels of debt, and sufficient stockpiles are examples of resource problems. Beyond physical resources, social resources (Duchek, 2020) such as clarity of work roles, effective relationships, and trust are crucial during disasters.
- *Coordination problems:* Coordination is one of the most important tasks in disaster risk management because poor coordination may lead to varying levels and standards of preparedness within the same organization. Different departments may have different criteria, approaches, and priorities in disaster preparedness. Different organizations may also experience different coordination problems.
- *Readiness problems:* Related to a lack of a relevant response plan are readiness problems such as a lack of emergency equipment (e.g., power generators, alternative devices for Internet connection, and emergency communication devices). A lack of training to prepare employees for disaster response is also a perennial issue.

While these problems are diverse, BI and greater organizational resilience can address all four types of problems. We discuss how so now.

BI, Organizational Resilience, and Disaster Preparedness

Organizational resilience is a multidisciplinary concept combining sustainable development, emergency management, psychology, economics, and supply chain management research (Corrales-Estrada et al., 2021). It is closely related to business continuity management and organizational sustainability and typically seen as an adaptive capability used in preparation to and during disruptions and disasters (Azadegan et al., 2020). Duchek (2020) conceptualization of organizational

resilience includes three stages: anticipation (before the unexpected event), coping (during the unexpected event), and adaptation (after the unexpected event). According to this conceptualization, various organizational capabilities underlie each stage.

Anticipation

Organizational and planning problems (Carter, 2008; UNDP, 2013) are the key disaster preparedness issues during the anticipation stage. Central to organizational and planning problems is the lack of a relevant response plan (Ha et al., 2022; PwC, 2021). Business owners and managers often do not have disaster response plans because they either do not believe a disaster would happen or they feel that they can rely on their years of experience and industry knowledge to effectively respond to disasters (Ha et al., 2022). The environment also affects what businesses focus on. Worley and Jules (2020) argued that pre-COVID-19 pandemic, the strong economy and positive business environment led businesses to focus on growth and efficiency at the expense of disaster preparedness and contingency planning. With reference to Google's experiences, they point out that organizations need to embrace paradoxes, such as the need for disaster preparedness during times of growth, in order for the business to be sustainable. Furthermore, businesses need to consistently and competently apply the tools of sensing and perceiving to thrive.

Sensing is a central component of Duchek's (2020) anticipation stage. Business leaders who engage in effective sensing are also more likely to develop a relevant response plan, directly addressing organization and planning-type problems. Here, organizations should strive to develop the three abilities to *observe internal and external developments, identify critical developments and potential threats*, and, as far as possible, *prepare for unexpected events*. The first two abilities involve environmental scanning – the recognition of early signals of disruption and the looking out for weak signals. The third ability echoes Sahebjamnia et al.'s (2015) recommendation for business to proactively plan internal and external resources such that disasters can be coped with efficiently.

BI can aid in the development of these three abilities. The lack of motivation to engage in environment scanning for internal and external developments and threats may be attribute to our discounting of the future. When they put off or avoid environment scanning, managers are engaging in time discounting, a cognitive bias in which we assign exponentially more weight to immediate or present choices, costs, values, or options than those in the future (Chabris et al., 2010). The further in the future the event or option is judged to be, the greater the discounting of the threat, and therefore, the lower the motivation to look out for internal and external developments and threats.

This discounting is an outcome of a large psychological distance between disaster preparedness actions and outcomes. A key barrier preventing businesses from taking steps to prepare for disaster is the mismatch in costs and benefits in terms of timeframe and certainty. Preparedness actions such as talking to employees about

what to do in an event of an earthquake (Han & Nigg, 2011) has an immediate cost (e.g., employees and business leaders have to stop work to have such talks) but an uncertain future benefit (i.e., probably better preparedness if a disaster were to happen). Disaster preparedness messaging can be made more persuasive by directly connecting disaster preparedness behaviors to outcomes that are current and immediate (Loewenstein et al., 2013). Benefits should also be presented as certain, if possible. For example, another activity considered to be vital for business disaster preparedness during an earthquake is learning first aid (Han & Nigg, 2011). In order to emphasize the immediate and certain benefits of first-aid training, employees can be told of how they are able to save lives immediately after first-aid training. Psychological distance can be further reduced by emphasizing how first-aid training can also be used to ensure the safety of their family and loved ones – that is, first-aid training will benefit people they care about, rather than just for the continuity of business. When psychological distance is judged to be small (e.g., the likelihood of disaster occurring is judged to be higher, or the benefits of engaging in disaster preparedness activities are clear and evident), adequate resources will correspondingly be devoted to disaster preparedness, addressing *resource-type disaster preparedness problems* (Carter, 2008; UNDP, 2013).

Additionally, the more in the future an event, such as a future disaster, is judged to be, the more abstract our representation of the event (Trope & Liberman, 2003). In terms of disaster preparedness, this means that distant future events are viewed in more abstract terms (e.g., are there alternative suppliers for a given stock?), while nearer events are viewed in more concrete terms (e.g., who are the specific suppliers for a given stock and how much can they supply us?). Clearly, the relevance of disaster preparedness planning is dependent on the specificity and concreteness of the plan. In both cases, a BI-informed intervention would seek to reduce the judged temporal distance of the potential disaster. Organizational members should also be encouraged to think of disaster planning in specific concrete terms, rather than in the form of abstract plans.

The third ability, the planning of resources, can also be supported with BI interventions. Social resources such as prosociality and employee well-being can be cultivated using BI interventions. In one field study, Spanish employees of Coca-Cola were assigned to either give or receive acts of kindness at work over a period of 4 weeks (Chancellor et al., 2018). The study found that both receivers and givers displayed increases in personal competence, happiness, work autonomy, and job satisfaction – all social resources vital for disaster preparedness. Another form of social resource, team psychological safety, the feeling that one is safe to share ideas and opinions and admit their errors, has been shown to increase with BI interventions (Grant et al., 2014). Human resource, in the form of employees who can double-hat, can also be encouraged through BI interventions that encourage workplace learning. One example comes from Google, which uses a 10-week, 10-nudge micro-learning email intervention aimed at helping managers build leadership skills (Newhouse & Getz-Kikuchi, 2017). The planning of resources can also be simplified with cognitively simpler (less mentally complex) checklists. The United States Chamber of Commerce produces business preparedness guides (US Chamber of Commerce

Foundation, n.d.). One of its top tip is to “keep it simple” – a goal enabled by well-designed checklists. All of these can apply to planning and managing disaster risk.

Coping

Central to coping with disasters is a recognition that there is a problem. Business leaders have been documented to avoid exploring nightmare scenarios and extreme possibilities (Worley & Jules, 2020). Sullivan-Taylor and Branicki (2011) note how resilient organizations have managers who are prepared to, without undue delay, make decisions and take actions to reduce the exposure and impact of disaster. Indeed, the *ability to accept a problem* is, alongside *the ability to develop and implement*, the capability posited by Duchek (2020) for the coping stage of organizational resilience.

