The disaster and crisis management failure was so visible that chaos and lack of coordination/mismanagement at all levels attracted media attention across. This chapter attempts to study the Kashmir scenario during this calamity through the prism of media treatment at local, national, and international level. For this purpose local popular newspaper *Greater Kashmir*, a mainstream newspaper *Times of India*, and an international newspaper *New York Times* were selected, and their coverage of Kashmir floods has been analyzed and interpreted. The issues looked are themes, sources, role of media, and audiences perception.

The coverage given to the floods exhibited an interesting graph revealing a thematic pattern. The international media dominantly covered aspects like issues of human interest and health and gave very little attention to the politicking of the disaster, whereas the mainstream national media presented the issue in a dominantly visible political frame giving very little attention to the other aspects like health, problems, and local issues. On the contrary local media extensively focused on the humanitarian aspects of the issues. The international and national media sourced their reportage on official interpretations and minimally on eyewitnesses and the affected populations, while the local coverage was entirely based on oral stories, eyewitnesses, and experiences.

A striking feature very prominently visible was that the national media focused entirely on the role of the security forces in rescue and relief while exaggerating the same. This deflected the attention of the audiences from the actual issue of emergency and relief operations. Moreover the audience's perception of the issue revealed that non-state actors played a major role in the issue redressal as there was complete lack of coordination and no communication with authorities and government was a common discourse. Audiences were of the opinion that media had no role in the disaster management as most of the local media itself was paralyzed and caught up in the deluge.

An analysis of the reportage revealed that most of the reportage focused only on the causative factors like massive unplanned urbanization, improper housing, land management, ghettoization of low-lying flood-prone areas, etc. An interesting feature revealed in the international coverage was the relationship of conflict and disaster. The reportage revealed the dissent among the Kashmiris as they refused to accept the politically backed relief from the Indian sources. National media focused mostly on the operations of airlifting tourists and non-locals in special flights while ignoring the local humanitarian aspects of floods. The local media were the only reliable agency highlighting the role of local self-help groups and other organizations. This triangulated pattern of media covered and its response among audience's evolved as an interesting finding revealing the biases in the system. Noteworthy to mention that role of the social media was neutral and most effective in the time of this crisis.

Abstract

Reactions of people at large to a crisis are results of their understanding and perceptions. In today's world driven by social media, with almost instant availability of reports and imagery related to any new or ongoing crisis, reactions and perceptions are quickly created in the minds of people far and wide. People react to and read visuals differently, depending on their understanding of the situation. It is important to understand the way images can lead to strong reactions based on how they are interpreted, and many a time misinterpreted. This chapter specifically looks at the role of visual imagery created during various crisis situations and its psychological and social impact. The way the angles, colors, and content within the frame or window of the camera are created directly leads to forming impressions in the minds of the viewers who are not always in sync with the full reality or severity of the situation. Panic and heightened emotional reactions resulting from insensitive or irresponsible visual imagery freely circulated on the social media platforms can sometimes lead to overreactions and create additional difficulties in managing the crisis at hand. It is important to understand the social responsibility that lies with the creators of these images. Even so, visual

images can be a great tool for informing and sensitizing people about a crisis. The challenge is to understand the difference between “right” and “wrong,” and “subjective” and “objective” interpretations and perceptions of these images. This chapter looks at visual images created and circulated in the media during some of the past disasters and has attempted to analyze their impact by broadly categorizing them under various heads based on the role of the creator, the observer, the storyteller, and the aide.

Social media · Visual imagery · Media literacy · Photography · Television · Journalism · Video

Introduction

Camera does not lie, A picture is worth a thousand words, Seeing is believing – these are just a few common phrases that lend a certain amount of credibility, belief, and trust in photographs and videos. The impact of photographs and videos and the power they have for creating impressions and perceptions in the minds of the masses cannot be denied or underestimated. Any tool with so much power to shape the minds needs to be understood and handled with extreme caution. Lack of critical thinking and understanding of the impact of a single picture or film can prove to be catastrophic, especially during crisis when emotions run high and logical thinking takes a back seat. Panic and heightened emotional reactions resulting from insensitive or irresponsible visual imagery freely circulated on the social media platform can sometimes lead to undesirable overreactions and create additional difficulties in managing the crisis at hand. These visuals can also leave long-lasting impressions on the psyche of the viewers. The iconic photograph of the *Bhopal gas disaster girl* taken by Pablo Bartholomew in color and Raghu Rai in black and white, in 1984 following the Bhopal gas tragedy, is deeply engrained in the minds of many, even today constantly reminding them of the horrific tragedy (The Famous Pictures Collection, 2013).

As the well-known and frequently quoted photographer and filmmaker, Elliot Erwitt aptly puts it “Photography is an art of observation. It has little to do with the things you see and everything to do with the way you see them.” In today’s world driven by social media, with almost instant availability of reports and imagery related to any new or ongoing crisis, reactions and perceptions are quickly created in the minds of people far and wide. People react to and read visuals differently, depending on their understanding of the situation and cultural upbringing. It is important to understand the way images can lead to strong reactions based on how they are interpreted, and many a time misinterpreted. Photographic memory and the power of instant recall of images and the way they impact the overall mood and behavior patterns of the audiences may leave irreversible psychological impact in the long run.

Nevertheless, visual media can also be of great advantage and use. Not only as a tool for communication, but also to assist and help in crisis management. However, the need to handle and regulate the use of this media carefully during a disaster is of utmost importance. It is imperative to understand the social responsibility that lies with the creators of any visual content for mass consumption. The challenge is to understand the difference between “right” and “wrong,” and “subjective” and “objective” representation, interpretation, and perception.

Visual Perception

Many factors determine how the mind perceives visuals. The viewer's background, culture, past and present experiences, preconceived notions, and education are just a few of them. There are several theories put forward on how visuals are perceived. For example, Gestalt theory essentially says that the mind perceives the whole by putting together various elements or grouping them based on similarity, proximity, continuity, and closure. Gestalt theorists have shown that how an image or visual is perceived depends not only on past experiences and on what they want to see, but also on the viewer's mental state when looking at the visuals (Lester, 2003).

Semiotics or the science of signs and cognitive abilities also impact how visuals are interpreted. Different signs and symbols may have different meanings depending on the audience and their individual or cultural perceptions. For example, different colors mean and imply different things to different audiences – red can represent love, passion, anger, danger, and so on depending on the audience's understanding and cultural upbringing; black similarly can hold different meanings like mourning, or rebellion, or protest.

Bloomer (1990) in her book *Principles of Visual Perceptions* highlights different cognitive aspects such as memory, culture, habituation, expectations, and selectivity that can impact visual perception.

What needs to be emphasized and understood is that visual imagery is extremely impactful and influences minds and evokes emotional response. Even though different audiences may react to images differently, some images tend to evoke similar impact across audiences such as images of children suffering, death, and destruction. For example, sometimes photographers may purposely choose children as their subject to evoke heightened emotional impact. Pictures of corona patients looking at their children or loved ones from across the glass partition used for isolating them had an immense emotional impact globally. The Bhopal picture showing a child being buried with the hollows of the eyes graphically directing us to take note of the devastation and impact of the gas tragedy even led to the photographers themselves breaking down in tears (The Famous Pictures Collection, 2013).

Knowing and understanding the audience and its psyche is crucial to evaluate the impact of visual imagery. It is also pertinent to comprehend the content creator's mind. Who is the creator of the content? What is the intent? Who are the audience and what are the possible desirable or undesirable impacts of these images? These

are some questions we should ask ourselves when we consume any visual content which is related to a real event.

The Observer, the Storyteller, and the Aide

To appreciate and analyze visual content, we must spell out the difference between the roles of the content creator and the purpose behind these creations, especially during crisis or disaster. Based on the intent, we may broadly categorize the role of the creator as that of the observer, the storyteller, and the aide.

The observer creates the visual content for mass consumption and often claims to be the unbiased observer of events or a creator of the journalistic representation. The storyteller aims to bring you the stories before, during, and after the event, often dramatized and sensationalized, compelling the audience to look at disaster from their viewpoint or perspective as a story, many a time with the intent to play on the emotions by creating some element of drama. The aide uses and creates visual content with the intent to help before, during, and after the event, often using visual imagery to assist in rescue and recovery. Each one has their own important role to play.

The Observer

Visual content can be instantly created by anybody with simple access to a camera. In today's world, it is easily and readily available in the form of a mobile phone that almost everyone carries. When disaster strikes, instantly cameras start rolling, often without much thought. Instant reactions are to click and share. This is a dangerous situation. By sharing any live content during crisis without proper understanding and media literacy, the observers and the reporters of such content on social media can do irreversible damage. Videos and pictures go viral at alarming rates, especially during disaster. Taking the case of coronavirus pandemic and the images circulated on social media showing the handling of dead bodies by hospitals in India, created not only panic, but also fear. The panic and fear created lead to fresh challenges for the disaster management agencies. Many people avoided getting tested for the fear of being taken to the hospital. It is of utmost importance for the creators to follow certain standard protocols in public interest. Media coverage is like a rat race today. Every news channel wants to run a breaking news story with the prime objective of increasing viewership. The live coverage of the 26/11 attacks in Mumbai in 2008 resulted in providing the terrorist, who were also watching the news, live updates and key information regarding the strategy and rescue measures being taken by the rescue agencies, jeopardizing the rescue efforts in the process. After this episode, new guidelines for coverage of emergency situations were drawn up by India's News Broadcasters Association, an autonomous industry body for TV news channels (Mirchandani, 2018). Media ethics and responsibility must be an integral part of journalistic reporting of such occurrences.

When looking at visuals and videos of any such happening, the viewers also need to look deeper and keep in mind whose viewpoint is being depicted in the pictures related to a specific disaster. A research study undertaken post the Nepal Earthquakes in 2015 showed a difference between the tweets generated by the *locals* as opposed to the *global* twitterers. According to this study, “*locals* focus more on relief and recovery imagery more than the retweeting *globals* do, whereas *globals* focus more on people suffering and rescue activities” (Bica et al., 2017). The perspective, priority, and purpose of the images captured and posted on social networking sites by people directly impacted by the event are generally very different from those created or shared by an outsider, looking at it from far. Due to the direct impact of the event on the lives of the local people, the images created by them are more convincing and tend to be considered more authentic. Therefore, careful and cautious handling of these images is important. This is easier said than done in today’s virtual world.

Governments have laid down standard broadcasting guidelines. However, today the content on social media is created by people without knowledge of these guidelines. Even those trained to follow these guidelines sometimes fail to recall them during a volatile situation. Visuals evoke instant reactions from the heart and not always from the mind. Images of disaster and human suffering bring out strong and emotional reactions. Sometimes these first observations by the observer and the creator of the instant visual content can be instrumental in creating panic. Even so, they could also play a critical role in bringing out facts and action can be accordingly planned. The awareness and realization of the impact of these instantly created and shared content is important for both the creator and the consumer of these images.

The Storyteller

Stories are often told with visuals to add a certain amount of attraction and appeal for the audiences and to grab their attention. Stories related to a disaster are human interest stories that people believe in and are instantly drawn to. These stories can have both positive and negative impact during crisis. The good part they play is in sensitizing the masses about the gravity of a situation and the need for action. There have been several times in the past when the stories of people affected by the crisis have played a big role in mobilizing resources and people have come together to help. The camera angle and positioning of the subject within the frame creates not only an image, but also a story in the viewer’s mind. This can be intentional or sometimes unintentional. Storytellers often use camera techniques and skills to create dramatic visual imagery, bringing forth sensitive reactions, and the enormity of the disaster may sometimes be over or understated by these visuals. There have been times when images not related to the event have gone viral, suggesting them to be images of that event. Various justifications have also been given as to the relevance of these images to the present event even though they were taken at another time and place. The study undertaken after the Nepal earthquake specifically gives the example of the picture of a young boy holding his younger sister which

went viral. The picture in fact was taken in Vietnam in 2007 but was tweeted as “young boy protecting his sister in Nepal” in 2015. There are other similar examples mentioned in the study with one thing common in them – *a sense of drama* (Bica et al., 2017). But is this ethically and morally justifiable? It is crucial to be able to tell the difference between the real and the created reality, which is often beyond the understanding of the masses.

Images engrained in the minds of the people through representations of calamities and disasters in movies also tend to impact the way people react to the images of real disaster. Sontag (2003) writes in her book, *Regarding the Pain of Others*, “The understanding of war among people who have not experienced war is now chiefly a product of the impact of these images.” Sadly, watching these images repetitively on television and in movies at times also tends to desensitize the audience to the real events. Sontag also talks about the attack of World Trade Center on September 11, 2001, which to many seemed unreal and like a movie or created reality. In some ways, it removed the audiences from the reality and true horror of the happenings. Such responses make one question and wonder how much of these violent images of destruction and devastation should be a part of our lives through recreations in movies and television dramas.

A large population is ignorant and unaware of the reality and believes without checking the facts when looking at the viral content. Today many social media content creators and bloggers are obsessed with only the number of likes and forwards they receive without much thought or concern about the impact. This once again calls for an initiative to educate and increase media and visual literacy among the general population. A large part of this population is also social media content creator and consumer, and their balanced understanding of this new omnipresent media is important. Unnecessary dramatization and distortion of facts for personal objectives, such as increasing the number of likes, should be the last priority while circulating images during an ongoing crisis. However, if slight overemphasis or dramatic representation can lead to higher sensitization and positive response and the coming together of the masses to help, these exaggerated and dramatized images are still justifiable. The key is to be able to find the right balance while telling a true story through dramatized or exaggerated visual imagery. Similarly, when it comes to the consumer of these images, it is crucial to be able to know the difference between “good” and “bad” and indulge in a bit of retrospection and thought before hitting the forward or share button.

The Aide

The immense importance and role of visual imagery as an aide during disaster cannot be negated. Be it satellite imagery or live imagery from the site of disaster, their use and relevance in disaster management is enormous. We are all aware of the relevance of satellite imagery, especially in forecasting disasters and in evaluating the extent of the impact of disasters such as tsunami, cyclones, hurricanes, and forest fires. First reports or images made available by the people present at the site via social media

can be of great importance for generating timely and appropriate rescue response. Images shared by eyewitnesses of the crisis can also indicate the nature of help that needs to be made available. For example, when an image shows a person trapped under a collapsed wall, we know there is a need to get appropriate equipment that can lift and clear heavy rubbles. Similarly, images encourage and motivate the people to lend a helping hand to the victims. Photographs also assist in identification and search of missing people. Pictures often show the suffering and emphasize the need for empathy. As brought out in a study by Liu et al. (2008) on the emergent role of online photo sharing in times of disaster, “sharing photos in such situations can be informative, newsworthy, and therapeutic.” The study also points out the increasing importance of eyewitness photos. They can provide a true pictures and insight into the severity or enormity of a disaster.

Images and photos cut across language and literacy barriers. This makes them a very effective tool during crisis. Visual rescue instructions are always more effective and easily understood. Creators of such material use signs, symbols, and graphic representations to help during crisis. Simple visual representations can be used for self-help before the rescue team reaches the site. The fact that almost everyone today carries a mobile and has Internet access also implies that there is huge scope to provide help to victims during disaster times via mobile applications and by providing easy access to self-help material over the Internet. However, this may not always be possible as during several natural calamities, Internet access is affected. Yet, the use of mobile apps with ready access to already downloaded reference material on the mobile can be encouraged in disaster prone areas.

Conclusion

Looking at the visual content that is generated during and after a disaster, one needs to understand the mind of the creator and be a little more critical, analytical, and aware of where the image is coming from. One also needs to understand the cultural and social factors at play. Visual imagery during disaster or crisis is of critical importance. Equally important is the positive role it can play, provided it is handled in a responsible and balanced manner. Be it the observer, the storyteller, or the aide, the one fact that is common to all is the concern and empathy for the disaster victims. The utility and role of images created by all need to be handled carefully with the clear understanding of the intent. Government agencies have a critical role to play in terms of authenticating and endorsing such images that are freely circulated across social media platforms. Clearly defined rules of conduct need to be drafted and updated frequently to ensure ethical and responsible media content creation and circulation. Social media ethics must be clearly defined. The key to it is media education and media literacy. Not as a specialized program in colleges and media institutes, but as a general course that is part of the school curriculum. Social media ethics and understanding of its impact need to be taught at an early age in today’s virtual world where blogging, Youtubing, and social networking are an integral part of daily life, especially for the young. The utility of visual imagery for

rescue and recovery during crisis should be optimally tapped by encouraging the creation of self-help mobile apps. One shoe does not fit all. When disaster strikes, reactions to media and visual images are different of those directly impacted and those removed from the happening. What relevance and impact an image has varies depending on many factors (cultural, regional, religious, mood, location, education level, so on and so forth). The role of these images during disaster will also depend on where, for whom, and for what purpose they are created. Creating and sharing these images is no rocket science, but having the ability to appreciate and use them effectively and purposefully for the larger good is altogether a different ball game.

Abstract

The massive earthquake that hit India on the 26th of January 2002 in Bhuj in Gujarat was a wake-up call for a coordinated response to disasters in the country. Seventeen thousand people lost their lives and over 165,000 were injured following the earthquake. By August that year, the Government of India had signed an agreement for a Disaster Risk Management program with the UNDP. By 2005, the National Disaster Management Authority, NDMA, a single-point entity for disaster management under the aegis of the Ministry of Home Affairs, was in place with “the ethos of Prevention, Mitigation, Preparedness and Response.” The system got tested over the years in the wake of many natural and man-made disasters such as the tsunami of 2004, cyclones, etc. But the ongoing Covid-19 pandemic which started in 2020, being declared a disaster, has pushed the disaster management system in India under even greater strain. The mechanism under the NDMA, with state governments having their own Disaster Management Authorities, has never before faced such a challenge. As per the National Policy on Disaster Management 2009, “Communication and sharing of up-to-date information using state-of-the-art IT infrastructure remain at the heart of effective implementation of the disaster management strategy.” This chapter makes the case that ineffective communication as part of the disaster management strategy led to

S. Narayanan (✉)
Indian Institute of Mass Communication, New Delhi, India

avoidable hardship to the common man during the pandemic in India. The chapter presents a case study of the pandemic as a lesson in communication during a disaster.

Keywords

Disaster · Communication · India · Covid · Pandemic · Government

Introduction

A disaster denotes disarray and chaos and is a dynamic event which creates disorder. At such times, communication becomes critical as it connects those affected with first responders, support systems, and family. Information systems at such times need to be reliable and accessible. In fact, communication is a vital tool in the entire disaster life cycle of preparedness, response, recovery, and mitigation. Disaster communication is an integral part of disaster management which can help in raising public awareness at all stages – from disaster preparedness to early warning to mitigation efforts to rehabilitation. Community action before, during, and after a disaster is strongly shaped by the kind of information and communication that is disseminated about a disaster, using participatory communication, that is, involving the community at each step. Such communication is effective in bringing stakeholders together to reduce the risk of disasters.

An important aspect of the communication that is going out to the public is that it needs to be credible. The government being the repository of public funds and legitimate pursuer of public good largely enjoys the trust of the people. Thus, the role of the government in communicating for the purposes of disaster management becomes crucial. Whether it is with regard to the Early Warning Systems or EWS or about the strategy for mitigation, the public largely looks up to the government for communicating required response from the citizens. Putting in place a structure for disseminating information throughout the life cycle of a disaster thus becomes crucial on the part of the government. Also, other disaster risk reduction measures that are formulated by the government and need change in public behavior such as preparedness and mitigation strategies need to be disseminated, sometimes on a long-term basis. These could include communication about the building of a wall to prevent a tsunami from causing extensive damage, to reinforcing concrete buildings to make them earthquake-proof, etc. Policies and procedures brought in by the government in such regard for purposes of mitigation need sustained communication campaigns for behavior change. The four elements of effective disaster communication are customer focus, leadership commitment, situational awareness, and media partnership.

When it comes to the messages being communicated, it is important that during a calamity, they be clear, concise, action-seeking, and relevant. The communication vehicle being used is also as important as disasters often impact the telecommunications networks and make it difficult to reach the exact audience aimed at. Today

there are a plethora of options available for mass information dissemination, both legacy and new media. Among the legacy media, radio is one media vehicle that is likely to reach those affected during a disaster, as compared to say, television. New media including social media are increasingly playing a larger role in disaster management, but they bring their own challenges. One of the characteristics of new media is the flow of information from one to many and from many to many. This results in a disruption of hierarchies which in turn affects the proper channelizing of any information. Equally disturbing is the spread of misinformation on new media, which can create confusion and wreak havoc on all aspects of disaster management – the early warning, relief, rescue, and rehabilitation efforts.

Government Information Dissemination Structures and Processes in Disasters

Government information dissemination systems and processes during a disaster are vital for serving the public in such times. Information dissemination comprises two elements – the physical structure of telecommunication and other vehicles such as satellites and the messaging that goes out via those structures.

Given the importance of communication in disaster management, governments across the world have instituted systems for disaster communication management to help the government coordinate all aspects, as well as give stability to decision-making functions. These information structures are aligned to the governance structures and exist at the central, state, district, and local levels. The requirements for effective communication as well as information technology support for disaster communication include voice, video, and data connectivity for both key stakeholders and decision-makers, real-time dissemination of warning and information to local authorities and threatened community, and last mile connectivity at the disaster site for rescue and relief operations as well as providing communications to the community. In India, these form the guiding principles for the National Disaster Communication Network.

Here it may be mentioned that India is a signatory to the Tampere Convention of 1999 which is a legally binding international treaty for employment of telecommunications resources, signed by 75 countries, recognizing that “the timely deployment of effective telecommunication resources for rapid, efficient, accurate and truthful information flows are essential for reducing loss of life, human suffering and damage to property and to the environment caused by natural disasters.”

India's Disaster Management Information Structures and Processes

With a landmass stretching for nearly 3.3 million square kilometers in a subcontinent capped on one side by the youngest mountain range in the world and the sea on the other three sides of its peninsula, India is geographically prone to natural disasters. Combine that with it being the second most populated country in the world (and

rapidly heading toward becoming the most populated), and the scale of disasters becomes huge.

It was only after the massive earthquake on 26th January 2002 in the western district of Bhuj in Gujarat state, following on the heels of the Orissa super cyclone, that India woke up to the lack of a coordinated disaster management structure in the country, an essential element that gives a permanent, always-ready mechanism to deal in the event of disasters. With over 17,000 people dead and more than 165,000 injured in the earthquake, it was one of the biggest disasters to hit the country, causing losses to the tune of millions of rupees. Media reports of the disaster spoke of mismanagement in relief supplies and medical aid reaching those affected in the immediate aftermath of the disaster, even as international humanitarian aid started pouring in. Within 7 months of the earthquake, the Government of India had signed an agreement for a Disaster Risk Management program with the UNDP. By 2005, the National Disaster Management Act was in place which provided for the setting up of a National Disaster Management Authority, NDMA, with the Prime Minister at its helm. The NDMA was a single-point entity for disaster management under the aegis of the Ministry of Home Affairs with “the ethos of Prevention, Mitigation, Preparedness and Response.”

The NDMA’s vision is “to build a safer and disaster resilient India by a holistic, pro-active, technology driven and sustainable development strategy that involves all stakeholders and fosters a culture of prevention, preparedness and mitigation.” The stress on involving all stakeholders “through sustained and collective efforts” in the disaster management plan is a cornerstone of the National Policy Framework which clearly spells out this key feature by saying that one of the themes underlying it is: “Community-based disaster management, including last mile integration of the policy, plans and execution.” To that end, there is a defined structure that works at every level for disaster management.

Given the scale of India, geographic and political divisions have been created for ease of administration, and the country is thus divided into 28 states and nine union territories, UTs. These same states and union territories also make for easier governance of disaster management and communication during disasters, which flows along the governance structures. Thus, just as at the center there is the National Disaster Management Authority headed by the Prime Minister, at the level of each state, a State Disaster Management Authority, SDMA, also exists, headed by the Chief Minister of that state.

The overall stated objective of the National Disaster Communication Network is to “provide reliable, responsive and dedicated communication and IT support for effective Disaster Management during all phases of disaster at the National/State/ District levels.” To that end there is a vertical connectivity with the National Executive Committee, NEC, overseeing the efforts of the Integrated Operations Centre of the Ministry of Home Affairs and of the NDMA’s Operations Centre, which in turn oversee the inputs from similar command centers at the state and district levels called the State Emergency Operations Centre and the District Emergency Operations Centre. Communication flows two ways between the three levels of governance – national, state, and district. At the district level, coordination is also

sought with civil society organizations such as non-government organizations and self-help groups, along with vertical and horizontal interactions with all levels of governance structures including those at the block/village level.

An important aspect of disaster communication is the use of Information, Education, and Communication, IEC, activities to reduce disaster risks. As per the model framework adopted by the NDMA for use at the district level (Model Framework for District Disaster Management Plan, DDMP), among the mitigation measures to be adopted for reducing disaster risks should be IEC activities which should form part of non-structural methods to be adopted as part of mitigation strategies. Also listed among preparedness measures as part of knowledge, management, networking, and sharing is the stress on uploading of information on resources on India Disaster Resource Network (IDRN)/State Disaster Resource Network (SDRN). The National Disaster Response Force or NDRF is also on standby for assistance during any disasters and is trained to respond immediately in disaster areas.

As the efficient management of information and media in times of disasters is needed to keep chaos at bay, training and interaction strategies with media/pre-event awareness for the media are also recommended. To prevent multiplicity of voices and have continuity in information dissemination, the nomination of an official spokesperson about a disaster event is essential too. Such a spokesperson becomes the sole contact for the media for any and all information related to a particular disaster. Media management, including press releases, and giving out of sitreps or situation reports are other tasks that need sensitive handling at such times. Hence, information management and dissemination as well as media management strategies form an integral part of the Standard Operating Procedures (SOPs) for model disaster management.

Disaster Communication During the Initial Phase of the Covid-19 Pandemic in India

The classification of disasters depends on their severity and types whether man-made or natural, e.g., tornado, fire, earthquake, accident, etc. Epidemics also fall under the category of disasters, and the Government of India declared the Covid-19 pandemic as a disaster on the 14th of March 2020. As of writing this chapter, the third wave of the pandemic was just about ending in India in March 2022 in 2 years. The unprecedented scale of the epidemic has put it at par with the Spanish flu that struck about a century ago and affected a third of the world population. In the initial months, the world and India were still grappling with facts about the Covid-19 virus. In the absence of clear scientific evidence of how to control its spread, or how to combat the infection, or a vaccine, communication from the government to the public was changing frequently. It must be stated here that unlike other natural disasters such as floods and earthquakes, the telecommunications structures remain mostly unaffected during health disasters and the structure of the information dissemination system exists. As such, during the Covid-19 pandemic, all media, legacy and new, were available to the public and were well utilized by the

government to carry its messages. New media, including social media, played a big role in helping the public remain connected even during the lockdowns. In fact, the consumption of social media, particularly social messaging platforms such as WhatsApp, went up by as much as 40% during the first phase of the pandemic.

Of the recommended ten principles of disaster communication, especially in times of health disasters, the first norm of public communication is that the government should strive for maximum credibility. The others include engaging in clear communication, communicating with empathy and honesty, recognizing that uncertainty is inevitable, accounting for levels of health literacy and numeracy, empowering people to act, appealing to social norms, considering diverse community needs, and being proactive in combating misinformation (Hyland-Wood et al., 2021). For an effective government communication strategy, community engagement through reference groups such as young adults, senior citizens, etc., as well as effective use of digital tools is essential. Community reference groups can help the government identify the media tools to reach the affected as well as the framing and toning of messages, e.g., whether the use of sign language or a children's program on television or some other social media platform will help reach the targeted populace adequately. While using digital tools such as the *Aarogya Setu* app in India, concerns regarding the privacy of the data are being maintained, need to be addressed, etc. The government's handling of the Covid-19 pandemic in as far as communication is concerned drew flak from many. Ghosh (2021) says: "The evolution of the government communication since the announcement of the Janata Curfew on 19 March (2020) is a fascinating study in how not to do public health communication" (pp. 209). The problem lay, according to her, not in the dissemination mechanism but in the messaging itself which sought to deliberately misinform the public on how the lockdowns would ensure the complete wipeout of the virus in 3 weeks, then 40 days, etc., in a bid to allay the fears of the general public about Covid-19 in the early days. Also, the shifting goalposts gave a further blow to the credibility of communication from the government. The choice of the word "social distancing" for the campaign to combat Covid-19 was also a misnomer as it did not convey the fact that *physical* distancing was required to be maintained. The use of masks was also not made mandatory by then. However, the greatest flaw in the public health communication in the initial days of the pandemic was the use of fear to make the people compliant to the restrictions imposed during the lockdown. This atmosphere of panic led to the exodus of thousands of migrant laborers from urban centers to their homes in rural India, leading to many tragedies in its wake.

An analysis of the structure of government information systems during the pandemic shows an adherence to the basics of crisis communication: the government was quick to declare it a national disaster and deploy the entire machinery of the disaster management system for it, which meant a clear two-way flow of information from the center to the states and districts. The regular briefings by a duly appointed Joint Secretary from the Ministry of Health and Family Welfare through the Press Information Bureau were another highlight of the information dissemination mechanism. These briefings proved very useful for keeping track of the progress of Covid-19. Besides, it also answered queries from journalists on the issue. The top doctors

from the Apex health institution, All India Institute of Medical Sciences, were regularly addressing concerns about the Covid-19 virus on the public service broadcaster, Doordarshan, and All India Radio, as well as private television channels. In an all-out initiative, the government also reached out to private players to reach to all corners of the country. With a toll-free helpline and an email account where people could write in, the government strove to better community engagement too (Sengupta, 2021).

The government's social media profiles and pages were also being used to disseminate all information about the Covid-19 virus. At the same time though, misinformation was rife on the same social media about the ways to combat the virus, ranging from superstition to the ridiculous. The government's ministers stood behind some Ayurvedic medicine purporting to "cure Corona" which led to a run on the stocks of the concoction, before its claims were proved hollow. Such embarrassments also led to a loss of credibility for the government. The Prime Minister himself, in a bid to boost the morale of a population suffering the effects of isolation during the lockdown imposed in the initial days of Covid-19, put his weight behind clanging of vessels at an appointed time. But the exercise led to circulation of messages on WhatsApp claiming that the clanging would result in an end of the virus because of the sound waves generated at that particular witching hour would kill it. Through the government's Press Information Bureau, an attempt was made to counter such misinformation via PIB Fact Check, but the sheer volume of the misinformation was daunting. Another criticism leveled was the lack of inclusivity in the messaging for a diverse nation such as India (Nankani, 2021). Uncritical acceptance of the global framework of risk communication was another criticism of the Ministry of Health and Family Welfare's risk communication messaging (Sengupta, 2021). Scholars also called for the necessity of having a legal framework for risk communication and crisis management (Mondkar, 2020).

Conclusion

A look at the government information dissemination structures and processes suggests that a permanent system for disaster management is essential so as to have a proactive and holistic approach. Such structures must be constantly extended and updated and must make use of already existing structures. The processes for information dissemination need to be clearly defined and must always be two-way as well as participatory. Public communication in times of disasters rests on three pillars – the telecommunications networks, the channels for information distribution, and the messaging employed. As far as the telecom network (including satellite) is concerned, the goal should be to have real-time, voice, data, and video connectivity which can benefit the community affected. Where the communication channels are concerned, in an age of multimedia, all possible channels need to be employed, tailored to various audiences with inputs from community reference groups and community involvement. While employing digital tools of communication, it is necessary to be aware of the problems of spread of misinformation through them

and public communication must address them. However, a great deal of attention is needed when it comes to the content of the messages which need to be clear, empathetic, honest, and, most importantly, credible. An analysis of the Government of India's response to the Covid-19 pandemic in the early days shows flaws in the messaging, leading to a crisis of credibility and panic among migrant populations, which were avoidable.

Abstract

The coronavirus pandemic that triggered lockdowns across the world from early 2020 hit the global economy adversely and one of its worst victims was the fashion industry. Lockdowns disrupted normal business activities and barring essentials, and many commercial engagements came to a grinding halt.

Brands had two options – transform or perish. They chose the former. Their common and immediate goal was to accept the new reality, respond to it effectively for survival, and devise strategies to reclaim the lost ground.

The pandemic had pressed the “reset button” for fashion brands. But, it also gave time to introspect to a sector that was always in the rush to beat its own creation. It was the time to reinvent and re-brand. This transformation was inevitable to survive devastations caused by the pandemic that threatened the very existence of the industry.

e-mail: meha.palan@pearlacademy.com

It was evident in some of the reactions. Due to lockdowns, businesses in general halted and the first casualty was advertising and PR spend. The advertising budgets were ruthlessly slashed by brands for print media – newspapers and magazines, followed by out-of-home/billboards, radio, and TV, according to industry reports. Therefore, the fashion industry that is based primarily on branding and storytelling struggled to stay visible as the pandemic and imminent lockdowns not only separated people from other people but also brought forced distancing between brands and their audiences. While digital advertising budgets were also slashed, several opportunities for brand communications in digital media emerged such as Instagram Reels, YouTube channels, and SnapChat.

Across the globe, fashion and luxury brands turned their focus toward the manufacture of essential items to protect health professionals and those working to combat the novel coronavirus. The narrative in India was no different from the rest of the world. Fashion designers stood for the cause by communicating through their collections and digital campaigns and by designing products catering to the need of the hour. The fraternity proactively reached out to help and contribute financially to the migrants and craftsmen, from providing shelters to workers and craftspersons to donating percentage of sales to organizations working on the ground.

This chapter will present to readers the “reinvented fashion sector with primary information from the Indian fashion sector” and details on its altruistic contributions, brand building initiatives. It will discuss how fashion brands attempted to stay relevant and how messaging was characterized by humane, ethical, and social overtones.

Fashion designers · Reinvent · India · Brand outreach · Altruism · Fashion Communication

Introduction

When clothes leave the factories where they are made, they are merely ‘garments’ or ‘apparel’. Only when marketers get hold of them do they magically become *fashion*. (Tungate, 2005)

Fashion is not just a word that can be described by itself; it has a broad perspective and multiple connotations. The *Fashion Theory: The Journal of Dress, Body & Culture* defines fashion as “the cultural construction of the embodied identity.” It tells stories through clothing and the cultural influence of the embodied. It’s not just a piece of garment that we wear. It’s the image and identity that we wear. It is how we wish to appear before others. This perception or image is created through advertising and brand communication across all its touch points and also through all seasons, festivals, and occasions. The swing tags, catalogues, visual

merchandising, packaging, and invitations – these are all elements that communicate a fashion brand's narrative.

Just like many other sectors, the fashion industry was also hugely hit by the coronavirus pandemic and consequent lockdowns across the world that started from March 2020. Disruptions due to lockdowns caused immense economic uncertainties and the fashion industry was not an exception. Brands had two options – transform or perish. Most chose the former. Their common and immediate goal was to accept the new reality, respond to it effectively by devising strategies beyond survival, and reclaim the lost ground.

The pandemic had pressed the “reset button” for fashion brands. But, it also gave time to introspect to a sector that was always in the rush to beat its own creations. It was the time to reinvent and re-brand. This transformation was inevitable to survive devastations caused by the pandemic that threatened the very existence of the industry.

While speaking about the challenging time in an interaction on this matter, Mr. Sunil Sethi, president, Fashion Design Council of India (FDCI) said, “Economic stunting and inflation, affected small designers, who not only faced cancelled orders, inability to pay rents, salaries, poor infrastructure, but also could not sustain the business as they had no savings. To multiply their woes, there was an exodus of skilled embroiderers due to the lack of work with factories forced to shut down. The interesting part is that as an industry it taught us many lessons that will hold us in good stead about business management, in the future.”

Brands responded proactively with quick action responses toward communities-at-large through improvisation and innovations. These actions were community-centric that had gone into survival mode with uncertain near-term future.

Pandemic Threatened the Existence of Certain Segments

The handloom sector which is the most important element of the fashion and luxury sector value chain was already in perils, and the pandemic only worsened the plight of weavers across the country (Ref. Fig. 7). Founder and director Ramesh Menon, Save the Loom, a nonprofit organization, said:

The first phase of lockdown came weeks before the harvest festivals across India in mid-April and that resulted in huge pile up of stocks, and the resultant cash flow, and work orders getting cancelled, delayed payments and supply chain issues ensured a doom time, and the process continued through the last 24 months with multiple waves, lockdowns, containments etc. In May 2020, West Bengal and Odisha were affected due to Cyclone Amphan, and that also led to damage in certain areas. We at ‘Save The Loom’ with our partners ‘India by Hand’ led a revival of a cooperative with 35 odd looms in Kalna (East Bardhaman district), in Bengal. We devised catalogues of the material and products and circulated to push sales wherever possible. Online sales were explored as well during the festive season to find new avenues of sales. It’s been a learning journey to devise new ways to add value to artisanal products.

Reinventing Fashion Brands: Altruism Versus Brand Building

Strategy for Survival

Disasters are biggest catalysts for change that are increasingly offering opportunities to direct and navigate change toward aspired outcomes, such as sustainable development goals (Brundiers & Eakin, 2018). However, leveraging those opportunities created by disasters to achieve both sustainability and commercial viability objectives has to be community-centered.

Due to lockdowns, the advertising budgets were ruthlessly slashed by brands for print media – newspapers and magazines – followed by out-of-home/billboards, radio, and TV, according to industry reports. While digital advertising budgets were also slashed, several opportunities for brand communications in digital media emerged such as Instagram Reels, YouTube channels, and SnapChat.

Fashion industry that is primarily based on branding and storytelling was getting choked because their outlets were closed, and they had no ready platform to engage with their customers. It needed a new strategy to engage with buyers and recreate relevance. The first major task was to save traditional art forms that live and die with artisan communities. Their survival was a must if fashion had to fight the pandemic and reinvent itself. Most of the fashion brands focused on resilience, rather than vulnerability (Gaillard, 2007).

Fashion brands and designers volunteered and proactively reached out to help and contribute financially to the migrants and craftsmen, from providing shelter to “karigars” and craftpersons to donating a pie from sales to keep the craft alive. The corporate social responsibility (CSR) this time was absolutely voluntary and guided by the principle that survival of the entire ecosystem is a must for all stakeholders – entrepreneurs, designers, workers, and craftsmen. “The FDCI began the very successful Covid Support Fund (CSF) initiative in which we supported many small businesses and helped them sail through a tough time,” shared Mr. Sethi in the interview with the author.

The popular fashion and luxury brands across the globe turned their focus toward the manufacture of essential items to protect health professionals and those working to combat the novel coronavirus. A slew of the world’s luxury brands started from making sanitizers to medical overalls and surgical masks. For example, Donatella Versace, Giorgio Armani, and Miuccia Prada made generous contributions to hospitals in Milan. LVMH™ and Bulgari™ were also among the top fashion and luxury brands donating generously with funds and services (ref Fig. 1). LVMH started manufacturing sanitizer to donate to the French health authorities (Pidgeon, 2020).

The narrative in India was no different from the rest of the world. Fashion designers stood for the cause by communicating through their collections or digital campaigns or by designing products catering to the need of society. For example, during this time of the Covid pandemic, Indian designers came forward to help society with their design solutions (Assomul, 2021; Tewari, 2020).

Designers like Rahul Mishra, Masaba Gupta, Anita Dongre, Payal Jain, Gaurav Gupta, Manish Tripathi, and Shruti Sancheti to name a few famous designers were

Fig. 1 Versace's Instagram post. (Source: @donatella_versace (Instagram))

promoting social distancing and wearing of masks, during this pandemic, through their cotton-based printed face masks and graphics on t-shirts made from their existing collection or by creating new graphics and prints.

The Essentials

As the demand for masks grew and a shortage of masks prevailed, the designers took a lead in providing beautifully illustrated and printed designer masks which gave them a new image and brand outreach at a time when people were not buying designer wear. Realizing the fact that with the number of these masks available in the market being nowhere close to their demand, many designers opened up their factories and began producing reusable, washable cotton masks to supply to slum dwellers, daily wage earners, and others who did not have access to this essential commodity. Going beyond, many designers deployed their teams for the distribution of the masks for those on the streets and migrant laborers (Ref. Fig. 6).

Designer printed masks emerged as a huge trend and a new fashion statement started with a social cause in the disaster (Rabimov, 2020). The amount collected was going to the Fashion Design Council of India (FDCI) fund which was being given out to the needy. *The Times of India*, world's largest circulated English daily, also started the Mask India project and asked fashion designers to voice and demonstrate the usage and importance of masks. The Indian fashion industry took up the challenge to create awareness on Covid through their design solutions and spreading positivity. And, fashion itself became an important medium of communication as compared to the traditional medium of newspapers and television.

Save the Loom, a nonprofit organization, worked with the Khadi institution to support the production unit. This effort not only served the need of the country then

but also gave livelihood to weavers. Those handwoven cotton masks were even exported to the United States.

In an email interview with the author, Mr. Sunil Sethi stated, “The CSF also provided financial assistance to the handloom sector, during the pandemic. In the first tranche, we helped fashion designers to be able to support their staff, the second tranche was open for all non-FDCI designers too. The third tranche of CSF for craftsmen was, buying their unsold stock. The clusters were identified by the DC Handlooms, under the Ministry of Textiles. The FDCI extended financial aid through the NGO MG Gramodyog Sewa Sansthan, which has been working for many years to revive Bengal muslin and cotton.”

It was a special time that influencers, designers, harnessed the power of using their platforms for their community. Designer Anita Dongre, who owns one of the largest homegrown Indian fashion brands, turned her social media pages into a Covid-19 helpline, depicting all vital information related to the crisis, and her social media channels were amplifying every demand, that of hospitals to medical supplies. The brand has 1.6 million followers on Instagram; hence it became a helpful Covid resource guide. Her team was working tirelessly to verify each source and also sharing requests from followers who were in need of medical aid. In similar lines, designer Rahul Mishra also contributed to verifying and amplifying Covid-related posts on Instagram (Ref. Figs. 2, 3, and 4).

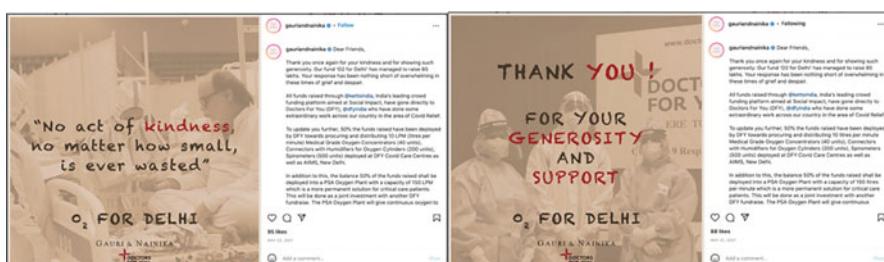

Fig. 3 Indian fashion designer Gauri and Nainika’s Instagram post. (Source: @gauriandnainika (Instagram))

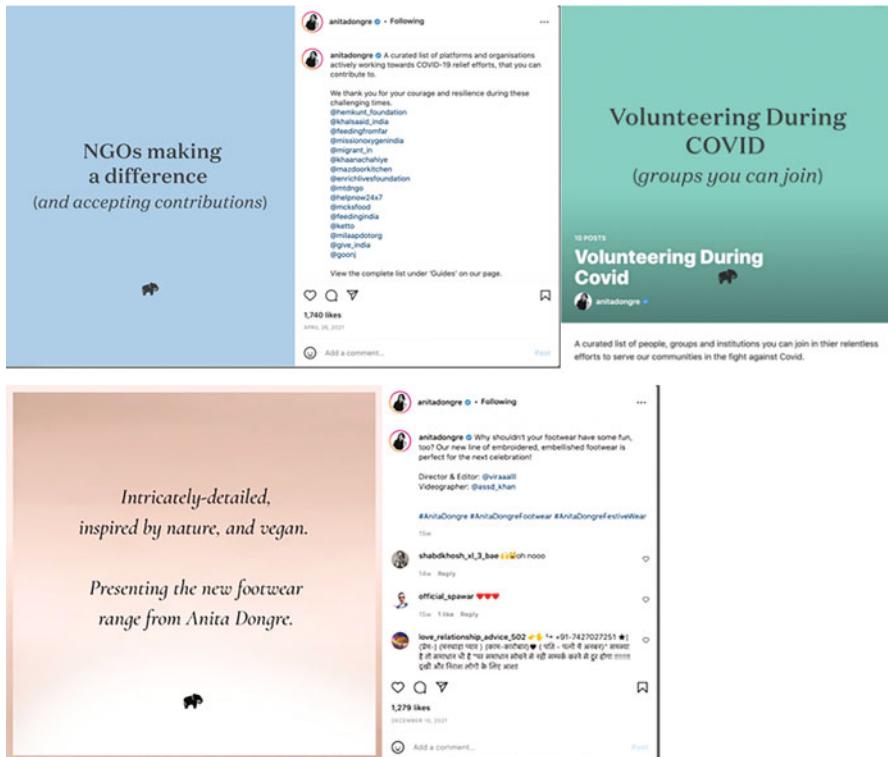

Fig. 4 Indian fashion designer Anita Dongre's Instagram post. (Source: @anitadongre (Instagram))

Another designer Gaurav Gupta partnered with Hemkunt Foundation to save lives. The foundation worked tirelessly to provide oxygen support to thousands across the capital. Couturier JJ Valaya pledged 20% of his label's sales online and offline to support three NGOs, Hemkunt Foundation, Khalsa Aid India, and Give India, that were tirelessly working toward Covid-19 relief.

The Reinvention

"The pandemic in the long run will always be marked as a turning point for most businesses. It brought in a reality check in the fashion business. Non-viable, vision less organisations without strategy for long term survival were put in the spot, to either make a turnaround or perish," said Menon in his interview with the author.

Fashion brands focused on surviving the crisis in the short term by reconfiguring existing resources and initiated long-term recovery by mobilizing efforts for a redesigned business model. They used this pause in the business to digitize their processes and enhance their systems and technology. This allowed them to develop operational efficiencies and provide personalized experiences to the consumers. Many of the former processes that were etched in stone underwent a complete revamp (Ref. Fig. 5).

Fig. 5 How fashion brands contributed? (Source: Self created)

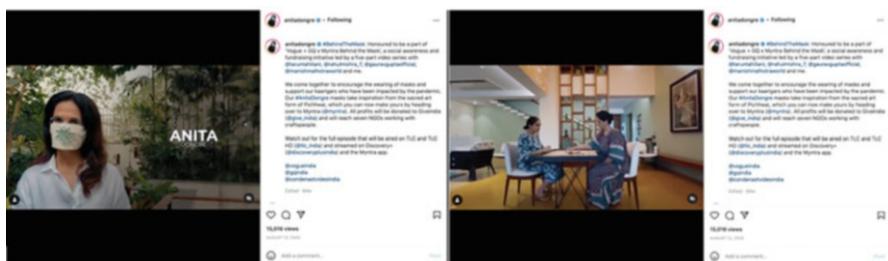

Fig. 6 Indian fashion designer Anita Dongre's Instagram post. (Source: @anitadongre (Instagram))

From Physical to “Phygital” Fashion Weeks

The physical fashion show was substituted by elaborate fashion films and campaigns that went beyond accessible, lavish, and elaborate venues. Mr. Sethi said, “We at the FDCI were the first ones who began the digital fashion week, to make sure that designers retain their will to showcase online through the medium of fashion films. We then went phygital to ensure some shows can be offline too, and we received an overwhelming response even for a niche segment like India Couture Week which is super exclusive.”

The shows were livestreamed for more than 40 designers who participated under the banner of Lotus Make-up India Fashion Week. The Fashion Design Council of India converted parts of its office building into a studio and created a stage, with screens and lighting set up to facilitate shooting of fashion films and videos by the

Fig. 7 Save the Loom craftspersons. (Photography Credit: Maneesh Aggarwal)

designers. Fashion labels/designers who participated in the fashion show included Varun Bahl, Tarun Tahiliani, Suneet Varma, Shivan and Narresh, Shantanu and Nikhil, Rohit Gandhi, Rahul Khanna, Rina Dhaka, Rajesh Pratap Singh, Payal Jain, Nitin Bal Chauhan, Namrata Joshipura, Geisha Designs, Ashish Soni, and Abhishek Gupta.

This led to many Indian fashion designers to explore investments in campaign videos and fashion films with characters, music, and screenplay. This democratized the reach of fashion designers and marked a shift in the way these brands communicated with their audience on social media.

The design council also created an online “designer showroom,” a dedicated space where designers could upload their lookbooks and hold virtual meetings with domestic and international buyers. In order to support designers, Mr. Sethi shared “We deployed technology in our favour by creating a space where designers could interact with buyers virtually creating a market for their products through fashion weeks. The FDCI launched a virtual B2B platform titled ‘Designer Showroom’ and many designers sold their inventory here. This enabled domestic and international buyers to interact with designers virtually and place orders. Designers’ profile page (virtual stall space), had their collection images, line sheets, campaign video and imagery, and they could conduct virtual meetings with their buyers.”

It was observed that during the pandemic, fashion brands all over the world shifted their marketing strategies toward storytelling, experiential, human, conscientious, and fair wages instead of pushing sales through ostentatious showcase.

E-Commerce, Social Commerce, and Digital Stores

Sharing his journey of how he realigned his business strategy during the pandemic, designer David Abraham of *Abraham and Thakore*, said “We immediately put our attention and resources to become strong digitally and on e-commerce sites.” The team realized that being in touch directly with consumers helped the brand.

Most of the fashion brands and labels went silent during the lockdown phases on all posts related to brand and commerce on their social media handles. Many Indian designers and boutiques hadn't built robust online strategies, or it was just a slow work in progress until early 2020. Pandemic turbocharged the online presence for fashion and luxury. Designer Pankaj of the fashion brand Pankaj & Nidhi also shared similar views. According to him, his brand did not have any online presence, and they focused their energies to strengthen their digital sales strategy.

In September 2021, Amazon announced the launch of its Luxury Stores, a new shopping experience offering both established and emerging luxury fashion and beauty brands. Iconic American fashion house, Oscar de la Renta, was the first to unveil its store-in-store featuring its Pre-Fall and Fall/Winter 2020 collections. According to the press release issued by Amazon, "More customers were turning to Mobile Shopping and in the previous year (2020), Amazon customers ordered more than one billion fashion items on mobile devices."

Support the Artisans and Craftspersons

Artisans and craftspersons are integral to the fashion's supply chain. Designer Rahul Mishra shifted his production bases from larger cities to craft clusters in villages and smaller towns. He "decentralized" his "system of production" and "employed artisans in smaller villages that were less impacted by COVID-19."

The co-founder and director, Alpi Boylla, Save the Loom (Savetheloom.org) is a nonprofit community group to revive, restore, and restructure the handloom industry in India) organization, said to the author:

What we encountered on the ground were harsh realities. Initially it was all about retrieving as much material, and fixing their looms and homes. As we went along, we also documented the misery in which weavers thrive – they were earning a measly Rs. 150 a day (~\$ 2.0/day), and that was a shocker – and as we went deeper, we realised it won't make sense if we just fixed their looms and left. Most weavers – 96% are women, and 85% of them are above the age of 45. It's not possible to overhaul a system that has been running to this state for past few decades, or to find immediate solutions. Most importantly, work on the grassroots to bring change where it matters – the processing of the raw materials, the livelihoods of the weavers and associated allied workers, and then make the product relevant (again). We have been working on all the above areas over the past 43 odd months. And have been able to find a way to establish a model space – with our built-in social impact philosophies that revolves around 3 P – People, Process, Planet and 5 E's – Educate, Empower, Employ, Engage, with concern to Environment, followed by 5C's Connect, Collaborate, Create, Culture and Community as part of our Build Better program to provide resource to the Craft sector.

Shift to a Seasonless Fashion or Trans-Seasonal Fashion

On the third of May 2020, Alessandro Michele, creative director of an Italian high-end luxury fashion house based in Florence, Italy, shared on the brand's community

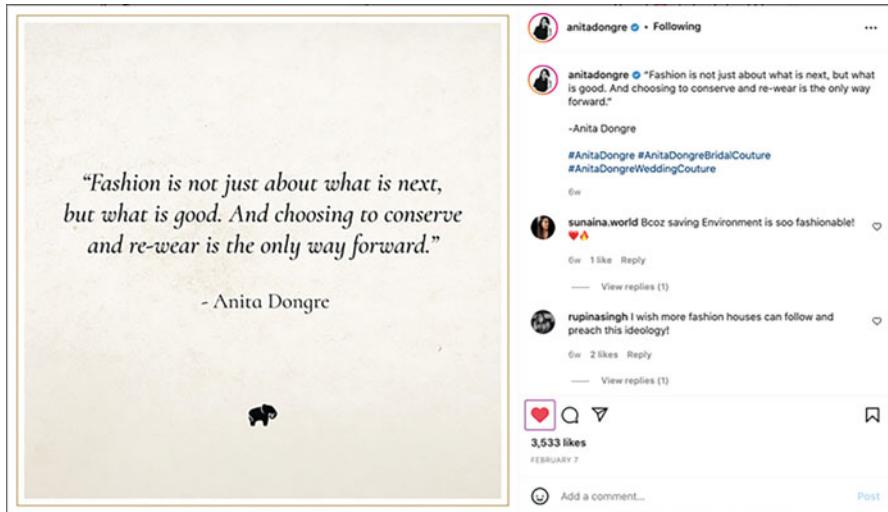

Fig. 8 Designer promoting slow fashion [Source: @anitadongre (Instagram)]

pages from his personal diary written in Rome that the brand will pause multiple season showcases and have only two-season showcases in a year.

With order cancellations from retailers across the world, the stocks piled up with the Indian fashion brands as well. The climate crisis also became an unavoidable issue. And, this movement of seasonless fashion gained momentum and set many to question themselves “Do we really need that many seasons?”

Alyssa Hardy in her article titled “Fashion Year” stated, “...many of the biggest brands like Michael Kors™ and Saint Laurent have removed themselves from the traditional seasonal calendar. Others, like Gucci™ and Prada™ have decided to completely cancel their new collections all together.” Explaining seasonality, she added “Seasonality is a means to sell more products throughout the year. In the fast-fashion realm, where brands like Zara™ and Fashion Nova™ crank out designer knockoffs at lightning speed and at price points that more consumers can access, the cycle has gone up to 52 seasons. Essentially, a new ‘collection’ of clothing gets designed and produced *every single week of the year*.”

Indian designers Rahul Mishra and Anita Dongre agreed that sustainable, seasonless fashion is the new trend and that pandemic has propelled it (Ref Fig. 8).

See Now Buy Now

While the fashion week organizers gave virtual platforms for fashion designer’s B2B showcase, designers were showcasing their current season collection on the ramps at the Lakme Fashion Week 2022. Fashion designer Pankaj in conversation with the author stated, “See Now Buy Now is the trend. Most of my fellow designers are

showcasing current season at the fashion week to reach consumer's directly to drive monetisation."

The India Fashion Week in 2022 tied up with video apps Roposo and Ajio Luxe to support designers in the "see now, buy now" model. In September 2021, Roposo launched live commerce from short videos in India. Similarly, Ajio Luxe also collaborated with designers such as Manish Malhotra at his show for consumers to buy it from the ramp.

Collaborations

In an interview with Asmita Aggarwal, a fashion consultant and official blogger of the Fashion Design Council of India, she said, "The pandemic has initiated collaborations within the sector as well across-industry. Everyone has realised in the fashion circuit that no one will get through this pandemic alone. We saw collaborations earlier but not at this scale. This time in 2022 at the fashion week, we saw designer Varun Bahl with Lakme Salon; Tarun Tahiliani with NEXA, Suneet Verma with Bata, boAt and Huemn, John Jacobs with Shantanu and Nikhil, realme with Shivan & Narresh and few more."

These unique cross-collaborations demonstrate how fashion fraternity has realized the power of collaborations to grow. Collaborations will create newer markets and help designers to optimize resources.

Conclusion

The pandemic disrupted social behavior and that also influenced the business of fashion. Although pandemic was temporary, the transformations it brought are here for good. It has changed the way people perceive fashion and engage with it. Forward-looking multiple fashion trends in a year are now a passe. A seasonless fashion trend is the new mantra.

The last 2 years had been difficult for all. It also hit India. It endured the Covid-19 pandemic, ravaging floods in Kerala, cyclones in West Bengal, shortage of oxygen, deaths, and devastations. These catastrophes did disrupt the entire ecosystem, but could not annihilate it. The difficult situation prompted all stakeholders to adapt to a new ecosystem through a unique blend of technology with creativity. Fashion world went digital and reached the customers without waiting for them to come and knock at the door. The combined strengths of social media and e-commerce not only worked well, but they also paved way for startups – enterprises beyond giants like Amazon, Myntra, and Ajio. In the digitally aided world seasonal, forecasts paved way for instant trends. The new mantra is – create – show and sell, direct-to-consumer through various platforms including social media such as Instagram, Facebook, Twitter, and so on.

This is the power of creativity that works at its best when in crisis. Covid-19 pandemic disrupted the normal – plan and forecast for a forthcoming season, organize fashion or phygital shows to popularize it with the glamour quotient, and encash it. The crisis invented wings for fashion entrepreneurs, designers, and promoters – don't wait for the customer to come, but just fly to them instantly through digital means – now explore the endless possibilities through the virtual reality. However, it is important that the industry works together to protect their crafts and focus on the 3Ps (People, Process, Planet) and 5Es (Educate, Empower, Employ, Engage, with concern to Environment) as stated by founders of Save the Loom.

Abstract

Although all media platforms are active partners in disaster management communication, radio is the most immediate, intimate, and accessible medium due to its faster and larger reach, affordability, and simpler technology. When a disaster is actually happening, radio is the pivotal medium of choice globally. Media essentially supports the efforts to safeguard lives and livelihoods by creating public awareness and helping rescue, relief, and rehabilitation activities. The components of an effective disaster communication plan are disaster risk prevention/reduction, early forewarning, real-time coverage of rescue and relief, and the post-disaster role of focusing on rehabilitation. As the premier public service radio broadcaster of India, All India Radio (AIR) has continually risen to the occasion in discharging this role through its network reach and employing its bouquet of broadcasts in 23 languages and hundreds of dialects. AIR has its own internal standard operating procedure (SOP), which enables all AIR stations to

R. K. Shukla (✉)

swing into immediate action when a disaster threatens their service areas. Now, besides AIR, private radio channels and community radio stations also contribute significantly in this field working in synergy with various stakeholders. Better real-time information sharing among various nodal agencies and the respective nearest AIR and other radio stations particularly in the disaster vulnerable areas would facilitate faster communication and action thereon. Media should be treated as an active, valuable, responsible, and trusted partner in the realm of disaster management so that it is empowered to do timely, accurate, factual, and responsible reporting and also combat the scourge of misinformation.

Keywords

Disaster · Communication · Media · Radio

Introduction

Accurate, effective, and timely communication is a crucial component of disaster management. All media worldwide participate in disaster communication activities. Due to various reasons, radio has repeatedly proved to be the most potent media tool in disaster communication. However now, many a times, the people handling disaster management activities underestimate the role and potential of radio. They need to be made better aware in this regard. The evolution in radio content creation, presentation, and dissemination due to giant leaps in technology as well as other factors such as changing audience profile, ever-increasing competition, new communication platforms and avenues, etc. also needs to be understood and then used for better efficacy in delivering the message.

Disasters Becoming More Frequent and Fierce

It has been becoming increasingly evident that the incidence of hydro-meteorological and geological disasters is constantly on the rise. And further acceleration of this phenomenon is happening before our very own eyes. Disasters are becoming more and more frequent as well as ferocious. What can no longer be brushed under the carpet and now is almost universally acknowledged, although still grudgingly at times, is the damning fact that a host of increasingly virulent human activities are not just causing but actually hastening the rampant ecological degradation and the resultant climate change patterns have vastly aggravated this situation. The crowning irony is that much of it flows from the “dominate and exploit the nature” development model which has been the gospel truth almost globally since the industrial revolution. In India, the horrifying images of hotels and houses tumbling into an angry swollen river Mandakini during the colossal 2013 Uttarakhand state disaster are still fresh in memory although terrible scenes of

various succeeding disasters have also been superimposed on those. One can see the all-consuming greed encroaching into areas where no human settlements should have been created. Alas, not enough enduring lessons seem to have been learnt from that and many other disasters, which seem to be mushrooming all around us.

Disasters take a very heavy toll in terms of life and property leaving behind tragic tales of utter destruction. Disasters adversely impact local, regional, national, and also global economy, where everything now is so intimately and intricately interconnected. Of course, it is not possible to prevent disasters altogether. Terrible disasters have been occurring through the ages and will keep happening in future too. But, now with the massive advancements in science and technology, steps can definitely be taken to mitigate the damage caused by them. In fact, the heartening fact is that there has been substantial progress in this regard. Thus, to reiterate, disaster prevention may not be possible, but disaster mitigation certainly is. This article intends to look at what media in general and radio in particular have been doing and can further do in this regard.

Role of Radio in Disaster Mitigation

As the frequency and ferocity of natural (and also man-made) disasters go on rising, the increasingly critical role of media, which now seems to be omnipresent if not omnipotent, in mitigating disasters is self-evident. In a disaster situation, media has to **support the efforts to save lives and livelihoods and contribute to the rescue, relief, and rehabilitation activities by creating and nurturing public awareness. This is the core of media's role in disaster management.** Obviously, **well-informed people are a significant asset in disaster mitigation endeavors.** They are generally better prepared to face disaster situations. They can also add vitally to rescue, relief, and rehabilitation efforts and ensure success thereof.

Among all media platforms, radio takes a pivotal and preferred position in disaster management communication due to its faster and larger reach, easy affordability, and simpler technology with continuous innovations. **When a disaster is actually happening, radio is the medium of choice globally.** Mr. Kamal Kishore, member secretary, National Disaster Management Authority, which is the apex body for disaster management in India, has some very relevant observations in this regard. He feels that radio has an unparalleled reach outnumbering the reach of any other broadcast media, and in the far-flung areas such as high Himalayas that are exposed to mountain hazards, radio has the potential to reach every single person. He believes that radio has the ability to deliver messages to remote areas that might be difficult or unsafe for outsiders to access.

The components of an effective disaster communication plan are disaster risk prevention/reduction, early forewarning, real-time coverage of rescue and relief, and the post-disaster role of focusing on rehabilitation.

Disaster risk prevention/reduction aims at educating people at large and particularly those residing in disaster-prone areas to remain prepared at all times targeting

general as well as specific population groups such as farmers, fisher folk, and industrial workers as well as women, children, youth, especially abled persons, etc. This is an activity in which all media – traditional and emerging – should contribute. As this is an ongoing process, all media organs have a role to perform here. However, even in this phase, radio does enjoy some functional advantages including that of effective targeted messaging. **Mr. Kamal Kishore, member secretary, NDMA, underlines these advantages in these words – “Because it is only an audio medium, it does not require listeners to drop other activities. Targeted programmes for different user groups can be developed using this unique strength of Radio as a broadcast media.”** He points out that **different time slots, languages, and dialects can be used for different user groups.** He goes further stating that **radio can provide locally tailored programming that accounts for the specific issues faced by people.**

It will be relevant at this juncture to recall as illustrations of such programming some documentary serials mounted in the past by All India Radio. These were mostly produced in house in collaboration with agencies like Vigyan Prasar. Hindi and English versions were usually created centrally, and then these were reproduced and broadcast by relevant AIR stations across the country in their respective languages. The serial devoted to the concept of sustainable development was entitled “Life must Go on” (Chaltee Rahe Zindagee in Hindi). The one on climate change and global warming was called “Whispers of the Wind” (Badaltee Fizaan in Hindi). Perhaps, the most important from the disaster management communication perspective was the serial “Lest we Lose” (Kaheen Der Na Ho Jaae in Hindi). It must also be reiterated here that these are some examples of centrally originated programs and a huge number of such programs are mounted regularly in different languages and formats by individual radio stations serving their respective areas as a part of the perennial campaign to educate the people thereby preparing them for likely disasters.

However, this process acquires a sense of urgency and is focused on specific information dissemination when the threats of a natural calamity such as cyclones or tsunamis or floods loom large. This is the phase of disaster warning. Disaster warnings are given in two stages – early warnings and emergency warnings. Mr. Kamal Kishore quotes the **United Nations Office for Disaster Risk Reduction (UNDRR) regarding radio’s role in providing early warnings – “When emergencies and disasters strike, radio has a strong and specific role to play in keeping communities up to date with events and advising them on practical steps to take to reduce the impact of a disaster** such as setting food aside for an emergency period.”

When a disaster actually strikes, disaster coverage phase begins usually in the form of “breaking news.” This is quite dramatically evident in disasters of a sudden nature such as earthquakes, landslides, flash floods, etc. The immediate media follow-up activities are primarily directed at lending assistance to rescue and relief operations and keeping affected people as well as people at large fully informed.

The less attention grabbing but vitally important role of media in disaster management relates to a sustained and continued focus on the rehabilitation process of the victims. This is the post-disaster role.

Although all media platforms are active partners in disaster management communication, in disaster situations, radio often comes out as the most immediate, intimate, and available medium. Mr. Kamal Kishore, member secretary, NDMA, emphasizes radio's role as a **friendly, accessible, and relatable interactive platform**. He feels that **there is no other media that is more amenable to an interactive format**. He notes that communities can dial-in to live programs and interact with experts. They can pose relevant queries and also provide vital information and insight from the ground on specific challenges and opportunities for disaster risk management. He underlines that this can be very effective to improve communities' ability to convey ideas from the ground and even raise awareness of their rights. He believes that **radio can also provide basic psychosocial support to communities**. Mr. Kishore is alive to the new trends in the media landscape and notes that convergence with emerging tools such as social media, web-based platforms, podcasts, etc. can further multiply the effectiveness of radio as a medium.

In recent years, amateur or ham radio has played an increasingly important role in disaster communication. This is essentially a hobby but now has evolved into a useful tool. However, it needs to be understood at the outset that communication through ham radio is between individuals equipped with the wherewithal. Thus, it is not a mass media thing. But, often there are situations during disasters when all normal modes of establishing contact between the areas affected and the authorities capable of bringing succor to the people are snapped. Ham radio operators can and do step into such a situation and provide critical communication links. It is a matter of satisfaction that ham radio operators are now getting the recognition they deserve and premier disaster management agencies enlist their support as and when needed.

All India Radio as the Premier Disaster Management Radio Communicator in India: The Kosi Floods of 2008

As the premier public service radio broadcaster of India, All India Radio (AIR), which is also known by its Hindi name "Akashvani," has continually risen to the occasion when disasters like explosions, fires, landslides, bus and train accidents and air crashes, cyclones, tsunami, floods, and earthquakes strike. With almost every disaster in the country, there are stirring sagas of selfless and courageous service provided by the AIR employees, often going beyond the call of duty. As one of the illustrations, it is worthwhile to recall what AIR program and engineering personnel did at the time of the terrible Kosi river floods in Bihar state of India in 2008.

In August, 2008, Bihar was facing the wrath of the river Kosi, which flooded the northern part of Bihar by changing its course. As per reports, this disaster was due to an embankment breach at Kusaha village of Sunsari district in Nepal. The plight of the people in the flooded areas continued for more than a month.

All India Radio stations serving the affected areas swung into continuous action to provide succor to the people by disseminating critical and accurate information round the clock. To supplement their efforts, a specially constituted team from AIR

headquarters at Delhi, comprising officials from program, engineering, and administrative streams, was sent to Bihar by the then director general of All India Radio on eighth September, 2008, to devise additional ways to address the post-flood distress of the victims in Bihar. The IT division of AIR at Delhi had developed a software, which transferred all the messages coming to an earmarked telephone number to a centralized database and loaded it on to a server space to be seen at the AIR stations of Patna, Bhagalpur, Darbhanga, and Purnia. The website biharflood.air.org.in was having the facility to upload information about the missing person and messages. This was the first time in the history of broadcasting in India that a special website was created during a disaster to help the affected people.

It is heartening and inspiring to recall that the members of this team, apart from making major value additions to the programming of the AIR stations in the affected area in tune with the latest norms of disaster management communication, also went to the flood-affected areas and to the relief camps. There were heart-touching moments at every spot. People in groups, with their invaluable radio close to their heart, gathered around the team and poured out their despair as if they had found their most trusted companions. The staff of the concerned AIR stations worked relentlessly and with a great sense of responsibility and dedication.

The team coordinated the implementation of the special helpline module from the AIR stations of Bhagalpur, Patna, Darbhanga, and Purnia. Once the module was publicized, SMSs, messages through message box, and information of missing/ found persons started pouring in, which were broadcast at regular intervals by these stations. Every day the team visited some relief camps and marooned villages. Travelling in wooden boats for many kilometers through the flood waters, the AIR team reached these villages to find out first hand from the villagers their urgent needs for food, clothes, medicines, fodder, and drinking water.

AIR through the live phone-in programs and messages received in the form of mailbox and SMS was able to reunite hundreds of persons with their families. The disaster management authorities also closely monitored the radio programs to send right help to the affected people.

AIR's role in the Kosi floods of 2008 proved the adage – “a friend in need is a friend indeed.”

Good Radio Practices and Future Needs for Disaster Management Radio Communication

Now, besides AIR, private radio channels and community radio stations also contribute significantly in the field of disaster management communication. Thus, the entire radio fraternity can and does unite to discharge the role of disaster management communicators working in synergy, as and when required, with various local (including panchayats and other civic bodies), regional, state, national, and even international agencies such as UNICEF, WHO, UNESCAP, etc. However, the fact remains that private radio channels can devote very limited time chunks as they are

constrained often by commercial considerations. Public service broadcasters such as All India Radio can and do employ long as well as short formats in different languages and dialects. It has to be mentioned here that India has, among other things, a bewildering diversity of languages and dialects. There are 22 languages currently in the Eighth Schedule of the Constitution of India (thereby recognized as premier languages), while many others are jostling for that status. There are thousands of dialects. All India Radio broadcasts programs in all the aforementioned 22 languages enshrined in the Eighth Schedule and also in English besides originating programs in hundreds of dialects, which goes a long way in ensuring the last mile connectivity, the importance of which cannot be overemphasized. Now, the community radio stations (CRS) also provide and in fact reinforce this crucial last mile connectivity. In fact, CRS are going to play an ever-increasing role in reaching the hitherto less or unreacheds.

Some important good practices have to be scrupulously followed in this regard. First reports often tend to be exaggerated and cannot be followed blindly. The sources of information have to be verified and quoted with utmost care. Precise, factual, and responsible reporting is a must to dissuade rampant rumor mongering during and after a disaster, which unfortunately often does happen and more so when true information is not available. It has also to be borne in mind that while, to a large section of the audience, disaster stories are of general interest, these are “life and death” issues to the affected people and also of utmost importance to relatives and friends of such people living elsewhere. The world is increasingly becoming a “global village” and thus interested people can be anywhere. Therefore, timely dissemination of full, factual, and accurate information is crucial. Facts likely to create panic, pandemonium, and chaos have to be very carefully and sensitively handled. Sensationalism is to be totally shunned and eschewed.

For receiving disaster warnings in India, All India Radio and other media entities primarily depend upon information from various concerned departments and institutions such as National Disaster Management Authority (NDMA), State Disaster Management Authorities (SDMAs), India Meteorological Department (IMD), Central Water Commission (CWC), Geological Survey of India (GSI), etc. and respective state governments and district administration officials. The merit of the system being followed is that the information is received after due vetting and verification thus ensuring authenticity.

However, mechanisms for better real-time information sharing among agencies like NDMA, SDMAs, IMD, CWC, GSI, etc. and the respective nearest AIR and other radio stations particularly in the disaster vulnerable areas would facilitate faster communication and action thereon.

With the emergence and growth of local self-government institutions in India and other democracies, the importance of proper coordination and synergy of their efforts with media in general and radio in particular cannot be overemphasized.

All India Radio has its own internal standard operating procedure (SOP) in place, which enables all AIR stations to swing into immediate action on their own in case of a disaster happening in their area thus acting as one of the first responders. This is

updated as per the exigencies of the situation. All media need such a document, and this could be prepared in consultation with the other major stakeholders.

It is pertinent to reiterate here that AIR stations, particularly those located in the disaster-prone areas, carry out campaigns regularly for education of population at large on dos and don'ts in case of various disasters.

To further improve AIR's disaster management communication preparedness and performance, upgradation and fine-tuning of AIR's internal apparatus, in technological as well as programming aspects, are continuous processes. Now, AIR is streaming live on the Internet, and all its channels and stations are available globally through its official app. Its programs are being transmitted from many digital transmitters also, which can be received on digital receivers. These receivers have provision for carrying texts also, and in the case of special programs being put out on an emergency basis during or before a disaster, these receivers have the capacity for such special programs to automatically override other programs being broadcast at that time. What is more, if these are in a standby mode, these can switch themselves on when needed to carry such programming. The disaster management authorities also need to keep themselves abreast of such advances.

AIR's already robust linkages with all concerned agencies such as National Disaster Management Authority (NDMA), India Meteorological Department (IMD), etc. are being further strengthened. This should extend to all radio operators.

AIR participates in many international activities such as training courses, workshops, seminars, etc. geared to this end. AIR has partnered with organizations like Asia-Pacific Broadcasting Union (ABU), Asia-Pacific Institute for Broadcasting Development (AIBD), UNICEF, USAID, BBC, etc.

The key media principles in this scenario continue to be **accuracy**, objectivity, **scientific temperament**, adoption of regional languages and dialects for maximum reach and easy and correct understanding by the audience, empathy, courage, and selfless devotion to duty and to public good while taking necessary care to ensure one's own safety, so that one can continue to be active and useful.

Avoiding dogma, sensationalism, and rumor mongering remains critical.

Radio in the Times of Global Health Emergencies: Lessons from Covid-19

The Covid-19 pandemic, which has been a humongous global public health emergency, underlines the importance of effective communication. There have been unprecedented scientific research and public health activities globally to find effective and safe solutions. Various vaccines have been developed and deployed. New drugs and treatment protocols are being evolved and tried out. India is making a major contribution in this endeavor. But new challenges are also appearing like new strains.

Thus, there is an overwhelming explosion of information, which is not always scientifically true and sometimes contradictory and misleading.

Therefore, application of critical appraisal skills becomes necessary, so that half-baked or incorrect information is not disseminated. Only the authentic sources have to be used to collect and disseminate information.

Another crucial endeavor is fighting stigma and discrimination. Stigma springs from ignorance and can have devastating effects on the stigmatized. Worse, it can lead to suppression of information which may enhance spread of the infection.

Various global functionaries including the United Nations Secretary General as well as top officials of the World Health Organization (WHO) have repeatedly voiced concerns about the “infodemic” in traditional and social media. Digital users have been requested to “pause, take care before you share” under UN’s “verified” initiative. The Ministry of Health and Family Welfare in India has released a tool kit for youth to fight stigma. In this context, media’s role assumes even greater significance.

Media as an Equal Partner in Disaster Mitigation

Authorities handling disaster management need to be sensitive to the enormously positive role that media plays in support of their preparedness, rescue, relief, and rehabilitation activities. They should understand and appreciate media’s dynamics and compulsions also.

Remnants of a colonial mindset sometimes prompt authorities in countries like India to view media with suspicion and mistrust. The impulse then is to look upon it as an adversary or an unwanted companion. But information suppression is always counterproductive. An information vacuum is sure to promote falsehoods and misinformation.

Thus, media should be treated as an active, valuable, responsible, and trusted equal partner in the realm of disaster management. The Covid-19 pandemic is a great example of the generally constructive role of media. This has to be further strengthened.

(I must acknowledge the support of my erstwhile colleagues in All India Radio Mr. Sanjiv Dosajh, Mr. Ashok Kumar Panigrahi, and Mr. Dilip Kumar Jha in writing this chapter.)

Conclusion

The role of radio is always going to be very important in disaster management communication. It is also evolving with the changing times. In India, NDMA has now included on its website <https://ndma.gov.in/> battery-operated radio as a part of the emergency kit in respect of many kinds of disasters such as cyclones, landslides, urban floods, floods and earthquakes. NDMA also includes listening to radio to get local weather news for remaining prepared for the onset of heat waves. This recognition needs to further deepen so that the meaningful cooperation and partnership are further strengthened.

Siri Hettige

Contents

Introduction	1530
References	1534

Abstract

The interest that sociologists have taken in natural and human-induced disasters goes back many decades and, therefore, is not a response to increasing frequency and intensity of disaster events in recent decades due to climate change and environmental pollution. Yet, their focus has been quite specific, concentrating on the impact of disasters on the long-established patterns of social and cultural life of people, including aspects of the emergence and short- and long-term consequences of major disaster events in time and space.

In this section of the handbook, we bring together nine chapters dealing with a variety of disaster situations in a number of countries. The disasters concerned are related to diverse situations such as the Covid-19 pandemic, housing development, and a confluence of multiple disasters in one case. The social, economic, and cultural effects of disasters and short-term and long-term mitigation of their impacts have been the focus of authors of the above chapters. Their analyses, conclusions, and recommendations not only contribute to our understanding of the diverse problems that the disasters have given rise to and issues involved in the processes of disaster management but also indicate how governments and relevant institutions can take policy and intervention measures to reduce disaster risks and mitigate diverse adverse impacts on the lives of the affected people. The areas that the authors have investigated are food security, domestic violence, neglect of marginalized groups, Covid-19 pandemic and education, role of indigenous knowledge, community mobilization, and social and cultural

Introduction

The vast literature on disaster research available today shows that much of the published work is multidisciplinary, drawing from both natural and social sciences. Even a cursory glance at diverse publications over the years shows that many sociologists have also taken an active interest in the study of disasters over many decades, not just when natural disasters became more extreme and frequent in more recent decades due to climate change and environmental degradation and pollution (e.g., Sorokin, 1942; Young, 1954; Prince, 1920; Barton, 1969; Oliver-Smith, 1991; Oliver-Smith & Susanna Hoffman, eds., 1999; Dynes 1970; Turner 1978). This is understandable because any major disaster event would have a significant disruptive impact on social and cultural life of people.

The establishment of a research committee under the International Sociological Association (ISA) dedicated to the promotion of the study of the sociology of disasters and the commencement of the publication of its *International Journal of Mass Emergencies and Disaster* showed the growing interest among many members of the ISA scattered across the world. Today, the conceptual and empirical literature produced by sociologists in different parts of the world is so vast that it is not possible to even have a cursory look at it here for want of space. Yet, their contribution to the vast interdisciplinary literature produced by researchers around the world is highly significant and has provided an important perspective for understanding and responding to disasters occurring in different parts of the world.

Drabek (2017) who did a review of some of the international sociological research literature pointed out that most of this literature has emphasized the social responses to disasters with few exceptions that have focused on their causes. Moreover, the overall focus of the sociologists has also been on the effects of disasters on structural, social, and cultural aspects of communities and societies. The fact that disasters have a dramatic impact on social life and cultural patterns in the communities exposed to major disasters is well established. In more recent decades, sociological studies focused on the disaster as a process rather than an isolated event that unsettles and traumatizes individuals, families, communities, and even an entire society depending on the scale and the intensity of the disaster. This is a widely shared view among researchers with diverse disciplinary orientations and refers to distinct stages in the disaster management process involving hazard mapping, risk assessment, preparedness, response, mitigation, and restoration of long-term resilience of economic, social, and cultural life (Drabek 2005).

As is well-known, disasters emanate from diverse sources, both natural and human-induced, and necessitate multiple responses, depending on their nature, magnitude, and the complexity. This is what we witness today. The expertise needed to manage is complex and diverse, i.e., to identify the potential hazards, study and monitor their development, design measures needed to eliminate or reduce the risks and steps needed to reduce the adverse impacts, and finally mitigate diverse issues and restore normal life of the people and ensure long-term stability of communities.

Sociologists have demonstrated through their work as researchers and policy experts that their contribution has become more and more relevant and significant not only in the research and policy process but in post-disaster interventions such as relief, resettlement, rehabilitation of disaster victims, and restoration of social and cultural life of the people (Hettige & Haigh, 2016).

What is also noteworthy is that researchers have dealt with a variety of disasters including human-induced ones like conflicts and development interventions. In this section of the handbook, there are nine chapters dealing with diverse economic, social, cultural, and psychological aspects of a range of disaster situations. Three of these chapters deal with the effects of the Covid-19 pandemic. Other chapters have focused on diverse aspects of disaster risk reduction and disaster management in several different contexts.

In ► Chap. 101, “Disaster Preparedness, Disability Awareness, and Disability Inequality: A Study of Hong Kong’s Property Management Sector,” Yung Yau examines the issue of marginalization of differently abled persons within the housing development sector in Hong Kong, pointing out that the neglect by the construction industry managers of the need to provide built-in infrastructure to allow speedy evacuation of people with disabilities has exposed this extremely vulnerable segment of the population to hazards emanating from a major natural disaster like floods. This situation has arisen as a result of the failure of relevant regulatory authorities to ensure that housing development sector firms incorporate in the building plans adequate facilities to enable residents with disabilities to be evacuated speedily in the event of a disaster.

Nina Joseph, in her ► Chap. 103, “Combating Domestic Violence During Lockdown of COVID-19 Pandemic,” has explored how the measures taken to contain the pandemic in India, i.e., imposition of lockdowns for extended periods, precipitated domestic violence against women. The study, based on data from numerous sources, was aimed at identifying the root causes of gender-based domestic violence against women. The author claims that the findings of the study provide a guide for policy-makers, administrators, and human rights activists to take measures to deal with the problem in disaster situations in general and in lockdowns in particular.

In his ► Chap. 104, “Food Security in India During the Pandemic: Future Learning for Ensuring Zero Hunger,” Rabindranath Bhattacharya examines the nexus between the Covid-19 pandemic and food insecurity. He, however notes that increasing natural and other disasters on a global level also leads to increasing food insecurity in many parts of the world. In the case of India, he argues that food insecurity is not necessarily the result of a deficit in food availability. The disruption of supply chains due to the pandemic increased food insecurity for vulnerable

groups, resulting in widespread hunger among them. Moreover, excessive centralization of public distribution system has precluded the participation of civil society organizations, making the inclusion of the most vulnerable segments of society in state-sponsored programs more difficult.

The Covid-19 pandemic disrupted the normal functioning of both public and private institutions as well as many public services like education. In many countries, the closure of schools and other educational institutions for extended periods compelled authorities to adopt modern, communication technology-based solutions and conduct teaching and learning activities in a virtual environment as an interim measure and to enable students to engage in their studies. This of course depended on the availability of online facilities at an institutional and household level. This posed a serious problem in poorer countries across the world where digital divide prevented many students from having access to online learning. Despite these ground realities, educational institutions in many countries switched to online teaching and learning in schools, universities, and other educational institutions.

Jayasinghe and Rajapaksha, in their ► [Chap. 105, “Managing Teaching and Learning at Higher Education Institutions During the COVID-19 Pandemic,”](#) examines the experience of a convenient sample of teachers drawn from higher education institutions in a number of Asian countries who began conducting online classes when the pandemic led to the suspension of face-to-face teaching in their institutions. Given the pervasive problems created by the pandemic for educational institutions and students to continue with their educational activities, there are many areas to be examined in terms of both positive and negative outcomes, from the point of view of not only institutions and teachers but also students and their families. The discussion and findings of this research open up a vast array of possibilities for both educational authorities and researchers to prepare for similar situations arising from major disaster events that can disrupt educational processes irrespective of the duration and scale of the disaster in terms of its adverse impacts.

John Morris and Machiko Kamiyama, in their work presented in ► [Chap. 107, “Preserving Cultural Heritage and Psychosocial Support After the Great East Japan Earthquake: An Interdisciplinary Approach to Good Practice,”](#) deal with an important sociocultural dimension of managing the emergent situation following unprecedented, triple disasters in eastern Japan in 2011 when the coastal regions of the country were devastated by a series of three major disaster events. The need to promote social and cultural resilience as part of the management of the aftermath of the disaster and restore and promote psychological and social well-being of the affected people is the main focus of the study. The chapter underlines the value of working across disciplines, namely, psychology and history in this case, to preserve small heritage connected with the day-to-day lives of the people as a strategy to achieve the above objective. It addresses a neglected dimension of people’s lives that is important to bring people together as a community connecting their lives through the restoration of their memories, artifacts, records, and other symbolic aspects of the lives of the disaster-affected people.

Managing public affairs and responding to emerging issues in modern democratic societies usually depend on the long-established formal institutions of governance. This has been true also with respect to managing disasters across the world. Yet, in many countries, the formal institutional structures are not without their shortcomings and limitations, particularly when the institutions are highly centralized and often do not reach out to peripheral areas of the countries. S.M. Pradhan and B. Sharma, in their ► Chap. 106, “[The Role of Traditional Institution of Governance in Disaster Risk Reduction in Eastern Himalayas](#),” identify the limitations of top-down government institutions and make a case in the utilization of informal local institutions to fill the void left by the former. Their main assertion is that the goals of DRR can be better achieved by making full use of local-level institutions that are closer to the lives of the communities.

The term community is widely employed in the sociological and anthropological literature as a unit of observation often assuming that members of a community share a great deal in terms of values, interests, and ideas. Patnaik, in ► Chap. 108, “[Community Participation Strategies in Nepal’s Disaster Management](#),” points out the need to recognize intersectionality of gender, ethnicity, class, and territoriality. The chapter is based on an ethnographic study conducted in three districts of Nepal, namely, Rupandehi, Makwanpur, and Sarlahi. The author asserts that paying attention to intersectionality holds the key to the success of disaster management practices.

As is well-known, modern scientific research in a range of disciplines have immensely contributed to not only to our understanding of all forms of disasters but also to develop strategies and diverse interventions to reduce disaster risks and mitigate their adverse impacts on people and infrastructure, while paying attention to longer-term resilience of disaster-affected communities. Yet, many of the disasters are not new, and, in the past, indigenous knowledge accumulated over a long period of time have helped them to cope with many disasters. Mahifuzul Haque in his chapter in this section on ► Chap. 102, “[Indigenous Knowledge and Practices of the Ethnic and Small Island Communities in Disaster Management](#)” has highlighted the need to recognize the value of such knowledge in DRR based on his observations on the experience of coastal communities in the Asia-Pacific, Southeast Asian, and Indian Ocean region. The author also points out that the scientists need to examine the practical value of indigenous knowledge to make it complementary to current DRR strategies.