At this stage, resilience is the coping with unexpected dangers that have now surfaced. Catalan and Robert (2011) propose three components of this ability to accept a problem: (i) businesses need to have an understanding of the operating environment; (ii) there is a reference state available for businesses; and (iii) there is an awareness and acceptance of failures. As we shall subsequently see, BI interventions can address all three components.

The second coping-stage ability, the ability to develop and implement, is a crucial capability at this stage. To be successful, businesses have to combat *coordination-type problems* (Carter, 2008; UNDP, 2013). One solution is to implement clear step-by-step guides. Ha et al.’s (2022) study of businesses coping with Tennessee wildfires in December 2016 found that franchised businesses responded better to the wildfires because of the step-by-step guides provided by their parent companies/ brands. Step-by-step guides are useful applications of BI because they demonstrate the usefulness of low cognitive load interventions – interventions that do not require much thinking and analyses. In times of disaster, businesses and communities are typically in shock and less able to engage in deep analytical thinking. Business should develop simple step-by-step instructional guides which can be crucial during a disaster.

At the coping stage, business will also likely have to adapt to the situation by developing ad hoc solutions (Duchek, 2020). Sensemaking, the understanding of reality through efforts to create order and sense retrospectively, requires employees to be accountable to each other and to continually share information and make meaning. Improvising and solving problems creatively are important processes here (Weick, 1993).

Previous research has demonstrated that creativity can be fostered through BI interventions such as social labeling (Agogué & Parguel, 2020), increasing knowledge about creativity (Cropley & Cropley, 2020), and the sharing of mental models (Reiter-Palmon & Paulus, 2019). Similarly, the ability to implement plans involves the willingness of employees to change – a propensity that has been found to increase with greater organizational commitment (Duchek, 2020). A simple

BI-informed intervention to increase organizational commitment is to have an employee stock option program (Lampel et al., 2014).

BI can also address the key issue at this stage – business leaders' willingness to accept that there is a problem. Optimism bias, the tendency to underestimate the probability of unfortunate events happening to oneself, is one reason why businesses often wait till too late to accept that there is problem. To combat optimism bias, businesses can declare implementation intentions to deal with disasters once certain conditions are met (Ebert & Freibichler, 2017). For example, a wholesaler may have a declared rule that if stocks were to drop below a certain percentage, then they are to implement a series of prepared remedy actions (e.g., order a stock top-up, source for alternate suppliers).

Another reason why businesses may not readily accept that there is a problem is that they have limited past experience to disasters. The use of availability heuristics, the tendency to judge the probability of an event occurring based on how easily such events can be brought to mind (Tversky & Kahneman, 1974), when businesses have had limited past experience to disasters, will lead to an underestimation of the probability of encountering the disaster. In such cases, BI interventions should focus on increasing businesses' vicarious experiences and knowledge of disasters so that such events are more readily brought to mind, correcting any underestimation due to the use of availability heuristics.

Adaptation

The final stage of Duchek's (2020) three-stage organization resilience model describes an offensive-type resilience. The central problem type being addressed at this stage is *readiness-type problems* (Carter, 2008; UNDP, 2013). Whereas anticipation and coping can be seen as defensive, damage prevention and loss minimization, adaptation, and the making of adjustments following crises can be a source of competitive advantage where crises may present opportunities, not just threats. Reflecting this offensive potential are the two capabilities of *reflection and learning* and *organizational change*. Both capabilities will lead to greater future readiness.

Reflection and learning capability refers to an organization's ability to reflect on the disaster episode and incorporate gained insights into its knowledge base. Subsequently, it should involve the acting on this knowledge to produce change. Small business post-disaster survival has been found to be dependent on the business owners' ability to recognize changes in business opportunities and to change their businesses accordingly (Ha et al., 2022). BI interventions here might include the use of defaults and the rewarding of learning to support organizational agility. Previous models of organizational resilience often exclude this stage, adaptation (Duchek, 2020). This illustrates the underweighting of reflection and learning that businesses sometimes exhibit after exiting a disaster situation. One way to ensure that businesses reflect is to have employees and managers reflect on challenges by default. For example, organizations can require employees to provide regular feedback or

reflections, as a matter of standard policy. Doing so would facilitate post-disaster reflection and learning.

The other ability, organizational change capabilities, is what happens after the event is reflected upon, and the insights and resulting strategies are saved. At this stage, the organization needs to change by acting on these insights. The transition from strategy formulation to implementation can be aided through leadership nudges (Tawse et al., 2019) such as implementation intentions (discussion in the coping section above), celebrating small wins, and the intentional framing of messages. Illustrating the power of framing, Zhao and John (2021) were able to nudge homeowners to engage in natural disaster risk mitigation and purchase insurance through calls to action that were framed as gains.

Conclusion

This chapter introduced the potential of BI interventions to increase organizational resilience before, during, and after disasters. While research into the use of BI interventions to support disaster preparedness is young, this chapter echoes Linnemayr et al.'s (2016) supposition that BI can be used in disaster preparedness and response. We showed specific ways in which BI interventions can do so in this chapter.

We end with two important caveats. The first is that we have not distinguished between businesses of various sizes and in different industries in this chapter. Yet, just as entrepreneurial marketing is a special form of marketing (Morrish & Jones, 2020), businesses of different sizes will find that BI solutions, suitable to one type of business, may not be useful for others (Sullivan-Taylor & Branicki, 2011). Indeed, as we have pointed out, larger businesses have consistently been found to be more prepared for disasters (Ha et al., 2022). Similarly, businesses in different industries have been found to vary in terms of general disaster preparedness (Han & Nigg, 2011). We call for future research into BI interventions for disaster preparedness to investigate the differences in outcomes for firms of different sizes, industry, and capacities. Our second caveat is one often raised by BI researchers (e.g., Hummel & Maedche, 2019). While BI has the potential to support disaster preparedness, BI is not a panacea. BI cannot singularly solve complex and deep-seated disaster preparedness issues. Used as an addition tool though, BI can provide an extra push for businesses to better prepare for disasters.

Abstract

The reach of businesses is expanding, customers' needs and wants are increasing, and natural and man-made disasters permeate the business environment causing tremendous financial implications on business productivity. Given these crises, there is the need for business leaders to develop leadership skills or adapt different leadership approaches to mitigate the negative effects of crisis and disaster in order to maintain business effectiveness. Considerable literature on disaster management seeks to aid business leaders on how to address/manage disasters in business. This conceptual chapter explores leadership approaches that leaders can implement in times of crisis. We suggest that a leadership function in a crisis environment intensifies the impact of management functions. The chapter concludes by examining the implications of leadership approaches. This then leads us to a discussion of business sustainability and the impact of decision-making on leadership. Although the literature states that transformation is the best in times of

Introduction

There is no doubt the COVID-19 pandemic affected business negatively across the globe. The impact of COVID-19 on the global economy was increased because of the geographic spread of the virus. A survey conducted by Bartik et al. (2020) between 28 March and 4 April 2020, to explore “expectations of business owners at a critical point in time when both the progression of COVID-19 and the government’s response were quite uncertain” (p. 1) revealed that of more than “5800 small businesses that are members of Alignable, a network of 4.6 million small businesses” (p. 1) were impacted negatively.