As mentioned at the outset of this introduction, sociologists for decades have emphasized that any major disaster, be it natural or human-induced, disrupts the long-established patterns of social, economic, and cultural life of people. Given this reality, any attempt to deal with the aftermath of a disaster needs to address the issue of how to restore the livelihoods and life patterns in the affected communities. In ► Chap. 109, “[Exploring the Social Effects of Disasters: Causes, Consequences, and Mitigation](#),” in this section of the handbook, Siri Hettige emphasizes the need to adopt a chronological and inter-sectoral perspective on disaster risk reduction and mitigation.

Abstract

Inclusion of persons with disability (PWDs) to the society is one of the important Sustainable Development Goals advocated by the United Nations. An inclusive built environment facilitates their full participation and enjoyment of equal opportunities. To this end, it is necessary to remove the “manageable” environmental obstacles in our buildings. While many previous studies worked on inclusive design of built environment, little emphasis has been placed on the management issues. In particular, PWDs have often been ignored in the formulation and execution of crisis management or evacuation plan. Against this background, this chapter aims to provide a preliminary inquiry into how PWDs are treated in the context of disaster preparedness. Data were collected in Hong Kong through a survey on 16 residential developments and 8 in-depth interviews with PWDs and property managers. It is found that in none of the 16 residential developments investigated the property management agent had kept a register of residents with disabilities who might help in case of emergency or disaster (like

flooding, fire, or terrorist attack). There was no clearly written protocol or manual for the property management personnel on how to assist these residents to evacuate from the buildings. No training was offered to the property management personnel to raise their disability awareness. The interviewed PWDs expressed that they were never told what they should do in case of emergency. Drawing on the research findings, this chapter makes a number of recommendations for achieving disability equality in the local property management sector.

Introduction

According to the World Health Organization (2021), about 15% of the world population (i.e., about a billion people) have one or more forms of disability. In Hong Kong, the number of persons with disability (PWDs) amounted 534,200 in 2021, accounting for approximately 8% of the city's population (Census and Statistics Department, 2021). To the PWDs, enjoyment of equal opportunities and full participation in the community are often challenging due to the inaccessible built environment. The growing number of PWDs throughout the world has made barrier-free built environment a universal goal. The United Nations' (2006) Convention on the Rights of Persons with Disabilities adopted in 2006 stipulates that it is the responsibility of signatory states to identify and eradicate obstacles and barriers to accessibility in the built environment. Following the international trend, Hong Kong had its determination to protect people against discrimination on the ground of disability realized through the enactment of the Disability Discrimination Ordinance (Chap. 487 of the Laws of Hong Kong) in August 1995. Pursuant to the Disability Discrimination Ordinance, owners and managers of premises must provide PWDs means of access to their premises that the public or a section of the public are entitled or allowed to enter or use. It is an offence if these parties fail or refuse to provide appropriate accessible facilities unless unjustifiable hardship is resulted from the provision of these facilities. The Design Manual: Barrier Free Access 1997, which was later replaced by the Design Manual: Barrier Free Access 2008, specified the standards of new construction or alterations and additions to existing buildings that would be deemed to satisfy the legislative requirements (Buildings Department, 1997, 2008, 2021).

While the rights and special needs of PWDs in Hong Kong's built environment have been seemingly protected by the law, the statutory protection is not completed. There are codes of practice specifying the design requirements; little attention has been placed on the unthoughtful management of the built facilities (Yau & Lau, 2016). Equally worse, disaster preparedness for PWDs, which is of particular importance in the high-rise compact development setting in Hong Kong, has not

been accorded much emphasis. As a matter of fact, the impacts of natural and man-made disasters (e.g., flooding, hurricanes, superstorms, and terrorist attacks) on PWDs have been extensively studied. A large volume of literature has been devoted to disaster preparedness of PWDs in the past two decades (McDermott et al., 2016). However, it is not just the PWDs themselves (and their household members) to get prepared. Some other people like property managers need to be well-prepared for the disasters too. This is what has been largely ignored in the literature.

Against this backdrop, this chapter aims to provide a preliminary inquiry into how PWDs in Hong Kong are treated in the context of disaster preparedness from the perspective of property management. The remainder of the chapter is organized as follows. The next section is the literature review which forms the theoretical foundation of the empirical study. What comes next is the description of the research methodology. Afterward, the findings of the empirical study will be presented and discussed. Drawing on the research findings, some recommendations are drawn. The last section presents the conclusion and limitations of the research.

Disaster Preparedness and Disability

Preparedness is one of the critical elements in the holistic disaster management (O'Brien et al., 2010; Sawalha, 2020). Disaster preparedness generally refers to the efforts undertaken by individuals to mitigate their harm in disasters (American Red Cross, 2006; Samsuddin et al., 2018). Diab and Mabrouk (2015: 18) define "disaster preparedness" as "activities and measures taken in advance of an event to ensure effective response to the impact of hazards." From these definitions, one can envisage that the primary objective of disaster preparedness is to ensure appropriate procedures, systems, and resources are in place for assisting those affected by a disaster.

From the angle of urban governance, disaster preparedness is essential at different levels, ranging from the national level, through the city and neighbor levels, to the building levels. To prepare for some known disasters, thoughtful land use planning and building design have vital roles to play (Awotona, 2016). Disaster resilience has become a buzzword in the fields of architecture and urban planning (Allan & Bryant, 2012; Dupre & Bischeri, 2020). Yet, all these are just one of the aspects that can address the issue of disaster preparedness. Careful preparation of an emergency plan and its effective execution in times of disasters are also critical for disaster mitigation (Alexander, 2005). In this regard, personnel involved in disaster management, including police, firefighters, medical practitioners, and property managers, should receive adequate training to facilitate them in performing preparation for disasters (Achora & Kamanyire, 2016; Fung et al., 2008; Nazli et al., 2014).

The impacts of disasters on people with different levels of ability (or disability) vary (Fox et al., 2007; Tomio et al., 2012). In general, in emergencies, PWDs may encounter obstacles to communication, physical barriers, and inaccessibility to essential services (Alexander, 2015). Therefore, PWDs are one of the most vulnerable groups to disasters (Han et al., 2017). Evidence shows that there have been

disparities in the disaster preparedness between PWDs and those without disability (Bethel et al., 2011; Smith & Notaro, 2009, 2015). These disparities can be ascribed to the fact that PWDs tend to be poorly represented or ill-informed in disaster or emergency planning (Fox et al., 2007). For the sake of equality, PWDs should “have the right to participate in the assessment, design, implementation, and monitoring of emergency programmes” (Smith & Notaro, 2015: 415). As pinpointed by Alexander (2015), PWDs have long been ignored in disaster management. Together with the deficiency of involvement of PWDs, the lack of interest in and understanding of the needs of PWDs results in “disabling” emergency or disaster planning.

Obviously, quite a lot of previous efforts have been dedicated to investigation of PWDs’ disaster preparedness at the household or individual level. Nevertheless, the extent to which PWDs can prepare for disasters is contingent on the nature of their disabilities and the level of support received from others (Alexander, 2015). Where personal preparedness is not totally possible (e.g., for persons with limiting disabilities), external assistance is needed for evacuation. One common example is fire evacuation in high-rise building. Lift is generally not considered as means of escape (Koo et al., 2013). Persons with locomotor disabilities cannot use stairs for evacuation without the assistance of the others (Egodge et al., 2020). Therefore, it is necessary to have some rules or guidelines specifying who will and how to assist those PWDs who do not have the ability to evacuate independently to escape from a building in case of emergency. Alexander (2015) advocates that training should be provided to emergency responders so that they know how to deal with PWDs in crisis situations.

Are PWDs in Property Managers’ Minds in Disaster Preparedness?

Professional property managers are regarded as facilitators of building owners’ interests (Kyle, 2005). Their importance is more significant in multi-owned properties like housing in multiple ownership (Yau & Ho, 2019). Apart from daily routine in building management (e.g., cleaning and security), property managers play important roles in disaster preparedness at the building level. They are managing the life safety in buildings under their management (Kyle, 2005). They are responsible for preventing and controlling disasters in the buildings (Shen et al., 2021). Besides, it is critical for property managers to facilitate evacuation of the building occupants and visitors. Disaster recovery is another oft-mentioned responsibility of property managers (Hardy et al., 2009).

Payant (2016) offers detailed guidance on what property managers need to do in disaster management. However, he does not mention how PWDs are dealt with in different stages of disaster management. Moreover, little previous efforts have been made so far to empirically measure property or facility managers’ disaster preparedness for PWDs. The work by Schnitker et al. (2019) is one of these relevant ones, but its focus is placed on special low-rise aged care facilities which are significantly different from the typical multi-owned housing developments in high-rise cities like Hong Kong.

In view of the extant research gap, this research aims to investigate to what extent and how property management practitioners take PWDs into consideration in practicing disaster preparedness in Hong Kong's building management. To achieve this intended aim, a broader understanding of the existing procedures, practices, guidelines, and legislations that are related to disaster or emergency preparedness for PWDs in building management around the world is deemed essential. Therefore, a desk study was carried out through a comprehensive review of the relevant literature including international academic journals, scholarly books, policy documents, and practice notes or guidelines issued by professional bodies (e.g., Bay of Plenty Civil Defence Emergency Management Group, 2009; National Fire Protection Association, 2016). The "best practices" of disaster preparedness for PWDs identified in this stage would form the basis for exploring the gaps in Hong Kong's property management industry in the next stage.

A mixed approach was adopted in primary data collection. Firstly, 50 residential developments throughout the territory of Hong Kong were purposively sampled. In order to ensure diversity, these residential developments varied in terms of scale (i.e., number of residential units), building age, and location. All these residential developments were managed by external property agents (i.e., private property management companies). Property managers of these sampled developments were invited to participate in a structured questionnaire survey. The survey was designed to gauge the level of incorporation of PWDs' needs in the planning and execution of the disaster preparedness practices in each sampled residential development. If necessary, the property managers were requested to provide documentary records (e.g., emergency plans and fire drill records) for verification. Eventually, property managers of 16 sampled residential developments (32.0%) agreed to participate in the survey.

Secondly, in-depth interviews with four PWDs and four property managers were conducted. The four property managers had participated in the questionnaire survey. As for the four PWDs interviewed, they were recruited through the author's personal network. The responses from the interviewees were transcribed. Content analysis with manual coding was performed on the transcribed data collected from the interviews.

Lack of Disability Awareness in the Property Management Sector

Organizational, Procedural, and Protocol Inadequacies

Table 1 summarizes the responses of the 16 property managers who participated in the questionnaire survey. Generally speaking, property management personnel in the 16 residential developments were not well prepared to assist PWDs in disasters. To prepare for assisting PWDs to evacuate from their buildings, disability training was offered to the frontline staff in only four of the residential developments (75.0%). Fourteen residential developments (87.5%) did not have protocols or procedures formulated for assisting residents with special needs (e.g., those with disabilities) in

Table 1 Summary of responses to the questionnaire survey ($n = 16$)

Practice	No. of responses (percentage)	
	Yes	No
Maintaining an emergency contact list of the residents with special needs (e.g., those with disabilities)	0 (0.00%)	16 (100.00%)
Formulating protocols or procedures for assisting residents with special needs (e.g., those with disabilities) in disasters	2 (12.50%)	14 (87.50%)
Creating a support network of property management personnel who are responsible for helping PWDs in a disaster	0 (0.00%)	16 (100.00%)
Providing assisted evacuation devices in the residential development	1 (6.25%)	15 (93.75%)
Performing regular emergency or fire drills for PWDs	0 (0.00%)	16 (100.00%)
Offering training to frontline staff to assist PWDs in emergency evacuation	4 (25.00%)	14 (75.00%)

case of disasters. Only one residential development in the sample (6.3%) had assisted evacuation devices like med sleds or evacuation chairs to facilitate evacuation of PWDs. In all the 16 residential developments, no register of PWDs that need assistance in emergency evacuation was maintained, no support network of property management personnel who would be responsible for helping PWDs in a disaster was set up, and no emergency or fire drill for PWDs was regularly held.

Reasons Behind Disability Inequity in Disaster Preparedness

Lack of Consideration of PWDs' Needs

Most of the interviewees, both property managers and PWDs, opined that PWDs were poorly prepared for disasters and emergencies in Hong Kong's building management. A wheelchair user interviewed said nobody had ever informed her about what to do and where to go in case of emergency:

There is an evacuation plan posted in the communal lift lobby on each floor. Nonetheless, that is for the use of the able people only. The government says it is not safe to use lifts in case of fire. I really don't know how I can get to the ground floor or refuge floor without using a lift. Should I simply wait at home for the firemen to rescue me? (Persons with Disabilities C)

The PWD interviewees criticized that property managers usually devised their disaster or emergency strategies for the residential developments for operational needs only. They added that the property managers were not aware of the needs of PWDs in their daily building management practice. One of the interviewees who was visually impaired shared his experience:

In time of COVID-19 pandemic, the property management company managing my housing development covered the control panels in the lifts of the residential towers with plastic

sheets. I think the purpose was to protect the electronics in the control panels such that they would not be affected by the disinfectant. You know, during the pandemic, the lift buttons have to be disinfected every few hours. However, the plastic sheets were too thick, affecting me to 'read' the braille. (Person with Disabilities A)

Ambiguous Responsibility of Property Managers

The lack of consideration mentioned above could be ascribed to the absence of legislative requirements for disaster planning and management for PWDs. One of the property managers interviewed said:

in Hong Kong, emergency or disaster planning is not mandatory for building management. It is just a kind of value-added service. At the same time, the Disability Discrimination Ordinance does not require the managers of built facilities to have emergency plan for PWDs. (Property Manager B)

However, the PWDs interviewed thought the property managers should have the moral responsibility to provide emergency plans for their built facilities even though it was not mandated by the government. They argued that the formulation of such emergency plans should take the needs of differently abled residents into consideration:

For example, we need to make sure that the emergency can be communicated effectively and timely to some specific groups of PWDs like those hearing impaired. In Hong Kong, visual advisory systems are not mandatory in residential developments. It is hard for those with severe hearing impairment to notice the audio warning signals. (Person with Disabilities B)

Lack of Disability Training and Knowledge

As explained by most property managers interviewed, a low degree of disability awareness in disaster planning and management in building management is a result of the inadequate coverage of the relevant topic in the professional education programs:

In the master programme on housing management I previously took, I was not taught any issue related to disability discrimination and accessibility. Perhaps, that topic was not so important in Hong Kong. (Property Manager D)

Three out of four property managers interviewed had received no disability-related training before. The four property managers interviewed admitted that they did not have enough knowledge and skills to facilitate PWDs' evacuation in case of emergency. It was a general perception by most property managers that planning and organizing disability training is challenging because disability can take a variety of forms:

There lacks a 'one-size-fits-all' approach to disaster planning and management for PWDs. PWDs have a large variety. We have people with visual impairment, hearing impairment or locomotor disability. I think the government or professional institutes should publish some

guidebooks or guidelines on how to cope with the needs of these different groups of PWD for the property management practitioners' reference. (Property Manager D)

Some of the PWDs interviewed thought that the property managers managing their residential developments were not professionally competent enough to help them survive through a disaster happening in their buildings.

No Involvement of PWDs in the Planning and Management of Disaster Preparedness

All the interviewees, including property managers and PWDs, believed that they should have their own roles to play in disaster planning and management in the context of building management. Nevertheless, the four PWDs interviewees expressed that they were not involved in the formulation of any disaster plan or management strategy in their residential developments. They thought they were under-represented in planning stage. There was no channel for their voices to be heard. As explained by one of the interviewed property managers:

disaster or emergency planning in Hong Kong has long been a top-down process dictated by the property management companies. Owners' corporations may have a say on some occasions. We seldom include all residents in the formulation of the emergency plan. It is too difficult have resident involvement in emergency planning because of the large number of residents to be involved in a typical high-rise residential development in Hong Kong. (Property Manager C)

Nevertheless, this view was not received by the PDWs. They argued that the property management companies could perceive the needs and difficulties of PWDs in emergency evacuation:

The emergency plans and procedures are developed from the perspective of 'able' people. They are not workable for us in many scenarios. (Person with Disabilities D)

Moving Toward More Inclusive Disaster Planning and Management

The empirical findings of the research revealed a noticeable gap in the building management practice in relation to the disaster planning and management for differently abled groups of people in Hong Kong. The awareness of PWDs' needs depends on a number of factors including familiarity with PWDs. For example, people with disabled members in their families tend to have a higher level of disability awareness (Han et al., 2017; Yau & Lau, 2016). However, disability training can help most people to gain awareness. Yet, as evident from this study, disability training provided for the property management practitioners was far from enough. The practitioners were deficient in disability awareness, which led to poor preparedness for PWDs in their daily building management practice. The results echo with findings of Fox et al. (2007) that limited staffing and lack of awareness are

obstacles to the accommodation of the needs of SWDs in an organization or community's guidelines of emergency management.

Procedures or protocols for assisting PWDs to evacuate in time of emergency were absent in most of the residential developments under investigation. In this case, when a building needs to be evacuated during an emergency, there will be substantial challenges arising from the special needs of PWDs. All these challenges can be significantly reduced through various steps of disaster preparedness, including formulation of operating procedures, practitioner training, proper equipment staging, drills, and exercises. To this end, it is necessary for the property management practitioners to notice and understand the needs of PWDs in the buildings under their management. Besides, from the practical point of view, the property management practitioners should learn how to safely assist and evacuate PWDs during an emergency.

While it is a general consensus that a stronger commitment from the property and facility management sector is needed to uphold the interests of PWDs in the built environment (Egodage et al., 2020), the research findings suggest that the property management companies might not know how to develop the procedures for assisting disability to evacuate. Perhaps, PWDs should be engaged more in the disability planning and management. That depends on whether the property managers open up more opportunities to be involved in the processes. Moreover, external resources seem to be necessary to help the property management companies and practitioners to develop more "inclusive" disaster or emergency plans. These may come from the government, professional bodies, or disability concern or self-help groups.

Undoubtedly, the lack of legislative requirements and official guidelines to cater to the special needs of PWDs in disaster planning and management in Hong Kong needs to be addressed. The Disability Discrimination Ordinance stipulates the mandatory provisions of accessible facilities in building design and construction. However, its relevance to the resident management in disasters is rather weak. The Buildings Department issued the Code of Practice for Fire Safety in Buildings 2011 (which was later revised in 2015) to set out the minimum acceptable design and construction standards of buildings for fire safety (Buildings Department, 2015). Although the code of practice has a section on means of escape provisions for PWDs, it does not touch upon any issue of emergency planning and management. Similarly, in the field of property management, the Secretary for Home Affairs issued several codes of practice governing the maintenance works in multi-owned properties and procurement of supplies, goods, and services for building management in Hong Kong; there is no guidebook or code of practice for assisting property management practitioners to protect the rights of PWDs in their daily building management practice. Therefore, the coverage of the DDO should be widened to cover emergency planning in building management to prevent and eliminate discriminations against PWDs. In addition, for property management professionals to safeguard the rights of PWDs in disaster planning and management, codes of practice or guidelines are required.

Inadequate disability awareness among property managers is one of the major barriers to inclusive disaster planning and management. This can be ascribed to the

fact that PWDs' rights are not covered in any of the professionally accredited property management programs in Hong Kong. Hence, the curricula of professional training programs in relation to property and facility management, no matter at diploma, undergraduate, and postgraduate levels, should include the topics of anti-discrimination and disability inclusion. While it is generally believed that disability training is important for the fresh entrants to the property and facility management field (i.e., the potential practitioners), continuous professional development (CPD) of existing practitioners, particularly those in senior positions, is equally vital. For their members to be more disability-aware, professional bodies and institutes related to the property and facility management profession (e.g., Hong Kong Institute of Surveyors, Hong Kong Institute of Housing, and Chartered Institute of Housing) should offer enough relevant CPD events. Given that the licensing regime for the property management companies and professionals has been in place in Hong Kong since August 2020, the Property Management Services Authority should specify disability awareness training to be an essential area of CPD. This type of training should include points of view of PDWs and information on the range of needs.

Practice makes perfect. PWDs need to be included in periodical emergency and fire drills (Lee, 2016). This is crucial because François-Xavier Bagnoud Center for Health and Human Rights (2016) reveals that quite many PWDs do not know where to escape in case of contingency. Apart from the PWDs, the property managers should also practice how to use the assisted evacuation devices. Besides, they should know how to lift people in such a way as to avoid harm to both the person being lifted and the lifter (Alexander, 2015). According to the suggestions made by Alexander (2015), property managers should be made aware of the need to preserve the rights and dignity of PWDs and to treat them fairly. In this regard, practice and training provided to the property managers should cover both technical issues and awareness raising, but preferably separately.

Concluding Remarks

It is not enough to design and construct an inclusive, accessible built environment. If it is not managed effectively, a building will quickly become inaccessible. More importantly, accessibility issue is not just for convenience but also for safety. However, disaster planning and management for PWDs, particularly from the perspective of property managers, have been largely ignored in the literature. As a matter of fact, property management practitioners play a pivotal role in ensuring the personal safety of PWDs who use a built facility. PWDs should receive the same level of safety protection as those without disabilities do. This chapter aims to provide an overview of how PDWs in Hong Kong are treated in the context of disaster preparedness. It investigated how property management companies took PWDs' needs into account when formulating and implementing their disaster or emergency plans. Also, the experiences of PWDs were researched.

In this study, it was found that there is a low level of disability awareness among local property management practitioners. Many property management companies

and practitioners did not have specific guidelines or protocols for dealing with residents with disabilities in their emergency plans. Moreover, little provisions were made for facilitating PWDs' evacuation in case of emergency. Disability training was not a norm to the property management practitioners. Overall, the situation is very worrying and not favorable to the promotion of the concept "aging in place" in Hong Kong. Many senior residents have limited levels of mobility so they need assistance in emergency evacuation. Based on the findings of the current baseline study, property managers will be able to track their disaster preparedness for PWDs in the future.

The study has several limitations. First, the empirical study relies on the primary data collected from surveys and interviews. The reliability of the self-reported data may affect the research findings and conclusion. Second, only property management practices in residential properties were covered. Other types of properties such as office buildings and shopping centers were ignored. The level of disaster preparedness for PWDs in these properties may be different from that in the residential properties. Third, the generalizability of the research findings may be limited by the small number of surveyed residential developments and interviewees. A larger number of observations will be warranted in the further studies to confirm the findings of the current research. Besides, future studies should investigate how the degree of accommodation of the PWDs' needs in disaster preparedness varies with property type.

Abstract

Disaster does know no boundary. Irrespective of people's color and shade, caste and creed, religion and culture, and language and ethnicity, disasters continue to cause havoc on population it traverses. In most cases, the poor, destitute, and the marginal ethnic communities are badly affected. The ethnic communities are doubly affected mainly due to their poverty and living in the periphery. The chapter looked into survival strategies of the coastal communities in the Asia-Pacific, Andaman and Nicobar Islands in the Indian Ocean, and the coastal islands of the Bay of Bengal. Their coping strategies as they face earthquake, tsunami, and hazards like cyclones, floods, and tidal surges were examined in threadbare. Various signs and bizarre symptoms reflected in animal behavior, movement of the celestial bodies, and environmental signs and symptoms; beliefs in local tradition and religion helped the local community to develop a coping mechanism in order to live with the disasters. The chapter observed that these island ethnic communities have been living with floods, tidal surges, cyclones, and tsunamis from time immemorial. Their life and living are intertwined with the sea, forests, hills, volcanoes (often dead), and the surroundings. They are the children of the sea. Many a times, their local knowledge and practices

M. Haque (✉)

Introduction

Amin (2000) and Haque (2013) defined “functional knowledge” of the local community living in a particular ethno-cultural and agroecological condition as their indigenous knowledge. Indigenous knowledge (IK) is developed through sharing of experience, stories, and anecdotes passing from generation to generation orally. The knowledge remains in force in various aspects of community life in unwritten forms. Unwritten knowledge may run the risk of being lost. IK generally sticks around in peoples’ knowledge, folklores, stories and anecdotes, belief, and perceptions, mainly among the rural community (Warner, 1991; Sillitoe et al., 1998). According to Walker et al. (1991), a specific group of people with similar traits living in same geographical setting generally promotes this knowledge collectively. Generally, indigenous knowledge is not “codified or written in formal language” in books or literature. Researchers and policy-makers acknowledge that this knowledge is a resource and it should be promoted and conserved in order to supplement existing scientific knowledge. Sillitoe (2000) observed that opposed to “top-down” planning process, IK has followed a “bottom-up” or “grassroots” process. Such a knowledge is unique and could be separated from that of scientific knowledge based on years of scientific research in laboratories. IK continues to be used by the villagers in the management of natural resource, fisheries conservation, and maintaining healthcare practices of the livestock (Mustafa, 2000; Haque, 2019). Corroborating others, Sillitoe et al. (1998) observed that “contrary knowledge relates to any knowledge held collectively by a population mostly inhabiting in rural areas under similar topographical setting.”

We cannot ignore the importance of local knowledge and practices, and it is neither primitive nor unscientific. It is true that the local community is exposed to modern living conditions and associated knowledge. Despite their access to local technology and knowledge, they continue to cling to their forefathers’ knowledge for survival during a disaster and never disowned their traditional knowledge learned over the generations. With the new ideas and thoughts and rapid spread of new technology, local knowledge is disappearing fast. It is increasingly felt that indigenous knowledge needs to be promoted and documented as it could fast disappear as time passes by. Acknowledging local and indigenous knowledge, UNESCO’s program on Local and Indigenous Knowledge Systems (LINKS) refers to the

“understandings, skills and philosophies developed by societies with long histories of interaction with their natural surroundings” (Hiwasaki et al., 2014). Both the two international conventions, namely, Hyogo Framework for Action 2005–2015 and Sendai Framework for Disaster Risk Reduction 2015–2030, put emphasis on local and indigenous knowledge and practices and stressed that they should be incorporated in national disaster risk reduction strategies.

In line with these two international documents, national disaster risk reduction strategies of the signatory countries are to address local knowledge of the indigenous communities practiced over many generations. One of the five main drivers of “Hyogo Framework” was on strong community engagement for effective disaster risk reduction. Priority actions suggested that the people are to be made aware of indigenous knowledge and practices in order to save themselves from natural disasters. The Sendai Framework, on the other hand, emphasized on “indigenous knowledge and practices and coping strategy of the local community in facing challenges of natural disaster.” The role of the stakeholders is important here. Both the framework conventions wished that the local community would significantly contribute in disaster risk reduction using their local knowledge and practices.

This chapter mainly deals with the hazards caused by floods, earthquakes, cyclones, tidal surges, tsunami, and other hydro-meteorological events. The chapter to start with deliberated on the definitional issues on indigenous knowledge, coping strategies, survival strategies, and resilience of the people in the face of a disaster. The communities chosen for discussion are the coastal and small ethnic groups of people of the islands of Asia-Pacific, Indian Ocean, and the Bay of Bengal.

Asia-Pacific Islands

Hazards caused by irregular hydrological and meteorological events severely affect the communities in Asia-Pacific Island nations. These are the earthquakes, cyclones, tidal surges, heavy rainfall, floods, and landslides. Cyclones originate when mixture of heat and moist air forms a low pressure over the oceans. It is known as cyclone in the Bay of Bengal, hurricane in the Atlantic Ocean, typhoon in the Pacific Ocean, bagyo in the Philippine Sea, and willy-willy in the Pacific countries. In the northern hemisphere, it is counterclockwise, and in the southern hemisphere, it rotates clockwise. Bay of Bengal is the most important cyclone-prone area because of its funnel shape and most cyclones visit in the months of May, October, and November period.

Issues related to climatic changes, warmer days and cooler nights, changes in rainfall patterns, and frequent and stronger cyclonic storms are all intricately observed by the local islanders. High and low tides, rise in sea level, and salinity intrusion affecting their crops are all closely witnessed by these people. Based on their years of observation, they gather a wealth of knowledge and practices on how

to live with them. These communities closely observe and inspect changes of their surrounding environment by looking at the seas, the horizon, shifting of the clouds, and erratic movements of the animals, plants, ants, and insects. Restlessness among the birds and crawling of the frogs, snakes, and lizards announce the advent of an impending disaster. There are also changes of position of various celestial bodies. Color and composition of the clouds and placement of the moon, sun, and the stars also carry meaning for the islanders, who live along the edges of the ocean for ages.

According to Hiwasaki et al. (2014), the island communities envisage heavy rainfall or strong winds by witnessing movement of the clouds, height of the waves, sun, and the stars. Their understanding is based on the “(a) observations of animal behavior, (b) observations of celestial bodies, (c) observations of the environment, (d) material culture, and (e) traditional and faith-based beliefs and practices.”

They understand changes in the texture of clouds, shade of color, location, and movement, including speed and direction. They observe the changes of color of the sky, direction, and height of the waves. Wind direction and temperature fluctuation, location and size of the sun, and visibility of the stars convey messages to the community of an impending disaster. Sometimes, bad smell coming from the sea carries message that a storm or typhoon is approaching.

People watch movement of animals, insects, and plants in some Pacific coastal islands in predicting a hazard. Leaches and caterpillars are seen appearing before typhoons in the islands of Timor-Leste. People in the Philippines, when noticing the leaves of the banana trees falling on the ground without any gusty gale, consider the situation as a bad omen and apprehend the advent of a storm or typhoon (Hiwasaki et al., 2014). Visit by migratory birds is an important sign of changing season. Some bizarre animal and insect behavior also signal approach of a disaster. Erratic movements like the rays leaping repeatedly in the sea in summer, the unnatural activities of sea snakes, and climbing up trees by the hermit crabs signal that a disaster would soon hit the region.

As they predict and apprehend the approach of a storm, the islanders have their own mitigation plans and various ways to guarantee food security during a disaster. As an indigenous way of preserving fish, they use salt and practice sun-drying. During and aftermath of a disaster, people eat locally available fruits, tuber, and roots of plants for survival.

In 2007, an earthquake measuring 8.1 caused death of 52 people of the Solomon Islands (McAdoo et al., 2008). Between the earthquake and tsunami, there were hardly 3–4 min of lull period, and the indigenous peoples of Solomon Islands could sense impending disaster and took refuge for safety. Had the local community not applied their local and traditional knowledge, casualties would have been higher. What did happen on that fateful day was that when the shaking stopped, the coral lagoon was drained uncovering the sea floor. High wave of tsunami advanced within 10 min later and inundated the area with high tides. The local community moved toward the high lands apprehending an impending tsunami. People who died that day in the Solomon Islands were mostly the immigrants with no knowledge of island ecology.

Andaman and Nicobar Islands

Some 1200 km off the eastern coast of India, the Andaman and Nicobar Islands were severely hit by the 26 December 2004 tsunami with epicenter of the earthquake in Aceh province in Sumatra (Singh et al., 2018; Sekhsaria, 2017). The tsunami killed 2,30,000 in 14 countries inundating coastal communities with waves up to 30 m (100 feet) at a magnitude of 9.1–9.3 in Richter scale. Most devastated countries were Indonesia, Sri Lanka, India, and Thailand. There was another tsunami on 27 October 2010 in the coast of Indonesia, although milder though. Islanders of these countries are used to watch these killer waves and have contingency plan for immediate rescue and safety.

The islands of Andaman and Nicobar are inhabited by some 12 distinct aboriginal groups, whose forefathers came all the way from Africa. These primitive people are on the verge of losing their culture and identity due to urbanization, tourism, and modernization. There are only 92 *Ongees*, 43 Great *Andamanese*, 350 *Jarawa*, 100 *Sentinelese*, and over 250 *Shompens* (Reddy, 2018; Chandi, 2010), and they constitute the “particularly vulnerable tribal groups” of the islands. The southern parts of the Nicobar Islands were worst hit by the 2004 tsunami (Reddy, 2013; Sekhsaria, 2014). The earthquake-induced tsunami affected the coastal areas of Malaysia, Myanmar, and Thailand. The giant waves later reached the coast of Bangladesh, India, Maldives, and Sri Lanka killing between 2,50,000 and 3,00,000 people (Shaw, 2006). Due to tsunami, land subsidence took place in some islands with massive devastation. Various parts of the islands were deformed and were reduced in size with death and destruction. Forests of Little Andaman was inhabited by the primitive *Ongees* tribe. It is learned that they could escape to safety during tsunami. Following the earthquake, about 83 *Ongees* gathered their belonging and ran in the midst of the forests to a safer place in the high hills (Pandya, 2005). Their primitive tribal knowledge helped them to have the sagacity that tsunami waves were treacherous. On the morning of tsunami, unlike the settlers, the *Ongees* did not wait to see aftermaths of the earthquake, which to them was an ordinary event. Many lives of the settler communities were lost, because they were looking at the retreating sea in order to catch fishes, unaware of the killer waves trailing behind.

The *Sentinelese* and the *Jarawa* communities are the hunter-gatherer tribes. The *Jarawas* are the forest people and know the forests they live in. They are a group of people of *Negrito* origin, and their ancestors came all the way from Africa some 60,000 years ago (Chandi, 2010). They are familiar with the special use of plants and leaves as they soil their bodies with a paste of leaves that can drive away the bees and help in collecting honey without being attacked (Chandi, 2010; Sekhsaria, 2014). It is also learned that suspecting the looming threat of tsunami in advance, the most isolated and violent primitive tribe living in inaccessible North Sentinel Island, the *Sentinelese* were able to quit their homesteads and escape to the highland forests for safety and security. It is apprehended that the Rs 75,000 crore proposed development project (The Frontline, 22 July, 2022) for construction of a transshipment port, townships, powerplant, and airport by the government of India in tsunami-prone areas of Little Andaman and Great Nicobar Islands could be a disaster not only for

the environment, forests, and wildlife (endemic and endangered) but also for the primitive people of *Shompen*, *Ongee*, and *Nicobarese*, who have been living there for generations.

Bangladesh Coastal Islands and the Haors

The coasts of Bangladesh are one of the disaster-prone areas of the world. The 12 November 1970 cyclone and tidal bore killed around 3,30,000 people in unprotected coastal areas of Bangladesh. Further to that on 29 April 1991, another cyclone and associated water surges killed as many as 1,38,882 people (Haque, 2019; Haque et al., 2011). Bangladesh recently faced bad cyclonic storms with associated tidal surges, named *Sidr* on 15 November 2007, *Aila* on 25 May 2009, and *Mohasen* in 2013 (BMD, 2009). Cyclone warning system helped people to take refuge in cyclone shelters, numbering around 4000 in the coast. Cyclones generally originated in the sea due to low depression and travel toward the landmass, where they get weakened and make eventual landfall. On the other hand, tornado is built up over the land when large masses of cloud converge. The clouds begin to whirl around and make a gigantic twisting funnel. When it touches the ground, it sucks up anything and everything they come across – trees, houses, animal, trains, or people – like a giant vacuum cleaner. Tornado comes sudden with a gusty wind and catches its victims unaware.

Bangladesh has a 710 km coastline (Rasheed, 2008) covering many small and newly emerged *charlands* (shoals). These islands are subjected to tropical cyclones and storm surges incurring loss of lives and property. The area is populated by 35 million people (2005) representing 29% of the total population (Rasheed, 2008) and expected to be 43 million in 2025 (GOB, 2002). Some of the *charlands* are in the process of formation and not yet fully developed. As they live in a hostile land close to the sea, the charland people through a process of community adaptation had developed many strategies concerning disaster. These strategies are based on their indigenous knowledge and practices gathered over many generations. Bangladesh coast was hit by 35 devastating cyclones in the last 150 years (Haque, 2019). The cyclonic months are generally April–May and November with associated tidal surges. The 12 November 1970 cyclone and tidal surges killed around 3,30,000 people in the coast and another 138,882 people died on 29 April 1991 (Haque, 2019; Haque et al., 2011). Some recent cyclones, namely, *Sidr* in 2007, *Aila* in 2009, *Mohasen* in 2013, *Bulbul* in 2019, and *Amphan* in 2020, caused lesser number of deaths and damages, mainly due to a paradigm shift in disaster management from relief and rehabilitation to disaster risk reduction.

A number of researchers did work on the contributions of indigenous knowledge and practices in disaster forecasting, prediction, and disaster risk reduction in the coastal area of Bangladesh. Hassan (2000) has observed that the coastal people could identify and forecast the nature of a cyclone by observing the following signs: (a) direction of wind, (b) temperature and degree of salinity of water, (c) color and form of the clouds, (d) presence of a rainbow, and (e) movement of certain birds and

animal species. It is believed that wind blowing from the southwest would likely to cause a storm. On the other hand, the northeasterly wind has the potential to create a cyclone and not a massive one.

In course of time, the people of the coast have introduced some survival strategies during and after a cyclone. They bind themselves round a tree, mostly a coconut tree and rise and fall with the water level (Haque, 2000). They look for comparatively higher grounds like embankments, polders, and rooftops for a refuge. They cling to floating items such as timber, thatched roof, straw piles, and coconut bunches as the tidal water recedes with enormous speed. People eat stems and roots of edible plants. As cyclones are always followed by rain for several hours, people collect and drink rainwater. In the absence of rainwater, they drink green coconut water to quench thirst. Instead of waiting for external help, the local community treat their minor injuries and recover from diarrhea with herbal medicine. For immediate relief, they depend on herbal medicines for treating minor injuries and diarrheal diseases. They grow vegetable crops in waterlogged area caused by a prolonged flood. Hydroponics or *Baira* is very common in southwestern parts of the country. Vegetables are grown in floating garden made of water hyacinth and mud. This survival strategy during and after a flood helped the coastal community with food security.

Low depression of land in the northeastern parts of Bangladesh, commonly known as the “Haor,” has different ecology. The land is mainly a one-crop land, and the villagers are fully dependent on the harvest from the lone crop. There are various beliefs and taboos surrounding the harvest. People believed that “abundance of mango will bring floods and abundance of jackfruit will increase rice production” (Islam & Bremer, 2016). These “local scientists,” mostly the village elders, could effectively explain and predict the advent of flash floods and rainfall that matter a lot to them. They are able to understand behavior of certain animals, insects, birds, lizards, and even movement of the ants. They believe that visit by snakes during monsoon is a sign of the advent of flash floods. Similarly, if grasshoppers are found flying too high in mid-April and frogs croak in the month of March, this means heavy rainfall would engulf the region. According to them, early return by cattle to their home and birds to their nest symbolizes the advent of a big storm. They consider erratic flight of herons as a sign of northwesterly storm. Similarly, a continuation of southerly wind may herald heavy rainfall. As their agro-based economy is closely linked with crops and harvest and environmental surroundings, the rural folk continues to nurture these signs and symbols in their beliefs and thoughts transcended to them from generation to generation.

Conclusion

Indigenous knowledge and practices are yet to be fully recognized by disaster risk reduction specialists. Vulnerable communities, scientists, policy-makers, and executives have not fully subscribed to the practices. It is to be noted that IKP can play a critical role in addressing hazards and improving disaster preparedness. In order to

operationalize, IKP are to be supported and examined by scientists for their practical value enabling them to be complimentary to disaster risk reduction strategies.

Local and indigenous knowledge is key to survival strategy of coastal and small island communities to hazards, like tsunami, earthquake, and the impacts of climate change. Due to the lack of scientific data and ground truthing, indigenous knowledge and practices suffer limitations. Unfortunately, they remain mostly in oral form and undocumented. A group of scientists and researchers, however, has tried to validate the knowledge with scientific observation. Led by Hiwasaki et al. (2014), they started a process to identify, document, and validate local and indigenous knowledge and integrating this knowledge with science. They coined it as “Local and indigenous knowledge and practices Inventory, Validation, and Establishing scientific knowledge (LIVE).”

Hiwasaki et al. (2014) gave scientific clarifications to local knowledge like (a) observations of animal movements; (b) observations of cosmic and planetary bodies; (c) movements of cloud, direction of the wind; (d) material culture; and (e) traditional and religion-based beliefs and practices. Researchers and academicians are of the opinion that all stakeholders (policy-makers, policy executives, scientists, and the local community) are to be involved for the implementation of the LIVE skill.

It is important that IKP are documented and promoted. They are to be validated with scientific rationale and clarification. Such a validation would help the scientists, policy-makers, and the practitioners in developing an operational country-specific disaster management plan. In line with the recommendations of the Hyogo and Sendai Framework for Disaster Risk Reduction, it is recommended that the local and indigenous knowledge of the community is mainstreamed in national plans and policies before they are lost in time.

Abstract

Disasters have a differential impact on vulnerable sections of a society with gender as the crosscutting dimension and violence as the prominent feature. Gender-based violence exacerbates during disasters and most of it is directed against women and girls. The most rampant category is the violence perpetrated by the intimate partner. Though a perpetual global phenomenon, domestic violence has become so frightfully pervasive during COVID-19 that it attracted UN attention. Countries had introduced systems to combat domestic violence during lockdown, because this was a time when women were trapped within homes without access to legal, administrative and social resources and hence victims were conveniently and continuously accessible to the abuser inside the locked house. The objective of this study is to consolidate the learnings from global experiences and to prepare guidelines for action during lockdown situations for containing this scourge and for suggesting long-term strategy toward its elimination. The global scan is done with specific reference to the state of Kerala, India. An attempt is made to examine the deep-rooted causes besides the specific triggers characteristic of lockdown situations. Inputs were collected from UN

reports, government reports and records, and literature and by interviewing key officials from government, local bodies, and community-based organizations in Kerala. The findings are intended to be a ready reference for policy makers, administrators, and human rights activists to deal with domestic violence during disasters in general and lockdown situations in particular.

Keywords

Domestic violence · Lockdown · Administrators · Guidelines

Introduction

“Gender based violence refers to any act of physical, sexual or economic violence directed against a person or group on the basis of their gender, sex or non-conformity to gender norms and stereotypes It is an expression of unequal power relations, underpinned by social norms and beliefs linked to dominance, power and abuse of authority and formalised through laws policies and regulations of social institutions” (Javed & Chatty, 2021). Going beyond the binaries, gender-based violence includes violence against LGBTQIA++ community as well as violence happening inside and outside domestic spaces. Indian law’s definition of domestic violence (DV) includes emotional, verbal, and economic violence. Respondents can be male relatives by blood, marriage, relationship in the nature of marriage, and adoption in shared households. But the focus of this chapter is DV happening within marriage against women by the husband.

UNDOC study on homicide marks home as the most dangerous place for women (UNODC, 2020). According to the National Family Health Survey-5 (NFHS-5), during 2019–2021, 29.3% of married women in India in the age group 18–49 years had experienced spousal violence at some point in their life. NFHS figures for Kerala reveal that among the victims who had ever experienced physical violence, 90% experienced the same from husbands.

DV is a human rights violation. Unplanned pregnancy, miscarriage, stillbirth, premature child birth (WHO, 2021), chronic diseases, post-traumatic stress disorder, depression, nightmares, social dysfunctions, eating disorders (Das et al., 2020), compromise of self-care and child care, suicidal ideations, deterioration of health, aches, and pains are some fallouts of domestic violence (WHO, 2021). Disruption of peace of the family and neighborhood, decline in productivity, and loss of jobs happen. This is a public health problem which affects the exchequer (UN Women, 2022a, b). It entails intangible and indirect costs such as loss of working days, treatment expenses, decline in the educational attainment of children, time government spend in handling domestic violence, and the transmission of violence into subsequent generations.