... 43% of businesses had temporarily closed, and nearly all of these closures were due to COVID-19. On average, the businesses reported having reduced their active employment by 39% since January, where 54% of firms were closed and employment was down by 47%. Impacts also varied across industries with retail, arts and entertainment, personal services, food services, and hospitality businesses all reporting employment declines exceeding 50%; in contrast, finance, professional services, and real estate-related businesses experienced less disruption, as these industries were better able to move to remote production (p. 2).

A survey conducted by Dun and Bradstreet (provider of commercial data, analytics, and business insights) stated that 82% of small businesses experienced a negative impact and 70% believed that the recovery demand will be approximately 1 year (Dun & Bradstreet, 2020). The COVID-19 pandemic saw a financial fragility of business’ operation that caused massive layoffs. According to Donthu & Gustafss (2020), the disruption was unprecedented and caused challenges in business entities, cash flow, marketing and sales, supply chain, customer demand for product and service, health and safety, and education. However, it also exposed a call for businesses to be resilience in their operations. The negative impact on business called for a change in business processes, adaption to technology, and change leadership/change management.

The development of business strategies to mitigate the negative effects of disaster for business continuity include preparedness and resilience, recovery, and solutions to achieve business financial viability. Business leaders in crisis situations should ensure that in the event of a disaster or crisis occurring, the impact is minimal. This then raises the need in leaders for personnel efficiency, effectiveness, knowledge, and flexibility to be adhered to obtain the best solution (Teutsch, 2010). The negative impact of COVID-19 on business saw the closure of many businesses through the

lack of mission and vision for the business, and the failure of leadership to have scanned the political, economic, social, technological, environmental, and legal (PESTEL) framework to improve their business processes. Strategic management principles call for a continuous monitoring of a business's ongoing processes, internal and external events, and timely change. Adapting to change in business organization forces an organization to assess internal capabilities and resources (human, financial, and material resources). Businesses that were able to adapt were positively impacted. For many this meant focusing more on their online presence in the global marketplace. For many they have seen massive growth in areas of online communication, entertainment, and shopping (Donthu & Gustafsson, 2020). The adaptation to change in business stability during the pandemic forced business managers to effectively formulate, implement, monitor, and evaluate their strategies to achieve continued economic and financial growth. Thus, business strategies to mitigate the negative impact of a disaster/crisis to maintain business effectiveness becomes an important determinant of success.

Change management theories addressed the need for change alignment to business paradigm and success. Lewin's model emphasizes the need for change in business organizations to *unfreeze, change, and refreeze* (Lewin, 1947). *Unfreeze* in organizations calls for a change in the existing processes and procedures that were counterproductive to business operations; the pandemic ushered the prime factor of several businesses. Business entities have to *change* their perspective, perceptions, and processes to include an online space or presence for continued capitalization on their market share and growth rate to include training of their staff complement or workforce. *Refreeze* sees business entities change their business culture and norm based on lessons from the pandemic.

Business managers' inclusion in their strategic plan or business plan of their organization/business the need for change management for business survival. This will hold managers accountable for the endowment, contingency implications, and confirmation of the profitability of the business. Chinoperekweyi (2020) supported that "there is need to make change management part and parcel of the business plan, and not an add-on that is managed independently; and ensuring managers are accountable for making sure change happens and certain behaviors are rewarded or punished" (p. 6). The pandemic forced business organizations into a contingency approach for continued viability in the marketplace of goods and services offerings. Organizational practices should be consistent with the demand of the organization (McLoughlin & Clark, 1988). Business managers are the nucleus of organizational change. They need to act upon the responsibilities for the direct functions of the organization in a manner that will boast profitability and yield a return on investment, which includes people and other resources.

The frequency of disaster occurring globally affects people's lifestyle, business operations, and strategic planning of business/organizations. The need for the tools, resources, and best practices to effectively provide the technology to develop business strategies to mitigate the crises of disaster to maintain business effectiveness is vitally important. Successful business strategies need integrate organizational change to sustain and shield business from disaster. People are the most effective and

profitable means of production in organization. For organizations to be sustainable to manage change in 2020 and beyond, the need for “agility, embracing digital, customer centrisim, and innovation” (Chinoperekweyi, p. 6) should be intertwined with the philosophies of change management and the technical perspective. The key for creating that agility and intertwining change management lies within the leadership of the organization. Therefore, leadership is the key component to successfully navigate through a crisis environment. Thus, this chapter will focus on leadership and explore the functions, sustainability, and leadership approaches in a crisis environment.

Functions of Leadership in Business in Times of Crises

The management of any business operations calls for effective planning, organizing, controlling, staffing, and leading to manage disasters. The functions of management are relevant prior, during, and after any pandemic. Maintaining the functions of management was not easy during the pandemic. For example, Middaugh (2020) found that the fundamental functions of management are often forgotten before and during a disaster and stressed its application and revision before and during such times. Leaders/managers with technical, critical thinking, and conceptual skills should lead the organization. Leadership is grounded in technical, human, and conceptual skills (Northouse, 2015). The technical relates to proficiency in the product, service, and regulations (Katz, 1974; Yukl, 2006). Human relates to how the manager’s interpersonal initiative influence and motivate team members to accomplish the goal of the business (Katz, 1974; Yukl, 2006). Conceptual skills refer to the problem solving and critical thinking skills of the manager (Northouse, 2015). The functions of management for any organization liaise with how effective the manager can use this technical, human, and conceptual skills to turn around the organization and to shield it from negative impact, especially in times of crises.

Leadership and Sustainability

Before a discussion on leadership, it is necessary to frame our discussion of sustainability within this chapter around the definition of sustainable business practices. In the literature, business sustainability is commonly aligned with the definition of sustainability, which refers to the concerns surrounding the impact of business decision-making on environmental, social, and economic factors through resource depletion (both physical and natural) (Benkert, 2021; Mollenkamp, 2021). Haanaes (2016) states

. . .sustainability is a business approach to creating long-term value by taking into consideration how a given organization operates in the ecological, social and economic environment. Sustainability is built on the assumption that developing such strategies foster company longevity (p. 1)

However, Mollenkamp points out that sustainability, at its root level “refers to the ability to maintain or support a process continuously over time” (Mollenkamp, 2021, p. 1). The two definitions illustrate the need to clearly state a definition of sustainability. For this chapter we define business sustainability as “a long-term approach in decision-making to maintain/support business activity that ensures organizational longevity.”

For us the key to the definition is “decision-making.” Within any business organization, key business decisions and/or strategic business decisions are made by organizational leaders. Decisions made in times of crisis are often made under less than ideal situations. Decision makers often have little or no data to base decisions on. To add to the difficulty, time is often of essence. Under normal conditions, research has shown that the leadership approach impacts decision-making (Northouse, 2015; Uzonwanne, 2015). Thus, it is only logical that when exposed to a crisis such as natural disasters (e.g., the pandemic or earthquakes), leadership will significantly impact the outcome. This then leads us to our investigation of leadership approaches in times of crisis and in particular during the COVID pandemic.