“Gender-based violence has been an invisible phenomenon for decades, being one of the clearest manifestations of inequality, subordination and power relations of men over women.” The underlying reason is structural (Donato, 2020). Incidence of

female violence against spouse is very rare and happens due to individual characteristics and not due to structural inequities, whereas the reverse is structural, cultural, and systemic and requires corrections at these levels for its containment and elimination.

Distilled wisdom from recent experiences in handling domestic violence during lockdowns can guide us. A ready set of doables is required to handle DV during lockdowns. Awareness of triggers is crucial. Understanding of the patriarchalized gender dynamics is important for nuanced implementation.

Global Experiences of DV During COVID-19 Lockdown

Prevalence During COVID Lockdown

According to the World Health Organization, globally 30% of women are victims of either physical or sexual violence in their lifetime. Twenty-seven percent of women in the age range 15–49 report such type of violence from their intimate partner (WHO, 2021). Globally, 38% of all murders of women are committed by intimate partners.

Post-COVID period witnessed spike in violence. In Hubei, China, cases tripled (Usta et al., 2021). In the Philippines, it surged to 16% (UN RC Philippines, 2020). In Australia, onset, intensification, severity, and diversification of DV occurred during the first 3 months of the pandemic. “COVID-19 conditions were weaponized to enhance their controlling and coercive behaviour” by the perpetrators (Carrington et al., 2021).

During lockdown, homes became spaces for multiple activities and ended up simultaneously as a home school and workspace besides being spaces for multiple routine domestic engagements including nursing the sick. The “legitimate” care receivers, often healthy men, are always around. Along with the tensions of the pandemic, women’s role overload poses major challenges to them.

A high percentage of women opined that DV has increased in their community: Kenya (92), Bangladesh (81), Nigeria (74), Poland (68), Ukraine (59), Thailand (57), Columbia (43), and Kyrgyzstan (33) (UN Women, 2021).

Overall help calls increased by five times. In South Africa, call centers were overwhelmed (Parry & Gordon, 2020). In Portugal, Spain, Italy, South Africa, and Brazil, immediately after lockdown, reportage decreased (Gama et al., 2020; UNODC, 2020). But, once help services were ramped up, distress calls, messages, and demand for shelters increased sharply: USA and Canada, Brazil (40 to 50%), Argentina (25%), Columbia (12%), Europe (60%), Ireland, the UK, Germany, France (30%), Spain (20%), Belgium and Austria, and Cyprus (30%). The Netherlands and Switzerland did not report any change (Gama et al., 2020; Brink et al., 2021; UN Women, 2022a, b; Usta et al., 2021; Parry & Gordon, 2020). Helpline calls increased by 33% in Singapore (Usta et al., 2021). In South Africa, since the commencement of lockdown on March 26, 2020, call centers were overwhelmed

(Parry & Gordon, 2020). When reporting mechanisms were reinstated, helpline calls hiked up to 111% in some countries (Oxfam, 2021).

In India, the first lockdown was from March 25, 2020, to May 31, 2020. According to the National Commission for Women, the reportage decreased immediately after lockdown and then escalated: 538 (January), 523 (February), 501 (March), 377 (April), 552 (May), and 730 (June) (Oxfam, 2021). Again in 2021, the number of domestic violence complaints received was the highest when compared to the last 12 years.

The worldwide initial decrease could be due to the temporary shutting down of the victim protection centers' mobility curbs and lack of transportation during lockdown. Once restrictions were lifted, complaints surged beyond the capacity of call centers and shelters.

During lockdowns, surge of DV needs to be anticipated and domestic safety services should be ramped up.

Vulnerability to Intimate Partner Violence

Intimate partner violence – physical and /or sexual violence – prevails disproportionately higher in countries which are marked as the “least developed” by SDGs. The contrast is 22% vs the global rate of 13% (UN Women, 2022a, b).

Generally, the major predisposing factors of DV are history of experiencing or witnessing violence and an already impaired marital relationship with little interpersonal communication, tendency to control the female partner, etc. The risk factors also comprise alcoholism, antisocial personality, notions and practice of male privilege, lack of women's access to paid employment, and existence of patriarchally biased social milieu including gender discriminatory laws and absence of protective laws. Sexual violence occurs more in a setup where ideas of male sexual entitlement, family honor, and impunity for sexual crimes prevail. Lower educational level too is another reason mentioned (WHO, 2021). Women underwent lifetime intimate partner violence at the hands of men who cherished patriarchal attitudes and behavior such as controlling women's bodies, autonomy, and social interaction (UN Women, 2022a, b).

Slim Jahan, Director of UNDP HDR Report Office, blogged that violence against women is both cause and consequence of inequality (Thurston et al., 2021). Ageism, disability, LGBTQIA++ status, refugee status, and displacement status all multiply the vulnerability of women to this scourge. When two or more such vulnerable identities intersect, unique problems emerge which are usually invisible and go unrecognized (Vaeza, 2020). COVID-19 restrictions had a disproportionate impact on women who are already working in informal sector and who are already poor. This will “push about 47 million women worldwide into extreme poverty” (UNODC, 2022). Women who are poor are at higher risk of domestic violence (UNODC, 2022).

Multiple and intersectional vulnerabilities to DV exacerbate during lockdowns. These need to be mapped out and at-risk sections can be identified and prioritized for proactive interventions. Disaster risk reduction plans should integrate risk to DV. Measures to reduce inequality (SDG 10) and to challenge patriarchy are required, and for India, this is a formidable challenge considering that Global Gender Gap Report, 2021, places India in the 140th rank vis-à-vis Afghanistan ranked as the last 156th one (World Economic Forum, 2021).

Triggers for DV During COVID-19

In general, during economic crises, adverse impacts on mental health and issues such as “depression, substance abuse, addictions, and suicidal attempts” are to be anticipated (Sochanska, 2020) “Exposure to disasters can increase VAWG (Violence Against Women and Girls) through an increase of stressors that trigger VAWG; an increase of enabling environments for VAWG to occur; and an exacerbation of underlying drivers of VAWG” (Thurston, 2021). During disasters, men could not live up to the patriarchally exaggerated and impossible masculine images as protectors and providers (Parkinson & Zara, 2013). Threatening of breadwinner role of men can severely stress men (Sochanska, 2020). Patriarchally driven compulsions, on incessantly displaying masculine characteristics, roles, and performances, refrain men from expressing emotions other than aggression. Studies corroborate the idea that repressed emotions trigger violent behavior (Anderson et al., 2003). DV is resorted to by some men to ease the tensions generated by the threats and challenges posed by the pandemic (Arora & Jain, 2020).

The USA, Australia, Canada, and New Zealand witnessed incidence of domestic violence during disasters. This was rampant in Australia during the Black Saturday bushfires (Parkinson, 2017). The same rose by 53% in New Zealand after the Canterbury earthquake as reported by the police. After Katrina Hurricane, rise in physical violence on women was 98% (Parkinson & Zara, 2013). Similar experience was witnessed in India and Sri Lanka after the 2004 tsunami (Hines, 2007). During the earthquakes in Churchgate, New Zealand, a rise in DV also was seen (True, 2013).

Regarding the post-COVID scenario, ILO estimates reveal that globally, during the second and third quarters of March 2020, loss of employment hours was 18% and 7.32%, respectively, compared to the same period during the previous year. Loss of jobs for women was 5%, while 3.9% for men (World Economic Forum, 2021). Nonearning status makes women dependent and vulnerable to DV. Nonearning status triggers DV in men.

During COVID, DV was predicted to spike due to anxieties related to health and personal finance, heightened by confinement within homes (UN Women, 2022a, b). Stress disorders, unhealthy sexual behaviors, and substance abuse set in. Stress generated by threat of employment and loss and absence of social interactions can trigger DV (Abramson, 2020). COVID restrictions per se are a stressor. Entrapped condition of helpless victims within homes powered up the triggers. Enclosed within

home, there were more chances of intensification of DV and slippage into substance abuse (Parkinson & Zara, 2013). Intensification and diversification of DV occur (Abujledana et al., 2021). The COVID situation can make an abuser to utilize the social distancing stipulation to further isolate the victim from her networks and lifesaving services (Vaeza, 2020; WHO, 2021).

New cases emerge in this stressed situation (Abramson, 2020).

In short, lockdown generated many stressors – financial (lack of income, debt, loan repayment issues, challenge of meeting daily needs), social (isolation from extended family, networks), psychological (fear of domestic violence, stress related with the upkeep of masculinities, uncertainties regarding employment, availability of services, lack of faith in the governmental systems), and physical (domestic violence, burnout due to role overload, general health issues, COVID infections) (from interviews with local body leaders) stressors which in turn trigger DV.

Various actors dealing with DV need to have a deep understanding of triggers and their deep rootedness and also of the lived experiences of the victims, so that justice can be delivered to victims. Patriarchy-informed gender-sensitive counseling is required. Men should be sensitized and encouraged to use nonhierarchical and nonviolent approaches in cross-gender conflictual relationships.

Help-Seeking Behavior of Domestic Violence Victims and New Barriers

Globally, only 40% of women who experience violence seek help and that too are limited to family, friends, and informal setups.

Only less than 10% of the complainants sought help from police (UN Women, 2022a, b).

Eighty-six percent of Indian women who experienced violence did not seek help and 77% of victims did not even tell anyone. Out of the help seekers, only 7% approached appropriate authorities which means that reported cases constitute only tip of the iceberg, i.e., 0. 98% (NFHS-4 or Hindu 26/01/22).

Non-reportage is due to many reasons including fear of retaliation, lack of primary and secondary support to lodge a complaint, unfamiliarity with the systems, uncertain future looming large especially for women and children who are financially dependent on the husband who is the abuser, notions about losing family honor, trivializing and normalizing violence by victims themselves, fear of social disapproval through victim blaming, and lack of faith in the systems.

COVID restrictions accentuated the barriers to reporting due to blockage of all avenues of support systems – formal and informal – isolation from native family, and inability to make a phone call when the abuser is continuous services such as counseling, police, and courts. Many of the services were shut down during lockdown in some countries. The gender divide in the possession of mobile phones is 24%. This factor further prevents help-seeking behavior of victims during the mobility-restricted lockdown.

There is serious deficit in the already low level of health-seeking behavior. These services need to be declared as essential including the transportation facilities to access such facilities.

Management of the Domestic Violence During Lockdown

António Guterres advised the nations to integrate gender-based violence initiatives to the general COVID management plans. The strategy suggested was “fund, prevent, respond, and collect.” Funding women’s organizations and campaigns and data collection to improve gender-based budgeting were the strategies (Vaeza, 2020).

A Global Scan of the Management of Domestic Violence

Across the world, vulnerabilities compounded during lockdown. Many countries identified the problem of intimate partner violence and had taken concrete steps to overcome it. Local self-governments, NGOs, civil societies, professional bodies, and individual activists by themselves or in collaboration worked to handle the problem. Many governments have taken these entities on board. UN Women, 2021 Report shows that many countries have undertaken prevention and response to gender – based violence and bolstered up their violence response services. One hundred fifty countries had bolstered up their violence response services (UN Women, 2021).

During lockdown, New Zealand listed gender-based violence (GBV) services as essential services. South African government fortified the reporting channels (Oxfam, 2021). In Occupied Palestine Territory, the feminist organizations stretched the services to 24/7 mode. The mental health needs of the counselors themselves were attended to. In Malawi, supported by Oxfam, during lockdown, trained volunteers reached out to the community to intervene in domestic violence cases and to rescue girls from early marriage. In some cases, services had to be shifted to digital mode. (But this resulted in the nonutilization by many in the vulnerable sections such as the unemployed, poor, differently abled, SC/ST, and LGBTQIA++ and also by others who did not have Internet access.) (Oxfam, 2021).

Many countries managed to introduce measures to counter the adverse conditions. In the Philippines, the pandemic worsened the present vulnerabilities arising out of the armed conflicts and climate change issues. Prior to the pandemic, about 17% of girls were married before the age of 18. Even amidst the devastating environment in September 2021, a bill was passed, banning child marriages. It is notable that in Bolivia, in response to the mounting domestic violence, youth from a few cities congregated to discuss the cause for GBV and to analyze the skewed power equations and unjust gender division of labor within households. In Myanmar, there was militarization and the preexisting power structures had scant representation of marginalized ethnic groups and LGBTQIA++. This unrepresentative structure failed the citizens. So, informed citizenry constituted separate networks for mutual support (Oxfam, 2021).

In Spain, campaigns were conducted with the message that gender-based violence was not a private affair but a human rights violation affecting the whole society. The focus of these countries was on spousal violence against women. An easy-to-read

pamphlet was released to guide women to access the variety of services offered, including legal, psychological support, and shelter services. Funds were earmarked and allocated to local authorities and even autonomous communities and cities. Spain undertook massive awareness at institutional level. The entire civil society was taken on board to evolve pertinent policies and practices. The linkages were already strong between civil societies and institutions. WhatsApp call support system was installed with automatic signaling of victim's geolocation to the police. All the services pertaining to GBV was declared essential. Money was allotted for specific services. The President tweeted giving assurance to the victims of GBV. Licenses were issued to hotels for accommodating victims and their children. The government was responsive to the demands of the feminist movements (Oxfam, 2021). Twenty-four-hour helpline was instituted (Brink, 2021). The Pharmacist Association volunteered to notify the police when somebody approached them for assistance. Spain had the advantage of some preexisting conditions: legislation against GBV right from 2004, presence of women in decision-making bodies, and shelters for GBV victims. As an immediate response, campaigns were held. The Minister of Equality extensively used social media to spread anti-violence messages. Television channels too were used. Excellently coordinated participative policy formulation was present. Cutting-edge-level functionaries who had direct contact with victims were trained. Telematic systems to monitor the implementation of the restraining orders were instituted. Due to these factors, there was overwhelming reportage of violence during the 3-month lockdown period. Spain introduced a code word (red mask) which can be used by women who went to the pharmacies to seek help.

On the other hand, Italy stopped distributing pamphlets to pharmacies to inform citizens and did not even create a protocol to report the violence. There was neither multisectoral approach nor institutional-level communication. The existing anti-violence centers were not consulted when response was planned. Dialogues started within the institutions and did not go beyond. Pharmacies were told just to distribute the pamphlets, and even in the distribution of the pamphlets, the already existing services were not planned into the loop. The number of new cases reported dropped from 2018 figures (Donato, 2020). But in Italy, victims could easily reach out to pharmacies. In response to complaints made, violent husbands were issued injunction orders against entering the house (Brink, 2021).

Portugal launched campaigns. In Ireland proactively, the earlier complainants were reached out. In Switzerland, the strength of task force was increased. The Netherlands issued guidelines to health professionals to detect domestic violence cases. Code word system was introduced and victims could lodge complaints at pharmacies. In the UK, 750 million pounds were immediately allotted for handling domestic violence. The Abuse Bill was made stronger. The UK arranged housing for the domestic violence victims who were desperate for shelter (Brink, 2021).

In Pakistan, all the protective services came to a halt in lockdown and such services were declared nonessential. Courts did not function. Psychological counseling services through mobile phones were introduced. But due to the lack of

equipment, many needy women who probably belonged to lower economic strata could not make use of this much needed service (Ashraf et al., 2021).

At this juncture, it would be interesting to take a peek at the gender ranking of some of these countries and to consider their responses to domestic violence during lockdown: New Zealand (4), Ireland (9), Switzerland (10), Spain (14), South Africa (18), Portugal (22), the UK (23), Italy (63), and Pakistan (153) (World Economic Forum, 2021).

Participation of women, girls, and LGBTQIA++ is necessary if their needs and concerns such as domestic violence and invisible work are to be integrated into the policies and programs. But UNDP and UN Women discovered that out of the 137 countries and territories, in task forces, gender profile is skewed with men predominant in 84% of them. Gender parity was present only in 4% of the cases. Surprisingly, women were totally absent in such teams in 24 countries (Oxfam, 2021).

Globally, the percentage of funding for GBV stood at mere 0.0002% of the COVID response funds of \$26.7 trillion (Oxfam, 2021). Fund allocation is necessary. Services of entities outside can be utilized and funded.

Most of the good practices gleaned from all over the globe can be customized and applied across contexts. Banking directly on the organized power of citizens is a possible option worth exploring.

Management of Domestic Violence During Lockdown in India

The National Commission for Women (NCW), India, in their newsletter dated April 2020, acknowledged the fact of exacerbation of domestic violence during lockdown and acknowledged the issue as structural. The role overload of women and the need to share household work were emphasized. Vulnerable sections such as migrant laborers were given specific consideration.

NCW was ever available for women via emails and complaint portals. Complaints were received through messages – directly and through social media platforms. Women were bailed out from distressful situations. WhatsApp number was launched on April 10, 2020. Special team was appointed to handle cases on a fast-track basis. NCW released a short video advising women how to de-stress themselves.

NCW drafted a policy “Women and Children in Disasters: Need for a Policy” and submitted this to the Ministry of Women and Child Development. Telecounseling facilities are created for women utilizing the expertise of doctors and psychologists. Direct Benefit Transfer arrangements to distribute relief packages through aadhaar-linked bank accounts were introduced by government.

When COVID was raging, to decongest jails, prisoners were sent on a 45-day parole. But a few women prisoners stayed back or returned before the expiry of the bail period, since they were not welcomed back (Hindu Daily April 5, 2020). But in the case of men, they enjoyed the full term of the parole and stayed inside their houses with a sense of entitlement, even if they were wife batters, murderers, or child

abusers, and among them were criminals who conveniently utilized this opportunity to indulge in domestic violence including women who complained against them.

Lockdown was declared without any warning. Migrant male laborers and their spouses and female laborers were left in the lurch with sudden loss of employment. Most of them were without savings. They were ousted out of their shelters by the shelter owners. Lack of transportation to native states forced them to traverse long distances, often without food and water. Many mishaps occurred on the way including deaths in childbirth.

Having a policy to meet the needs of vulnerable sections is imitable. Also the system failed the migrant workers, and this reiterates the need to map out vulnerable sections and to reach out to them during lockdown situations. Decongestion of jails has to be done prudently.

Management of Domestic Violence During Lockdown in Kerala

Kerala declared its first lockdown on March 3, 2020, 7 days ahead of the national lockdown. This continued in phases and lasted for 65 days. There were lockdowns in March, July, and August 2021.

The Chief Minister famously declared that the perpetrator would have to go from “lockup to lockdown” if they indulge in domestic violence. He also exhorted the males to share household chores.

In Kerala, there are many preexisting structures already functioning satisfactorily to tackle domestic violence. The Government of India (GOI), Government of Kerala (GOK), local self-governments (the grassroots tier comprising 1000 panchayats and 15,962 wards), government departments such as police and Women and Child Department (WCD), Kudumbashree Mission managed by GOK, wide network of anganwadis managed by SJD, many NGOs, Kerala State Legal Services Authority, etc. are a few examples.

Shelter homes, 24/7 police helplines, district police cells, Mitra Emergency Call Service, free legal counseling, and Snehittha of Kudumbashree Mission (an extensive network of 294,436 neighborhood groups, federated at ward level and gram panchayat level) providing the whole basket of services for victims are already available. Anganwadis one in each ward is a hub where women frequent for services including preschool education; food for preschool children, senior citizens, pregnant, and lactating mothers; and iron tablets for pregnant women and teenage girls, and Bhoomika, the one-stop crisis center in each district government hospitals, provides chance for unobtrusive reporting. Many local bodies at panchayat level have jagratha samithis which are constituted for dealing with violence against women.

Online data compiled from the 14 women protection officers of the WCD (Women and Child Development Dept.) revealed that registered domestic violence cases decreased from 185 to 138 compared to 3 weeks before and after lockdown. This decline indicates the barriers to reporting due to COVID-related restrictions including lack of transportation services. Perpetrators were always around and women were unable to make calls. Messaging services were introduced. WhatsApp call facility was introduced in April 2020. The services were widely publicized.

Ninety calls were received within 19 days out of which 51.6% were DV complaints. Seventy-eight percent of complaints were fresh ones.

Around June 2021 consequent to a series of dowry deaths, Kathorthu services were started to provide online counseling on complaining procedure, legal aspects, and psychological well-being to a victim within 48 h of registering a complaint. GOK immediately started "Aparajitha" under the leadership of a senior lady IPS officer for online reporting.

During lockdown, alcohol addicts displayed withdrawal symptoms and took out their frustrations on their wives though violence. Lockdown facilitated some non-addicted alcoholics to come out of alcoholism. Inaccessibility to contraceptives resulted in unwanted pregnancies. Many medical facilities were converted to COVID wards, and hence reproductive health facilities of women were compromised. Gender advisor, GOK, took up the case of facilitating medical termination of pregnancy.

Transgenders faced the threat of being ousted out of their shelters and government provided four shelters for them.

Immediately after lockdown, Kodakara panchayat in Thrissur district initiated a few women-friendly activities such as starting community kitchens, providing food packets to senior citizens (majority being women) living alone, delivering library books at doors, distributing saplings in grow bags, and producing a short video film to inspire irresponsible men to resume work. Community kitchens were a big relief to women. Creative activities of various panchayats were shared through online meetings arranged by Kerala Institute of Local Administration (KILA), thus facilitating cross learnings. Consequent to the dissemination of a study on domestic violence which was shared by KILA, many panchayats started counseling centers. Snehitha (the one-stop crisis intervention center of Kudumbashree) in Ernakulam district instituted frustration box through which women could ventilate their frustrations through letters, poems, paintings, video clippings, etc. A wide spectrum of frustrations poured into the box from all over the state: domestic violence, withdrawal syndromes of alcoholics, safety of parents living alone, security of wife and children of men who work abroad, anxieties about loss of employment, future of business enterprises, nonavailability of caretakers, problems of children, etc. Literature shows that frustrations can be one trigger for domestic violence. So frustration box might have averted some incidence of domestic violence. Snehitha counselors proactively interacted with early registrants of domestic violence and prevented exacerbation of the same.

In many intervention cases, various agencies worked in tandem to effect redressal. For example, the case of a wife batterer which came to Snehitha was directed to a protection officer who in turn helped the victim to get a protection order from the magistrate. Many abusers were apprised of the legal consequences of violent behavior. The robust network of many entities ramified across the state came in handy while handling complaints which needed cross-district coordination.

Effective management of DV during COVID requires well-coordinated preexisting networked institutions, appreciation of various categories of vulnerable sections, generation

and dissemination of DV data and responsiveness to the findings, understanding the needs of DV victims, handling frustrations of citizens, and invoking creativity of citizens and to make them part of solutions to tackle problems.

Guidelines for Responsible Functionaries to Prevent and Manage Domestic Violence During Lockdowns

1. Declare all the victim protection services as essential.
2. The victim protection services should be provided round the clock.
3. Ramp up victim protection services (facilities, skills, funds, functions, functionaries, etc.) during lockdowns.
4. Declare transportation to such services as essential.
5. Devise diverse mechanisms for reporting – phone, WhatsApp calls and messages, web portals, complaint receiving centers, etc. Due to lockdowns, many services will be shifted to digital platforms.
6. Design systems based on the needs and circumstances of the victims, e.g., accessibility to mobile phones, skill, and freedom to use digital methods. Skill gaps of functionaries and beneficiaries should be closed through coaching and trainings.
7. Ensure that such services can be conveniently accessed by all the vulnerable sections.
8. Make the calls geolocation-enabled so that grievous complaints can be attended to without losing time.
9. Plan to make the calls for help anonymous, if the caller wants it so. Ensure confidentiality.
10. Depending on the local conditions, code words may be devised for women to communicate to the reporting centers.
11. Widely publicize comprehensive structures and systems of victim services (medical, legal, psychological, shelter, etc.) through multiple media – public announcements, pamphlets, radio, TV, newspapers, social media, etc. – and mode of access too.
12. Make proactive follow-ups in the case of already registered pre-lockdown period victims.
13. Decide and plan with the primary complaint collection centers on how to link up with the next node of service depending on the nature of the case.
14. Collect relevant disaggregated (vulnerable group specific) data and use it for planning, budgeting, implementing, and monitoring and evaluating victim protection services. Data-driven responsive policies can be framed for protecting victims with special emphasis on groups such as women and girls, LGBTQIA+, economically backward, unemployed, differently abled, internal migrants, SC, ST, religious minorities, seniors, climate refugees, development refugees, etc. Intersectional vulnerabilities should also be taken into account.
15. Institute and continuously update vulnerability maps so as to enable prompt and customized responses.
16. Evolve robust and practical protocols regarding processing of the complaint and follow-ups.

17. Evolve contingency plans for repurposing buildings as shelters. Also the government needs to be agile enough and adaptable enough to convert facilities such as convention halls, hotels, and even ships to shelters for domestic violence victims.
18. When general campaigns are made about precautions against the pandemic or any disasters, make preventive measures against domestic violence an integral part of such campaigns.
19. Give wide publicity to the legal consequences of perpetrating domestic violence.
20. The government leaders can announce warning against perpetration of violence and publicize this.
21. Maintain continuously all the essential services at a high degree of preparedness and streamline for staffing them adequately when an emergency arises.
22. Provide sufficient funds for all victim service activities. NGOs need to be funded sufficiently. Funding for this should be made a part of the plan for COVID-19 containment.
23. Once notified, make the services fail-free so that the victims will not lose confidence in the systems.
24. Ensure employing gender-sensitized persons or at least give them good briefing on these lines before deployment.
25. Functionaries in victim protection services including doctors, health workers, and helpers should be given mandatory training on gender sensitization and on detecting early signs of domestic violence.
26. When there is unmanageable surge in call centers, the health professionals, workers, and staff could be overwhelmed. Devise methods to de-stress them and to take measures to provide them psychosocial support. Ensure that health professionals get food and other basic amenities so that their energies are sustained.
27. Cutting-edge functionaries need to be trained for gender sensitivity. Besides them, all functionaries, including judiciary, police officials, and high-level bureaucrats, need to be sensitized on the realities of domestic violence.
28. Ensure seamless coordination across various relevant entities responding to DV. On an ongoing basis, maintain the networks strong and ever ready to pitch in, when needed.
29. Sexual violence being the least reported category of violence, counselors need to take special effort to find out if this exists.
30. When each plan or policy is evolved, the impact on women has to be considered. Decongesting the jails by releasing the perpetrators of domestic violence and child abusers is a case in point.
31. Keep participation and inclusion as key components.
32. Ensure uninterrupted availability of contraceptives.
33. In a pandemic situation, when all the medical facilities are customized for, say COVID management, do not neglect the reproductive health needs of women such as facilities for MTPs.
34. Since stress is a driver for domestic violence, models in line with frustration box can be tried out for reducing stress in general.

35. When supply chains are disrupted, the impact of alcohol supply to addicted persons has to be assessed. This can be used as an opportunity to give deaddiction treatment to at least to some of them.
 36. The mental health consequences of pandemic-like situations should be handled by deploying mental health workers and experts and broadcasting their talks and advices through multiple media targeting at both the victims and perpetrators. Temper control problems of the abusers have to be handled. Counseling and if required, treatment should be provided for domestic violence victims.
 37. Since toxic masculinity is one of the not so widely acknowledged drivers of domestic violence, we need to come up with gender-sensitive counseling where men are educated on healthy nonviolent stress management alternatives. Treatment should be provided to abusers who have personality disorder issues and mental health issues. Women should be rescued from dangerous relationships.
 38. The local bodies can take initiatives to make the citizens participate to address lockdown-generated problems. The potential of citizen groups, civil society organizations, and CBOs can be leveraged.
-

Conclusion

Domestic violence is structural and systemic, and it exacerbates during any disaster and specifically so during lockdown situations necessitated by pandemics. Long-term solution is eliminating inequality (SDG 19) and addressing vulnerabilities. Preexisting robust well-branched out gender justice-oriented entities which work in well-coordinated manner are the lifeline to victims. Along with policies, grassroots-level creative interventions are crucial. Good governance is significant and so also is the cross learnings of solutions through digital media. Policies, programs, projects, and activities need to be inclusive and participative with all categories of vulnerable sections represented adequately. Multi-stakeholder, multi-sectoral, intersectional, and consultative processes are to become part of governance culture. Well-trained and gender-sensitive individuals are required at all levels who care to have a nuanced understanding of the lived experience of the vulnerable sections. The scourge of domestic violence came into sharp relief during lockdown. This can be used as an opportunity to build back a better violence-free future utilizing the collective wisdom distilled from these global experiences.

Introduction

Disasters are increasing globally; so is the food insecurity. “Globally, the frequency of natural disasters increased tenfold since 1960, increasing from 39 incidents in 1960 to 396 in 2019” (Institute for Economics & Peace, 2020, p. 5). Food and Agriculture Organization (FAO) has noted that “In recent decades, disasters averaged more than 360 distinct events per year (in the 2010s) and 440 per year (in the 2000s), compared to just over 100 in the 1980s and a moderate 90 per year in the 1970s” (FAO, 2021, p. 4). On the other hand, “An estimated 2 billion people currently face moderate or severe food insecurity. By 2050, this figure is expected to increase to 3.5 billion people” (Institute for Economics & Peace, 2020, p. 4).

So food security is one of the major challenges in managing any disaster for today as well as for the future world. In the climate related disasters like floods, droughts, or forest fire, food security is inherently interlinked with climate change and other current global challenges of economy. But the devastating impact of the recent pandemic of COVID-19, leading to an unprecedented recession since the Second World War, has deteriorated the food security and nutrition status of millions of people including children (FAO et al., 2021, p. vi). The Report of FAO, IFAD, UNICEF, WFP, and WHO (2021) observed “Unfortunately, the pandemic continues to expose weaknesses in our food systems, which threaten the lives and livelihoods of people around the world, particularly the most vulnerable and those living in fragile contexts” (p. vi). In fact pandemic has broken food supply chains, devastated food markets and fields, compelled labor shortage and forced *mandi* (where vendors sell their farm products in a wholesale manner) closures. So the issue of linkage between pandemic and food security has become very complex and 720–811 million people in the world face hunger in 2020 (p. vi). Besides “In the developing world, in addition to the millions of chronically undernourished, another 5–10% are at risk of acute food insecurity in times of crisis” (Ashley, 2016, pp. 19–20). Developing countries that have experienced political instability, conflict, or “unprecedented Desert Locust outbreaks in Eastern Africa” (FAO et al., 2020, p. viii) in recent decades are more likely to have sustained significant setbacks in reducing hunger during pandemic or afterwards. This chapter asks some questions in this context: How can the sustainability of feeding Below the Poverty Line People be ensured in terms of availability and accessibility of food grains? What role does the civil society play in the governance of distributive justice, particularly in the context of ensuring food security for the vulnerable sections of the society? What else are required for making the Targeted Public Distribution System (TPDS) more effective in a post-pandemic situation, especially in the context of another disaster? The chapter will be based on secondary data collected from government reports and non-government publications, reports of international organizations, and relevant books and journals.

Pandemic and Disaster

Pandemic has been defined as “an epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting a large number of people” (Kelly, 2011, p. 540). In 2009, Moren, Folkers, and Fauci defined pandemic with certain features of any disease. These are: (i)wide geographic extension, (ii) disease movement via transmission, (iii) high attack rates and explosiveness, (iv) minimal population immunity, (v) novelty (new, or at least associated with novel variants of existing organisms), (vi) infectiousness, (vii) contagiousness, and (viii) severity (Moren et al., 2009). So a pandemic makes the public health systems to confront serious challenges, which cannot be solved by traditional health governance practices and need new legal codes, new standard operative procedures (SOP) in administration as well as a competent leadership in polity. But the pandemic spreads very fast, whereas the administrative and political arrangements do not develop in

that fast manner. So temporarily, and initially, pandemic leads to an administrative disaster, where nobody has any SOP to deal with the configuration of new social risks in the community sphere.

In India, with the onset of pandemic, it was found that the only act that was there to deal with epidemic diseases was the Epidemic Diseases Act, 1897, which was 123 years old. So, after 6 months since the date of lockdown, on 29 September 2020, the Epidemic Diseases (Amendment) Act, 2020 was publicized in the Gazette of India. But the term pandemic was neither mentioned in the Amendment Act nor was the term epidemic defined. More vital question, that remained unanswered, is that – is there any relation between epidemic or pandemic and disaster? The Disaster Management Act 2005 defines disaster in the Section 2d as “Disaster means a catastrophe, mishap, calamity or grave occurrence in any area, arising from natural or man-made causes, or by accident or negligence which results in substantial loss of life or human suffering or damage to, and destruction of, property, or damage to, or degradation of, environment, and is of such a nature or magnitude as to be beyond the coping capacity of the community of the affected area.” Later on, the National Disaster Management Authority (NDMA) in India put epidemic and pandemic under biological disaster defining it as “causative of process or phenomenon of organic origin or conveyed by biological vectors, including exposure to pathogenic micro-organisms, toxins and bioactive substances that may cause loss of life, injury, illness or other health impacts, property damage, loss of livelihoods and services, social and economic disruption, or environmental damage” (NDMA website <https://ndma.gov.in/Man-made-Hazards/Biological>. Accessed 4 May 2022). With this interpretation, COVID-19 pandemic came under the Disaster Management Act 2005 in accordance with which lockdown was declared throughout India from 25 March 2020.

The Food Supply Chain

Lockdown for 9 weeks at a stretch was an unprecedented happening in India. Due to this lockdown, initially food supply chain got the shock and “Food arrivals in wholesale markets dropped by 62% in the three weeks following the lockdown” (Lowe et al., 2020, p. 2) although it recovered to 2019 level after 3 weeks. Lowe et al. also have found that wholesale prices initially rose by 8% (2020, p. 2). At the initial phase of lockdown, the movement of goods and services became severely restricted. Even after the declaration by the government of India that trade, agriculture and food related industries were to be exempted from lockdown, confusion and chaos regarding enforcement of rules regarding trade, agriculture and food in different states continued and that led to a major disruption of such activities. United States Department of Agriculture (Foreign Agricultural Service) reported in April 2020 that after the announcement of lockdown, the port of Mumbai did not effectively operate for a week, which led to a huge backlog of shipment. Then, with the start of clearing such backlog, it was observed that there is a shortage of the government of India personnel to conduct cargo inspection and other clearances on the one hand and the shortage of labor for unloading and distributing the cargo

consignment on the other (US Department of Agriculture, Section- Overview; p. 2). Same happened also in rural India, where the *mandis* remained shut off and on and the traders would not come up to buy the products. An International Food Policy Research Institute (IFPRI) survey (Narayanan, 2020) noted that, among around 370 farmers across nine Indian states, 29% were still holding on to the produce they had harvested; whereas 13% had dispensed with their produce at a cheap price and about 7% reported that they had to let the produce go waste. At the urban market the e-commerce companies were facing harassment in delivering food, groceries, or even medicines. At the initial period there was the lack of rules regarding Standard Operating Procedure. Thus police harassment of the e-commerce delivery agents was reported during the starting period of lockdown (Raman, 2020). But during the second wave of COVID-19, lockdowns were declared by different state governments with their own operating rules. During this phase of lockdown, manpower shortage, supply chain constraints, and a surge in demand hampered again the delivery service of e-commerce companies like Big Basket, Flipkart, and Amazon (Shinde, 2021). So it is observed that pandemic as a disaster acted like a tsunami and affected the food supply chain – from the farmers to the *mandis* to the merchants and finally to the customers. Thus, the physical, social, and economic access to sufficient, safe, and nutritious food for all people that meets their dietary needs and food preferences for an active and healthy life, which is considered as the basic pillars of food security was completely violated during pandemic.

Government Initiatives

The central government took many initiatives to overcome these food supply constraints. These initiatives were of three types: (i) cash deposit in the account of the economically marginalized people; (ii) Free feeding mission, and (iii) Strengthening the public distribution system. On 26 March 2020, the Finance Minister announced the Package of 1.70 lakh crore under the Pradhan Mantri Garib Kalyan Yojana (PMGKY) that included free food grains, insurance cover for each healthcare worker and directed cash transfers for affected people including farmers and daily wage laborers. It was also declared that under Pradhan Mantri Kisan Samman Nidhi initiative in which the farmers would receive 6000 Rupees per year which was in force since 1 February 2019, Rs. 2000 to each of 8.69 crore beneficiaries will be deposited (The Economic Times, 26 March 2020). An ex-gratia payment of Rs 1000 to 3 crore poor senior citizen, poor widows, and poor disabled was also declared under PMGKY. Also the Feed India Mission was launched by the Prime Minister on 30 June 2020 under which all poor people would get 5 kg wheat or rice and 1 kg of preferred pulses for free every month initially for 6 months which was extended for another 6 months. One of the reasons of free feeding mission was also “acute shortage of storage space for procurement of rice in ensuing Kharif crop” as was mentioned by the former secretary of the Union ministry of agriculture and farmers’ welfare Siraj Hussain (The Wire, 30 June 2020). The same report also mentioned two significant points: (i)the minister for Consumer Affairs, Food and Public

Distribution, Ram Vilas Paswan, himself pointed out in an interview to *The Wire* shortly before the mentioned report was published that there was no shortage of food grains as around 100 million tons of food grain was in buffer stock whereas the limit for buffer stock on July 1 is 41 million tonnes; (ii) despite this huge buffer stock, free feeding was not extended for the migrant workers although the minister was quoted as informing, “only 11% of the grain that was due to the 8 crore migrant workers has been provided to them.”

For strengthening the public distribution system, on 14 May 2020 the Finance Minister declared the rollout of “One Nation, One Ration Card” (ONORC) system in all states and Union Territories by March 2021. ONORC leads to digitization of the TPDS. But even in June 2021 it was found that in three states, viz., West Bengal, Chhattisgarh, and Assam, the scheme was not implemented. So, on 11 June 2021, the Supreme Court gave its observation that “One Nation, One Ration Card” scheme would have to be compulsorily implemented in all states (Mathur, 2022). As per rule, the beneficiaries of the PMGKY and the Atmanirbhar Bharat – for food distribution under the National Food Safety Act must have ration cards and must be registered for the scheme. The Court noted that despite the sanctioned 314 crore Rupees for development of the National Database for Unorganized Workers in the 2020 budget, “nothing has been done yet” (Mathur, 2022). Plenty of these unorganized workers migrate to other states for work, especially in the lean season. ONORC will allow all these migrant laborers to get rations even if they are away from their native place.

Disasters and the Right to Food

The first two areas where disaster had its impact is on food and drinking water. Disasters challenge the growth and harvesting of crops as well as its distribution to the targeted population. The Constitution of India has enlisted the “Duty of the State to raise the level of nutrition and the standard of living and to improve public health” (Art. 47) in one of the Directive Principles of State Policy. But that principle remained long unheeded until in the People’s Union for Civil Liberties v Union of India (popularly known as the Right to Food case) case in 2002, the Supreme Court upheld the right to food as a significant element of the Right to Life as provided under the purview of Art. 21 of the Indian Constitution. The Right to Food case is a complex one in which many “interim orders” have been issued by the Supreme Court. In all these interim orders, the Supreme Court (i) specified minimum allocations of food grains for the economically vulnerable population, (ii) identified certain government schemes like Antyodaya Anna Yojana and Mid Day Meal Scheme (MDMS) for distributing food grains, (iii) set out the process of distribution, viz., Targeted Public Distribution System by which those schemes would be implemented for the Below the Poverty Line people, (iv) upheld social audit to check the proper implementation of the schemes and (v) observed which government officials would be held responsible, if the schemes are not implemented (Jaishankar & Jean, 2005, Appendix 1: The Supreme Court Orders, pp. 41–67). As a follow up to all these orders, the National Food Security Act (NFS) was passed in 2013. This Act has

been executed in all states and union territories. But the NFSA does not provide any scope for giving priority under TPDS to any specific area or region. Thus, under the NFSA, whenever any natural calamity occurs in a specific area, additional allotment of food grain is made for that area for a period of 3 months (Ministry of Consumer Affairs, Food, & Public Distribution, 9 July 2022).

Despite all the Interim Orders of the Supreme Court and the NFSA 2013, in 2019 a PIL petition was filed by social activists Anun Dhawan, Ishann Singh, and Kunajan Singh seeking direction to the Centre for developing a national food grid through community kitchens in all states “for people falling outside the purview of the public distribution scheme” (India Today, 1 September 2019). On 16 November 2021, while hearing the petition, the Supreme Court directed the Centre to frame a policy and to “Come up with a comprehensive scheme, identify areas where there is an immediate need” within three weeks (The Hindu, 16 November 2021). The Supreme Court also observed that a “welfare state must ensure that nobody dies of hunger,” which was particularly relevant in the context of ongoing COVID- 19 pandemic (Hindustan Times, 17 November 2021).

Critical Role of the Public Distribution System(PDS) in any Disaster

2021 Global Nutrition Report: The state of global nutrition (Development Initiatives, 2021) mentions that “An estimated additional 155 million people are being pushed into extreme poverty globally, as a result of the pandemic” (p. 15) and “While the nutrition crisis pre-dates the pandemic, it is made only more urgent by the potential damage that the loss of resources can inflict on global food security and people’s health” (p. 10). For India the problem of food security is more of distribution than the availability of food grains. India has a solid stock of food grains, which is increasing in a more than proportionate way to the increase in population (Fig. 1). A cursory look into the Food grains Stock in Central Pool for the years 2016–2022 (Opening Balance) in the Stocks page of the Food Corporation of India (FCI) website (<https://fci.gov.in/stocks.php?view=46>. Accessed 12 May 2022) will show the huge buffer

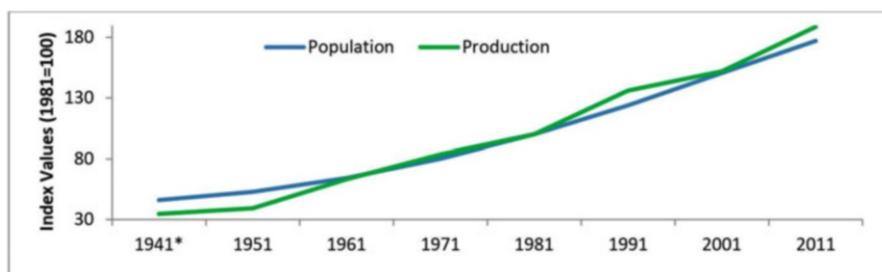

Fig. 1 Trends in Indian population and production indices 1980–81 = 100. (Source: Saini and Kozicka, 2014)

stock of food grains, much more than the quantity mentioned in the “Current Food Grains Stocking Norms” of the FCI since 2016. So, the first pillar of the food security, i.e., availability of food, is not at all a problem in the current situation in India. Still according to the India National Multidimensional Poverty Index Baseline Report (NITI Aayog, 2021, p. 33), the percentage of total population, who are poor and deprived in nutrition indicator is 19.90. So around 260 million people in India, if not more, do not get proper diet. During any disaster, the number goes up. Thus, we find in the initial phase of lockdown during pandemic around 80 million migrant laborers were denied food because of the sudden closure of the means of livelihood on the one hand and stopping of food supply chain on the other.

Taking lesson from the failure of providing free food through the PDS, despite the announcement of the Free Feed Mission by the Prime Minister, ONORC has been introduced. But to what extent that may make the PDS effective is a matter of conjecture. Leakage, exclusion, and outdated distribution system for static population were the basic problems with welfare delivery under the public distribution system in India. On 13 March 2022, Business Standard reported wide spread “leakages” in the PDS which was “about 47% of the total grain” (Business Standard, Noida, 13 March 2022). This leakage means the failure of PDS in providing food security to the most vulnerable people of the country. On 13 May 2020, The Wire reported that Jharkhand’s Garhwa district in Bhandariya block contains 40% SC and ST population among which “8611 families are categorised under the Particularly Vulnerable Tribal Groups (PVTG) who are one of the most marginalized social groups in the state.” The report mentioned that none of these families had a ration card (Kumar, 2020). Thus, the report showed that the hunger situation worsened during pandemic especially among the socio-economically weaker groups like Particularly Vulnerable Tribal Groups, Dalits, Adivasis, daily-wage workers, and nomads.