Leadership in Times of Crisis

Crisis management has been defined as a term that “broadly captures organizational leaders’ actions and communication that attempt to reduce the likelihood of a crisis, work to minimize harm from a crisis, and endeavor to re-establish order following a crisis” (Bundy et al., 2017, p. 1663). As can be seen in the definition and supported by numerous authors, leadership is a key aspect of crisis management (Bundy et al., 2017; Kalra et al., 2021; Kielkowski, 2013). This then leads us to the question of whether or not one particular leadership style leads to business sustainability in the face of a crisis?

The research on leadership styles during the COVID-19 pandemic delves into democratic leadership (Agusta & Nurdin, 2021; El Gharib & Elnahas, 2021; Sanusi et al., 2020), integrative leadership (democratic and transformational) (Agusta & Nurdin, 2021), transactional/authoritarian (Azizah et al., 2020; El Gharib & Elnahas, 2021; Frangieh & Rusu, 2021; Purnomo et al., 2021; Sanusi et al., 2020), and transformational leadership (Azizah et al., 2020; Bojadjiev & Vaneva, 2021; Brown & Nwagbara, 2021; El Gharib & Elnahas, 2021; Noureen et al., 2020; Purnomo et al., 2021; Sanusi et al., 2020). The common finding was that a transformational style was best suited for a crisis situation. This is due to its focus on change and encouraging and developing an attitude of the acceptance of change. Also, another common finding was the importance of open and transparent communication during a crisis. And here again, it was pointed out that open and transparent communication is a characteristic of transformational leadership (Bojadjiev & Vaneva, 2021). So, it would appear that transformational leadership is best suited for times of uncertainty – a crisis.

However, studies comparing leadership styles, such as Sanusi and co-authors (Sanusi et al., 2020), El Gharib & Elnahas (2021), Frangieh & Rusu (2021), and Purnomo and co-authors (2021), found that a transactional leadership style was also effective. In fact, Sanusi and co-authors (2020), El Gharib & Elnahas (2021), and Purnomo and co-authors (2021) found that multiple leadership styles had a positive impact on organizational performance. The research indicated that there was a strong need for leadership that had a clear vision of the future and the steps required to realize that vision. This meant that at times a different leadership approach may be applicable and more effective. This brings forth the concept of situational leadership.

In the context of situational leadership, the leadership style is contingent on the situation (Blanchard & Hersey, 1996). Therefore, the leader adapts to the environment and the interactions of the players in that environment. This means that at one point a transactional approach may be more effective to achieve the desired results of that moment. This then starts to explain the seemingly contradictory results of the research in leadership and crisis management.

Although it may be fair to say that no one style is more appropriate than another, it does appear that a transformational leadership style would be more effective. However, research also indicates that those that prepare for a crisis and have plans in place fair better and are more resilient (Bundy et al., 2017; Kielkowski, 2013). Therefore, business sustainability relies on strong leadership not only during a crisis but in pre-crisis preparation and post-crisis recovery.

Conclusion

Literature on the effects on sustaining, minimizing, shielding, and preventing business from the negative impact of disaster explores systems change, formulation of institutional and operational policies to overcome the losses of production, while improving consumption pattern to boost countries economic (Kumar et al., 2020) is minimal. The literature fails to provide strategies and procedures to fully address aspects of how to sustain, minimize, shield, and prevent business from the negative impact of disaster through the lens of leadership. Leadership needs to implement and mitigate loss through the implementation of strategies designed to shield and preserve organization vitality – business sustainability. However, business leaders can and need to engage in crisis management to reduce the risk and outcome of a crisis to create business sustainability effectively and efficiently.

According to the World Economic Forum's Global Risks Report (2020), there are critical risks manifesting the global economy and cited examples of stagnation, climate change, and cyberspace threats. Other risks for companies that the report highlighted were prolonged recession of the global economy, surge in bankruptcies of big firms and SMEs, waver of industry consolidation, weakening of fiscal positions in major economies, and increase in inflation globally. Leadership and business sustainability work hand-in-hand to prevent, implement, and resolve issues rising from crises. Crisis management needs strong leadership utilizing transformational leadership but with the realization of the need to adapt leadership approaches

to the situation. Building sustainability in business during the COVID-19 pandemic calls for support and collaboration to sustain, minimize, shield, and prevent business from the negative impacts of disaster. Business sustainability is therefore urgently needed to rebuild, adapt, and solve the business and economic challenges resulting from the COVID-19 pandemic.

impacts of the COVID-19 pandemic, natural disasters, and other disruptions in the Pacific, as well as preparing for unknown future disruptions. The chapter begins by reviewing the impact of COVID-19 on businesses in the Pacific and the effects of climate change-induced natural disasters. It then details the needs of Pacific Island countries for preparing, managing, and overcoming disruptions and presents a training model for business schools throughout the Pacific, to help them future-proof the region. One of the key elements for improving the resilience of businesses is the development of business continuity plans (BCPs), which are discussed here in some detail.

Keywords

COVID-19 Pandemic · Managing Disruptions · SIDS · Business Continuity Plan · Training

Introduction

The global economy has continued to struggle from the disruptions caused by the coronavirus disease (COVID-19) pandemic for more than a year. Some economies showed signs of rebounding in 2021, but the continued threat of new waves of COVID-19 remained a primary concern, with most of the developed economies ramping up vaccinations while other economies were reinstating partial containment measures to deal with new outbreaks. Apart from the pandemic, we live in an era of other disruptions such as technological, political, and climate change-induced natural disasters.

This pandemic, which is a once in a 100 years event, had taken businesses, as well as business schools, off guard in managing such a rare phenomenon. It has resulted in the “great global lockdown” by countries closing borders, banning travel, and disrupting supply and value chains. But it also changed how we live, study, and work. Interestingly, the world has also seen ingenuity and innovation from ordinary citizens who have had no or minimal education. These people have been handling this crisis with needs-based eco-solutions, both for communities and for their own selves, demonstrating that human beings have intrinsic abilities for survival even in extreme situations.

Developing countries consisting wholly of small islands are often called Small Island Developing States (SIDS). They are particularly vulnerable to climate change because they are small and remote and have a large land-sea interface proximate to their population centers. When Scandurra et al. (2018) analysed the vulnerability dynamics in SIDS from 2009 to 2014, using a comprehensive dataset including 32 variables, they found that the vulnerability of SIDS to climate change was related to their small size, isolation, and the hazards they faced, but each country was affected in different ways and to varying degrees.

This chapter, therefore, discusses the impacts of the COVID-19 pandemic and other natural disasters on SIDS in the Pacific, how they may best be managed, and how to prepare these countries for unknown future disruptions.

Disruptions in the Pacific

Before the advent of the COVID-19 pandemic, the socioeconomic characteristics of SIDS in the Pacific were highly sensitive to world markets, financial instabilities, and disruptions caused by environmental disasters. These factors impacted the livelihoods and economic performance of the societies involved. They were compounded by the heavy reliance of the economies on foreign investment and trade, remittances from abroad, foreign aid, and often on tourism. For example, the Asia-Pacific region experienced 75% of the global disaster-related mortality rate over the years from 1970 to 2011 (United Nations Economic and Social Commission for Asia and the Pacific, 2012, p.5).

This section provides highlights from business perspectives on two types of disruption that have impacted the Pacific in recent times, namely, the COVID-19 pandemic and other natural disasters.

Impact of COVID-19 on Businesses in the Pacific

According to the Pacific Trade Invest (PTI) (2021), businesses in the Pacific have been highly affected by COVID-19 restrictions. PTI commissions regular Pacific Business Monitor surveys across the Pacific region. In the 14th survey by PTI (2021), responses were gathered over the period from 3 to 16 May 2021, from 106 businesses. The survey showed that 91% of businesses reported a decline in revenue. Fiji had been particularly badly hit by the crisis, with 94% of businesses reporting a significant decline in sales and revenue. The survey found the following: 84% of Pacific businesses reported a negative impact from COVID-19; 88% reported a decline in revenue; and 69% believed that their businesses would survive the crisis (compared with 58% in the previous month) (PTI, 2021). The survey found the three highest-rated challenges facing businesses due to the COVID-19 pandemic were as follows: “the impact of closed international borders” (91%), “poor cashflow” (91%), and “not knowing how long the crisis will last” (89%) (PTI, 2021, p.4). The survey went on to report that the top four initiatives businesses required assistance with were as follows: “access financial support” (57%), “access to new markets locally and overseas” (38%), “diversifying their business” (36%), and “improve/implement online-commerce capabilities” (31%) (PTI, 2021, p.4).

Impact of Natural Disasters in the Pacific

Pacific SIDS are particularly vulnerable to all kinds of natural hazards, including those exacerbated by climate change, such as cyclones, storm surges, rises in sea level, droughts, and wildfires, as well as hazards less affected by climate change, such as earthquakes, tsunamis, and volcanic eruptions. These hazards add to the enormity of dealing with the COVID-19 crisis. Many disasters resulting from these hazards are linked in severity to global temperatures, which in turn are affected by

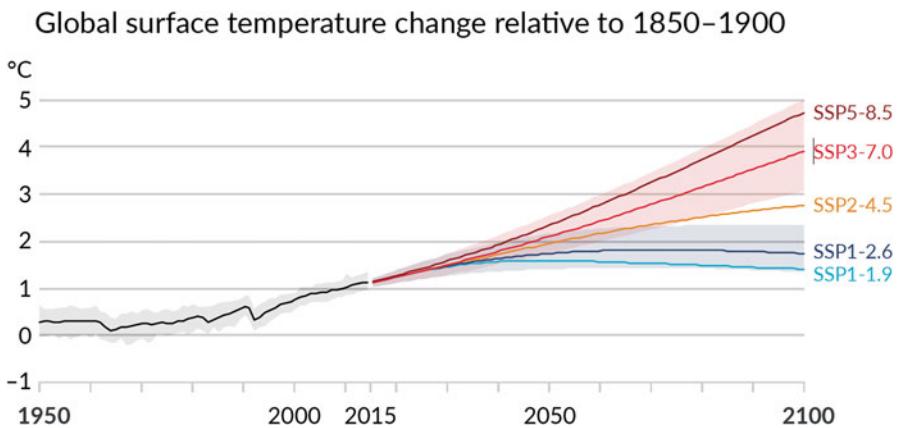

Fig. 1 Global warming scenarios. (Source: IPCC (2021))

global warming. Figure 1 shows the prognosis for the global temperature trends under two illustrative scenarios (IPCC, 2021): unrestricted fossil fuel use (SSP3–7.0, the pink band) and fossil fuel phaseout (SSP1–2.6, the blue band). The “unrestricted fossil fuel use” scenario assumes global annual emissions doubling by 2100, while the “fossil fuel phaseout” scenario assumes annual emissions falling below zero by 2075.

The forecast temperature trend, shown in Fig. 1, under an “unrestricted fossil fuel use scenario,” rises to nearly 4 degrees above preindustrial levels (the 1850–1900 average) by 2100. The “fossil fuel phaseout” scenario assumes a straight-line reduction in fossil fuel use starting in 2022, leading to zero fossil fuel use by 2075. The result, shown in Fig. 1, is a temperature in 2100 that is restricted to below 2 degrees above preindustrial levels.

These temperature rises will mean that sea levels will rise by about 0.6 m over 1900 levels under the fossil fuel phaseout by 2100 and by about 0.85 m under the unrestricted fossil fuel use scenario. More importantly, the trend in rise of sea level predicted for each scenario is still strongly upward at the beginning of the next century due to reaction lags. Sea levels will continue to rise well into the twenty-second century, even under the fossil fuel phaseout scenario.

With global warming, modeling suggests that there will be no upward trend in the *number* of cyclones in the Pacific, but there will be an increase in the average *severity* of these storms. This increase in severity will lead to an increase in the damage done by cyclones on SIDS. In addition, rising sea levels will mean that these storms will batter coastlines with greater ferocity in the future. Global warming will also lead to the increase in the severity of other short-term hazards in the Pacific, such as heatwaves, floods, and droughts. Sea-level rise will threaten low-lying islands and cities and adversely affect drinking water sources, particularly for atolls. This is not a sudden disaster, but a long-term disaster, extending to the end of the century after this one or longer.

Another long-term disaster is heat-induced coral bleaching, which threatens to wipe out coral reefs in the region before too long. This will adversely affect tourism, fish harvests, and protection of low-lying land and communities from storm surges. The continuing long-term rise in ocean acidity is another threat to corals but also to shellfish – another harvest from the ocean.

The World Bank calculated that for the South Pacific, the average direct losses resulting from natural disasters in the period from 1831 to 2009 have risen from US\$100 million per year to US\$400 million per year (World Bank, 2012). Despite this high and increasing exposure to natural hazards and now with the COVID-19 pandemic crisis, most people in the region are uninsured. For instance, the penetration rates of insurance are 12% in Fiji (Reserve Bank of Fiji, 2015), 13% in Tonga (National Reserve Bank of Tonga, 2016), and 5% in Vanuatu (Pacific Financial Inclusion Programme, 2016). Further, because many governments of Pacific SIDS do not belong to some sort of risk pool, they are unable to take advantage of rapid resourcing of recovery finances after a natural disaster.

Instead, such countries can only resort to measures such as budget reallocation, international emergency aid, and accumulating additional credit. These measures may help in the short term, but they affect the long-term economic performance of the country (Nath, 2019). Additionally, the lack of access to affordable insurance solutions and other disaster risk financing instruments for businesses has impacted the growth and investments of Pacific SIDS.