Reetika Khera and Anmol Somanchi in their study on “COVID-19 and Aadhaar: Why the Union Government’s Relief Package is an Exclusionary Endeavour” have noted that “In the PDS, Aadhaar is an important source of exclusion. It excludes people in three main ways: cancellation of cards (or names on ration cards) if people do not have an Aadhaar number, failure to link or if they fail to link it with their ration card, and failure of the Aadhaar-based biometric authentication (ABBA) at the time of purchasing grain” (EPW, 25 April 2020). During disasters, the exclusion due to these causes increases.

Corruption and the Governance of Natural Disasters

Neha Middela (2017), writing on the Corruption and Food Security in India, observed that “In order to analyze the linkage between corruption and loss of food security, the daily life of rural families, those most affected by a possible loss of food security, as well as the chain of circumstances behind corruption itself must be examined.” Middela observed that the cause of food security in India should be attributed more to the fact the food produced is not being used in a manner that is

transparent and which conforms to its intended purpose than to a singularly attributed factor – lack of available food. According to UNICEF ([n.d.](#)) website, 25 million children are born in India each year. Among them, according to National Family Health Survey (NFHS)-5 ([2019–2021](#)), per 1000 live births, 42 children die under 5 years. Also “The under-five mortality rate is higher in rural areas than in urban areas (46 deaths per 1,000 live births versus 32 deaths per 1,000 live births)” (NFHS-5, March 2022, p. 242). Neeta Lal ([2015](#)) pointed out on the basis of reports that “nearly 60% of the food that is channelled through the public distribution system is either wasted or siphoned off in transit.” Thus, the impressive list of programs in fighting hunger loses its relevance because of the failure in supply and distribution network.

During pandemic, this corruption increased due to the failure in supply and distribution network. The migrant crisis during lockdown showed the extent of hardship that the migrants had to bear just for getting a square meal a day. (For a detailed discussion on migrant laborers and food security during pandemic, please see Bhattacharyya, [2022](#).) Uzmi Athar (The Print, 10 April [2022](#)) reported that “Covid-19 and climate change push many older women into prostitution in Sundarbans,” who, due to the abject poverty that got worse by the pandemic continuing for 2 years, became vulnerable. On the request of Amicus Curiae referring the mentioned report in a plea seeking various benefits for sex workers across the country, the Supreme Court asked the Counsel representing the State of West Bengal to look into this issue and respond when the matter is put up for hearing on 17th May (Chowdhury, 12 May [2022](#), LiveLaw.in). Same type of incident was reported by Mousumi Singh (India Today, 8 July [2020](#)) where tribal minor girls were being sexually abused and exploited day after day by contractors and middlemen of illegal mines “in exchange for a few morsels of food and some money” at Chitrakoot in the Bundelkhand region of Uttar Pradesh. When asked, the mother of a girl narrated that they did not have work for 3 months and consequently they were running from pillar to post to get a square meal a day for the family. These few reported incidents show that despite the availability of food and despite the intention of the government to provide food grains as was expressed through the announcement of Pradhan Mantri Garib Kalyan Anna Yojana (PMGKAY) for free distribution of food grains the measures could not ensure zero hunger during pandemic.

The Lessons for Ensuring Zero Hunger in Future

One of the guiding principles (19 d) of Sendai Framework for Disaster Risk Reduction 2015–2030 says “Disaster risk reduction requires an all-of-society engagement and partnership. It also requires empowerment and inclusive, accessible and non-discriminatory participation, paying special attention to people disproportionately affected by disasters, especially the poorest.” Throughout the pandemic, the government policies for the schemes like PMGKAY were implemented through the government network only and the community engagement was never

recommended by the government for implementing social security policies, especially food security programs through the community organizations. In fact, whole food security benefit distribution program is very centralized. This is mainly because social security programs are upheld in the election campaigns as government's good intentions. There may also be an apprehension on the part of government regarding corruption or leakage, especially when government will not have total control over the community organizations. But there are credible and honest civil society organizations like Ramakrishna Mission or Bharat Sevashram Sangha, just to mention a few, who may provide an all-of-society engagement and partnership, if they can be involved with the distribution of food under security programs.

Second important point of course is empowerment and inclusive accommodation of the poorest who are always most affected by any disaster, let alone the pandemic. It should be born in mind that digitization of benefits, especially Aadhaar based Biometric Authentication (ABBA) itself needs considerable money, energy, and time for the poorest since they have to depend on *dalals* or middlemen going to cyber cafe for making biometric linkage. Government should provide adequate centers open day and night for making ABBA linkage free of cost. The lack of an adequate number of such centers will ultimately exclude disaster stricken poor people to get their entitlement.

Third point is bureaucratic bottlenecks, which were highlighted as one of the important causes for the inefficiency of PDS by the NITI Aayog in 2016. Disasters and their after effects make the marginalized more vulnerable than they were before. An accountable government should remove these bottlenecks in the PDS system, so that it becomes more effective and reaches the target group for whom it has been planned.

Finally an all-out effort should be taken to bring down the leakage in the TPDS system as minimum as possible.

Conclusion

India does not have a shortfall in the availability of food. Also, apparently the intention of the government in providing the poor people social security benefits, especially food security is established through a plethora of yojanas. Yet, the fact remains that with a score of 27.5, in Global Hunger Index 2021, India ranks 101 among 116 countries and as per the State of Food Security and Nutrition in the World 2020, the number of undernourished people during 2017–2019 was 189.2 million (p. 182). In such a situation, accessibility of nutritious diet, not just food, remains a big challenge even during a normal situation. A Pandemic, or for that matter any disaster, can make that challenge of reaching the marginalized vulnerable people for ensuring nutritious diet more daunting. A resolute fight can only resist that challenge. For that an effective and accountable administration may focus on the following steps:

-
- (i) Community organizations should be engaged more in implementing government schemes, so that an inclusive, accessible, and non-discriminatory participation grows at the community level.
 - (ii) If the Aadhaar Based Biometric Access (ABBA) is not operative due to the onslaught of any disaster, government should have some mechanisms for the inclusion of all marginalized poor people in the food security programs or in the PDS.
 - (iii) Government should take special care centers, in initiating digitization of social security benefits, so that the *dalals* may be kept away from such digitization programs.

Abstract

Commonly defined, a pandemic is a global outbreak of a disease which can result in economic as well as social consequences. A disaster can adversely influence physical, human, and environmental aspects of a country. Thus, direct and indirect impact on the education system of a country as a consequence is unavoidable. Disaster management involves implementing a set of policies and procedures needed to support the population of a country in the event of a sudden disaster. In the recent COVID-19 pandemic, severe economic as well as social impacts have been observed. In this environment, this study was aimed at understanding the impact of the pandemic on teaching and learning at higher education institutions across the globe. With the intention of drawing an

international sample to represent the higher education institutions in the Asian region, we selected 115 respondents from Sri Lanka, Thailand, Indonesia, India, and Bangladesh using a convenient sampling technique. A Google Form was developed to collect data, while qualitative tools were used for analyzing data. The study found that most of the academics were willing and able to manage teaching via online. Respondents mentioned that although their average workload increased, they were satisfied with reaching online as this allows to continue the teaching and learning process even during a world pandemic. Further, they commented that online classroom was the only solution that was available during the pandemic. Thus, it can be concluded that online teaching has contributed toward reducing the impact of the pandemic on higher education.

Introduction

The COVID-19 pandemic has affected every aspect of citizens' lives. It has changed the way of living of the population of the world. As defined by the Dictionary.com, an "epidemic" is a widespread occurrence of an infectious disease in a community at a particular time, while a "pandemic" is a disease prevalent over a whole country or the world. COVID-19 first started around December 2019 in China (Wuhan) and later started spreading to other countries in Europe and the USA. When it started in China, neighboring friendly countries like Sri Lanka offered volunteer medical services such as medicine, doctors, and nurses and face masks. Many countries shut their borders to protect their people. When the disease was confined to China, it was called an epidemic.

The World Health Organization (WHO) was very cautious in calling COVID-19 as a pandemic, because for an epidemic to be called as a pandemic, it has to be spread internationally in many countries and solutions to prevent/curb have to be found internationally. In a global pandemic, there are no sidelines, and the disease is everywhere; thus, there is no point in shutting borders; instead, health officials may recommend social distancing which can reduce the spread within a country. Thus, WHO did not declare COVID-19 as a pandemic until March 2020.

To avoid the spread of the virus, many countries closed borders, banned all gatherings, closed schools and other higher education institutions, and imposed curfew. Initially, no business was functioning, and people except for the ones employed in the health services and armed forces and the police were confined to their homes. Banks' function was restricted to few hours per day, and people were encouraged to utilize online services provided by the banks. Many small businesses engaging in the food and beverages and tourism were closed down, and many people lost their jobs. Migrated Asian laborers were to return to their home countries. Gradually, the business places started to function online, and facilities such as Zoom, Google Meet, or Google Classroom were introduced for people to work from home.

Impact of the COVID-19 Pandemic on Higher Education

Higher education institutions and schools were closed to prevent COVID-19 from spreading. The pandemic had confined people to their homes, and people listening to news broadcasted by media were overloaded with fear and worried as to what would be their plight if they get contracted with the disease. If someone gets contracted with the virus, they were taken to separate quarantine centers far away from their loved ones. Those who die from the virus will receive no funeral ceremony nor any religious blessing but will be buried/cremated by the government without the involvement of the relatives. The increasing COVID cases broadcasted by media daily were creating anxiety in the hearts of people. This atmosphere was not at all conducive for a successful teaching and learning experience. No one could expect the teachers to have a mindset for effective teaching nor students to have peace of mind necessary for successful learning. University education consists of not only lectures but workshops, practical sessions, events, projects, seminars, and many extracurricular activities to develop the required levels of knowledge, skills, and attitudes of students so that they will become employable. Thus, the problem faced by the authorities of the higher education institutions was how to provide the same service via a different platform. When considering conducting the courses using an online platform, many things such as the learning environment, mindset of the teacher and the student, facilities available for students and teachers, and minimum level of skills required were to be considered. Most of the higher education institutions (except for the institutions that have been offering online courses) embarked on online teaching on an experimental basis. They were very lenient on the teachers and on the students. Many students were suffering financially due to the lockdown. Some lost their close relatives due to the virus. Many have lost their internships and were even deprived of their daily meals. Most of the students needed counselling. In this background, universities couldn't expect students to purchase laptops/smartphones as preparation for online learning.

As online teaching was a novel experience to most teachers as well as students, there were a lot of discussions about it. During this time, many higher education institutions, both private and public, sought for online teaching as no one could give a proper estimate as to how long it would take for the pandemic to fade away. Most of the universities provided training for the teachers and students free of charge. This study focuses on understanding the effects of the adoption of online teaching on the teaching learning process of higher education institutions across the Asian region.

For this purpose, a Google Form was developed containing 25 questions. Convenience sampling was adopted in selecting respondents from both public and private universities from Bangladesh, Indonesia, Sri Lanka, and Thailand. The questionnaire was sent to the selected academics via email. Table 1 describes the country composition of the sample.

Sixty percent of the respondents were male, and the balance 40% respondents were female. Approximately 53% were in the category of "senior lecturer," 13.5% were professors, and the rest were lecturers and instructors. Approximately 49% of

Table 1 Country composition of the sample

Country	Participants
Bangladesh	05
Indonesia	07
Sri Lanka	59
Thailand	44
Total	115

Source: Authors' calculations

them were between 35 and 45 years of age, 20% below 35, and the rest above 45 years. Forty percent were teaching subjects related to information technology and computer science, and 20% belonged to the social sciences including subjects related to management, another 20% to mathematics, and the rest to languages, photography, and technology. However, 13% of the respondents have not engaged in online teaching; the reason for that was either it was summer vacations or they had completed teaching for the semester before the lockdown.

While analyzing the data collected from the questionnaire, the following information were extracted.

Challenges to Online Teaching

When asked what was the most challenging about changing into online mode, majority of the respondents said that making sure students were following the class from the beginning to the end was the most challenging task. Some others said converting the classroom-based lessons to online teaching was most challenging. Few respondents said that managing time was a challenge. Some others said that students did not have the necessary facilities to participate in the online class was a challenge. However, every respondent thought that getting used to teaching online was a challenge.

When asked about their students' responses on online teaching, almost all the respondents said that their students adapted to the system very fast (faster than the lecturer). Some said that students have learned to be interactive in class, carry out discussions in groups, submit answers to quizzes, and use additional material shared by the lecturer. The main problem with the students was the lack of facilities such as computer, smartphone, and internet connectivity. Some respondents said that final year students were very active during the sessions, while first year students were very unresponsive.

Effect of Online Teaching on the Workload of Lecturers

Commenting about the workload, a majority of respondents said that workload has increased, first because they needed more time to prepare and set cameras, whiteboard, etc. and second because they cover the material that was used for a 3-h class session earlier within half of the duration as there was no interaction with the

students, so they have to prepare additional materials such as videos, academic games, quizzes, etc. to be incorporated into the teaching session. Respondents said that preparation time was more for subjects with calculations (like Accounting as answers were to be prepared in Excel sheets). Teachers of subjects like management said that they hardly experienced a change in the workload. Another young respondent who falls in the age category below 35 said that their seniors assign a lot of work to them without giving any consideration to the fact that they needed a few days at the beginning to familiarize themselves with the new system. At the same time, the respondents said that it was alright to bear an additional burden in terms of workload as they were saving time on travelling to the university. One respondent said that online teaching gives him a different kind of a pressure that cannot be properly explained compared to classroom teaching.

Concerns About Online Teaching

Talking about what they were missing by shifting to online teaching, all the respondents except for a very few said that they miss eye contact, facial expressions of the students, the interactions in the class, student responses to questions asked, attending to weak students individually, and the inability to assess their teaching by making sure students understood the lesson. A few respondents said they were not missing anything by teaching online, and some said they even prefer continuing online even after the pandemic.

Their concerns on having to switch on to online teaching were diverse. Some said their concern was the internet connectivity, additional tools to be used, and quality of the sounds and the microphone. Specially the respondents who were living a little far from the towns have faced the problem of weak internet connectivity and low quality in sounds. Some others said their concern is the effectiveness of the teaching learning process, while some respondents said their concern was how to get the attention of the students; they said that they feel that some students were not following the lesson and they will be far behind the others who are keenly following. A few respondents said that they are concerned about the students not getting a chance to socialize with other students and trapped to computer at a desk in a room. Some respondents who were teaching photography mentioned that it was difficult to cover 100% from an online class. Those respondents who were teaching subjects that involve calculations (e.g., Accounting, Statistics) said teaching online, developing teaching material for online use, and explaining calculations were challenging. Some respondents said that having no office room at home and finding a place free of disturbances from others at home were challenges, and some others said that avoiding sudden power cuts and outside noises was a challenge. Few respondents whose subject was electronics said it was a challenge teaching online. Some respondents complained about the cost of data. All the respondents were concerned about the nature of the student evaluation system that is suitable and available on online basis.

What Motivated Online Teaching

Talking about what motivated them to switch on to online teaching, almost every respondent said that it was the rules and regulations imposed by their employers due to the spread of the COVID-19 pandemic. A minority said that it was the traffic that wasted considerable time going up and down to the university that motivated them to go online. Few others said that it was their enthusiasm to upskill their talents to keep abreast with the changing technology. Every respondent agreed that preventing students idling and wasting time due to the lockdown was also a strong motivator to go online.

Were They Happy Doing It?

When asked about how they feel about online teaching during the pandemic, all the respondents said that they were happy to reach their students even online and cover the syllabuses so that students would not waste their time. Almost every respondent said they were able to successfully adapt to the situation and provide a service successfully and that feeling makes them happy and contented that they did a good job. Some said that they could develop new skills and upgrade themselves to fit them into the newly created situation. Some respondents said as it was the best that was possible during the pandemic, while some others said they were feeling very tired spending many sleepless nights preparing for the sessions.

Use of Modern Technology in Online Teaching

When asked about new technology that was being used in online teaching, all the respondents mentioned that they used only the commonly used platforms for online teaching.

Did the Employer/Family Supported Them on Online Teaching?

Commenting on the support from the employer, a few said that they didn't get any support from the employer, but the majority said that they were provided with software licenses, training workshops, experience sharing sessions among lecturers, help desk facility, rooms with special facilities, supporting staff, released rules and regulations on lecture time schedules, and the place.

About 65% of the respondents said they received good support from their families, for example, some said family member let them spend time confined to their computers, some said family members did help their kids, some were released from house work, some said home people adjusted their schedules to fit the lecture schedules, and they also said it was a good chance for family members to understand

the nature of their job. The balance 35% said they receive no special support except for being quiet and maintaining silence during lectures.

Was Online Teaching Successful?

When evaluating the successfulness of online teaching, almost every respondent said that it is successful but less than 100%. However, they thought as online teaching helped reaching the students during the pandemic, and as a result they were prevented from idling, motivated towards learning and by doing that they could complete the syllabus therefore students enabling students graduating without a delay. However, most pointed out the teacher is not able to make sure that the student really participated in the lecture, due to many reasons such as availability of computer/smartphone and internet facilities and the ability of the student to grasp what is being taught. Due to these constraints, majority of our respondents didn't want to believe that online teaching was 100% successful. Those respondents who were into social sciences said it was convenient and effective, they felt that they were 100% successful, and they expressed their willingness to continue online even after the pandemic.

Advantages and Disadvantages of Online Teaching

Discussing about advantages of online teaching, respondents put forward many points. Being able to reach the students during the pandemic was mentioned by many respondents. The flexibility in time and place at which one does the lecture was the next most popular advantage mentioned by them. The third was the ability to record the online session; thus, the student can listen to it many times to understand the facts clearly. It was the best way to stay safely at home and protect their jobs was the fourth important advantage pointed out by the respondents. Fifth was that all students get the same opportunity to sit in front; some respondents said it is like all the students are sitting in the front row. Sixth was the facilities enabled by online teaching such as automatic attendance check and the duration of participation of student. The seventh in importance was the time saving of the teacher as they do not have to travel to university and instead that time can be used in preparing for the class. Eighth was the opportunity to use modern technology; the training received by the respondents as well as students was considered valuable. Especially the respondents who were language teachers mentioned that it was exciting because they could learn and develop new skills in them related to proper use of information and communications technology in teaching. The possibility of using online teaching successfully even after the pandemic was cited as the ninth advantage.

Among the disadvantages, the most cited disadvantage was the poor interaction between teacher and student, and there is no exact way of making sure that every student could understand the lesson. All students may not have the required devices

and internet connection to follow a lesson uninterrupted was the second important disadvantage pointed out by the respondents. Isolation of both teacher and student was also considered as disadvantageous.

Strategies to Enhance the Quality of Online Teaching

In addition to the advantages and disadvantages that were identified from the survey, respondents have given many suggestions that can be implemented (or they have already implemented) to improve the quality of online teaching during the pandemic.

- Universities/faculties/departments may conduct a survey assessing the accessibility of online lessons by students and then plan the best mode of time and delivery and make the recordings available so those students can have access offline too. (Some respondents said that their employers did it.)
- Handpick the students who are unable to afford a laptop/smartphone and try to provide those with the support of third parties.
- Conduct training sessions for teachers as well as students on online mode of teaching.
- Some respondents mentioned correspondence courses as an alternative (although slow).
- If students can be provided with laptops and internet, almost all the disadvantages will be cleared. (Introduce a loan scheme to purchase required material for online sessions.)
- Some respondents recommended sending hard copies of teaching material by post accepting the fact that they did it.
- Provide online student counselling to students who needed support.

Conclusion

Although respondents were complaining about many aspects of online teaching, all of them seemed to be satisfied with the fact that they could communicate with the students and impart knowledge amidst the pandemic which confined everyone's lives to their homes. Respondents commented positively on the opportunity to work even if it was online which helped protect their jobs and the monthly remuneration. If not for the decision to go online in teaching, many of them would have lost their jobs.

The pandemic has made a huge change in the teaching and learning process implemented by the higher education institutions. The strict timetables were to be relaxed. There are less rules and regulations on the time, place, and duration of lectures. There is no strict rule on compulsory attendance to classes by students. There are no hands-on experience in laboratory sessions, no projects, no activities, and no workshops, but the learning process was confined to what can be done via a

computer. The respondents believed that it will also influence the evaluation process at the end of the course.

Surprisingly, we did not observe any significant difference in the attitudes toward online teaching based on countries except for the fact that few of the respondents have been engaging in online teaching even before the pandemic. Regardless of the Asian country in which the respondent was employed, their problems, perceptions, and attitudes on online teaching seemed to be similar.

Majority of the respondents in the sample had received a training in online teaching before starting the online sessions. All the respondents mentioned that they were very enthusiastic about teaching online and although some have had problems in adapting to the new platform at the beginning, they were able to adjust themselves to the new system fast. Some highlighted the advantages like the ability to record and edit the lesson. Almost all the respondents said that they missed seeing students face to face.

All in all, everyone seemed to be very enthusiastic about the online teaching experience, and the positive point is that they are prepared even to continue online teaching under the normal conditions too. University authorities may use this as a strength in enhancing the quality of the teaching/learning process of their programs.

Abstract

The Covid-19 pandemic is a grim reminder of the fact that human society lives on the brink of disasters. Every year, disasters of various forms, magnitudes, and types affect millions of people around the world. Disasters, whether man-made or natural, represent a major threat to human security and development. Given the enormous effect and consequences of disasters on human society, the international community has implemented a number of efforts, starting with the Yokohama Strategy for a Safer World (1994) and continuing with the current Sendai Framework (Sendai, 2015–30). An important component of these initiatives is to encourage and engage the local communities in disaster risk reduction measures. Drawing on the experiences from Darjeeling hills in India, the chapter identifies the lacunae manifest in the formal institutional arrangements for disaster management, and highlights the potential of informal institutions such as *Samaj* in addressing disaster risk reduction concerns.

Introduction

The Covid-19 pandemic has affected almost every aspect of society, viz., health-care, transportation, education, and economy, among others. The enormous hardship experienced by the people in the wake of Covid-19 pandemic has only a few parallels, if any, in the history of human civilization. However, despite its enormity and impact, the Covid-19 pandemic is only the tip of the seemingly gigantic iceberg. Every year, millions of people around the world are affected by disasters of different kinds, types, and magnitudes. Besides causing massive economic loss, it is estimated that in a span of 20 years – between 2000 and 2019 – a close to a million people lost their lives to disasters caused by natural hazards (CRED, 2020). Whether man-made or natural, disasters pose serious challenges to human security and development goals. In order to counter the challenges emanating from disasters, the international community has committed itself to a series of initiatives. Among others, the Yokohama Strategy and Plan of Action for a Safer World (1994), the Hyogo Framework for Action (2005–2015) and the Sendai Framework for Disaster Risk Reduction (2015–2030) constitute important policy landmarks to build a safer and disaster-resilient society. An important component of these efforts is to encourage and engage local communities in disaster risk reduction measures. The Hyogo Framework, for instance, stresses on the need to reorganize the disaster management system by building a people-centric institution at the grassroots that is anchored around disaster risk reduction. The Sendai Framework, similarly, calls for strengthening of the disaster risk governance by empowering local communities and institutions, and entrusting them with decision-making responsibilities. Drawing on the experiences of disaster management in Darjeeling hills in India, including its recent encounter and response to the Covid-19 pandemic, this chapter identifies the lacunae manifest in the formal institutional arrangements, and highlights the potential of informal, community-based organizations such as *Samaj* in addressing disaster risk reduction concerns. In doing so, the chapter seeks to unravel how informal institutions – such as *Samaj* – that are embedded in the social system of a community can address the shortcomings of the formal institutions, and thereby help to build an effective disaster risk reduction regime.

Formal Institutional Arrangement of Disaster Management in Darjeeling Hills

The growing realization that disasters adversely affect human security and development goals has led to a systemic shift in our thinking and approach toward disaster management – there is, hence, a growing thrust on moving from reactive,

relief-based mechanisms to seemingly proactive and mitigation-based measures to prevent and lessen the impacts of disasters. The changed stance is also reflected in India's National Disaster Management Act which was passed in 2005 (Act, hereafter). Besides adopting a holistic perspective of disasters as "arising from natural or manmade causes" (GoI, 2009), the Act envisages the setting up of an institutional structure to deal with hazards and anthropogenic events. Accordingly, the Act established a three-tier disaster management system for the country. At the national level, the National Disaster Management Authority was created and mandated to lead and steer the overall disaster management system. However, given the geographical vastness and diversity of the country and the constraints on the national government – such as limited human resources, logistical challenges and time limitations – the state governments were encouraged to play a proactive role in addressing the concerns related to disasters and their management. Consequently, the Act empowered the state governments to establish State Disaster Management Authority that would coordinate disaster management activities for their respective states. Similarly, the District Disaster Management Authority was proposed to make plans and policies for the districts.

In consonance with the Act, the Government of West Bengal established a Department of Disaster Management and Civil Defense that, among others, seeks to strengthen the disaster management system of the state by delineating the roles and responsibilities of various governmental agencies and departments, and facilitating coordination among them. Darjeeling, the northernmost district of the state of West Bengal, constitutes an integral part and parcel of the Eastern Himalayas, and is acknowledged as a biodiversity hotspot. Famous for its teas and toy train, the place is, however, conspicuous by the high prevalence of disaster risk. A glance at the historical records reveals that the place has been plagued by frequent occurrences of landslides and earthquakes that, over the period of time, have severely undermined the development trajectory of the region. Administratively, the district is divided into four sub-divisions – namely, Darjeeling, Kurseong, Mirik, and Siliguri – and is governed through District Magistrate Office, Municipalities, and Sub-divisional and Block Development Offices. Before its conversion into a district in 2017, Kalimpong was a part of the Darjeeling district, constituting one of its sub-divisions. Of the four sub-divisions within Darjeeling district, Darjeeling, Kurseong, and Mirik are marked by rugged mountain terrains, while the Siliguri is composed of the plain areas. The three hill sub-divisions, along with Kalimpong district, are characterized by a distinct topography, climatic conditions, and population vis-à-vis the rest of the state. In terms of natural hazards, landslides and earthquakes, as noted above, are the most recurrent feature in Kalimpong and hill sub-divisions of Darjeeling that results in loss of lives and property, and greatly paralyses the social and economic system of the hill communities. The Ambootay landslide (1968) in Kurseong, regarded as the biggest landslide in Asia, for instance, disrupted the lives and livelihoods of the people for years, and compelled the disaster-affected families to resettle elsewhere (GoI, 2009). The "Aila" cyclone (2009) and the landslides in the monsoon of 2015, similarly, resulted in massive loss of lives and property, and displaced several families in different places of Darjeeling hills, including Kalimpong.

In order to address the threats and risks of landslides and earthquakes, the Darjeeling District Disaster Management Authority (hereafter, DDDMA) has been appointed as the nodal agency to plan, implement, and coordinate activities related to their management. The DDDMA is led by the District Magistrate who is assisted by other functionaries – such as Chairman of the municipalities and Disaster Management Officers at various levels of administration – in discharge of his responsibilities (GoWB, 2020). Given the vulnerability of Darjeeling hills to landslides and earthquakes along with the imperative need to safeguard the lives and livelihoods of the communities, the DDDMA has adopted a range of disaster risk reduction measures – among others, the building bye-laws, disaster management and development plans, and capacity building constitute important governmental interventions to strengthen the disaster management system (GoWB, 2020). The building bye-laws are important regulatory tools to ensure safe housing in the seismically-fragile landscape of Darjeeling hills that could prevent the risk of earthquakes and landslides, or reduce and lessen the magnitude of harm in case of their occurrence. The Disaster Management Plan, including Development Plan, seeks to encourage the culture of disaster preparedness by mainstreaming disaster management concerns into development practices. The overarching goal of Disaster Management Plan and Development Plan is to develop Darjeeling into a disaster-resilient region where various development projects are oriented toward reducing disaster risks of the communities. Besides, the DDDMA undertakes capacity building of the government personnel and local communities through such measures as training, mock drills, awareness generation and sensitization programs about landslides and earthquakes and their management.

A review of the above measures suggests that DDDMA apparently possesses the required framework to address disaster risk concerns – the building bye-laws, Disaster Management and Development Plans, and capacity building efforts, among others, can facilitate the process of building a robust risk reduction regime that will pave the way for a disaster-resilient society in Darjeeling hills. However, despite the presence of such enabling structures and institutions, the communities have remained susceptible to landslides, enduring greater damages and loss of lives and property in subsequent events of landslides. The land-use pattern, population growth, urbanization, and environmental planning, among others, negate the potentiality of existing mechanisms to reduce landslide risks and losses in Darjeeling hills.

A more serious lacuna that undermines governmental efforts to strengthen disaster risk reduction initiatives, however, emanates from its seemingly technical and managerial approach to disaster risk reduction. The governmental apparatus for disaster planning and management, as noted above, is imbued with a top-down, bureaucratic structure that provides very little in terms of engagement and participation of the local communities. The failure to engage the local communities in the disaster management system has had twofold effects. First, it prevents the sharing of information and indigenous knowledge that communities may possess about their built environment (which may be critical for understanding, preventing and responding to landslides). The exclusion of such vital inputs implies that the hazard

and vulnerability assessment, which remains at the heart of disaster risk reduction project, largely remains an incomplete and fruitless exercise.

Second, a lack of engagement with the community often results in ignoring and overlooking their needs and capacities. This is perhaps best illustrated by the fact that the West Bengal government sent life jackets and *dhoti* – a traditional garment worn largely by the people in plains – as relief provisions in the aftermath of landslides in 1968 (Pradhan, 2010). Furthermore, the absence of community from decision-making structures has crippled governmental interventions to evolve a disaster management system that caters to the needs of the people. The apparent failure of DDDMA to lessen landslide risks and disaster losses has encouraged the communities to look inwards and fall back on their traditional institutions of governance. In this regard, *Samaj* has assumed a central place, acting not only as one of the first responders in the events of landslides but more importantly in helping and assisting the communities in rebuilding their lives.

Samaj

Samaj is a traditional, self-organized, community-based organization that features local governance in Darjeeling. The *Samaj* operates at the grassroots level and functions with the participation of households. The member households can subscribe to the *Samaj* membership on payment of nominal fees. Although the subscription remains open to all, the individuals or households within a certain geographical boundary usually take the membership. The *Samaj* selects functionaries such as the president, vice president, general secretary and treasurer, from among its members, and are responsible for managing the affairs of the *Samaj*. Though these portfolios are conventionally held by the elder members of the community, there are recent instances of young members taking these positions. The *Samaj* holds regular meetings to discuss and deliberate over issues and concerns that are of common concern such as access to water, sanitation, and waste management, among others. While the participation in meetings is voluntary, the member households are encouraged to participate in deliberations. The *Samaj* also extends financial and logistic support to member families during weddings, funerals and other such ceremonies. Besides, *Samaj* also acts as a conflict resolution body in such cases as disputes between households or intra-family feuds, although it does not intervene in formal judicial matters concerning its members. The role, support and assistance rendered by *Samaj* create a strong sense of solidarity among the households who view *Samaj* as their support-base and a partner in their social life.

Given its role and overwhelming presence in the lives of the people, *Samaj* has become an integral part of the local governance structure in Darjeeling hills. The agencies engaged in social and welfare services, particularly Non-Governmental Organizations (NGOs, hereafter), often collaborate with *Samaj* in the administration of their programs, especially community-based, such as tree plantation, awareness generation, capacity building, and so on. As *Samaj* has better outreach and understanding of the locality, and the needs and constraints of its members, it possesses the

capacity to address the concerns and challenges of the community. Given such a position, *Samaj* has proven to be both cost- and time-effective institution of governance. While *Samaj* has emerged as a trusted conduit between people and agencies, particularly during rescue and relief interventions but also in disaster preparedness, it has become an important aspect of the disaster management system of Darjeeling hills.

Samaj and Its Role in Disaster Management

Samaj occupies an important place in disaster governance of Darjeeling hills, playing an active role in various phases of disaster management cycle. In the aftermath of landslides, *Samaj* is the first responder to help and assist disaster-affected families. As households are usually the members of one or the other *Samaj*, it becomes imperative for *Samaj* to render its assistance in times of crises such as landslides. Depending on the magnitude of disasters and the necessity of its action, the *Samaj* engage in various search and rescue interventions, along with government agencies such as National Disaster Response Force (NDRF). In fact, in the absence of external support, including the government, and in the urgency to save lives, *Samaj* becomes a forerunner in search and rescue efforts. The imperative role of the *Samaj* reflects in the spontaneity of its action in response to any disaster event – they are prompt in rescuing the victims and providing them with immediate relief provisions in form of food, shelter, and medicine. In the aftermath of rain-triggered landslides in 2009 and 2015, *Samaj* emerged as a lifesaver on several instances in Darjeeling, Mirik, and Kalimpong, rescuing people from the debris of shattered houses and mudslides, and assisting NDRF in the search and recovery of dead bodies later on (Indian Express [July 2, 2015] reported that around 38 people lost their lives dead, while 23 people went missing across Darjeeling hills, including Kalimpong, during 2015 landslides.).

As the immediate deployment of government rescue teams, including NDRF, is constrained by time limitations and their availability, the members of *Samaj* proactively participate in rescue missions, providing first-aid and arranging support for individuals with special needs such as old-age people and pregnant women. The information possessed and shared by *Samaj* regarding landslides-affected places plays a vital role in saving the lives of the people as the (rescue) logistics of the government are based on them. In cases where the *Samaj* lacks resources and capacity to effectively organize rescue interventions, their counterparts from nearby localities contribute and assist in their efforts. In the far-flung villages of Kalimpong such as Lingsaykha, Todey, and Tangta, the *Samaj*, during the 2015 landslides, also arranged shelter for disaster-affected families until alternative arrangements were made by the government. As several families lost their homes and savings, *Samaj*, in collaboration with other organizations, organized community kitchens to provide food and other necessities. The overarching role played by *Samaj* in the aftermath of landslides has turned it into a major relief provider, and an indispensable partner in rescue interventions.

Samaj's role, however, is not only limited to rescuing and providing relief provisions to disaster-affected families. There are several instances of *Samaj* assisting and rehabilitating their members. While housing reconstruction is funded from the government exchequer, there is an apparent delay in disbursement of funds owing to red-tapism and a cumbersome process of funding that is based on identification of the beneficiaries, scrutiny of their claims, inspection of housing sites, authentication, and so on. *Samaj*, in such cases, often intervene on behalf of their members to ensure the timely release of housing funds, thereby helping them to negotiate an apparently complex process of housing reconstruction. Besides, as the funds provided by the government are often insufficient for housing construction, *Samaj* also provide monetary assistance to those in need through voluntary contributions from other members. The *Samaj*, furthermore, assist the households during the housing construction process by offering their labor, logistics, and resources (for example, woods and stones). Such assistance provided by *Samaj* constitutes an important component of rehabilitation interventions that has become a benchmark for other organizations, including the government.

While *Samaj's* role during rescue and rehabilitation interventions becomes paramount, it plays an equally important role during other times, acting as a facilitator and supporting the disaster preparedness efforts of the government and NGOs. In this regard, *Samaj* acts as a bridge between the people and other agencies. The government agencies such as Civil Defense and NGOs working on disaster management collaborate with *Samaj* in conducting awareness and training programs. The *Samaj* helps in mobilizing and sensitizing the members about disaster risks and their role in addressing them. The members are also encouraged to participate in mock drills and training programs that promote and enhance disaster preparedness of the community. The *Samaj* coordinates with the DDDMA and encourages its members to volunteer for Civil Defense team that assists disaster-affected families in the aftermath of landslides and other disasters.

Apart from capacity building and disaster preparedness, *Samaj* assists NGOs in planning and executing various disaster risk reduction interventions that normally take the shape of Community Based Disaster Management (CBDM, hereafter) programs. As CBDM revolves around community, *Samaj*, as the representative of the community, plays a critical role in every phase of CBDM. First, as a repository of local information and knowledge, *Samaj* provides vital leads in Hazard, Risk and Vulnerability assessment (HRV, hereafter). The *Samaj* helps in identifying hazard-prone locations of a place along with the capacities and vulnerabilities of the households. Such assessments help the *Samaj* and NGOs to understand disaster risks and to plan and develop appropriate mitigation measures, including identifying shelter points and resources required during disasters. Second, the *Samaj* mobilizes its members to participate and contribute to CBDM. The members, through awareness programs, are sensitized about various disaster risks, and their role in mitigating and preventing them. The household members are encouraged to participate in meetings and deliberations that are aimed at improving the prospects and efficacies of CBDM. A visible outcome of such meetings is behavioral change among the participants who recognize the importance of disaster preparedness and disaster risk

reduction measures in mitigating landslides. Third, *Samaj* trains its members with such necessary skills as first-aid, search and rescue, and so on, and motivates them to join the disaster management team that would work during crises. Such measures help the *Samaj* to enhance the capacity of its members to respond, cope and deal with landslides when they occur. Fourth, *Samaj* provides critical inputs in the evaluation and assessments of CBDM. As *Samaj* possess insights and experience about the working of CBDM, it helps in divulging the challenges and lacunae of CBDM and the ways to improve it.

Samaj and Covid-19 Pandemic

The Covid-19 pandemic has proven to be a devastating phenomenon, having massive ramifications in India, including the Darjeeling Himalayan Region. Across the country, the epidemic prompted a wide range of reactions, the bulk of which were characterized by underlying anxiety, isolation, and discrimination against those who tested positive for the Corona virus. Individuals and families were, either directly or otherwise, cut off from the traditional social structure, leaving them to fend for themselves in the fear of contracting the Corona virus. In many cases, the affected families were seen to be left with a sense of abandonment under such circumstances. Following the outbreak, the call for vigilance and caution took on a new shape, resulting in several incidents of violence, discrimination, and stigmatization.

Darjeeling hills, however, witnessed a different stance toward the Covid-19 patients and those under precautionary quarantine. A unique approach to the handling of the crisis came afloat under the aegis of *Samaj*, who worked zealously to fill in the gaps in crisis management that arose due to the inability and inefficiency of the formal institutions of governance in functioning effectively at the grass-root levels, given the degree of crises that prevailed. The *Samaj*, under such circumstances, acted as an informal agency for vigilance and management of the Covid-19 pandemic. The *Samaj* across Darjeeling hills assumed responsibility of their respective areas and laid a foundation for preparedness, management and prevention of the pandemic. The role of the *Samaj* became indispensable in disseminating information, spreading awareness, sensitizing community and administering (Covid-19) protocols – such as physical distancing, use of face masks, hand washing or sanitizing, among others – at the local level.

The makeshift quarantine centers with provisions of separate toilets and bathrooms that were constructed by the *Samaj* for isolation and quarantine of the suspected cases of Covid-19 infection or those travelling from other places, stands to be a prominent feature of disaster response in the Darjeeling hills during the Covid-19 period. Those suspected of the viral infection were encouraged to undergo Covid-19 test by the members of the *Samaj*. Besides, the *Samaj* acted as a medium to sensitize people about the importance of observing the Covid-19 protocols and worked effectively to ensure their enforcement at the grassroots level.

During the escalation of Covid-19 crisis, when the households, particularly in the rural regions, were socially ostracized and left to fend for themselves, the villages

displayed a unique resolution and an exemplary case of crisis management under the leadership of *Samaj*. A prime example of such effort came forth from Kothidhura, a village located in the Phuguri region of Mirik – a basic model of operation that was adopted and followed by other Samaj across Darjeeling hills. Kothidhura had gone to raise concerns when 30 villagers tested positive for Corona virus. Contrary to the prevailing practice of isolating the Covid-19 infected people and subjecting them to a different behavior, the *Samaj*, stood by them and supported them all through their hardship of pandemic. Instead of panicking and abandoning the infected households and individuals, the *Samaj* encouraged the people come to together and respond sensibly.

After a series of meeting with the members, the *Samaj* decided that the Covid-19 infected individuals would be quarantined at their respective houses instead of sending them off to government quarantine centers which normally was the practice. In order to contain the spread of Corona virus, the *Samaj* urged its members to observe a strict lockdown throughout the village, thereby reducing physical interaction significantly. All the necessary items, including groceries, medicines and water, were provided at the doorsteps of the affected individuals by the members of the *Samaj*. The senior members, with the help of the youths, conducted sanitation drives through the village, while also monitoring the health and requirements of the infected people on a daily basis.

The *Samaj* collaborated with Health Department of the government to conduct testing and vaccination programs within the premises of the village, thereby controlling the interaction and movement of the people to nearby towns such as Mirik which had witnessed a sharp rise in Covid-19 cases. The *Samaj*, with the help of health department staff, also provided counselling about the treatment, sanitation, and hygiene requirements to the members and the affected individuals. In the absence of *Samaj*, it would have been difficult, if not impossible, for the government to organize such programs on account of lack of human resource and limited outreach in the grassroots. While being in isolation through the infection, the *Samaj* ensured that the Covid-19 infected households and individuals were supported in all respects for which a collective fund was started to provide necessary provisions, including medicines and grocery.

The *Samaj* sought to spread awareness about the Covid19 pandemic by encouraging symptomatic individuals to test for the Corona virus instead of concealing or suppressing the symptoms. Such an approach proved immensely effective in curbing the spread of the infections in the locality. Despite the fact that the government recommended stringent standards for Covid-19 proper behavior – with lockout and other “social” distancing measures in place – it would not have been possible to implement them uniformly, particularly in remote regions, due to a shortage of volunteers and staff. The *Samaj*’s grassroots presence and the villagers’ faith in it guaranteed that government rules and regulations on the Covid-19 pandemic were followed without fail, thus aiding in the containment of the Corona virus. Community competency is frequently cited as one of the most critical characteristics and aspects of disaster resilience. The *Samaj*’s prompt response and deployment of

resources not only prevented the Corona virus from spreading, but also assisted in the treatment of Covid-19 affected persons.

Conclusion

The *Samaj* works as a catalyst for disaster risk reduction in Darjeeling hills. Apart from its role in rescue and relief interventions, which constitutes one of its most notable contributions in the immediate aftermath of landslides, the *Samaj*, in partnership with government agencies and NGOs, is engaged in disaster preparedness and mitigation efforts through such measures as hazard and vulnerability assessment, sensitization, and awareness generation and capacity building, among others. In the aftermath of Covid-19 pandemic, *Samaj* emerged as an effective mechanism to address the crisis and played an important role in its containment. In the absence of governmental machinery, particularly in remote places where accessibility is difficult and challenging, *Samaj* led the crisis management, saving the lives of the people by extending medical care and support, and by invoking Covid-appropriate behavior. The *Samaj* also complimented the government's effort by supporting and volunteering during vaccination and awareness generation drives.