The table below (Table 1) shows the economic outcomes of major cyclones in Fiji, Tonga, and Vanuatu. It presents the losses in the agricultural sector and the amounts paid by the national governments toward recovery, donations from foreign

Table 1 The experiences of three countries (Fiji, Tonga, and Vanuatu) after major cyclones

After Tropical Cyclone Winston in Fiji (2016)	After Tropical Cyclone Pam in Vanuatu (2015)	After Tropical Cyclone Gita in Tonga (2018)
<i>US\$216 million</i> in losses by the agricultural sector (Ministry of Economy, 2017)	<i>US\$53 million</i> in losses by the agricultural sector (government of Vanuatu, 2015)	<i>US\$43 million</i> in losses by the agricultural sector (government of Tonga, 2018)
<i>US\$220 million</i> was given by the government to ordinary Fijians to rebuild	<i>US\$450,000</i> was given by the government for emergency relief operations	<i>US\$47.3 million</i> was given by the government for over 3 years for rebuilding
Government received <i>US\$64 million</i> from the international community	Government received <i>US\$4.1 million</i> from the international community	Government received <i>US\$11.2 million</i> from the international community
The government of Fiji had to take out a <i>US\$50 million</i> loan from the World Bank (World Bank, 2016)	PCRIC paid out <i>US\$1.9 million</i> (World Bank, 2017)	PCRIC paid out <i>US\$3.5 million</i> (ReliefWeb, 2018) The total economic value of the effects was estimated to be approximately <i>US\$164.1 million</i>

sources, and payouts from the Pacific Catastrophe Risk Insurance Company (PCRIC). Clearly, each country has been left with a substantial loss from the cyclone events. Of more concern, perhaps, is that many affected people were not able to recover their livelihoods and income streams. This made it almost impossible for large sections of the populations to sustain themselves when the COVID-19 pandemic caused further loss of businesses and income.

Fostering Social Media to Promote Traditional Economy of Bartering: An Innovation by Ordinary Citizens to Meet Community Needs during Market Disruptions and Lockdowns

Hundreds of barter trades, as in Fig. 2, are taking place across Fiji using the Facebook page “Barter for Better Fiji.” These came as a response to the early period of the pandemic in 2020, after sharp falls in employment. The page now has more than 180,000 members, in a country with a population of less than 900,000.

Examples of the posts to the site include the following:

Two piglets, two sacks of casava and 2 roosters for an iron corrugated roof for the house, a taxi fare in exchange for fresh produce, hot cross buns for online tutoring, an old carpet for a professional photography session, vegetable seedlings for homemade pies, have backyards cleaned for prayers. (Tora, 2020)

“The primary reason for setting up the Facebook group was to help offer a solution to the current economic situation,” said Marlene Dutta, founder of *Barter for Better Fiji* (Darmadi, 2020). “For many people across the world and Fiji, money was harder to come by and even harder to stretch out. The idea is to have an avenue where people get some things they need or want without spending money and that will help a lot and save their limited cash for bills, utilities, transport and other things that they need money for.”

The idea of bartering via Facebook has caught in other Pacific SIDS, with “Barter for Change” in Tonga, “Barter for Nambawan Life Vanuatu” in Vanuatu, and in Samoa – “Barter for Better Samoa” and “Le Barter Samoa” (Tora, 2020).

Managing Disruptions

Having given a snapshot of the impacts of disruptions due to natural disasters in the Pacific, along with need-based innovative solutions to economic hardship which are founded by ordinary citizens, it is important to review how business schools can better deliver education to address the issues discussed here. We need to ensure that business schools and their curricula are responsive to the challenges faced by local businesses, while meeting the broader needs of the society.

Here we suggest a suitable structure for how training in business management can be made both relevant and resilient to both internal and external disruptions. While most business management courses address economic disruptions to some extent,

8 May at 9.35 am

Bula Vnaka To All BFBF....members
I have a son...and am without a job...during this Covid19 crisis...
I would like to trade two Pigs....n 2 Sack of Cassava...with 2 Roosters n 2 Hens....
In Exchange with 15...12'x42 corrugated roofing iron
That really needs to be fully completed roof of a house...since there is a lot of rain.

The collage consists of five images. The top row contains two images of chickens walking on a grassy hillside. The bottom row contains three images: the left one shows a pig being fed from a trough; the middle one shows a close-up of a pig's head; and the right one shows a pig lying down on a brick-paved surface.

Fig. 2 Example of a post to “Barter for Better Fiji.” (Source: (Tora, 2020))

they tend to be fragmented throughout the various subjects, rather than being concentrated within a single module of an undergraduate or postgraduate program.

The suggested curriculum for a module or course, we call here “managing disruptions,” has three major units:

- (i) Preparing for disruptions
- (ii) Managing disruptions
- (iii) Overcoming disruptions

Preparing for Disruptions

Businesses and economies around the world were already under a multitude of stresses before the COVID-19 pandemic occurred. It has become abundantly clear that business leaders, in both public and private sectors, need to make more urgent and determined efforts to adapt to, and develop resilience to, the many stressors they face, and they will need to make major efforts to reduce the risks of disruptions. This will need a more detailed understanding of the specific vulnerabilities peculiar to each sector and each geographic location, the development of the appropriate skills and capabilities of the stakeholders, a vast improvement in communications at all levels and under conditions inherent in the wake of disasters and other disruptions, and a means to provide an inclusive society where all members contribute to building viable solutions to complex problems as they occur.

There are already a variety of digital tools that businesses can use to try and maximize their efficiency under normal conditions, including artificial intelligence, algorithmic business thinking, and digital solutions to complex supply and value chain problems. However, under the conditions pertaining in Pacific Island countries, evidence-based assessments suggest that the most important tool for helping both businesses and governments cope with the disruptions and issues they face is the designing and implementation of a simple business continuity plan (BCP).

A BCP reflects “the capability of an organisation or business to continue the delivery of products or services at pre-defined acceptable levels following a disruptive incident” (ILO 2021, unpublished). A BCP ensures that business processes and procedures continue without significant disruptions during a disaster and helps businesses to survive, rather than suffer total shutdown. They are based on detailed analyses and identification of critical business processes, whether they relate to a manufacturing plant or a small business trading in goods and services. To be clear, a *Business Continuity Plan* is a plan of action that will try to ensure that a business continues to function during and after a disruption. This is different to a *Disaster Recovery Plan*, which is a plan of action to restore vital support systems after a disruption and is a subset of the business continuity plan (Dobran, 2018).

However, the recent International Labour Organization’s (ILO) rapid assessment surveys on the impact of COVID-19 on businesses and employment in six Pacific Island countries revealed the startling reality of the low prevalence of BCPs in Pacific Island businesses. These data are illustrated in Table 2.

These data demonstrate that the prevalence of BCPs in Pacific Island countries is dangerously small. This needs to change, especially in the face of COVID-19 and the impacts of climate change, not to mention the globalization of economies. The only way forward is for business schools in the Pacific area to focus on training future business leaders and decision-makers on the fundamentals of creating and implementing BCPs.

To this end we suggest a major unit of a course in business studies, “preparing for disruptions,” that addresses the knowledge and skills required to create, maintain, and implement a BCP.

Table 2 A snapshot of BCPs in select Pacific Island countries

Country	BCP status
Fiji	<p>59% of the Fiji Commerce and Employers Federation's (FCEF) members surveyed had a BCP in place. However, many businesses did not include pandemic response in the BCPs</p> <p>39% of members comprising majority of Micro, Small, and Medium Enterprises (MSMEs) did not have a BCP</p>
Palau	Nearly two third of businesses had no business continuity plan, but 90% of businesses were comfortable with moving forward with COVID-19 safety protocols and business continuity training to reopen their businesses
Republic of Marshall Islands (RMI)	<p>More than two third of the businesses surveyed did not have any business continuity plan, while 22% of the businesses did have a BCP</p> <p>Of the 22% of the businesses that had a BCP, more than two third of them had planned their continuity for more than 3 months, while others planned only between 1 and 3 months</p> <p>Of the businesses that had a BCP, nearly half of them had staff assigned and made aware of the concept and process of BCP, while another half of them had not assigned their staff to manage the BCP. For the latter, even though they had a BCP, its application and implementation would be useful only if their staff were fully aware and assigned with roles and responsibilities to plan for disasters, undertake impact analysis, manage continuity plans, and deploy recovery mechanisms to overcome unforeseen disasters</p> <p>Two third of the businesses surveyed that did not have any kind of business risk protection were mainly sole proprietorship and self-employed businesses. Lack of awareness and cost of risk protection may have been the reason for these businesses not protecting their business operations</p>
Samoa	<p>82% of enterprises did not have any continuity plans in place and were completely overwhelmed by COVID-19. Enterprises had previously been exposed to natural disasters and climate change, but they were ill advised about pandemics</p> <p>Over half of the enterprises surveyed were “not insured,” and these were typically MSMEs</p>
Solomon Islands	<p>Majority of the businesses did not have a BCP. More than half of the businesses surveyed were poorly prepared for the pandemic-induced emergency, while nearly 11% were very poorly prepared. On the other hand, 44% businesses were well prepared, with 3% extremely well prepared</p> <p>60% of businesses were not insured, while one third were fully insured. Cost of insurance and awareness were the main reasons for not insuring their businesses</p>
Tonga	More than two third of the businesses in all the three sectors (manufacturing, agriculture, and tourism) did not have a business continuity plan before COVID-19. Seventy-four percent of businesses in agriculture sector, 68% in manufacturing sector, and 76% in service sector did not have any kind of BCP, and they had no readiness or preparedness to manage businesses during the pandemic or any natural disasters

(continued)

Table 2 (continued)

Country	BCP status
Tuvalu	Only 29% of the businesses surveyed in Tuvalu had a business continuity plan before the COVID-19 pandemic broke out. Of these, 11% reported that the BCP helped “significantly,” 45% said it helped “moderately,” and 44% said it helped “slightly.” This suggests that businesses need training in the usefulness of BCPs and how to make them effective

Sources: Rapid Assessments on Impact of COVID 19 on Employment and Business 2020–2021 conducted by the ILO Office for Pacific Island Countries (unpublished & IOM, 2021).

“Preparing for disruptions” should include the following elements:

- Definition and introduction to the business continuity plan
- The business continuity plan structure and the key strategies involved
- The difference between *business continuity plan* and *disaster recovery*
- The business continuity team responsible for managing disruptions and training staff
- Stages in developing a business continuity plan, including business impact analysis, gap analysis, options and trade-off analyses, efficiency and efficacy, and business continuity management

Managing Disruptions

The ongoing success of a business depends not only the efficiency under business-as-usual conditions but increasingly on managing the business through disruptions. Businesses in the Pacific, particularly MSMEs, are often badly affected by any disaster. But the greatest impacts of disasters are felt in the informal economy, where work is carried out by individuals or families just to subsist. The recent COVID-19 pandemic and other natural disasters have exposed the vulnerabilities of small businesses which are unable to rely on the support from any government grants or stimulus packages. Since insurance is relatively expensive and beyond the means of most small businesses, these businesses face cumulative losses from the recurring pattern of disasters experienced in recent years. It is vital, therefore, that business managers are trained in overcoming and working through disruptions and in undertaking “in-crisis” needs assessments. This requires an understanding of the holistic system they work within, from the world economic environment and national enterprise system down to the processes they use in their business every day.

Crises are described as being “sudden, inconceivable, damaging, sensitive, and unique,” so that there are no rules governing their management, and solutions to the problems they present need to be determined on the fly, often using unconventional methodologies. This calls for flat hierarchical societies. A flat hierarchical society is one of the six principles of resilience listed by Barnett (2001). The other five attributes of resilience are as follows: homeostasis, where feedback mechanisms

which assure effective communication channels are integrated into daily life (including community meetings, education, and exchange of traditional gifts); omnivory, where resources are sufficiently diversified to withstand shocks to individual parts (whether resource-specific or geographical); high flux, where movement of resources through the society is at a high rate (due to diverse or efficient transport methods); buffering, where resource surpluses help withstand perturbations (perhaps due to traditional preservation means); and redundancy, where there is significant overlap of resources that provide alternative means for achieving the same ends.

Haldane et al. (2021) reflected on the resilience requirements for health systems in the face of pandemics like COVID-19. They proposed four major categories: *activate comprehensive responses*, including whole of government approaches, training in infection prevention, purchase agreements for medical products, surveillance, and isolation procedures; *adapt health system capacity*, including public-private agreements, supports for health workers, recruitment of health workers or their reallocation from other fields, use of appropriate digital technologies, creation of additional healthcare facilities, and option of postponing elective procedures at times of greatest need; *preserve health system functions and resources*, including cost-effective procurement of medical supplies, guidelines to optimize medical resources, production of test and protective equipment, strategy for reaching local populations, support for primary care, and consultation with community in planning health services; and *reduce vulnerability*, including adoption of effective financing mechanisms for providing relief, leveraging skills and knowledge of local populations, strengthening manufacturing capacity, testing and contact-tracing strategies, and communication strategies.

In Fiji, for instance, thousands of people lost their jobs, many of whom were in the tourism industry. According to Raisel (2021), the traditional ways, called *Solesolevaki*, were a means for overcoming the outcomes of disaster. *Solesolevaki* involved the community working together to achieve the greatest benefit for the community. This illustrates how important it is to use multiple viewpoints to building resilience and to take note of both traditional and western ideas.

In a crisis situation, the physical infrastructure of the society is often disrupted or destroyed entirely. This means that planning based on access to communities by roads, availability of drinking water, or the use of electrical power may become redundant in the face of the actual conditions. A business or community would need to understand the options they have available to them for overcoming these limitations. The answers are often commonplace in communities which regularly suffer a particular type of hazard event. For instance, those who are regularly flooded might have boats handy, life jackets, emergency kits, routes marked out to higher ground, early warning sirens, two-way radios for communication, and backup generators to supply power when needed. These basic contingencies need to be shared with other vulnerable communities who might not have suffered such disasters in the recent past. This kind of sharing of ideas and options helps to make communities resilient.