Despite the fact that they play such crucial roles in disaster management landscape of Darjeeling hills, *Samaj*'s potential, however, largely remains untapped. First, as *Samaj* is a self-organized and self-sustaining institution with majority of its members coming from economically poor backgrounds, the *Samaj* lacks necessary resources - finance, disaster-combating equipment and materials, and contingency plans - to engage in long-term disaster preparedness. In the absence of external support, *Samaj*'s capacity to engage in disaster management activities, including rescue and relief missions and disaster risk reduction, is severely constrained. Second, the formal governance structure around disaster management, laden with top-down framework, provides little scope to *Samaj*, if any, to effectively intervene in disaster risk reduction efforts. The *Samaj*, at best, plays supportive role in capacity building programs, with no voice or participation in the decision-making processes on disaster management. Such exclusion of *Samaj* not only undermines the growth of appropriate institutional structure for crisis management but also deny an able and efficient partner to the government and NGOs. Third, the growing trends of urbanization, modern lifestyle, and erosion of social values, among others, often challenge and undermine the existence and relevance of traditional institution of *Samaj*. There are numerous evidences of households withdrawing from *Samaj*'s membership because they do not consider it as an essential aspect of their social life anymore, with its role seen largely in terms of assistance during social ceremonies. Such attitudinal changes often discourage *Samaj* to participate in societal matters, including disaster management.

To revitalize the institution of *Samaj* and maximize its potential, it is critical to reconfigure the existing institutional arrangement – from top-down intervention to bottom-up initiative – by making *Samaj* an equal partner in the disaster management system of Darjeeling hills. In order to ensure and sustain its participation in the

decision-making bodies on landslides management, *Samaj*'s role must be formalized and clearly defined. As capacity building and disaster preparedness of the community depend upon *Samaj*, the government must explore ways to assist them through provisions of financial support, information- and knowledge-sharing, and organizing training programs. The government should also encourage *Samaj* to play a proactive role in disaster mitigation measures by motivating and supporting their disaster risk reduction activities. Such stances of the government could go a long way in realizing the dream of a disaster resilient society.

Abstract

In articles 29 and 30(d) of the Sendai Framework for Disaster Risk Reduction 2015–2030, cultural resilience is listed, alongside of economic, social, and health resilience, as one of the factors necessary for disaster risk prevention and reduction (UN General Assembly). However, heritage workers generally lack a theoretical understanding of resilience, and there is a dearth of case studies providing objective evidence and examples of good practice in this field.

This chapter argues that an interdisciplinary approach to resilience enables heritage workers to reframe heritage in the larger framework of disaster risk prevention and promoting resilience. It provides an outline of three key terms which form the theoretical basis for this reframing and argues that undesignated heritage recording people’s daily lives (“small heritage”) can play a powerful role in building resilience. It next introduces three case studies from the Japanese triple disaster of 2011 to demonstrate how “small heritage” can promote resilience. The first two examples are cases of psychologists collaborating with

historians to provide an appraisal of the psychosocial effects of salvaging “small heritage.” This project not only yields objective evidence that preserving “small heritage” can provide a powerful form of psychosocial support, but it also demonstrates that interdisciplinary collaboration can yield results beyond those possible by either historians or psychologists acting alone. The third case is an example of how the administration of a town affected by the nuclear reactor accident in Fukushima is using salvaging “small heritage” to help the town survive as a community in the face of total evacuation, dispersal of its residents, and discriminatory backlash.

Preserving cultural heritage · Psychosocial support · Disaster psychology · Resilience · Social capital · Great East Japan Earthquake · Fukushima disaster

Introduction

Can it be demonstrated that preserving cultural heritage provides an effective form of psychosocial support for individuals and communities after a disaster?

In the “Sendai Framework for Disaster Risk Reduction 2015–2030,” cultural heritage was elevated from being a passive factor to be protected to the status of forming an important component of the complicated process of promoting disaster reduction and social resilience (UN General Assembly paragraphs 5, 29).

The booklet *First Aid to Cultural Heritage in Times of Crisis* published by the International Centre for the Study of the Preservation and Restoration of Cultural Property (Tandon, 2018) made an important contribution to implementing this new emphasis on the significance of cultural heritage. It lays out a systematic framework for salvaging cultural heritage at risk, incorporating the 2007 *IASC Guidelines on Mental Health and Psychosocial Support in Emergency Settings* and subsequent World Health Organization (WHO) *Psychological First Aid: A Guide for Field Workers* (WHO, 2011), which form an important part of the theoretical basis for the Sendai Framework. However, despite the prominence assigned to culture/heritage in the Sendai Framework, the reality is that there is an overwhelming lack of understanding among national and international disaster management planners on how cultural heritage can contribute to the realities of promoting resilience, saving lives, and ensuring effective recovery.

To bridge this gap in communication, cultural preservation specialists need to learn from and cooperate with other disciplines in order to explain and demonstrate the effectiveness of heritage preservation in providing psychosocial support for disaster survivors. This chapter introduces two data-informed theoretical frameworks which help explain why salvaging cultural heritage is important and draw attention to the potential of overlooked forms of heritage. It then provides three examples from after the triple disaster of 2011 in northeastern Japan as case studies of novel but effective approaches to applying these theoretical models in practice and

to highlight the need for an interdisciplinary approach to heritage preservation as psychosocial support.

Key Terms: Psychosocial Support, Resilience, and Heritage Preservation

In an emergency, for the majority of people, receiving timely humanitarian aid and regaining or building new social connections are in itself the most effective forms of psychological support. This recognition of the interconnectivity of psychological and social well-being is expressed in the term “psychosocial support.” Providing timely and appropriate aid to support people’s basic needs (food, water, shelter, safety) and paying attention to people’s social connections form the basis of improving people’s resilience and thus expediting the recovery process. Psychosocial support is directed at a wide range of people and is not something separate from other forms of aid. It is most effective when it is imbedded in the overall aid process or in people’s daily routines. If aid workers, including heritage workers, review their work and consciously incorporate the principles of psychosocial support, then any form of aid can actively contribute to promoting the overall well-being of disaster areas. Conversely, aid conducted in ignorance of these principles can cause psychological harm and impede or damage resilience (IASC, WHO, International Centre for the Study of the Preservation and Restoration of Cultural Property).

Resilience is not a trait, nor is it an innate ability. In psychology, resilience is defined in terms of interlocking systems. In this definition, people exhibit resilience when they succeed in adapting to disturbances in their environment which threaten their stability or well-being. Whether any person succeeds or otherwise in adapting depends on the various systems within which she/he is imbedded, including social networks, or the lack thereof (Masten, 2014).

Moving to the level of community resilience, social science also points to the primacy of social networks in the form of social capital. In his analysis of building disaster resilience, Aldrich defines social capital as “the resources available through bonding, bridging and linking social networks along with the norms and information transmitted through those connections” (Aldrich, 2012, p. 33). Bonding social capital is the kind of horizontal link between people who are similar to each other and are typically joined together as friends or by kinship (family) or geographical proximity (neighbors). Bridging social capital links horizontally different groups, sometimes crossing borders such as ethnicity, race, or religion, to bring in assets lacking in one’s own group. Linking social capital joins together vertically different groups working for a common goal across a social, economic, or political/administrative gradient between the groups (*ibid.*, pp. 31–33). Aldrich uses a robust analysis of data from four historical disasters to demonstrate that a balanced mix of these three kinds of networks (social capital) was the primary driving force behind the recovery in communities which achieved an effective recovery, while communities which lacked a well-balanced mix of social capital struggled to recover.

The process of salvaging and preserving heritage often activates existing or generates new social networks. Understanding the multilayered nature of these networks and social capital enables heritage workers to identify the underlying mechanisms embedded in the salvage process which can serve to promote people's resilience and therefore to explain how this process interlocks with the overall disaster response. When viewed in the light of the amount and variety of social capital that is generated not only by cultural heritage but also by the process of salvaging cultural heritage, it becomes possible to explain to people with no experience nor understanding of the power of heritage to promote resilience how and why preserving cultural heritage can promote the psychosocial well-being of people exposed to disasters.

"Big" Heritage, "Small" Heritage: Which Is Important?

One of the first questions that face heritage specialists faced with a disaster is how should they distinguish between "heritage" and "debris/garbage" (Izumita, 2020). There is no single correct answer to this question. However, experience shows that heritage designated as such by UNESCO or a governmental body is not the only kind of heritage worth preserving. Items held in private hands recording the history of a locality or community may be more relevant to the task of supporting local people's memory and sense of identity than the "big" heritage more commonly associated with "preservation." The experience of Miyagi Shiryo Network (MSN) conducting salvage operations for collections of private documents at risk after the Great East Japan Earthquake of 2011 shows that if one focuses not only on the role "small" heritage can play in providing effective psychosocial support but also on the nature of this process, this kind of activity can produce resilience-building results at multiple levels in a disaster-affected region.

Salvaging "Small" Heritage and Psychosocial Support: The Case of Miyagi Prefecture

MSN is a volunteer NPO located in Miyagi Prefecture, northeastern Japan. Miyagi Prefecture suffered the heaviest tsunami damage both economically and in terms of loss of life in the disaster of 2011. The core membership is comprised mostly of academic historians, but MSN depends on the participation of citizen volunteers, local government, and other public bodies in order to function. By December of 2013, MSN had conducted 105 salvage operations in tsunami and earthquake-damaged areas of Miyagi Prefecture. Most of these operations were for collections of privately owned heritage (documents). Some 88 collections were removed into primary holding for cleaning and restoration work, mostly after being exposed to prolonged submersion in polluted seawater. The contents of the collections varied widely, covering areas such as local administration, commercial dealings, private letters, diaries, and other numerous records of many facets of the workings of local

society and the lives of private individuals and families within society. The contents of each collection can span time from several centuries ago up until the present day. In general, MSN salvaged what the family members themselves had set aside; photographs and other records of recent memories can be as powerful form of support as ancient documents (Satō, 2020).

Activating “Small” Heritage as Psychosocial Support

However, in order to make local “small” heritage function as a source of individual and community identity and resilience, it is necessary to use the contents of salvaged collections to reconstruct the history of a locality/community. Where feasible, MSN gave feedback to communities through publishing booklets and holding public symposiums and lecture series and also workshops to teach citizens how to read and understand their documents (Takahashi, 2020). However, important as this kind of activity is in its own right, the potential of salvaging “small” heritage to promote resilience can be extended even further beyond its immediate parameters by collaboration with other disciplines or simply by paying attention to the social significance of the salvage process itself.

Activating “Small” Heritage: Collaboration with Psychologists

Members of MSN are collaborating in an ongoing project with a team of three clinical psychologists (PT) led by Kamiyama to appraise the historians’ work as a form of psychosocial support. The first step in this process was an appraisal of the effects/effectiveness of MSN’s salvage activities for owners of collections of heritage. A key aspect of this appraisal was that it also served as a nonintrusive form of psychological therapy for the owners, so that the appraisal process itself acted as a reinforcement of the psychosocial value of MSN’s activities. An outline of the appraisal process is as follows.

Method. PT conducted a series of semi-structured individual interviews with people owning collections of historical heritage salvaged by MSN. PT interviewed 21 subjects, 20 of whom were over 60 years old, and 3 were females. Twenty of the subjects were the heads of families with lineages dating back 100 to 500 years. Of the subjects, 11 had suffered total damage to their homes and 10 partial damage. MSN had contacted and conducted salvage operations for all the subjects who had suffered total damage of their houses within 1 year after the disaster, whereas MSN was able to reach only four of the subjects who had suffered only partial damage to their home within 1 year, and the remaining six had to wait for over a year before MSN was able to reach them.

Each subject was interviewed three times, generally spaced over a period of about 3 weeks. The interviews used personal attitude construct (PAC) analysis to analyze each subject’s attitudes toward their historical heritage and self-identity (PAC Analysis Society). The first interview was a familiarizing session where the PT explained

the purpose and outline of the study and asked whether the subject would agree to participating in the study. At this stage, three potential subjects declined for personal reasons, and the interviews proceeded no further. When the subject agreed to participate in the study, PT elicited free description of the subject's recollections of the MSN salvage experience. In the second interview, the PT presented the stimulus sentence "What words, ideas, images come to mind when you remember your experiences with MSN?" to elicit free word association from the subject. The subject wrote her/his choice of associated words each on a card. The PT entered the associated words into a random sorting program on a computer which was used to present the subject with a random pairing of all the possible combinations of the words chosen. PT asked each subject to scale the distance between each pair of words presented by the computer on a distance matrix of 7 points and to give each word a valency of positive, negative, or neutral. Before the third interview, the subject's assessment data for each associated word was entered into SPSS software using Ward's method to produce cluster groupings of the associated words as dendrograms. In the third interview, the subject was presented with the cluster dendrograms produced by the SPSS software and asked to assess the validity of the computer grouping and to revise and regroup the clusters as she/he thought appropriate. The subject was then asked to explain their rationale for their regrouping of the clusters and to give a name or title to each cluster grouping that they produced and what she/he feels on looking at the clusters and cluster groupings. To conclude the session, Kamiyama then gave the subject a supportive interpretation of the meaning of the subject's cluster groupings and answers.

Results. The responses given by the subjects can be subsumed into the following eight groupings: (i) positive impressions expressed in the associated words, (ii) feelings of gratitude to MSN, (iii) dissatisfaction with MSN, (iv) a recognition of their place in the family line/history, (v) pride in one's ancestors, (vi) passing on the family history to the next generation, (vii) a sense of devastation and loss, and (viii) disposing of garbage/cleanup. Subjects' answers in each of these groupings showed differing tendencies according to the degree of damage suffered. Overall, respondents (group 1) who suffered total damage to their houses showed a strong tendency to give positive replies, while respondents who suffered only partial damage to their homes (group 2) tended to give more negative answers compared to group 1. The results for each grouping are as follows:

- (i) Over half the respondents in both groups showed mostly positive attitudes in their choice of associated words, but the ratio was higher in group 1 than 2.
- (ii) Most respondents in group 1 expressed gratitude to MSN in their answers, but less than half the respondents in group 2 expressed gratitude.
- (iii) No members of group 1 expressed any dissatisfaction with MSN, but a small number from group 2 openly expressed dissatisfaction.
- (iv) A high proportion of group 1 expressed a positive recognition of their place in carrying on their family's line and history; over half of group 2 also expressed this wish, but the proportion was lower than in group 1.

- (v) This tendency became much clearer in the next word grouping of expressing pride in one's ancestors; over half of group 1 expressed a sense of pride in their ancestors, whereas the ratio was very low in group 2.
- (vi) Similarly, just over half of the respondents in group 1 had taken action to pass on information about and a sense of pride in their family line/history to their grandchildren and other family members, whereas this ratio was markedly low in group 2.
- (vii) The sense of devastation and loss was lower than half in each group but was considerably higher in group 2 when compared to group 1. This was in stark contrast to the reality that the group 1 members had suffered greater loss to property, family, and community than the members of group 2.
- (viii) No members of group 1 made any mention to their inherited documents and other heritage as being "garbage" or an imposition: a small number of members of group 2 made such references explicitly.

Subjects whose homes were totally damaged tended to show more positive attitudes and expressed more explicit thanks toward the work of historians than subjects whose houses were only partially damaged. This group showed a stronger sense of pride in their heritage and positive engagement with their immediate family to pass on awareness of and pride in their heritage and tended to actively engage in using their historical heritage to help revitalize their communities. This difference was directly reflected in the subjects' social behavior after the disaster: over half of group 1 became active in local history study groups and similar activities after the disaster, whereas this proportion was markedly low in group 2. Historians were quicker to react to calls for help from families whose houses were totally destroyed than those where the damage was lower, and this time difference may account for the observed differences in attitudes of subjects in the two groups.

Despite the differences between group 1 and 2, except for a small number of subjects exhibiting extreme stress, the answers given by the majority of subjects demonstrate that their experiences with MSN were positive. When viewed as individual cases, many of the subjects had taken steps to pass on the psychosocial benefits of MSN's support to their family and community, and to pass on their heritage and the meaning bound up in this to future generations. The PT assessment demonstrates that the salvage and follow-up operations of MSN achieved more than just preserving heritage objects; combined these operations served as a form of psychosocial support helping disaster-affected people recover their identity and mental and physical well-being.

This example of heritage workers collaborating with psychologists is significant in two ways. Firstly, the appraisal by the psychologists provides an objective, external measure of the effectiveness of preserving "small" heritage in helping disaster survivors recover a healthy mental attitude after a disaster. This kind of external appraisal based on strict methodology is crucial in explaining the significance of heritage preservation. Secondly, the PAC analysis methodology used by the PT was designed to also serve as an unintrusive form of psychological support for the participants while evaluating their psychological well-being. Two examples

illustrate this significance. One subject who gave markedly negative replies throughout the interview process resumed participating in a local history study group after the interview process. Prior to the disaster, this subject had been very active in participating in preserving local history and making recommendations to local government on heritage policy matters but had withdrawn from all these activities after the disaster. This sudden change in behavior suggests that the interview process motivated the subject to overcome his/her withdrawal and seek active participation in the community again. The second case is the exceptional case of one subject who originally was expressing a death wish. During the evaluation process, this subject came to recover the will to live and to rebuild links to his/her community. In this case, MSN's heritage salvage activities alone were not sufficient support to help this subject recover; however, the basis laid by MSN became a foundation for the subject's recovery through the PT's interview process. The results of this pilot study demonstrate that there is further potential for salvaging heritage to promote the overall well-being of disaster survivors by integrating heritage salvage with other forms of psychosocial support. Conversely, this particular example of collaboration between historians and clinical psychologists also demonstrates that applying appropriate methodology from clinical psychology in collaboration with other psychosocial support efforts can enable psychologists to provide effective support to people who can benefit from such support but would be overlooked by conventional clinical approaches (Kamiyama et al., 2021).

Funding. The above research has been funded by JSPS KAKENHI Grant-in-Aid for Challenging Exploratory Research, grant number JP 19K21645 (research project leader D. Satō).

Activating “Small” Heritage: Building Wide-Ranging Social Capital

Another important aspect of salvaging and preserving “small” cultural heritage is that MSN's activities generally involve or generate complicated social networks. Independent of the restorative effects of preserving cultural heritage, these networks add to a community's pool of social capital and thereby increase its capacity to adapt to challenges or adversity, in other words, to exhibit resilience. Moreover, this social capital extends beyond the areas directly affected by the tsunami.

The task of cleaning, restoring, digitally recording, and cataloguing the collections MSN has in temporary keeping before returning them to their owners in the disaster-affected areas is still continuing 10 years after the tsunami. MSN relies on citizen volunteers, many of whom are retired, elderly people, to carry on this task. These volunteers live in the disaster hinterland; while they themselves suffered little direct damage from the tsunami, because of their proximity, they feel a strong psychological connection to the disaster areas. In interviews, these volunteers describe how their volunteer work enables them to find an active role in the process of supporting the disaster-affected communities and that volunteering serves as a form of support for themselves. In advanced industrial societies like Japan which

have a high proportion of people aged over 65 years old, finding ways for active elderly people, and other people not physically suited to working in disaster-affected areas, to volunteer in tasks such as restoring salvaged cultural heritage can provide a continuing form of psychosocial support for people who feel alienated from mainstream society in a post-disaster situation (Satō, pp. 5–6).

The PT's next project was to have an investigation and appraisal of the psychosocial effects for volunteers involved in preserving cultural heritage, but this project has been interrupted by the current Covid-19 pandemic.

Activating “Small” Heritage: A Town Confronts Diaspora and Negative Heritage

A different example of good practice involves a town’s government adopting the practice of salvaging and disseminating the contents of “small heritage” in order to maintain a sense of community and identity in the face of extreme adversity. The township of Tomioka, Fukushima Prefecture, lies 15 kilometers from the nuclear power plants which exploded in the disaster of 2011. The whole town suffered total evacuation, and residents were scattered in temporary housing, mostly in other cities in Fukushima Prefecture. As a result of this helter-skelter exodus, communities and even families were sundered. Refugees from Tomioka were exposed to discrimination in their new surroundings, and many became ashamed of their origins and hid their identity. As a means of combatting this crisis both for the town as an entity and for its individual members, the town adopted a policy of salvaging “small” heritage into its overall disaster recovery plan. Before the disaster, townspeople believed that their town’s history was totally nondescript and had nothing worth mentioning. Using the salvaged material, the town aims to objectify the town’s history and change its focus from famous people and events to relocate the negative heritage of the decision to accept nuclear plants in the larger history of the region’s struggle for economic survival, as a way of healing the psychosocial wounds of the nuclear accident and subsequent diaspora. Momma (2020), a key person in the town’s decision to undertake this project, provides a richly detailed personal narrative of the inception of this project and how salvaging “small” heritage and utilizing it through exhibitions to enable townspeople to see the complexity of their region’s history can be used to face up to the powerfully negative legacy of the nuclear disaster and help the scattered townspeople regain their bonds to their hometown and each other. Tomioka not only provides a textbook case model of how a town administration is using the process of recovering its history as psychosocial support for its members in the face of severe adversity; it also provides a model for how a community can use the process of objectifying its heritage to overcome the social schisms produced by the town’s recent history.

Conclusion

Preserving cultural heritage can help promote disaster resilience, but learning from the activities of historians collaborating with psychologists and local governmental bodies after the triple disaster in Japan in 2011, it is clear that not only heritage officially designated as such by a public authority but also the undesignated “small heritage” of personal documents and photographs, the records and ledgers recording the vicissitudes of local economy and business, records kept by local institutions such as religious or social organizations, and items which are too often disposed of as “garbage” in the cleanup after a disaster can be used to provide a powerful form of personal and community support. In many cases, salvaging this “small heritage” in itself can serve as a form of psychosocial support for disaster survivors, by restoring their links to their past and, thereby, to their futures (Erikson, 1950, 1959). However, the impact of preserving heritage can be amplified beyond the primary parameters of preserving heritage itself if the following measures for good practice are observed:

1. The potential of undesignated, privately owned “small heritage” for building individual and community resilience can be increased when its meaning and contents are made accessible to the affected communities by historians and other specialists analyzing and publicizing the contents of this heritage.
2. Salvaging “small heritage” usually involves direct face-to-face interaction with its owners or custodians. Heritage workers should familiarize themselves with the principles of good practice in humanitarian aid (especially as outlined in the WHO booklet) and incorporate these into their planning and practice in order to ensure that the heritage salvage process itself does not inadvertently cause psychosocial harm and, more positively, to maximize its benefits as a form of psychosocial aid for all actors involved in the aid process and to ensure the heritage aid process interconnects with other humanitarian aid to contribute to the overall recovery and rehabilitation process.
3. Heritage workers should understand the principles of psychological resilience and social capital and apply these to their planning and practice. The process of preserving “small heritage” provides multiple opportunities for building social capital and promoting resilience. Being conscious of these opportunities enables heritage workers to maximize the subsidiary benefits and ripple effects of their interactions with heritage owners, communities, and other actors involved.
4. Heritage workers should seek ways of collaborating with other aid workers, for example, psychologists or social workers, in order to further and widen the results for all fields of aid involved.
5. Conversely, other actors in humanitarian aid should consider how collaborating with heritage preservation workers can provide mutually complementary avenues for providing appropriate support in unobtrusive forms as a way to augment the effectiveness of the overall psychosocial support effort.
6. Depending on the circumstances, incorporating salvaging and preserving a community’s “small heritage” can provide a powerful tool for healing social

divisions and problems resulting from disasters when incorporated into the disaster recovery plans of local and regional governmental bodies (Momma).

Preserving cultural heritage can help societies use traditional methods to adjust to disasters and emergencies, and reading old documents can help scholars glean information about past disasters to help them better predict the frequency and degree of possible future disasters. Nonetheless, no matter how important these aspects of heritage may be in contributing to disaster preparedness, the types of heritage that can yield this kind of result are only a very small part of the overall body of heritage contained in any society. The significance of the kind of psychosocial support that can be gained from heritage, especially the “small” heritage of ordinary people’s very ordinary lives, should be viewed in terms of the longer-term cycle of rebuilding and rehabilitating society after a disaster, where multiple levels and forms of psychosocial support need to be generated or mobilized to maintain the overall well-being of affected populations and therefore prevent the slow but remorseless attrition of disaster-related deaths caused by people being left to feel alienated from the recovery process.

Abstract

The Himalayan state of Nepal is at high risk of natural disasters caused by earthquakes, flash floods, landslides, and snow avalanches. People's vulnerability during disaster acquires alarming proportion due to chronic poverty, involuntary migration, unplanned settlement, and conflict situations. In the last two decades, attention of the state and INGOs has been drawn toward planning for disaster prevention and preparing local communities in developing capacities for its mitigation.

Based on an ethnographic study in three districts of Nepal – Rupandehi, Makwanpur, and Sarlahi – this chapter assesses the state policy and the programs that aim to strengthen community resilience to disaster through good practices in disaster risk reduction. It explores some of the operational challenges of adopting a top-down approach for understanding issues related to the notion of community, participation of indigenous people, resource sharing, gender concerns, and issues

of communication. Issues of migration leading to de-territorialization and loss of indigenous knowledge are important challenges for disaster management. A community-centric approach to disaster management in the cultural and political context of Nepal points toward the necessity of revisiting the concept of community questioning its centrality in the disaster mitigation process. The intersectionality of gender, ethnicity, class, and territoriality holds the key to the success of disaster management practices.

Keywords

Disaster management · State policy · Community participation · Capacity building · Nepal

Introduction

Nepal's disaster management practices are governed by its constitution adopted in 2015 and the subsequent Disaster Risk Reduction and Management Act 2017. The constitutional spirit of disaster governance is that the local government should manage the disaster situation on its own. However, if needed, the provincial and federal governments shall provide the backup and lead the initiative. Thus, the role of the local bodies at the village and community level acquires significance in disaster management. The decentralization of development initiatives is a product of a long transition from a previous unitary system to a new federal one aiming at effective and accountable service delivery. Nepal, a landlocked and mountainous country, shares border with India and the People's Republic of China. The majority of the Nepalis are Hindus (81%) followed by the Buddhists (9%) and other indigenous communities speaking different languages having distinct race, ethnicity, and culture. The diversity poses a major challenge for the strategies visualized by a unitary policy at a national level.

The changing policies of the federal government in local self-governance have created new ways of administrative groupings without considering the cultural or territorial principles of everyday life that have contributed to the ambiguities of formation, maintenance, and continuities of community ties and solidarities. This has affected community participation in disaster management practices in the local context. It is argued here that the development discourses in Nepal revolves around the idea of community participation making it almost like a fetish to be engaged with. The chapter attempts to find out ways in which multiple solidarities and voices contained in a community living are important parameters for understanding the efficacy of disaster management strategies. Using the framework of liminality and communitas which surface during any disaster, the present study attempts to examine the manner in which communitarian relationships intercepted with ethnicity, kinship, and gender play an important role in disaster management and mitigation.

Disaster Policy and Governance

Nepal's new constitution adopted a federal system enshrining people's sovereign right and right to autonomy and self-rule. Article 56 spells out Nepal as the Federal Democratic Republic of Nepal consisting of three levels of governance, federation, state, and local level. Disaster risk reduction and management is included in Schedule 7, Schedule 8, and Schedule 9 of the constitution which provides the sole authority to the local government along with shared responsibility at the provincial and federal levels. The local government can formulate laws on matters pertaining to disaster mitigation and management. However, such laws should not be inconsistent with provincial or federal laws. Article 235 stipulates that efficient coordination is to be maintained by the federal parliament through legislation and administrative mechanism. Article 273 empowers the president to deploy Nepal Army on the recommendation of the federal government, and under 273(2), the provincial government can request the federal government to declare an emergency during a disaster. Article 51 (G-9) enables the provincial government to formulate and implement policies related to advance warning, preparedness, rescue relief, and rehabilitation, some of which are also there in the shared responsibility.

Thus, the constitution of Nepal contains provisions in which a disaster situation can be handled at different levels of authority depending on its magnitude and severity. Disasters have been classified into four categories from level zero to level three following the international protocol. While for the first two levels of disaster the local government is responsible for its management and mitigation, for the disasters of level two and level three category, the provincial and federal governments take the lead in managing it. Nepal's National Emergency Operation Center's Standard Operating Procedure 2015 classifies the disasters into four categories on the basis of the degree of severity in terms of economic damage, human injury, or loss of life. The "minor" ones have an impact on human injury or missing individuals with economic damage, but no loss of life. The "major" disaster occurs when the loss of life goes up to 10, and when it goes beyond that but remains less than 100, it is classified as a "severe" disaster. Disasters with a death toll of more than 100 are known as "catastrophic" ones. The Ministry of Home Affairs has also adopted this classification since 2015.

Subsequently, the Disaster Risk Reduction and Management/DRRM Act 2017 was formed stipulating various roles and responsibilities of different stakeholders for smooth and well-coordinated disaster management in the country. Nepal came up with a National Disaster Risk Reduction and Management Policy 2018 for an empirically grounded yet futuristic national vision to mitigate and manage the disaster. A long-term initiative, the Disaster Risk Reduction National Strategic Action Plan was formulated in 2018 to meet all targets by 2030. This developed a comprehensive planning framework for disaster risk reduction and management identifying priority areas of intervention and focus areas for government and other stakeholders. The National Disaster Response Framework was developed in 2019 for dealing with emergency situations.

The local government reserves the right to call for external support from any agency. The decentralization of planning and decision-making as entrusted to the local government is generally not coupled with their preparedness for a big disaster. The local governments' expertise in using nationally endorsed tools and methods for streamlining the disaster relief distribution process always remains questionable. Further, they have not been able to generate or have meaningful access to the robust database on the vulnerable population, vulnerability profiles, and disaster risk profiles so important for managing the disaster (Karna & Bhandari, 2019; Oyen, 2019; Sujakhu et al., 2019). The constitution of Nepal bestows the responsibility on the provincial and federal government for handling disasters of greater magnitude; no clear-cut guidelines are available on the sharing of roles and responsibilities among local, provincial, and federal governments in such a situation (Bhandari et al., 2020).

Disaster, Liminality, and Communitas

Research on disaster studies reveals that their field is theory light, characterized by a paucity of theory leading to a considerable focus on case studies and practical solutions (Matthewman & Uekusa, 2021). Thus, they have remained marginal in comparison to other areas of social science research leading to some kind of "institutionalized marginality" (Stallings, 2006). The United Nations treats disaster as an event that critically disturbs the functioning of a society. According to United Nations' International Strategy for Disaster Reduction (2009), disaster can cause human, material, and environmental damage making it difficult for societies to go back to normal conditions on their own. To explain this phenomenon of destruction and devastation, this chapter adopts the framework of liminality and communitas to examine the dynamics of community resilience in dealing with disaster risk reduction and management in three districts of Nepal.

The concept of liminality refers here to Turner's (1969, 1979) idea of a "stage in transition" where society is viewed not as a "thing" but rather as a dynamic and dialectic process. Liminality is a stage in the process of change, a threshold or limen that holds promises for a new stage or return to the previous one. According to Turner, the presence of opposite processes and notions in a single representation characterizes the unique unity of the liminal, which is neither this nor that yet both (1969:95). Such states or entities falling "betwixt and between" past and future categories are marked with suspended statuses and roles where individual actors behave in a self-contradictory manner. Disaster situations can be productively analyzed using the framework of liminality in the sense that the disaster has devastated the society affecting every aspect posing a threat to its continuity; it is on the threshold of losing everything, even facing the fear of extinction, but it still exists (Hoffman & Oliver-Smith, 2002). Such an existence is filled with despair and hope and can be best regarded as a "moment in and out of time" (Turner, 1969) and "matter out of place" (Douglas, 1966). The formulation of Turner and Douglas developed from the analysis of a ritual context. However, it has been successfully applied to examine the dilemmas of migrant refugees and displaced communities

encountering a great sense of loss of home, habitat, and health (Marris, 1974; Malkki, 1995; Gronseth, 2001; Gaur & Patnaik, 2011).

In Turner's formulation, liminality brings out a state called "communitas" referring to a relatively structureless society based on relations of equality and solidarity, though communitas as opposed to the normative social structure is structurally defined, limited, and temporary and therefore dialectically serves to reaffirm the existing social order (Haney, 2018; Kapferer, 2019). Derived from the Latin roots conveying the idea of unstructured communities based on shared experience, the concept of communitas is also being used in disaster research (Jencson, 2001). Communitas refers to a modality of social relationship which emerges during a liminal stage, while the community is always viewed as an area of common living. There is also an element of utopia to building a bright and fulfilling future through collective action. Communitas is also known as prosocial and innovative behavior (Knowles, 2011; Rodriguez et al., 2006), emergency togetherness (Drury et al., 2009), extraordinary community (Solnit, 2009), and post-disaster solidarity and brotherhood of pain (Oliver-Smith, 1999). Thus, the idea of communitas, in a disaster situation, can help us examine the sense of common suffering with a utopian impulse of imagining the outline of a brighter future based on the idea of equality (Turner 2012).

Field and Methodology

Fieldwork was conducted in eight locations, out of which four are village development councils (VDCs), two are parts of rural municipalities, and two are from urban municipalities out of which one is a small town. The field locations of (i) Devdaha, (ii) Makrahar, and (iii) Kerwani are located in Rupandehi district, (iv) Basamadi and (v) Handikhola are from Makwanpur district, and (vi) Sundarpur, (vii) Lakshmipur, and (viii) Phulparasi are situated in Sarlahi district. The locations are marked with distinct topography, geographical elevations, different climatic conditions, and population density.

In Rupandehi district Devdaha constitutes a rural municipality, believed to be the home of queen Mayadevi, mother of Gautama Buddha; it was also the ancient capital of the Koliya Kingdom. Because of its historical importance, heritage and cultural tourism have come up in the area providing an important source of livelihood to local people in the nonfarm sector. Makrahar is a town in Tilottama urban municipality, and Kerwani is a village development council in the district. Basamadi in Makwanpur district constitutes a part of an urban municipality of Hetauda sub-metropolitan city. Handikhola is a village in Manahari rural municipality. Sundarpur is a part of an urban municipality in the Sarlahi district of the Janakpur zone in the central development region. Lakshmipur and Phulparasi are village development councils in the Sarlahi district inhabited by different ethnic groups.

Besides the abovementioned sites, visits were made to two major towns and business centers and sub-metropolitan cities, Hetauda in Makwanpur district and Butwal in Rupandehi district. While Hetauda was awarded the title of "cleanest city"

in 2016, Butwal has earned the title of “green city” of Nepal in 2019. The presence of great scenic spots in the surrounding natural environment and several historical monuments has made these cities places of tourist attraction. Several industries in the fields of cement, chemicals, paints, and other manufacturing units have come up in Hetauda Industrial Estate. Interviews were taken with entrepreneurs and businessmen on the philanthropic role of the private sector during disaster situations.

In-depth ethnographic fieldwork was conducted in these three districts in different locations in 2007–2008 and a brief visit in 2014 followed by a few online interviews in 2020. The primary data collection through fieldwork was done through the participatory ethnographic method (PEM) where the ethnographic insights were validated through people’s participation in the interpretation of social and cultural data. Checklists for conducting interviews and focused group discussions (FGDs) with district officers, project staff, and different office bearers and members of village development councils (VDCs) were prepared before the commencement of the fieldwork. Semi-structured or unstructured interviews were conducted to collect data from the villagers and other members of the neighboring local communities.

The main focus of the fieldwork was to have firsthand information from the communities which was done primarily through focused group discussion. Sometimes data from individual respondents were collected using the semi-structured interview technique. Whenever required, depending on the feasibility, interviews were conducted with men and women separately. Efforts were also made to interact with the field mobilizers and field staff of different civil society organizations. A diverse category of stakeholders were contacted and interviewed to ensure that the data and associated information came from a variety of sources. This included the District Administration Office, secretary of village development council, and other line agency staff such as people from the District Education Office, District Soil Office, school teachers, and media personnel. Validity and reliability of data were ensured through triangulation and corroboration. Observation visits, using consistent criteria to assess disaster mitigation measures and service utilization, were made to various project sites.

Spatial and Cultural Diversities

The study was conducted in three districts of Nepal, Rupandehi in the west, Makwanpur in the south, and Sarlahi in the east, each having its distinct geographical and cultural features. Rupandehi comes under the Western Development Region of the country in Lumbini province. With mountains of the Chure range and Palpa on the north, Nawalparasi and Kapilvastu districts on the east and west, respectively, and Terai plains on the south, the district has a well-developed communication system in terms of two national highways, Mahendra and Siddhartha highway passing through the district which is emerging as an important center of trade, business, and banking. Most of its area is flat and formed by alluvial deposits with small portions of low-rising mountains and rocky cliffs intercepted by rivers of Tinau, Kothi, Rohini, and a few others. The climate is that of a lower tropical type

with the elevation ranging from 394 ft. to 490 ft. (120 m to 150 m) approximately. Some of the ethnic groups inhabiting the Rupandehi district are Tharu, Magar, Newari, and Gurung along with Nepalis and Madhesis who speak Bhojpuri and Awadhi. The economy is mainly agriculture followed by off-farm activities like service, cottage industry, petty business, and trade.

Makwanpur district is a part of Bagmati province in the Southern Development Region of Nepal. The topography is marked by the presence of several hills and mountainous ranges. Out of 12 prominent hills, the Chandragiri Hills is the highest one with an elevation up to 8369 ft. (2551 m). Mahabharat mountainous range is also extending through this district which is intercepted by several rivers including the famous Rapti and Bagmati Rivers. The climate is that of tropical and subtropical type. Makwanpur is the home to several indigenous ethnic groups such as the Tamang, Chepang, Newari, Magar, etc., in addition to the local Nepalis. Agricultural land and forest constitute the two important traditional sources of livelihood.

Sarlahi district is situated in Madhesh province in the Eastern Development Region. With river Bagmati on its west, Mahottari district on the east, and the Sivalik Hills on the north, the district of Sarlahi is connected to the plains of Bihar of India in the southern part. Much of its geographical area comes in the Terai plains with less of hills and rocky cliffs. Sarlahi is one of the small districts with a high population density. The climate is that of a lower tropical type with elevations around 334 ft. to 452 ft. (102 m to 138 m). Agriculture and horticulture are the main sources of livelihood. However, service sector, business and trade, banking, and armed forces are also important sources of employment and income generation. The tourism industry has come up in the district around some of the famous shrines such as Mukteshwar Nath, Sitalmai, and Pathankot temple which attract lots of domestic tourists. Bajiika or Tirthutiya, a version of western Maithili and Maithili speakers, constitutes more than 70% of the total population of the district. Among other ethnic groups, the Tamang, Tharu, and Magar inhabit the district in addition to Muslims and Nepalis.

The three districts exhibit different geographical and cultural characteristics. While Makwanpur district has mountainous and hill ranges, Sarlahi has more plain land or Terai land. While the former has more risk from landslides, cloud bursts, and sudden flash floods, the latter has the danger of floods and heavy rains including lightning and thunder. Rupandehi district on the other hand exhibits an environment that is a kind of mixed one of the above two types.

Nepal society is broadly divided into three major categories: (i) hill caste groups, (ii) the Adivasi or Janjati, and (iii) the Madhesi. The hill caste groups are also known as hill Aryans which include Chettri, Bahun, Thakuri, and Dashnami comprising 39.37% of the total population of Nepal. The Adivasi and Janjatis, which include Sherpa, Tamang, Magar, Gurung, Rai, Tharus, etc., constitute 30.81% of the total population of the country. While 22.28% inhabit hill and mountainous regions, 8.53% live in the plains of Terai. The Madhesi and Newars comprise 22.53 and 5.5% of Makwanpur, respectively. The district of Makwanpur has nearly 56% of Adivasi and Janjatis. The Tamang, Newari, Chepang, Magar, and Rai are found along with the caste communities. In Rupandehi district nearly 80% of the

population belongs to hill and Terai caste groups. Besides them, the Tharu, Magar, Newari, and Gurung comprising nearly 13% of the total population of the district are also found in the field locations. In the district of Sarlahi, nearly 8.8% belong to the Adivasi and Janjati categories who share the territory with different caste groups of Madhesi category.

Except for the Tharus and Newars, who speak both Indo-Aryan and Sino-Tibetan languages, all other Adivasi and Janjatis speak Sino-Tibetan language only. The hill caste groups and Madhesis are Indo-Aryan speakers. The hill caste groups enjoy higher status than the Madhesis inhabiting the Terai regions. The Adivasis and Janjatis lie outside the caste system, but the strong influence of the idea of purity and pollution and social hierarchy is noticed among them.

The Tharus are agriculturalists and live on the bank of the river near the forest. Most of them are landless and work as sharecroppers or *kamaiya*. Animal husbandry and fishing are alternative sources of livelihood. The Magar are Nepal's largest minority group, the majority of them being Buddhists; however, the practice of animism and influence of Hinduism are also observed. They are known as Gorkha soldiers in Royal and Indian Army. Among the Tamangs, nearly 90% are Buddhists. The Gurungs do not follow the caste rules but are regarded as a caste of considerable ritual purity by Bahun and Chettri. They are gifted craftsmen and follow either Hinduism or Buddhism or animism in different areas. The Newars or Newa, the original inhabitants of Nepal, practice agriculture and trade as their main occupations. Built on the later Vedic varna model, they are divided into various endogamous groups and provide ritual services to other castes. The Rais have been a warrior community who have provided stiff resistance to the invasion of Gorkhas in the past. One of the dominant sections of the Kirati group, they practice animist shamanism but are also influenced by Buddhism and Hinduism. Agriculture is their main occupation, and they cultivate wheat, maize, millet, and mustard on dry terraces. Animal husbandry and small trade are also what the Rai engages with. The Chepangs of the Mahabharat mountain range are the most marginal and excluded group. Shifting cultivation has been the traditional occupation of these forest dwellers leading a seminomadic life. As per the census of Nepal (2011), the Chepangs numbered 70,000, out of which 65% are Hindus, 25% are Christians, and 10% are animists. Because of their political subjugation, they are also called the Praja or the political subjects.

Revisiting Community Participation

The idea of community in Nepal is understood differently by planners on one hand and people on the other. VDC is the smallest functional unit for development initiatives. Each VDC is divided into many wards that send elected representatives to VDC. While the VDC and its wards constitute the administrative units of local governance where the government has decided to constitute the disaster management committees (DMCs), the people, in reality, live in small dispersed settlements locally called *tol* which is the space for everyday interaction providing the basis for

group cohesion and solidarity that play an important role in combating disaster and emergency situation (Wood et al., 2013). Members of a *tol* are united by bonds of direct cooperation and reciprocity, while the relationship among ward members cut across the ties of caste, ethnicity, and territoriality (Bolin, 2007). Each ward may have several *tols* separated from each other by the stretches of deep forest, mountainous streams, and even flash flood divides. In Makwanpur it was found out that, in the case of both the DMCs, the members do not come from all the nine wards. In Handikhola the Chepang or Vankariyas settlements are distributed in four wards, and not a single representative of this ethnic group is found in the said DMC. In Basamadi the Tamangs live in four different *tols* in the hilltops of the Mahabharat range, but the DMC comprises members belonging only to Bahun and Chettri caste. The Tamang settlements are scattered in the mountains, and the dominant Bahun and Chettri believe that the soil erosion and the landslides are primarily due to the indiscriminate cutting of trees by the Tamang for shifting cultivation. Integration of the indigenous communities with the disaster management strategies initiated by the local administration through VDCs and DMCs remains a challenge.