Resilience is often thought of as the ability of a system to bounce back from a disruption to the level of functioning it had before the disruption. This is often interpreted as the need to make certain parts of the system robust to failure, rather

than the whole system. Further, the objective of returning to a previous state is clearly going to be insufficient to handle the same kind of disruption they are trying to recover from. A resilient system needs to be able to accept the precariousness of the environment that exists now and into the future and to ensure all parts of the system (including social, technological, political, ecological, and spatial) are robust to the likely disruptions they will face (Sakurai & Chughtai, 2020).

There is also the issue of time. Some disruptions, like cyclones and earthquakes, are sudden and need an immediate response. Other disruptions are long term, like climate change and sea-level rise, and need a prolonged response often termed “adaptation.” In the case of COVID-19, for instance, the response may be either short term or long term. In the short term, a community needs to adapt to the present situation; the healthcare system needs to handle the immediate numbers of severe cases and dead bodies, as well as handle all other medical needs. In the long term, communities would need to adapt to the realization that not only is COVID-19 likely to be with us forevermore, but other pandemics are likely to sweep the globe, and there are lessons learned from the present pandemic that need to be heeded in order to prepare for future pandemics.

Even the concept of making a SIDS community resilient in the face of the consequences of climate change loses meaning when there are no options for indefinite survival in their own country. This is the case, for instance, in Tuvalu, which is so low-lying that there are no safe places to retreat to in case of flooding. This will mean, in the long term, that migration will become the only remaining option. Unfortunately, there are no provisions under international law to fund or facilitate such mass migrations (Taupo, 2018).

We suggest a major unit of a course in business studies, called “managing disruptions,” should address the knowledge and skills required to build a knowledge base of the options that may be available in crisis situations, how to make assessments of the effects of a crisis, how to carry out a needs analysis, how to communicate and what to communicate, how to establish collaborative networks for cohesive and meaningful actions during a crisis, and how to coordinate leadership in a crisis.

In brief, “managing disruptions” training should include discussions of the following:

- What is “in-crisis” disaster needs assessment?
- The important elements of resilience.
- How to coordinate and collaborate to achieve greater resilience.
- Leadership and allocation of responsibility at all levels.
- Communications – means and strategies.
- Establishing public-private networks and community partnerships.
- Completeness of assessments.
- Timeframes and means of conducting relevant assessments.
- Responding to the outcomes of the assessments.
- Preparing a comprehensive financial plan for recovery.
- How international law relates to managing disruptions.

Overcoming Disruptions

In the aftermath of a sudden onset crisis or disruption, there needs to be both a planned and a reactive systematic process for recovery. The planned response is to follow the processes outlined in the BCP as best as possible under the prevailing conditions. Since many of the specific conditions are, by definition, unforeseen in a crisis situation, the community will respond in the ways that make best sense to them with the resources on hand. For instance, in instances where information systems break down under crisis conditions, businesses have often made use of “frugal information systems” that relied on available resources, such as using Microsoft Excel spreadsheets, or even pen and paper, to track transactions. When cities have had information systems disrupted by crises in the past, local IT businesses have helped businesses find ways to reestablish information and communications technology (ICT) capability (Sakurai & Chughtai, 2020).

In order to overcome disasters and address means of insurance, it is critical to understand the risk of future crisis events. To measure risk there needs to be a thorough understanding of the vulnerabilities of the Pacific Island countries. It has been argued that this should be based on four dimensions (Turvey, 2007): *coastal index* (length of coastline divided by land area), which measures the risk of inundation, *peripherality index* (insurance and freight debits as a proportion of imports of merchandise) as a measure of remoteness and insularity, *urbanization indicator* (proportion of people living in urban areas), and *vulnerability to natural disasters* (based on the proportion of a population disrupted by natural disasters over a specific time period).

Singh et al. (2021) argued that SIDS need to develop reserve funds as part of their annual budgetary process and contribute all unused allocated funds to the reserve fund. They say that each of the SIDS would likely need to revise their legislation to accommodate the extreme risks to their economies and livelihoods. And they recommend the development of appropriate insurance policies to address the losses to businesses from disasters.

Inevitably, there will be actions or processes that could have been handled better in retrospect. It is, therefore, essential for communities and businesses to capture the lessons learned and fold them into their BCPs. While this may seem obvious, the changes to planning need to be tracked with the associated rationale; otherwise the impetus for change in planning will gradually dilute as new people who are unaware of the rationale for the changes in question are tasked with revising the BCP. Multibillion dollar space programs, for instance, have suffered catastrophic failures through the loss of knowledge of design choices or system processes that had resulted from lessons learned.

We suggest a major unit of a course in business studies, called “overcoming disruptions,” should address the following:

- Understanding and determining risks of disruptions
- Addressing the issues and obstacles involved in overcoming disruptions
- Options for disaster risk financing

- Restructuring an organization to promote resilience to future disruptions
- Building a coherent network of stakeholders with a vested interest in business success and resilience (including suppliers, partners, distributors, and customers)
- Provision of comprehensive staff training and building a culture of continuous improvement across all levels of the organization
- Promote a person-centered culture for supporting staff well-being throughout the business, especially in the aftermath of a disruption or disaster

Learning Outcomes

A course based on the above principles would seek to equip managers and decision-makers in private and public sectors with the tools and knowledge they need to prepare for, manage, and overcome the effects of major disruptions to their businesses. It would help them understand the possible effects of disruptions and how they can survive the impacts. The course will help participants to use the appropriate tools and techniques to prepare for and address disruptions; carry out an “in-crisis” needs assessment in a disruption scenario and coordinate an effective response in real-time consideration of infrastructure failures; develop analysis skills through analysing disruption scenarios; prepare a business continuity plan for an MSME in a specific sector (tourism/hospitality, agro-processing, manufacturing, or industry of choice), to overcome crisis situations; and develop policy recommendations for executive management on preparing Pacific SIDS for future disruptions.

Teaching Methods

The course would make use of various learning methods, such as informational lectures, in-class discussions, practical demonstrations, field trips, engaging with experts on their experiences of managing previous disasters, video presentations from international experts, presentations by participant on simulated crises and resulting disruptions, case studies, and group work projects.

Conclusion

Innovation and resilience grow out of appropriate learning and skill development and collaboration with peers and the global community. The development of these qualities is critical today more than ever, with the ongoing COVID-19 pandemic and the effects of global warming. It is important that future generation of managers in disaster-prone and vulnerable SIDS are highly skilled in preparing, managing, and overcoming disruptions through appropriate training and education.

The world needs business leaders who can negotiate the vicissitudes of the increasing frequency and intensity of natural hazards and prepare their businesses for an uncertain and unpredictable future. They need to be proactive in empowering

their people, giving them the requisite training and skills, while caring for their health and well-being in stressful times. The *next generation of managers* needs to be equipped with the best and most up-to-date tools and techniques for managing the *new normal* of extreme disruptions.