During a disaster, it was the local communities or the *tols* which became the operative units for executing the immediate disaster rescue, relief, and rehabilitation and not the ones officially conceived at the level of DMC or VDCs. Ahupathi, one of the young men of Laxmipur VDC in Sarlahi, recalls "when the flash floods devasted the houses in two *tols* in 2010, the government assistance came much late, the neighbours were the first ones to rescue my family, nobody from the other wards came to help us." The members of the *tols* are readily available during emergency for instant intervention ensuring safety. At this level, the communitas surface in which people identify with the suffering other as if it is happening to them or their immediate family. The idea of *tol* incorporates the idea of a family writ large where the residents share the same space, aspirations, and sufferings. The members are united by the bonds of cooperation and reciprocity on an everyday basis, a phenomenon so important in handling emergency situations during natural disasters. A conceptualization of the community based on the principle of territoriality and sharing of resources and space in everyday interaction would enable us to look into the gaps which may not be perceptible if the whole VDC is taken as the unit for instilling and facilitating disaster preparedness leading to mitigation. Taking VDCs as the basis for the formation of DMCs reflects a top-down approach to classifying the local communities in a decontextualized manner without any regard to cultural sensibilities.

Further, the composition of DMC is less inclusive in terms of caste, ethnicity, gender, and territoriality. Ethnic groups like Tamang, Chepang, Vankariya, and Tharu remain marginalized in terms of management and decision-making at the level of DMCs. The dominant Bahun and Chettris of the region feel that due to extreme economic poverty members of these communities are not interested in activities pertaining to disaster preparedness training which requires long gestation. With great difficulty, the president of Basamadi DMC could convince an acculturated nonresident Chepang to be a member of DMC because of the insistence of an international donor agency funding a disaster mitigation initiative. In Siddhakali, one

of the Chepang *tol*s, the local administration, constituted a *Basti Bachao* subcommittee or save the village drive to facilitate mitigation work through gabion boxes made up of barbed wire to protect the soil erosion landslide on the river bank. Ironically the chairperson of this subcommittee working for the indigenous group is none other than a Bahun belonging to the locally dominant group.

In Twangra *tol* of Handikhola VDC, a massive landslide destroyed seven Chepang houses rendering these families homeless in 2015. The *tol* was inhabited mainly by Bahun and Chettris who did not display the needed sensitivity to the Chepang's precarious and vulnerable condition. The Chepangs also did not seek any external assistance as they considered that their plea may not be heard by the higher caste decision-makers. It was only among the affected seven families that the bonds of cooperation and reciprocal help were observed.

In Rupandehi, the Tharus have land, but instead of cultivating their own land which requires initial capital investment, they prefer to work as agricultural laborers in fields owned by higher castes. Tharu women also work in stone quarries as wage labor. They stay far off and generally remain cutoff from the other caste communities. In the Sunawali *tol*, it was recently observed that most of the Tharus are selling their agricultural and homestead land to local immigrants, mainly from Bahun and Chettri castes, and migrating out to the interior areas on the Indo-Nepal border. Many of the families have crossed the international border and settled down in Indian territory. In case of natural disasters and other emergency situations, they depend on themselves rather than on neighboring caste communities who may be living in the neighborhood.

Gender Concerns

It was observed that many of the training programs for disaster risk reduction conducted by the local government connected more to young boys than girls. These training programs were conducted in the schools involving both the categories of stakeholders, the students, and the local youth. Bipna, a young Chettri girl of Sundarpur VDC, says: "the young women of the village who had never gone to school were given the training for first aid and disaster rescue operations along with students of 10th standard. Like many others I could not follow few points, but was shy of asking to the trainer." Most women felt that separate training programs for them would have been more effective. The young women of the *tol* could hardly attend these training programs as the timings were not suitable for them to take time off from the everyday routine of the household chores and they cannot afford to be absent from the household at that point of time (Bradley et al., 2021; Gaillard et al., 2017).

The headmaster of Mahendra Jyoti School in Handikhola VDC, with more than 32 years of service in the area, is of the opinion that "we have to walk few extra miles to bring the girls from the marginalized communities so that they get interested in disaster mitigation training." He went out of his way to identify Chepang children not going to school and convinced them to come for the classes. In his entire service

career, he has never witnessed the enthusiasm that the Chepangs have demonstrated. Recently one of the Chepang girls has completed 10th standard and is now in 11th standard. She has received first aid training organized for local women in 2018 and subsequently received training under the Community-Based Disaster Risk Reduction (CBDRR) program initiated by the government of Nepal together with major development partners including INGOs. She is definitely a role model inspiring other village girls who have started thinking that they can also do it if they receive the right kind of training.

Needless to mention that, in the given cultural context, disaster preparedness and mitigation rely on the prevailing social structure that carries deep-rooted seeds of patriarchy. Men and women have different vulnerabilities in facing disaster as they have differential access to resources, social networks, information, and skills including literacy (Bradshaw, 2015). Men deal with public spaces and use cell phones; therefore they are well connected to information flow in comparison to women counterparts. With virtually no access to decision-making or control over family assets, women have restricted personal mobility and autonomy. Thus, the ability to cope with the crisis and recover from it depends on men and women's everyday life and unequal power relationship. Women-specific needs and concerns are perceptibly missing from the disaster management strategies. Saree, the common traditional attire for Nepali women, slows down the movement causing greater vulnerability during emergency. The local women of Sarlahi remember that, when the trainers from Bangladesh came to teach them the skills of rescue operations, they have demonstrated with a women's traditional trousers and shirt (*salwar kameez*) or with a sports tracksuit. During the flood in 2021, the local women in Rupandehi who had received training were shy to wear the sports outfit in front of patrilineal kins, and when they tried to rescue other women, when they were in sarees, it was not very effective. Male in-laws hesitate to touch a drowning woman in Sarlahi due to avoidance relationship.

Further, women's reproductive and sexual health is at more risk during a disaster. In most cases, the shelter homes do not contain the provision for separate spaces for pregnant women and lactating mothers. The challenges of menstruating women during the monthly cycle have not been addressed in terms of infrastructural requirements in the shelter homes. In the post-disaster situation, women continue to do routine domestic chores such as cooking, serving, cleaning, washing, and minding children which further reduces freedom and mobility. It was also observed that during the flash floods that occurred in 2012 severely damaging the settlements in Handikhola VDC, the relief from the local government did not reach instantly. Reenu, a 38-year-old widow from the village, recalls that when the government aid reached her village, it was first given to those who were known to the president of DMC or had political connections outside. She along with her young daughter and infant son had to wait for 5 more days to receive the aid after the whole village had received it. Baijanthi, a 32-year-old women separated from her husband, living with her 4-year-old daughter also had to wait for a nearly a week before she received any aid from the local government. In fact, gender-based violence increases in post-disaster scenarios in multiple ways. One of the strategies thought of by the local

government is to include gender budgeting in disaster planning and management, but it remains only a thought-out strategy for disaster risk reduction for women. It existed only on paper and has yet to gain momentum in practice.

Challenges of Disaster Management

At the local level, disaster management strategies face many challenges, ranging from the issue of integrating the indigenous communities, youth, and women to the local competition for sharing the resources that the federal and state governments provide to the local administration (Matthewman, 2015). The manner in which disaster management committees (DMCs) are formed is not free from the challenges of exclusion and marginalization. The DMCs are key structures playing an important role in emergency and everyday situations. Ideally, they are to be formed at the level of VDC with a president and secretary and nine members from the wards so that the training, capacity building, and dissemination of strategic learnings can be effectively distributed among all residents. It was also observed that if a member quits the post, there are no clear-cut guidelines available for filling such vacancies. In Rupandehi district, the Kerwani DMC co-opted a new member in place of the vacancy created due to the moving out of a member to a nearby town, Butwal in search of a better livelihood. The Makrahar DMC of the same district preferred to keep one post of member vacant after the sitting member migrated to Qatar in the middle east for better job opportunities.

The role of the VDC secretary is to coordinate the plans, programs, and strategies agreed upon at the level of DMC with other bodies of local government in the district. However, it was observed that the involvement of the VDC secretary, who is ideally the ex officio member of DMC, has been minimal. Different DMCs have involved the VDC secretary in a different manner. While in Makwanpur and Sarlahi districts the DMC has the VDC secretary as an ex officio member, the DMCs in Rupandehi do not have a VDC secretary as their member. Instead, the DMCs in Rupandehi have an advisory committee where the VDC secretary is a member. This has led to a weakening of the linkages of DMC with other government bodies creating bottlenecks in mainstreaming the theme of disaster management with other government agencies and programs. In this context, the role of VDC secretary assumes significance as he is the only contact between the local government and the community.

Under the disaster mitigation initiative of the local government, shelter homes and community halls were constructed in every VDC. Instead of choosing the construction site close to areas that are more vulnerable to disasters like flash floods, such structures were built in the *tol* belonging to the leader. These structures are important resources for community members who use them for hosting marriage ceremonies, community feasts, and even at times political meetings. However, managing such shelters and sharing the revenue accruing from them have become challenging for the community members. In Sarlahi district one of the community shelters was being used by a school teacher who was taking private tuition for school

children. The other side of the *verandah* was being used by a tailor who has kept the sewing machine. The DMC president was charging some rent from them, but the norms pertaining to its access and utilization are still emerging. Such processes await streamlining so that they can lead to institutionalization. Since the members of the *tol* where the community halls are located take the responsibility for everyday cleaning and maintenance of the structure, some of the DMCs do not charge anything from the *tol* members. Thus, the membership of the *tol* or *samudaya* where the community shelter is located carries greater privilege. However, there has been competition among various subgroups and village factions for having control over such attractive and visible structures.

Mobilizing the youth and connecting them to the DMC initiatives have been a challenging task. Many youth clubs existed in these districts much before the formation of the DMCs. In Devdaha VDC of Rupandehi, the Moon Light youth club was already taking local initiatives to face the disaster situation. The local youth organize themselves cutting across the lines of caste and gender with participation from both boys and girls in considerably equal numbers. In Phulparasi VDC of Sarlahi, the youth organized a *shram daan* campaign urging the people to contribute voluntary labor for the construction of a community shelter. In some cases, high fee structure and method of payment have excluded the poor and marginalized youth to participate. The Adarsh youth club of Devdaha VDC which started functioning after the formation of DMCs has kept the fees very high. A monthly fee of Rs 50 has to be paid for a period of 6 months in advance along with one-time processing fee of Rs 200. Youth from poor and marginalized groups found it difficult to participate in group activities.

In Twangra *tol* of Handikhola VDC, the youth club existed many years before the disaster preparedness initiatives were taken up by the DMCs. The youth club has been organizing sports events for boys and girls. After the initiatives are taken up by the local government, the youth club was renamed as youth group and got actively involved in building the community shelter and participating in training for disaster preparedness to such an extent that they could not pay much attention to game and sports. Ojita, a young girl, would fondly recall how they used to meet every Saturday to play different games. Many of the local youth felt that disaster preparedness programs were too tightly packed, almost in a continuous manner, one coming up immediately after another virtually giving them no time to breathe and play. The multiplicity of training and preparedness programs in a routinized manner often leads to too much pressure on the local community.

On the other hand, the office-bearers of Basamadi DMC find it difficult to mobilize youth in their activities. The president of DMC says that the youth of the area are migrating out in search of jobs leading to a decline in the youth population in the village. Even the youth club of Basamadi finds it difficult to have membership in spite of a very nominal fee of Rs 10 per month. Indradu, a 26-year-old upcoming entrepreneur from Basamadi, has recently started a shop in the village. He is of the opinion that, during the massive landslide and flash flood in 2018, most of the reconstruction work was done by contractors from outside with their own supply chain and workers from outside the region. Thus, management strategies adopted by

the local government did not give priority to local aspirations. Members of the affected and neighboring communities were neither engaged nor consulted.

Concluding Observations

As reflected in the foregoing pages of this chapter, the decentralized planning and decision-making as entrusted with local government are not coupled with their preparedness for a disaster of greater magnitude, where the provincial and federal government pitch in. However, no clear-cut guidelines are available for sharing of role and responsibilities among these three either in the constitution or in the policy. The narratives and verbatim of local people clearly point toward the inefficacy of government aid and reconstruction initiatives. The fellow citizens residing in the same *tol* are the first responders who do the heavy lifting when the disaster strikes (Tierney, 2003). People realize that official assistance is never adequate and seldom reaches the right people at the right time. This not only gives the civil society a boost and creates a situation where *communitas* surfaces. It is argued here that disasters do not remain restricted to the natural environment because devastation, damage, and threats are public and widely experienced. In this sense, disasters are also social phenomena. A sense of suffering together connects the survivors leading to an emergent shared social identity. Mutual aid from within the “society of equals” is the important resource available (Haney, 2018, P106; Wood et al., 2013, P145). In *communitas* social relations are horizontal bonds, where empathetic and altruistic acts are more pronounced. It differs from social capital in the sense that it is short-lived, context specific, experientially based, inclusive, and transformational (Aldrich, 2012; Aldrich & Meyer, 2015). The local narratives corroborate that, when the initiatives of federal agencies become ineffective in reaching out the people at the right time, the *communitas* provide the relief effectively.

These findings point toward two important observations. Firstly, the command-and-control model of disaster recovery is extremely questionable. On the other hand, the presence of *communitas* has a significant impact on community’s recovery process following disaster. Secondly, in an ordinary situation, planners and policy-makers focus on “physical lifeline infrastructure,” i.e., hard technological system that sustains life like electricity, communication, energy, transportation, and water supply, rather than the “social infrastructure,” the ultimate driver of resilience (Klinenberg, 2018). The realization that by building social infrastructure we build resilience and create an effective strategy for disaster recovery especially in small communities may help the planners and administrators responsible for disaster mitigation.

Finally, this chapter has demonstrated how *communitas*, though appear temporarily (Casagrande et al., 2015), can be instrumental in making disaster-hit lives better. As reflected from the field, this is based on the idea of expanded sense of self and community. According to Turner, liminality is “optimal setting *communitas*” in which individuals are stripped of attributes of structure, i.e., the identities and status that mediate their relations in ordinary situations, and therefore they are in a position

to comfort one another directly and equally in a situation of antistucture (1979). His conceptualization of human existence through liminality, communitas, and structure-antistucture dynamics had challenged the static and structured nature of social reality which is affected by the phenomenon of disaster.

Abstract

Disasters, both natural and human induced, have received greater attention in recent decades from scientists, policy makers, and the wider public, partly due to their increasing frequency and intensity and the growing human toll across the world and partly due to the urgent need to take diverse measures to reduce disaster risks emanating from different sources. With increasing disaster risks, social effects of disasters are also more than likely to intensify, leading to the disruption of long-established patterns of social, economic, and cultural life of people resulting from displacement, relocation, and resettlement. In this regard, the disruption of social networks, livelihoods, and social infrastructure can be critical factors. In this chapter, an attempt is made to discuss what measures are necessary to reduce and mitigate the adverse social effects of disasters resulting in the displacement of people. It is widely recognized today that disaster mitigation is a wide-ranging process that unfolds much before the onset of a major disaster and continues far beyond the immediate management of an actual disaster that has occurred. This perspective is particularly relevant in dealing with adverse social effects of disasters as these can be significantly reduced if an integrated, long-term perspective is adopted in identifying measures necessary to reduce disaster risks to families and communities, in particular, to vulnerable segments of a

population such as children, the poor, and the elderly. The analysis in this chapter is largely based on the recent research experiences of the author and co-workers in investigating and documenting the impacts of several major disasters in the recent past.

Vulnerability · Displacement · Social effects · Relocation · Social infrastructure · Social well-being

Introduction

Disasters have diverse effects, namely, physical, economic, social, and psychological. These effects are often intertwined and cannot be easily disentangled. Moreover, the understanding of the causes and consequences of social effects of disasters is important from the point of view of prevention, management, and mitigation of disaster risks. In this chapter, the focus is on the nexus between disasters and society.

Natural disasters like earthquakes, tsunamis, droughts, and storms are not new. Yet, with ongoing, human-induced climate change, what we witness today is a clear increase in extreme weather events across the world. Human interventions by way of unsustainable and destructive development and consumption patterns in many countries have clearly contributed to environmental pollution and degradation, biodiversity loss, depletion of natural resources, and the spread of many related diseases (Hettige, 2017). These trends need to be arrested in order to reduce their adverse effects. On the other hand, climate change is a much bigger global challenge to the planet and humanity. There is an emerging global consensus on the need to act fast to overcome the above challenge before it is too late.

Meanwhile the countries across the world have no choice but respond to disasters when they occur, to protect communities, save lives, meet the needs of the affected people, and restore their habitats, vital services, and livelihoods that are disrupted or destroyed. Given the increasing frequency and intensity of natural and human-induced disasters, it is increasingly realized today that disaster risk reduction (DRR) is a far more meaningful and effective approach in responding to disasters. This of course demands us to revisit the disaster cycle in order to treat disaster mitigation as a residual category. In other words, all measures need to be taken to prevent or reduce disaster risks so that when disasters strike, their impacts are less damaging or costly. The measures of DRR can be diverse, continuing, and long term involving a multitude of disciplines, actors, and institutions.

Looking at disasters from a sociological perspective, it is important to look at the nexus between disasters and society from a chronological angle to cover the three stages, namely, before, during, and after disasters. What should happen at each of these three stages can be very different but remain interconnected. In the first stage, what happens should be guided by a holistic and long-term perspective. This is where economic, social, and physical planning comes in with a focus on DRR. Yet,

disasters occur, and, therefore, disaster preparedness is critically important to minimize their adverse impacts. On the other hand, the aftermath of a disaster can be complex and extends beyond the mopping up operations to include long-term measures of rehabilitation, restoration, and resettlement.

Disasters, by their very nature, are disruptive of long-established social arrangements and cultural practices. If a major disaster precludes the restoration of pre-existing habitats and social infrastructure, establishment of new settlements elsewhere to accommodate the displaced needs careful planning and considerable new public investment. This is a complex process that involves addressing a whole range of economic, environmental, social, and cultural issues. Reintegration of new communities into a host environment is a complex process with political, economic, social, and cultural implications. A critical component of the entire process is the nature of social solidarity, both pre-existing and emerging. Integration of a new settlement in a new social, cultural, and economic environment can be a complex and at times a challenging process that needs to be carefully managed to ensure that there do not emerge misunderstandings, tensions, and conflicts between the resettled community and the host communities. Restoration of social and community life following a heavily disruptive disaster, particularly when the displaced people are resettled in a new environment, can be a major challenge for all stakeholders involved in the process (Hettige, 2007; Haigh, 2016).

Mitigation of Adverse Social Effects of Disasters: A Chronological Perspective

Disaster risk reduction (DRR) perspective embedded in the Sendai Framework persuades us to go beyond conventional disaster management practices that usually concentrate on disaster mitigation. In other words, disaster risk reduction entails what we do to reduce risks before a disaster strikes, what we do at the onset of a disaster to minimize adverse impacts on people and infrastructure, and the interventions following a disaster to restore social and cultural life, habitats, social infrastructure, and livelihoods of affected communities. What this means is that policies, institutions, and professionals need to be adapted to engage in a much wider range of interventions in the three stages mentioned above.

As is well known, disasters vary widely in terms of their types and intensities depending on a range of factors. Moreover, the risks they pose to individuals and communities also vary accordingly. The disaster risk mapping at a country level can identify key disaster risks that people in different parts of the country face. For instance, people living in Sri Lanka face many disaster risks, often depending on where they live and under what social and economic conditions. These include floods, landslides, droughts, coastal hazards like coastal erosion, sea level rise and tsunamis, storms, lightning, and cyclones and hazards caused by unsafe disposal of waste such as air, soil, and water pollution. Then, there are also human-induced risks posed by violent conflicts (Haigh et al., 2016).

It is obvious that all of the disaster risks mentioned above cannot be eliminated. If at all, some of these might even be intensified due to such factors as climate change, sea level rise, increasing population density, haphazard development interventions, and unplanned human settlements in vulnerable areas. So, what is needed is to identify vulnerabilities and take measures to reduce risks to people's lives, livelihoods, habitats, and social and physical infrastructure (Birkmann, 2013). This demands the development of policies; enactment of necessary legislation, revamping of existing institutions; establishment of even new institutions where necessary; development and mobilization of diverse expertise and other resources; preparation of vulnerability maps at different levels and in different sectors; increase in disaster preparedness at community, region, and country levels; and development of detailed mitigation plans to deal with the economic, social, and psychological effects of a significant disaster, either natural or human induced.

What is indicated in the above paragraph needs detailed discussion, but the space available here does not permit such a detailed analysis. Therefore, in the remainder of the present chapter, what is presented is an analysis of the institutional responses needed to address highly significant social effects of disasters from a DRR perspective, in the light of the research experience of the author and co-workers in recent years in dealing with the social effects of several disasters in Sri Lanka.

Learning from the Past Disasters to Prepare for the Future

As mentioned before, disasters of some type or another, large or small, have been the common experience of most adults living in any part of the world today. When a disaster occurs in any country today, people expect the government authorities, either local or national or both, to come forward to provide various forms of assistance through diverse interventions to reduce the likely harms caused by it. These interventions include pre-disaster measures like vulnerability mapping; identifying and relocating families and communities vulnerable to significant adverse effects of disasters such as coastal erosion, flooding, and landslides; providing early warnings and evacuation of the vulnerable people in actual disaster situations such as rising flood waters and tsunamis and cyclones; and providing immediate relief to affected people by way of temporary shelters, food, and medical support. This is usually followed by restoration of settlements, livelihoods, and basic services. In some situations, the affected people and communities require resettlement, either in the vicinity or away from the earlier habitats.

What is outlined above is what usually follows a major disaster that leads to displacement of people. But, as mentioned earlier in the chapter, our approach to disaster mitigation has changed in recent years. This is based on the new knowledge that has been generated by research across the world and the new policies that have been developed based on evidence. Countries are expected today to draw from this continually growing body of research and policy analysis (Haigh & Hettige, 2016; Hettige, 2006; Hettige & Haigh, 2016; Hettige et al., 2004; Weerasena et al., 2018).

Increasing population pressure on natural resources due to population growth, the growing public desire a higher standard of living, and haphazard government interventions to create livelihood opportunities for people have often encouraged governments to allow people to encroach on available public land, at times even in ecologically sensitive areas, often ignoring disaster risks such as floods and landslides. In other words, often there has not been systematic settlement planning to ensure the safety of newly settled people. This has also been true in coastal areas exposed to diverse disaster risks. This is clearly evident from makeshift dwelling units scattered in coastal areas where many migratory fishing communities can be found. When the 2004 Indian Ocean Tsunami struck the coastlines of many countries in the region, there were many victims in all countries affected resulting in many deaths in affected communities besides mass displacement of hundreds of thousands of families.

Rapid population growth has also led to internal migration of people from densely populated to sparsely populated regions. Recognizing the problems of poverty, landlessness, and other related issues, governments have also facilitated the process by providing access roads and other social infrastructure like schools and health facilities. Yet, the lack of any assessment of disaster risks in the areas that the new settlers move into, no effort has been made to provide any guidance to them regarding possible vulnerabilities involved in their search for a better life in a new area.

Governments often regularize irregular immigrant settlements but rarely evict them even if the habitats are found to be vulnerable to adverse effects of natural disasters. This has been true for many rural, urban, and coastal settlements. Yet, in more recent years, after many years of exposure and hardships suffered by people in such communities, researchers and state officials, under the influence of new DRR initiatives, have taken an active interest in investigation, documentation, and identifying ways to address disaster risks faced by vulnerable communities. Moreover, global discourses on DRR, SDGs, and climate change have influenced governments, relevant national institutions, and state functionaries, and there has been greater recognition of the need to revisit old practices (Hettige, 2017). So, it is possible today to plan human settlements in secure areas to resettle people who are displaced by disasters and violent conflicts, but national and local authorities find it difficult to find suitable alternative resettlement sites in many situations due to diverse constraints. On the other hand, there is a greater realization today that there is no choice but relocate such communities to reduce their risks and vulnerabilities to future disaster events.

Disasters and Settlement Planning

What is evident from the above is that human settlements have cropped up in areas vulnerable to disaster risks, but, today, such haphazard developments can be avoided as responsible institutions are expected to possess the knowledge and tools needed to determine the suitability or otherwise of the possible settlement sites. Yet, in densely

populated countries and regions, the choices are not easy, and relocation and resettlement need to be done carefully to minimize risks while making every effort to optimize benefits to the resettled. For instance, finding alternative livelihoods is a key consideration in selecting a resettlement site, for livelihoods are critical to sustain people who move into new settlements. In fact, this is as important as minimizing disaster risks at the new site. When this aspect is neglected in the planning stage and the new settlers do not have access to employment and other sources of income, many families are likely to fall into abject poverty, encouraging adversely affected families and individuals to return to their old habitats under very difficult social and economic conditions.

As mentioned earlier in this chapter, moving families or even entire communities following a devastating natural disaster or a major violent conflict needs careful planning, taking diverse needs and concerns of the people concerned into consideration. This is usually done while the displaced are accommodated in a temporary shelter pending relocation. On the other hand, those responsible for managing the resettlement process usually come under great pressure to expedite the resettlement process as entire families living in often congested temporary shelters with minimal facilities for an extended period create many social, health, and psychological problems. Yet, rushing into careless decisions to save time can have long-term adverse consequences that can make life difficult for settlers who move into a not so well-planned new settlement.

Based on the experience in the recent past relating to relocating communities displaced by major disasters in Sri Lanka, several key considerations seem to stand out. These are selection of new settlement sites, selection of settlers for a particular location, prospects for livelihoods in and around the settlement, nature of dwelling units, relationship to host communities, and the provision of social infrastructure.

Each one of the above aspects needs careful consideration, but, for lack of space, these are only discussed in brief here. It is important to emphasize at the outset that the future prospects of the settlers, their health, and well-being depend a great deal on how carefully the above are considered in the planning and implementation process.

Moving people displaced by a disaster, away from their familiar habitats and related living circumstances such as livelihoods, social networks, social and cultural spaces, etc., is difficult for them, particularly when the new location is far away from the old one. Yet, given the highly disruptive and destructive impact of a major disaster on the living environment, livelihoods, etc., the displaced people often do not have much of a choice but move out from there. But, it is also necessary for them to compare the likely living and working environment at the new location with what they were used to at the old location. Moreover, in view of the idea of “build back better,” the conditions in the new location are expected to be better.

Depending on the extent of destruction caused by the disaster, a site affected by it might be partly or wholly damaged. But, it is the government authorities who determine whether to relocate people or rebuild the affected site. Moreover, often no pre-disaster settlement is homogenous in terms of the composition of the pre-disaster community, unless it was a housing scheme with identical housing units. This pre-existing diversity cannot be ignored when relocation of the displaced

is being considered. For instance, unequal property ownership is an important issue as much as unequal livelihoods and employment. Given this diversity, settlers might want a choice with respect to relocation. In other words, random selection of new settlers to be moved into a new settlement might not be to the liking of some of the displaced due to their particular personal circumstances.

As much as livelihoods are a key consideration in relocation, ability to adapt and fit in to livelihood opportunities available in the vicinity of the new location might be challenging to some prospective new settlers. In fact, moving people with certain established livelihoods to a new settlement located far away from the old location can be rather unsettling. For instance, moving fishermen from a coastal fishing community to a new settlement far away from the coast can be problematic unless the persons concerned are ready to change their occupations.

Housing units and social infrastructure are two critically important areas that many new settlers are concerned about. So, prior consultation with prospective new settlers can elicit many useful information and insights that can be critically important to design housing units and determine the nature of social infrastructure needed or desired by new settlers. It is the diversity of the community that is formed around a new settlement that determines the variety of social infrastructure required by different segments of the population in terms of age, gender, education, cultural practices, etc. Location of social infrastructure facilities such as health, leisure, education, transport, meeting places, skill training, child care, elderly care, etc. within and in the vicinity of the settlement can play a vital role in ensuring health and well-being of community members. It is critically important to ensure that the needs of diverse segments of the local population are taken care of by various social infrastructure facilities, ranging from small children to elderly senior citizens. These can best be determined through a detailed community consultation process involving potential beneficiaries with community volunteers playing a catalytic role.

Another important aspect of a relocated community is its relationship to host communities in the vicinity. This is a complex issue depending on how the relationships develop between the new settlement and other communities. In this regard, mutual understanding of each other and the inter-community relationships that evolve are highly significant. At times, hostile relationships emerge due to diverse circumstances. But, what is desirable is a mutually beneficial relationship based on mutual understanding, exchanges, and social solidarity. This may not happen automatically, and some measures might be necessary to facilitate throughout the process of settlement planning, to ensure the host communities remain alienated till the new settlers begin to move in. What needs to be avoided are possible tensions and conflicts between the relocated community and the host communities in the vicinity. Integration of communities through shared social infrastructure facilities can be one way of doing this, while engagement of community members in collective inter-community social and cultural activities can be another.

The above inter-community issues can arise in relocated communities following major natural disasters as well as in new settlements established after a major violent conflict. There are many countries that have faced both major natural disasters and long drawn-out internal conflicts in recent years resulting in mass displacement of

people requiring planned resettlement. Since victims of conflicts have experienced inter-community problems even prior to resettlement, special care needs to be taken to prevent recurrence of inter-community tensions and conflicts in the new setting. Here, certain well-thought-out measures might be necessary to prevent such conditions from emerging in the new environment.

Conclusion

In this chapter, we have focused attention on social aspects of major disasters, displacement, and the management of the mitigation processes following a major disaster, natural or human induced. Special attention is focused on the issues of relocation and resettlement of the displaced with a view to highlighting the need to mitigate the adverse social effects of displacement in order to not only avoid possible negative consequences of relocation and resettlement but also to ensure that the conditions of life in the new setting are better, rather than worse than the conditions obtained in the previous habitat. This is not only to fall in line with the principle of “build back better” but also to fit into the widely shared global concerns regarding climate change, sustainable development, and social justice.

With increasing attention being paid to disasters today, by scientists, global institutions, researchers, policy makers, and the wider public, there is a growing demand for evidence-based decision-making relating to DRR, disaster mitigation-and securing a safer and just future for people adversely affected by disasters. Evidence-based management of the mitigation processes following a major disaster, therefore, has become critically important. Extensive research evidence emanating from the field observations on how processes of resettlement of the displaced have unfolded in many real-life situations provides guidance for decision-making in the above regard. If such guidance is followed, people who are affected and displaced by disasters, both natural and human induced, can look forward to living in a secure environment free from wants.

Abstract

Disaster law (DL) is a new and emerging area of law provoked by a specific need of governance to prevent, mitigate, and manage emergencies which damage and destroy life and property. Various other branches of law, i.e., for contracts, company, business, competition, property, women, children, criminals, technology, international law, etc., have started from a specific felt need for justice due to silence or incompleteness of law. These areas of law have seen progressive advancement and inclusivity only when they were interpreted on grounds of equity which is justice and fairness to supplement shortcomings and the silence of laws. In short, it is a correction of law as Aristotle defined it which has enlarged areas of legal studies. A latest entrant to legal discourse is disaster law which is

growing in proportion to quantum of governance deficits to manage nature's fury against living creatures. Much depends on how one perceives a disaster. A primitive understanding treated a disaster as an "act of God," but growth of science and subsequently a stronger analytical rigor of democratization of governance found them preventable if attended to in time. Modern science, skepticism in policy enforcement, and growth of democracy have helped in the development of disaster law in areas of accountability, transparency, participatory governance, global humanitarian principles, and rule of law. Global approach to disasters changed post-tsunami in 2004 which triggered a golden phase for developing a holistic framework for disaster law. Starting with a UN initiative in Hyogo Declaration (2005–2015), member states came up with their nation-specific laws to manage disasters. After the completion of Hyogo mandate in 2015, the Sendai Framework for Disaster Risk Reduction (2015–2030) set the stage for a merger of disaster law to technology development, tortious liability of decision-makers, administrative coordination, and international-regional partnerships. The present paper addresses the issue of formative and developmental journey of disaster law, its defining pillars, and future directions.

Keywords

Equity · Subsidiarity · Compliance · Accountability

Introduction: The Idea of Disaster Law

Disaster law (DL) finds a key place in disaster management as understanding of disasters deepens to human causation from its erstwhile origin in supernatural forces. Thus, to save lives trapped in a calamity is not anymore a charitable act of the state but a mandatory responsibility. Consequently, disaster management comes closer to state governance in contrast to state philanthropy. As it became fairly clearer that timely, efficient, and knowledge-based preemptive action could prevent, mitigate, or reduce impact of many disasters, a need for legal deterrence against authorities appeared necessary. Administrative accountability for actions starting much before an actual disaster event in the form of risk assessment, strategic planning, enforcement, and implementation defined and demonstrated quantum of negligence, lack of integrity, and extent of vicarious, tortious, and contributory negligence. Three perceptual changes as mentioned below catalyzed the need for adoption of "disaster law" (DL) in mainstream state policy framework, that is:

1. Disasters are a result of political and administrative failures rather than an "act of God." Therefore, accountability and tortious liability of offenders need to be worked out effectively and clearly through their framework of governance, workability of institutions, governmentality (Foucault to Agamben) (Agamben, 1998, 2011; Jessen & von Eggers, 2020; Biebricher & Vogelmann, 2012), and implementation.

2. Disasters know no boundaries and give no time; therefore, no country can handle it alone. There is need for international collaboration, cooperation, and agreements to address them immediately through preemptive risk reduction strategies. This suggests reinvigoration of international humanitarian law from its “war focus” to “disaster focus” as disasters have wiped out communities faster than wars.
3. Disasters can be mitigated and are preventable with the state anchored on the top as a public trustee of all natural resources including all flora and fauna. Acting according to the doctrine of public trust, the state has a mandate to oversee carrying capacity of planet Earth and stop overextraction and overkilling. Consumption should draw limits and be proscribed till it is in sync with sustainable development.

From the above three realizations, disaster studies and research moved out from its shrunken existence as a supernatural outburst or an “act of God” to a calamity or a devastatingly forceful event caused by human action which has directly or indirectly brought immense damage and loss to its surrounding.

History of the Growth of DL

Disaster law has found wisdom from failures of developmental policies irrespective of being or not being a cause for it. Failed development causes immense misery, suffering, unemployment, and even wars. So, the objective of disaster law is to reduce vulnerability and enhance resilience or in other words generate a stronger possibility of bouncing back when struck by wars or disasters. Somewhere, disaster law becomes indispensable to sustainable development and inclusive human progress. History of economic advancement of the world reveals the nature of vulnerability that was later dropped into the field of disaster law to address.

The period of the 1960s was a period of immense philosophical discourse in political and economic theory which questioned state and institutional failures leading to some of the key economic and decisional disasters, i.e., UK economic failures (English & Kenny, 1999; Ringe & Rollings, 2000; Tomlinson, n.d.), USA’s (Moffatt, 2020) explosive unemployment and industrial crisis, and South Asia’s particularly India’s repeated collapse of Five Year Plans of holistic development. United Nations felt that a more holistic addressing of economic challenges was needed. On December 19, 1961, resolution 1710 (XVI) proclaimed the 1960s as the “United Nations Development Decade.” Besides economic restructuring, increasing growth rate, and eliminating hunger, these newly admitted 19 countries from the developing world were directing world politics toward responsible and accountable role of the state to eliminate illiteracy, hunger, and disease. It started a phase of international collaboration and international responsibility toward world’s problems. *Lack of unanimity and partnership increased vulnerability of both humanity and nature.*

An Argentinian economist Raúl Prebisch, who was at that time secretary-general of UN Council for Trade and Development (UNCTAD), worked on a plan to let the world know that *they share a common future*. He suggested a plan for financial resource transfers to developing countries in the form of official development assistance (ODA). The United Nations adopted resolution 2626 (XXV) and proclaimed the 1970s as the Second United Nations Development Decade. As the world severely plunged into one of the gravest economic crises aggravated by the Vietnam war and then the Yom Kippur war between Israel and the Arab states in 1973, oil prices shot up due to oil embargo imposed by the Organization of Petroleum Exporting Countries (OPEC) and destroyed whatever remained from the first development decade. While this phase was laying the foundation for principles coming 20 years later as the Millennium Development Goals (MDG) and then the Sustainable Development Goals (SDG), world powers lost an opportunity of realizing a common future.

Disasters have never been in any discourse of environmental or humanitarian law despite some of the world's worst disasters causing immense vulnerability, death, and damage. Governments bypassed norms of sustainable development, i.e., need to sync carrying capacity in development, managing scarcity without overextraction and overkill, and lastly a visionary passion for intergenerational and intragenerational equity and justice. Climate change is one such outcome of failed governance. The focus of disaster law is at sources of disasters. Its strength depends on an independent and experienced judiciary which has to provide solutions to damage, losses, and reduced resilience on grounds of equity. It banks upon a state which acts as a public trustee, not an authoritarian top-down enforcer. The idea of development was succinctly revisited by the UN secretary-general in his report on Proposals for Action (E/3631, pv): *At the opening of the United Nations development decade, we are beginning to understand the real aims of development and the nature of the development process. We are learning that development concerns not only man's material needs, but also the improvement of the social conditions of his life and his broad human aspirations. Development is not just economic growth, it is growth plus change.*

Transition of DL from Supernatural Origin to Origin in Governance Decisions

Despite its religious connotations, act of God is repeatedly used in statutory and case laws on disasters. Why were disasters treated as an “act of God”? God is a metaphor used for an all-encompassing, all-knowing, and most powerful supernatural being, but since it is subjectively defined, it inhibits any action on ground to identify, prosecute, and punish the offenders. This proved beneficial to prevent accountability of an apathetic, corrupt, and negligent government in contributing to disasters. The concept was approached for the first time in *Forward v. Pittard* (1785) (1 TR

27, 33.82017, English citation 99 E.R. 953, p. 33) when a carrier caught fire and damaged goods. The question raised by Lord Mansfield was “whether a carrier is liable for the loss of goods occasioned by fire, without any negligence in him or his servants.” He further pointed that there is doubt on the construction of the words “the act of God.” It is something immediate, without interposition of any human cause. He cited examples of a ship lost to tempest or burned by lighting as acts of God but a house burning my negligence or mischance is not an Act of God. In *Fish v. Chapman* (1847), Justice Nisbet carried this forward to identify human act from an act of God and refused to exonerate the transporter from liability for his own negligence or the negligence of agents whom he employs to perform the transportation. The learned judge distinguished the much used “inevitable” in courts in place of seldom used “unavoidable.” The semantic difference between the two words is rarely seen in that the “inevitable” being an act of God. J. Nisbet found that the two phrases mean the same thing. In the case of *Tennent v. Earl of Glasgow* (1864) in which Lord Westbury defined an “act of God” as an event or occurrence born of natural causes without human intervention and described with clarity as the accident occurs “in circumstances which no human foresight can provide against and of which human prudence is not bound to recognize the possibility.” The parameters of act of God could be stretched wider in interpretation therefore in a case *Greenock Corporation v. Caledonia Railways* (1917); Lord Shaw of Dunfermline expressed his dissatisfaction with a definition given in the case to the expression (damnum fatale) or an “act of God.” Some act of God circumstances were mentioned as lightning, storms, perils of the sea, earthquakes, inundations, sudden death, illness, etc. An act of God excludes every bit of human agency and subsequently any liability on the part of a negligent. So the judges expressed that the exception of unavoidable accidents excludes all other exceptions in this case, “*expressio unius est exclusio alterius.*”

In a famous 1868 case of *Rylands v. Fletcher* (LR3HL330), J. Blackburn laid down an important proposition of law, “The true rule of law is that the person, who for his own purposes brings on his lands and collects and keeps there anything likely to do mischief, if it escapes, must keep it at his peril and if he does not do so, is *prima facie* answerable for all damages which is the natural consequence of its escape.” Yet in a court verdict in 1876, a turning point in defining an “act of God” came in *Nichols v. Marsland*. In 1875 case of *Nicholes v. Marshland* (L.R.10 Ex.255), the defendant had a series of artificial lakes on his land in the construction of which he claimed no negligence when heavy rains washed off many country bridges. Since it was reasonably unanticipated, the defendant escaped liability by treating the disaster as an act of God. It became clearer that an occurrence could be classified as an “act of God” only “if it could not be reasonably anticipated or guarded against.” In a follow-up later case of *R. v. Commissioner of Sewers for Essex* (1889), this was explained as being extraordinarily unprecedented and unexpected.

Black’s Law Dictionary defines the act of God as an “An act occasioned exclusively by violence of nature without the interference of any human agency.” “Vis major,” another metaphor for an act of God, is defined as “A greater or superior force; an irresistible force. A loss that results immediately from a natural cause

without the intervention of man, and could not have been prevented by the exercise of prudence, diligence, and care." Fearful of unprecedented calamities, most contracts have a "force majeure" clause to avoid any eventuality of nonperformance due to an act of God. The High Court of Orissa however rejected the act of God argument in an Indian case of Saraswati Parabai v. Grid Corp. of Orissa (2000, AIR). It imposed responsibility upon the Grid Corporation authorities for the death due to falling of an electric pole. Similarly, the Kerala High Court in Ramalinga Nadar v. Narayana Redilier (AIR 1971, Kerala 197) held that criminal activities of an unruly mob cannot be considered as an act of God. In 1997, While elaborating on the act of God, the Orissa High Court in 1997 said that an event which happens not only without the concurrence of the will of man but in spite of all efforts on his part to prevent it. In the case of 2018 floods in Kerala, the High Court of Kerala ensured that procedures, plans, and strategies were followed in management of rains and dams. Interestingly, while business has always wished to hide behind the act of God argument, insurance contracts claim not to provide coverage and indemnification for acts of God such as was seen in contracts during the recent pandemic. So this term becomes relevant in drafting contracts in contemporary times when use of advanced scientific technology such as the artificial intelligence (AI), drones, and databases has high predictive ability about natural disasters. The pandemic has no doubt revived this defense as in the 2020 case of JN Contemporary Art v. Phillips Auctioneers LLC and many others.

Three expressions are strongly providing pillars to the act of God argument to defend causality of disasters, i.e., unexpected, unprecedented, and unanticipated by any human skill or science. Finally, in the case of Transco PLC v. Stockport Metropolitan Borough council (2003) (UHKL 61), the act of God criteria was prescribed as:

- No involvement of human agency
- Which is not realistically possible to guard against
- Which is due exclusively and directly to natural causes
- Which could not have been prevented by any amount of foresight, plans, and care

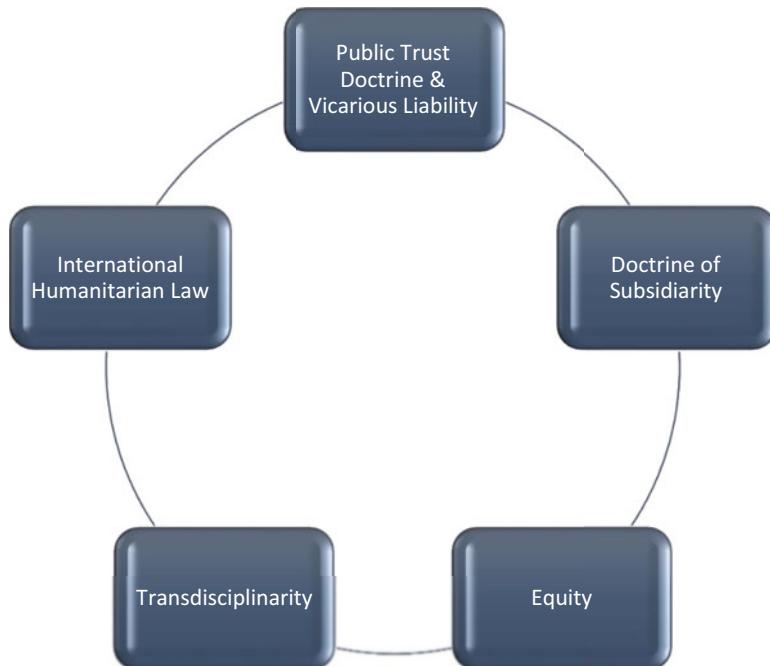

Policy makers have been using an anachronistic framework of decision-making which belied any relief and respect to affected lives and property. DL, as it stands today, is a product of an enlightening intellectual revival at United Nations after the deadly and devastating tsunami of 2004. The United Nations called the World Conference on Disaster Reduction at Hyogo's capital city Kobe in January 2005. The discourse which ensued at this aspiring congregation of nation states revisited often used policy terms such as disasters, vulnerabilities, and hazards which set important levels of action required from governments, people, and technology regimes. Finally, the Hyogo Framework for Action 2005–2015: Building the Resilience of Nations and Communities to Disasters was adopted to provide for focused

and inclusive strategies which reduced vulnerabilities, mitigated hazards, and prevented death and damage in disasters. A new democratic term from ecosystem sciences “resilience” which was somewhat reminiscent of “carrying capacity” used in environmental law to indicate strength and “re-bouncing limits” of environment entered into disaster epistemology. This phrase soon became a plea for sustainable development as perceived in the Sustainable Developmental Goals (SDGs, 2015–2030).

Law arrives when equity and justice are threatened. The way disasters were conceived prevented any progress in the direction of law. Disasters were treated as sudden occurrences beyond human capacity to control (Salmond, 1907), manage, or explain so an “act of God” explanation satisfied most people. Courts have carried forward this narrative woven around the belief that disasters are an act of God. The era of the 1960s was a turbulent phase in social sciences when the UN declared first developmental decade collapsed and the world over movements against government failures in managing economy were rising. The 1968 First Minnowbrook Conference was an indicator that the state could not hide behind a veil of altruism anymore and was being watched for its self-aggrandizing and corrupt practices in public policy decisions. In political economy, a parallel movement was picking up in Virginia School of Economics where James Buchanan and Gordon Tullock wrote *The Calculus of Consent* in 1962 which was to become a seminal text for governance theory which not only brought down curtains over Pigou’s school of thought representing “state as altruistic and public spirited” but also pulled carpets under those who saw state as a saintly relief provider when Gods bring disasters on Earth. What becomes important here is to see that Buchanan and Tullock were the front-runners, in fact initiators, of analysis of law and constitutions on the basis of economics. Thus, the sarcasm that came into writings on disaster management in the phase that followed vociferously attacked state agencies which flew as administrators as angels flew to disaster-affected regions for relief action but in turn immensely benefitted from unaccountable funds received as aid for suffering people in the form of “emergency funding.” (Sainath, 1996).

As natural sciences and life sciences advanced, many erstwhile beliefs in supernatural and divine powers crashed, and simultaneously disasters emerged as a product of negligent, greedy, and corrupt governments. Most disasters such as hurricanes, floods, glacier burst, earthquakes or tsunami were found to be grounded in governance deficits. The “act of God” belief appeared as a shield to protect all those responsible for disasters once science took over disaster studies. It took some time for law to shape up into a clear direction expected of it, and this came up when Hyogo Declaration of 2005 identified “sources” of disaster not beyond administrative action for being sacrosanct and divine but formed the prime area that sought mitigation and preventive action against a likelihood of disaster. Governance deficits and not “divine cause” became the focus of addressing disasters and subsequently a passage to a worldwide demand for legal imperatives against human frailties causing avoidable disasters, death, and damage.

Five Pillars of Disaster Law

Doctrine of Public Trust and Vicarious Liability

Vicarious liability is a concept which is much adored, respected, and recommended to strengthen accountability of administrators for decisions which bring disasters. The "Principal is liable for the acts of his agent, master for the servant and State for its administrators." However, it is yet to become a norm in disaster law for the fuzziness in governance that prevents fixing up responsibility upon decision-makers. This concept is a clear direction to justice dispensation systems in every country to identify those large numbers of disasters which are clearly man-made due to greed, corruption, or desire for political capital and are linked to illegal clearances for use of land, water bodies, river bed, hills, or other public spaces. Some major disasters like floods, landslides, fire, dam burst, oil spill, and subsidence repeatedly strike human and nonhuman habitats, while the decision-maker who caused this calamity goes unscathed. Vicarious liability holds that the person responsible for omission of another person is accountable before law. Under a general tort law, one is held responsible for one's own act but under vicarious liability a person is held responsible for the negligent actions of a third party. This makes the decision makers issuing unworthy orders to ground level implementers accountable for their act

which increases vulnerability to disasters anywhere ie; coasts, forests, mountains and cities. Such decision-makers must be held liable for the acts of others who are their subordinates or their field employees or contractual or outsourced workforce. In an era of globalization and liberalization of government activities, vicarious liability is an indispensable source of fair justice in offshoring and outsourcing of projects. In summary, it is explained in the phrase, *qui facit per se per allum facit per se*, suggesting that “he who does an act through another is deemed in law to do it himself.” This is presumptively and logically established in law as a maxim of “respondent superior” or letting the “principal be liable,” thereby making both the commanding superior and the compliant and obedient junior equally liable for a harmful decision leading to calamitous situations.

Vicarious liability in disaster law is primarily about man-made injury to public goods found free in nature for use by anyone irrespective of class, caste, race, or species such as “the air, the water, the forest and the sea which are all common to the public.” This is the law of nature which takes a doctrinal form in the case of M. C. Mehta v. Kamal Nath and Ors [(1997) 1 SCC 388]. The encroachment of Himalayan River Beas by a tourist company Span Motels Pvt Ltd. belonging to the environment minister was decided on public trust doctrine. This and the polluter pays principle were applied to question and penalize wrongful state decisions which destroy these resources despite being its public trustee. Generally, those many offices which have participated in a combined approval of an otherwise environmentally prohibitive project designs, equipment, and machines tend to go scot-free with impunity. The Apex Court had noted in its judgment that behind the rampant rise of unauthorized constructions in urban areas, there prevailed an “unholy nexus between builders and planners (administrators).” When it subsequently ordered demolition of 40-story Emerald Court project of Supertech Ltd. (*Supertech Ltd v Emerald Court Owner Resident Welfare Association; CA 5041 of 2021, LL 2021 SC 407*) in NOIDA, it also sanctioned prosecution of officials under *Section 49 of the Uttar Pradesh Urban Development Act 1973 and under Section 12 of the Uttar Pradesh Industrial Area Development Act 1976 and UP Apartments Act 2010 for violations*. In the approval of Maradu Apartments (State of Kerala, 2019) in Kochi’s coastal zone area, more than seven government offices worked as a nexus to grant all approvals from land, water, electricity, design, etc., in defiance of the Coastal Regulatory Zone Notifications (CRZ). Law provides for a combined action against several persons joining hands in committing a wrong. Winfield (Rogers, 1984) and Jolowicz (1984) clarify that “persons are said to be Joint Tortfeasors when their respective shares in the commission of the tort are done in furtherance of a common design and there must be a concerted action to a common end.” In *Khenyei v. New India Assurance Co. Ltd. and Ors*, (Civil Appeal No.4244 of 2015) the Apex Court held that the affected party is entitled to sue both or any one of the joint tortfeasors to seek joint action against them. The principle of joint tortfeasors has been well laid out since the Petrie v. Lamont (1841) (*Petrie v. Lamont* (1841) Car & M 93, 96; 174 ER 424, 426). All persons who aid or counsel or direct or join in the commission of a wrongful act are “joint tortfeasors.”

Equity Brought Public Trust as Fly Wheels of DL

In legal philosophy and in the jurisprudential history of law, equity has been the basis of making law more humane, just, and fair and therefore more acceptable and accommodative of diversity and differences. It is embedded in the fairness principle of law standing as pillars of constitutional guarantees for fundamental rights, division of powers and property, etc., so that these rights do not become a plea for injustices, loss of opportunity for others, and unaccountable accumulation. In the absence of equity, any legitimate right may turn into a self-gratifying and acquisitive action. In that sense, equity brings to disaster management inclusiveness principles which reject caste, racism, speciesism, and sexually differentiated people. Equity prevents marginalization of persons with disability, gender, language, regions, and positions. In disaster management, Hyogo Declaration (2005–2010) was the first comprehensive and visible adoption of the principle of equity when it considered preparedness as a greater priority than rescue and rehabilitation. A sensitization toward social exclusion, cultural diversity, and geographical vulnerabilities besides inclusive and efficient governance continued to improve disaster risk reduction. This further advanced in the Sendai Framework which followed the Hyogo Declaration. Equity was like a growing light within disaster management operations and entailed a process of self-realization against systems of oppression which inhibit advancement of inclusive disaster management policies. It also joins hands with natural law to establish a more equitable regime of governance as in other branches of law. Many principles and doctrines which grew within disaster studies came from a sensitized judiciary rather than administration performing a lopsided task of rescue and supplies after a disaster occurred.

Many instances can be given here. In the case of Saraswati Parabhai v. Grid Corp. of Orissa and Others (AIR 2000 Orissa 13), when an electric pole was uprooted and fell on a live wire to cause death, the judge rejected the act of God defense and invoked tortious liability of administrative authorities responsible for the accident. So the change that had transformed since the Crown Proceedings Act of 1947 the dictum of English law that the “King can do no wrong” strengthened and re-invigorated Art 300 of the constitution dealing with the liability of the state in which it could not only sue but also be sued. The Supreme Court had categorically established in the case of Saheli Women Resource Centre v. Commr of Police Delhi (AIR 1990 SC 513) that a sovereign immunity is not available when the state or its officers infringe a person’s fundamental right given under Art 21. Subsequently, a stream of Public Interest Litigation brought out concerns of state dysfunctionalities, corruption, and criminality besides negligence and oversight causing disasters. The case of M.C. Mehta v. Kamal Nath and Ors 1996 brought such embeddedness of governance simply by taking note of the newspaper caption in Indian Express (Feb. 25, 1996) that “Kamal Nath dares the mighty Beas to keep his dreams afloat.” It brought to light the politico-administrative-contractor nexus which brought to light how a private company, Span Motels Private Limited, administration gives approvals for heavy earth movers encroached upon 27.12 bighas of land and a large forest area. The high-powered effort made to divert the course of a mighty

Beas river using crores of public money and power caused a disaster. The Apex Court invoked “public trust” to restrain such surreptitious activities, and validation of this invocation was well brought out through several international judgments and writings.

The “Doctrine of the Public Trust” was forcefully developed by the ancient Roman law about “resources were either owned by no one (res Nullius) or by every one in common (Res Communis)” (Span Motels case 1996). English law accepted only a limited ownership of nature as resources used by all being free in nature deemed to be held in trust by the Crown. This was further explained by referring to an important path-breaking article by a law professor, Joseph L. Sax (1970), from the University of Michigan who is considered one of the chief proponents of public trust doctrine. His defense of this doctrine was in an act of state understanding, “Public trust problems are found whenever governmental regulation comes into question, and they occur in a wide range of situations in which diffuse public interests need protection against tightly organized groups with clear and immediate goals.”

Several issues emerged in the M.C. Mehta v. Kamal Nath and Ors 1996 (Span Motels) Apex Court judgment which highlighted that the state needs to be bound by this doctrine in managing water bodies (in Sacco vs. Development of Public Works 352 MASS 670, the Massachusetts Court restrained the Department of Public Works from filling a great pond as part of its plan to relocate part of State Highway), wet lands (in Robbins vs. Department of Public Works 244 N.E. 2d 577), and protection of recreational natural spaces (National Audubon Society vs. Superior Court of Alpine County 33 CAL. 3d 41). Over the years, respect for equity, fairness, and justice prevailing with the judiciary has transformed an erstwhile nuts and bolts discipline of disaster management into a mission driven, principled, and beyond the call for duty platform to prevent disasters.

Principle of Subsidiarity

The manner in which authority is divided in the management of disaster and risk undertaking forms a crucial point of governing emergencies. Disasters are now a regular feature as climate change, sea level rise, exploding population, and poverty has increased vulnerable communities across the world. The governments have more or less failed to prevent disasters except where local communities were heard in time and action was taken. It is repeatedly being established that an important part of efficient prevention is to stay in communion with local communities, improve local governance to a more participatory and understanding partner, and to synthesize local knowledge into strategic planning.

The principle of subsidiarity may be explained as a devolution to the lowest level of governing structure. It is a kind of percolation of initiatives and precipitation of power to where it should logically be. Just as in science, laws of gravitation cannot be reversed, so in governance power needs to percolate and precipitate downward, not from bottom upward. Authors have repeatedly written about this principle and

have found it of utmost importance in disaster management. The administrative principle of “arm’s length” whereby the party to a transaction is kept at an equal footing of accountability is part of the principle of subsidiarity. This principle has been meaningfully used in contract law to bring greater clarity within the agreement so that it would stand up to legal scrutiny.

This principle is different from decentralization per se as it emphasizes that power should rest at the lowest level and also that the lowest governance level be vested with decision-making unlike the federal or central government as the case is made out to be in most constitutions (Zurita et al., 2015).

This concept of subsidiarity is a fallout of democratization of governance and media when there were more open analyses available in public about disasters in remotest areas. In most cases, it was evident that the local communities had been voicing their concerns about highway constructions, bridge structures, city high rise buildings, dam management, natural waterways, and riverbed cementing. A closed and authoritative government was either evasive of grassroots voices or was treating them as troublemakers protesting unconstitutionally. It is established across the continents that there can be no disaster management if decision-making on disaster prevention are not devolved to the lowest level. This would involve local control over local resources and eventually affect political positions of contesting governments in an election. Therefore, most governments refuse to devolve to this level (Handmer & Dovers, 2013).

The principle of subsidiarity insists on the following requirements as given:

1. Initiatives and power of decision-making should percolate to the lowest level of community governance.
2. Local structures should be the center of constitutional democracy, and effort to make these structures increasingly participatory should be the mandate of disaster management.
3. Local knowledge and heritage resources should be conserved, and local teams of elders should be formed to carry the culture of local knowledge and solutions forward.
4. Capacity building through involvement of nongovernment groups and organizations ought to be working on a sustainable and continuous manner.
5. Appropriate ecological education should be made part of school syllabus.

Many other authors have considered the lowest level of governance in a country as the most optimal level as it leads to appropriate solutions which are cost-effective and easily implementable (Evans & Zimmermann, 2014). However, if this effort lacks even one of the above requirements, this whole effort may get wasted as it happened in India when the epochal legal initiative was launched by the government in the Panchayats Extension to Scheduled Areas (PESA) Act, 1996, which gave the lowest unit of community governance called “Gram Sabha” in areas inhabited by tribal communities special powers and the right to manage their natural resources. Over the years, for lack of other requirements mentioned above, the powerful groups of developers and contractors took over controls to promote central government

agendas. The natural areas shrunk, water bodies leveled, and highways were constructed through protected zones with much more ease than before. Devolution and percolation means that power which the lowest level holds is “weighty” or knowledge laden. This suggests that capacity-building programs, eco-education, and judicial scrutiny by environmental courts (i.e., Green Tribunal in India) on the structural gaps become a mandatory exercise prior to imposition of projects by any upper-level government in that area. Failure of central/federal government to be a good governance Samaritan is a major cause of disasters. Legal remedies demand a synthesis and rationalization of appropriate controls in disaster governance as laid out in Disaster Management Acts of most countries.

Transdisciplinarity

Transdisciplinarity would mean “hand-holding” in ground activities, based upon a belief that when you sink together, no one solution helps but each one ought to use their sectional expertise to save the ship and its passengers. Ironically, this concept has found little attention in emergency governance required during disasters, leading the universe of disasters still under lopsided and limping control of science spewing civil engineers, GIS experts, and environmental scientists. Lately, one can see a stampede of professionals from IT companies, machine learning, and artificial intelligence into disaster management.

“Transdisciplinarity” was first found in the cognitive analysis conducted by the Swiss psychologist Jean Piaget in 1972. Human intelligence is about the nature of knowledge itself which could build capacity and direction to obtain social harmony, community resilience, and base knowledge for larger human welfare. Many other researchers such as Rene Berger (Berger, 1990) and Edgar Morin (Edgar Morin explained transdisciplinarity through constructivist epistemology where social movements lock horns with models and jargons. The reality deconstructs and helps in reconciliation with other branches of knowledge) in the early 1990s reflected on constructivist epistemology to liberate scientific phenomenon from the complex models constructed by scientists and experts. It was the German philosopher Jurgen Mittelstrass who set up university centers on transdisciplinary studies and got the academia and educationists start a dialogue on the need for this approach. Many unanswered questions on legal ethics were aptly undertaken in many ancient works in the Indian subcontinent prior to 1500 BCE (This is a period in which knowledge of the Vedas was compiled within a system’s framework, more as a transdisciplinary literature as Samhitas, the Brahmanas, the Aranyakas, and the Upanishads). Transdisciplinary knowledge was passed on as “words” and “dialogues” [Veda (Veda is a compilation of four books (Rig-Veda, Yajur-Veda, Sama-Veda, and Atharva-Veda), which date back to pre-5000 BCE, the most ancient text from India passed on from generation to generation through talking, reciting, and discussion. Vāda (वाद) refers to “discussion” or “oral words.”)] from generation to generation. The *Vedas*, (Vedas have a transdisciplinary domain in which they answer questions of life and state governance) *Shantiparva* (*Shantiparva*, The Mahabharata

12th Book, translated by Dutta, Manmatha Nath., Elysium Press, Calcutta), *Upanishads*, and the *Samhita (Charak)* found that the source of all knowledge is just one single idea. A work worth mentioning here is the *Mundaka Upanishads* which indicates that access to “dispassionate analysis of a problem” can only come once older load or baggage of information is shed such as a process “that shaves or liberates one of errors and ignorance” (Eduard Roer (1856) *The Brihadaranyaka Upanishad and the Commentary of Shankaracharya on its First Chapter*, translated from original Sanskrit by Dr. Eduardo Roer, Published in *Biblioethica Indica* by East India Company and The Asiatic Society of Bengal, Vol. II, Part III, Nos. 27, 38 & 135, Printed J. Thomas, Baptist Mission Press).

Disaster management advances through new transdisciplinary knowledge such as microdata on pollution, air quality, riverbed and coastal erosion, phytoplankton and coastal vegetation, wild life and green areas, etc. Experts are expected to walk through domains of various knowledge areas without trespassing in vengeance but in a manner of hand-holding. Many best initiatives of governance have come through with courts appointing expert committees to study and present findings. These findings in the form of status of health of natural resources and communities and wild life could bring laws to protect and conserve them in a scientific manner. The compressed natural gas (CNG) that replaced lead-based petrol as fuel in Delhi (M.C. Mehta vs Union Of India And Ors on 5 April, 2002, Writ Petition (civil) 13029 of 1985) or recent laws which banned firecrackers during festive times are an outcome of expert findings on air quality index being highly toxic for human and animal health.

Transdisciplinarity is a continuous discovery of experts and those who are experienced in local knowledge and culture. If governance structures are open and intentions of government are ethically clean, this discovery can act as a firewall against disasters by making preemptive action possible. Law ought to achieve an inclusive and participatory direction of managing disasters.

International Humanitarian Law (IHL)

International humanitarian law protects victims of armed conflicts who become weak, sick, and tortured in confinement due to belligerent party behavior. It restricts the use of violence during war. Therefore, technically, it may not be applicable to disaster victims. However, the main object of IHL is avoidance and prevention of human sufferings, barbarism, brutalities, and inhuman activities. The Hague Convention of 1899 and 1907 paved the way for IHL, but it was the Geneva Convention of 1949 which strengthened a fair humanitarian treatment of victims of war, whether a declared one or an ongoing undeclared warfare.

The international disaster response law (IDRL) is an emerging new area of international law which fills the gaps which are much needed in IHL. An increasing frequency of natural disasters and an increasing number of casualties due to

man-made disasters have drawn the attention of the International Federation of Red Cross and Red Crescent Societies (IFRC) on existing laws, rules, principles, and cultures of different countries to produce a better oversight, regulation, and accountability mechanisms for managing disasters, relief operations, and risk identification through the help of local authorities.

Since international law does not establish any legal protection to victims of disasters and much of it is still based in local laws, it is generally used by national governments to ill-treat minorities and socially excluded caste communities and temporarily suspend many human rights. IHL ought to generate international collaboration and flexibility in international trade and aid provisions during emergencies and relief operations. IFRC has brought forth three key international agreements, i.e., Sendai Framework, Sustainable Development Goals, and the Paris Agreement, to deal with new and emerging crisis linked to climate change and the pandemic.

IDRL is neither comprehensive nor a mature law to be easily handled by national governments. It is also not substantiated by core treaties such as Geneva Conventions and Protocols. However, custom plays an important role in which bilateral expressions on technical and medical assistance, humanitarian relief, and relief distribution between nations play important roles. Regional treaties such as the SAARC Rapid Relief in Natural Disasters (SARRND) of 2011 for South Asia can play a major role in disaster operations toward mitigation. Many regulatory barriers to trade, movement, relief, and rescue and for aid workers to holistically operate on foreign land are the needed requirements of present times. The Tampere Convention of 1998 commits parties to reduce regulatory on export of telecommunications equipment for disaster relief (Bannon, 2008). Besides these bilateral approaches, a need for today is to apply globally binding agreements as well. The UN operations and dominance should provide greater space to international nongovernment actors in humanitarian rescue and relief operations.

IDRL could be a great force if some of the soft laws in the form of declarations and guidelines could be enforceable, i.e., the “Measures to Expedite International Relief,” which was brought about in 1977 by the UN General Assembly and the Red Cross in 1977 and following that the 1981 Resolution 36/225 which called for strengthening the UN’s capacity to respond to disasters and subsequently the 1992 Resolution 46/182 focusing upon “coordination of emergency humanitarian assistance” of UN operations. These efforts gave rise to the Office for the Coordination of Humanitarian Affairs (OCHA) endorsed by the General Assembly in 2002 when it adopted the Resolution 57/150. A new leaf was turned in IDRL toward international urban search and rescue assistance soon after the UN Resolution (GSDRC, 2013).

The international humanitarian law has much to explore in managing oceans, oil operations, international rivers, mountains, and flight operations, most of which work beyond boundaries for causing immense destruction during disasters to all sides of international boundaries. As world closes down with common threats for survival, IDRL needs much strengthening and support from legal scholars and governments.

Conclusions

Disaster law is an indispensable need for managing disasters which are growing in rising quantum of destructive ability as well as in their frequency of occurrences, yet anti-environmental human operations have not yet paused. The focus on DL is to reclaim for the State its primordial role of “a public trustee.” This discipline is increasingly transdisciplinary and judiciary has to rise up to adapt to these changing times. Lastly, scholars in law and social sciences should broaden the reach of international humanitarian law from its current focus of dealing only with “victims of war” to incorporating “victims of disasters.” War, is no doubt a man-made disaster as much as other disasters rooted in greed, pride and politics.

The world can achieve this only by collaboration and knowledge exchange within regions and in international forums. The handbook section on DL aims to bring together legal scholars to help fill these unidentified gaps in DL.

Abstract

Regulators across the world are entrusted with the task of formulating regulations to help governments in improving economic growth, promoting social welfare and protecting the environment. Regulations can range from legal restrictions, contracts, co-regulation to certifications or accreditation and social regulations such as norm-setting. A disaster of any kind may affect the direct or indirect functioning of a regulator. In times of a disaster, the regulators are faced with unique challenges to ensure free play in the market with its limitations due to the extraneous circumstances.

In the wake of the current pandemic situation, Indian regulators have reacted and modified their approach in unique ways. For e.g., the Securities and Exchange Board of India (SEBI) immediately posted the outbreak of the COVID 19 pandemic, took early cognizance of the volatile markets and initiated measures in forms of relaxations for almost all kinds of markets, market participants and intermediaries. IBBI has suspended initiation of insolvency operations

for a whole year with special focus on MSMEs. Post disaster challenge lies in designing clear, coherent, and efficient regulations, to effectively implement them continually and evaluate them for their appropriateness, relevance and impact. This chapter strives to delve into the space of regulators' response in stabilizing the economic markets and other aspects in times of a disaster. In analyzing the issue at hand, the chapter puts a spotlight on the power sector and analyses the possibility of creating a shift to create more sustainable and environment friendly practices. The synergies between current practices and adoption of green energy that are fast tracked in the pandemic era are also examined in the chapter.

Disaster · Regulators · Pandemic · Market · Regulations · Green energy

India's power sector is one of the world's largest and most complicated. And it has seen a dramatic transformation during the last several decades. Almost all citizens now have access to energy and electricity generated through power. Installed renewable energy capacity now accounts for a third of overall capacity and the country's power shortage has been considerably decreased. The power sector played an exceptional role in the pandemic world when the need for household electricity was at its peak and all and sundry were using electrical means to communicate. The electricity sector in India is heavily regulated. Electricity is a concurrent list subject i.e., both the Centre and the States regulate the various aspects of electricity. Being a concurrent subject there is a federal dimension to the sharing of power and responsibility between Centre and States. This is reflected in the structure of electricity regulation in India. The Central Electricity Commission regulates tariffs for generating companies owned or controlled by the Central Government, those with an inter-State dimension, and those concerned with inter-State transmission of electricity. The State Electricity Regulatory Commissions (SERCs) regulate tariffs for generation, supply, transmission and wheeling of electricity within the States.

The alacrity of the pandemic caught all sectoral regulators by surprise and threw the regulatory spaces into a completely new arena where instant resolutions were required even on policy related matters. The Covid-19 Pandemic disrupted the growth and development of the electricity sector at several stages. The pandemic led disaster pushed governments all around the world to impose a state of emergency & lockdowns. The Indian government also followed suit and imposed a complete lockdown across the country. All commercial activities were halted (OECD, 2020). As a result of the lockdown and other limitations imposed by the government, many people were unable to leave their homes, resulting in a significant reduction in energy usage from the national grid (Elavarasan et al., 2020). In such scenario, new electricity patterns emerged and many new issues arose in the electricity sector that were never thought of earlier and needed to be handled in a unique and previously unimagined way. During the pandemic, there were unprecedented changes in the patterns of power demands from both domestic and commercial users. With the exception of some essential

commercial activities, everything else was shut across the nation. As a result, energy demand from industrial and commercial consumers decreased dramatically. On the other hand, there was an increase in the household demand, particularly during the lockdown's early stages, since work-from-home was getting adopted as the new normal. It was hence observed that, a sudden shift in lifestyle has drastically boosted household power consumption while simultaneously reducing its demand in commercial activities, affecting the national energy demand profile. For example - Roads and airports were almost vacant, stores and restaurants were shut, and industrial activity was essentially halted globally as a result of these regulations. In the initial days, from March 25 to May 20, 2020, a rigorous lockdown was implemented across India too, resulting in a huge reduction in power demand, ranging from almost 20% to 40% (Aruga et al., 2020). The impact of this consumption gap on India's power sector comes in the form of financial obstacles for majority of electricity distribution companies (discoms) as the Electricity Regulatory Authority of India assures that household consumers are charged a lower price than commercial consumers, which is sometimes even below the average cost of supply (Electricity Act, 2003). A huge gap was created in the power generation side due to the lack of demand for electricity. In the aftermath of the same, there has been much thought and deliberation on effective ways of reducing the distress of the power sector. The pandemic has given an impetus to thought and deliberation in this field.

The financial burden on discoms in India is a pressing issue and it needs to be addressed urgently. The most effective solution to this intense problem is transition of energy from non-renewable sources to renewable sources. The silver lining that the COVID-19 pandemic brought with itself was that it pushed and encouraged the government to look beyond their current energy production sources (which heavily depend on coal) and shift to renewable energy sources. The focus on diversifying energy resources and promoting renewable has put renewable energy in the momentum of replacing coal, which dominates more than half of India's energy sector (Parajiyia, 2021). As a result, despite the current crisis, India remains dedicated to its objective of becoming a greener nation, with the energy sector playing a significant role. This is in sync with the United Nations sustainable development goals which are an environmental parameter for all countries. While the Covid-19 crisis has been the most devastating disaster that humanity has faced in recent years, this lockdown has impacted India's energy sector both negatively and positively. The possible change in energy transition to renewable and supply has resulted in a number of scenarios that may be efficiently utilized and provide significant insight to regulators and stakeholders. In effect, in the wake of the pandemic, the future roadmap for the India's growth trajectory has been mapped and set.

The COVID-19 Disaster and the Scenario of Green Energy in India

India is the world's third-largest energy consumer. Global energy consumption also has increased since 2000, with the majority of demand being met by coal, oil and solid biomass (Outlook, 2021). It is estimated that India would overtake China as the

world's most populated nation in the coming years and as a result, it is expected that India's energy consumption will grow at a rate faster than the country's overall energy production. To fulfill this demand-consumption gap, it will become necessary to add an energy system to its current system to fulfill the future energy demand which will rise over the next 20 years. Another key issue that will be addressed by this adding on of new energy system is that the pandemic and its aftermath may temporarily reduce emissions due to reduction in the demand for coal and oil, but that does not get India much nearer to its long-term sustainable development agenda and vision of a greener nation.

Several aspects of India's energy system are highlighted by the coexistence of shortage and excess. Despite having the world's fifth largest coal reserves, it is still one of the world's largest coal importers. However, the coal sector's grip on India's power industry seems to be decreasing, particularly in the wake of the Covid-19 pandemic, and the latest coal crisis has turned the attention to renewables. The energy sector has encouraged a significant spike of renewable energy sources with solar power leading the way (Sharma, 2021). During the Covid-19 lockdown, which began on March 25, India saw its energy consumption drop by about 30% (Covid, I. E.A, 2019), with coal generators facing the brunt of the impact. The pandemic induced lockdown had imposed significant hurdles to the energy sector's supply and value chain. For example – Inadequate and costly power plants were requested to either stop generating and remain on hold, or limit their production, due to lower energy demand levels. The adoption of renewable sources of power generation was strengthened during the lockdown (Pyper, 2021). At this juncture, it is important to mention the remarks of Sunil Dahiya, an expert at the Centre for Research on Energy and Clean Air who stated that "*before pandemic, there was a strong indication that coal will not drive future energy development, and it will be pretty much driven by renewable.*" The pandemic gave the world and energy generating bodies to pause and take stock of the possibilities of power generation through cleaner sources other than coal. In this context, India has a good chance to accelerate the shift from coal and more toward renewable energy sources (Pathi, 2021).

This acceleration can be seen by the fact that despite the numerous obstacles brought on by the pandemic, the renewable energy sector had tremendous growth in 2020. While the world was battling a rapidly declining economy during the crisis, global renewable energy capacity addition increased by 45% in 2020, the biggest growth in a decade and has been steadily doing well even in 2021 (Parajiya, 2021). According to the International Energy Agency's (IEA) report, it was predicted that India might develop twice as much green energy capacity in 2021 as it did in 2020. Additionally, even when the worldwide energy consumption was predicted to fall by 5%, renewable power generation was expected to increase by 7% (due to long-term contracts, priority access to the grid and continuous installation of new plants) (Renewables – Fuels & Technologies – IEA, 2020).

However, while the use of renewable energy sources and consumption has increased significantly, so has the use of fossil fuels. According to the report (Global Status Report, REN21; Murdock et al. 2021), even a small rise in renewable capacity over 2009 levels would significantly raise the sector's overall challenging task to

adopt renewable in terms of a tremendous upfront cost, subsidies of fossil fuels, a lesser supportive framework, available resources, and technological solutions. As a result, the development of Solar PV has been amazing; the resource potential is immense, the expectations are lofty, and governmental backing as well as technical cost reductions has quickly made it the most cost-effective solution for new power generation (International Energy Agency (IEA), 2020). The Jawaharlal Nehru National Solar Mission (JNNSM), sometimes known as the National Solar Mission (NSM), was launched in India in 2010. It was the first time that the Indian government has focused on promoting and developing solar power. By 2022, the plan aims to have installed a total of 20 GW of capacity. On August 20, 2019, the government announced that it would aim for a total of 300 GW of solar power by 2030. A compound annual growth rate (CAGR) of roughly 59% has been recorded in India's solar sector from 2011, increasing from 0.5 gigawatts in 2011 to 55 gigawatts in 2021 (Garg & Gulia, 2022). According to the latest data, India is presently ranked fifth in the world in terms of installed solar power capacity, following China, the United States, Japan and Germany. Further, in order to achieve ultimate leading position, the government should implement steps to address internal difficulties such as safeguarding of duty, tax management, and so on, in addition to attaining raw material independence. Moreover, for the past several years, renewable energy initiatives in many parts of the world have driven new power generation capacity expansions and have progressively outperformed fossil fuels. So, when it comes to the integration of renewables into the grid, India has always been a forward-thinking country. The economic consequences of the pandemic are widespread, and the renewable energy sector in India is no exception. Furthermore, it is also no longer associated with high-cost solar energy. Small-scale renewable energy power plants have become more affordable, stable, and efficient in recent years. Renewable energy is therefore considered as the way of the future, and it can provide India with what it requires.

Problems Faced by the Energy Sector During Covid-19

The Covid-19 situation has thrown a twist into attempts when it comes to addressing several crucial problems in the power sector. Such as, there has been a shortage of consistent power for many users; a continuous dependence on solid biomass, mostly firewood and poor air quality, which has put Indian cities among the world's most polluted. Many things have changed in India and in the world of energy, but the Covid-19 epidemic has created more damage to the industry than any other event in recent history. For years to come, the consequences will be experienced in India and around the globe. India's energy consumption was set to rise by roughly 50% between 2019 and 2030 before the pandemic, but it is now closer to 35%, or even estimated as 25%¹¹.

Moreover, India was suffering from the severe effects of rising health, economic, and social issues during the second phase of Covid-19. Meanwhile, India's power system was being put to the test as the nation confronted with the extraordinary

health and economic crises brought on by Covid-19. Hospitals and citizens relied on steady power, therefore the power sector's resilience became crucial. Simultaneously, India had one of the highest energy consumption reductions in the world, with Covid-19 causing power demand to drop by 28%¹¹ by the end of March 2020 (IEA, 2020). Power consumption from hospitals, critical services, and residential sector increased during the extreme lockdown and growing Covid-19 cases whereas industrial demand and commercial activity decreased significantly.

Remarkably, India's energy sector has shown exceptional resilience in the face of global financial and commodities market turmoil, with supply holding up remarkably. This has, however, come at a price. As roughly a third of the world's population remained at home, energy consumption fell substantially. According to estimates from KPMG India, demand for energy commodities fell by 25–30% during the lockdown (De, 2020).

When most states in the country cut power supplies due to lower demand, The Ministry of New and Renewable Energy (MNRE) had already assigned renewable energy projects as must-run energy sources (Parikh, 2020) (meaning that power generated from renewable sources must be prioritized over others), dramatically increasing renewable energy's market share. During the crisis, the government identified power generation, particularly from renewable sources, as an important commodity. Public utilities like transmission, and distribution were also classed as important services, ensuring that services were not disrupted. If the benefits of the lockdown are continued throughout, the landscape of the Indian energy sector might be fundamentally transformed (Verma, 2020).

As a result of the Covid-19 epidemic, India's energy sector players have put their institutional capabilities and financial resources under considerable strain. Many of the state-owned utilities relied on government aid and subsidies to run their businesses. In addition, there's the matter of who owns what. Public ownership of the energy sector puts it at risk for political sensitivity because the government plays multiple functions, including owner, operator, and regulator. Institutions that lack self-determination and adaptability are more likely to be undermined in times of crisis. Attempts to withdraw the government from these operations have been made in the past, but they have been inconsistent and ultimately unsuccessful. Hence, in the case of India it can be said that the Covid-19 crisis hit the nation at a time when transition to green and sustainable energy was becoming increasingly urgent and necessary.

Nevertheless, some of the current reforms could have had a positive influence on the energy system and lead to a cleaner energy shift. India needs to fulfill its energy demand for a green energy transition and be financially and infrastructurally strong in order to obtain capital. Though the Covid-19 might have worsened the sector's current financial and infrastructural existing problems, this crisis along with the government's response, seems to have the potential to contribute to energy sector reforms in over a decade. Moreover, the energy sector has perhaps the most crucial infrastructural constraint, if not supply-side, that the Indian economy faces. India has made significant efforts in developing the renewable energy scenario, particularly since the Paris Agreement.¹¹ Despite this, considerable obstacles exist, such as a lack

of infrastructure and an inadequate knowledge of the sector. The Covid-19 situation has only contributed to emphasize India's deteriorating infrastructure, which is in dire need of renovation, and while it is doing so, it may benefit from a green boost too.

The impact on the regulators can also be seen from the key cases that were taken up by the tribunals/courts to solve pandemic related issues. One such key case is ***Sprng Renewable Energy Private Limited v. Central Transmission Utility of India Limited (CTUIL)*** (Sprng Renewable Energy Private Limited v. Central Transmission Utility of India Limited (CTUIL), 525/MP/2020 dated May 23, 2022.). In this case Sprng Renewable Energy Pvt. Ltd., a wholly-owned subsidiary of Sprng Energy Pvt. Ltd. (SEPL), had requested that the Central Electricity Regulatory Commission (CERC) deny a request by Sprng Renewable Energy Pvt. Ltd. to waive its transmission fees, open a letter of credit (LC) for PoC charges, and reject a default notice sent by Sprng Transmission Utilities (CTU) due to a force majeure and change in law event that occurred.

The facts of the case are that on 05.02.2018, Sprng Energy Pvt. Ltd. (SEPL) allotted 300 MW of wind capacity under SECI's 2000 MW RFS. Letter of award (LoA) for the project was issued on 01.06.2018. Subsequently power purchase agreement (PPA) was signed with an effective date from 30.08.2018. Accordingly, the initial scheduled commissioning date (SCOD) turned out to be 29.02.2020 after 18 months from the effective date of PPA. Further petitioner applied to CTU for ISTS connectivity and long-term access (LTA) for evacuation of 300 MW wind power. Stage-I & Stage-II connectivity at Pugalur (existing) ISTS substation was granted by CTU from effective date of 12.07.2018 and 31.10.2019 respectively. Subsequently transmission service agreement (TSA) was signed between petitioner and CTU. Long Term Access (LTA) was granted by CTU to the petitioner from 30.11.2019 till 29.11. 2044. Petitioner submitted a bank guarantee of Rs 5Cr for transmission agreement. Sprng Energy Pvt. Ltd. (SEPL) requested repeated extension of scheduled commissioning date (SCOD) on account of various challenges and impediments which were out of responsible control of the petitioner.

The commission identified three issues and resolved the same. They are:

A. What shall be the date of commencement of LTA of the petitioner?

As per the signed LTA agreement, CTU opened LTA for 300 MW wind capacity from 30.11.2019. Commission noted that LTA agreement has no clause with respect to date from which supply under PPA is anticipated or alignment of such date with LTA start date. The Commission further observed that PPA & LTA agreements are entirely different and distant agreements. Thus, petitioner's prayer for requirement of LTA start date with extended SCOD is rejected.

B. Whether the Petitioner can claim any relief on account of Force Majeure and Change in law events faced by the Project as claimed by the Petitioner?

Commission observed petitioner did not claim any of the time extension based on change in law or force majeure event in terms of signed PPA clauses. SECI allowed time extension of commissioning date based on different government of India & MNRE notification. Thus, in view of the fact that the petitioner never

invoked the provision of Force Majeure or Change in law event, petitioner cannot claim any relief on account of Force Majeure event.

- C. What shall be the liability of the petitioner for payment of transmission charges for the period before COD of its Project?

Commission observed that as per this Regulation, waiver from payment of transmission charges and losses is available for generation based on solar and wind power resources for a period of 25 years from the date of commercial commissioning date. There is no provision for exemption from transmission charges and losses for generation based on solar or wind power resources before the date of commercial operation of such generation projects. Therefore the regulation clearly states that till the generating station has achieved commercial operation, the responsibility to pay transmission charges shall be of the generator. Accordingly, petitioner shall be liable to pay transmission charges for the delay of its project in terms of the 2010 Sharing regulations and the 2020 Sharing regulations for the respective applicable period.

Further commission observed that as the petitioner has already achieved the COD of its project for the full capacity and is availing the waiver of transmission charges, any specific direction on opening of LC is not required.

Therefore, the electricity sector has been battling with financial management and due to payment delays by the State Discoms it has been witnessing bankruptcy of big generation capabilities. Pandemic and lockdown issues have been unique and destructive and are threatening to push an already moribund sector over the top. **In light of the lockdown's precipitous escalation**, the industry has demanded financial assistance in order to alleviate its current restrictions.

Possible Actions Taken by the Government

As elaborated in the previously, how over-production, low consumption and fluctuations were directly impacting the power sector as a whole and this indirectly raised questions upon the regulators as they are the ones who are primarily responsible for the smooth management and stability of the sector in disruptive times or extreme situations.

It is pertinent to note that any real endeavor to reform the energy sector must focus on four priorities: (a) boosting fuel availability by closing the demand-supply gap; (b) addressing energy price through periodic tariff revisions; (c) introducing regulatory reforms; and (d) assuring improvements such as lowering distribution losses, among others. To make headway on any of these, the concerned authorities must go beyond policy and regulatory changes and must also seek to address the challenge of political collective action too (Necoechea-Porras et al., 2021). As a result, deregulation and private engagement in electricity generation and distribution, fuel exploration, as well as advancements in public utility efficiency have been advocated as standard solutions to the problems arising in the sector. Several technical evaluations, on the other hand, oversimplify the problem and do little to address it effectively. Further, as this sector seeks to double India's renewable energy capacity by 2030 the clean energy shift

should also emphasize numerous variables, including clean air, resilience, and economic and social justice, now more than ever, while getting the economy back on track (India can increase, 2021). These obstacles are anticipated to have an impact on demand for clean and renewable energy, making the transition in India's energy sectors more difficult. Transforming each issue into a potential driving force, can help India's economy recover and become more robust by leveraging renewable energy.

Response of the Power Sector Regulators to the Pandemic Disaster

Ministry of Power (MoP)

On March 25, 2020, the MoP released a notification:

- Designating the operation of power generation utilities as a vital service and granting them authorization to move any supplies they would require during the nationwide lockdown. On designating electrical power transmission as an essential service and mandating the continuity and availability of the transmission network for maintaining service during the nationwide lockdown. .
- The MoP issued an Order on March 27, 2020 saying that power may be scheduled even if the PSM is formed for just 50% of the amount for which it must normally be contractually established. On March 28, 2020, the Ministry of Power (MoP) issued instructions to the Central Electricity Regulatory Commission (CERC) to:
 - (a) grant Discoms a 3-month moratorium before making payments to generating companies and transmission licensees; and (b) specify lower Late Payment Surcharge rates (LPSC). Additionally, the MoP asked the state governments to give the state electricity regulatory commissions similar directives (SERCs). On April 6, 2020, MoP made the following clarifications:
 - The requirement to pay for electricity within 45 days of the bill's presentation or in accordance with the terms of Power Purchase Agreements (PPA) remains in effect.
 - The LPSC will only apply at a reduced rate from 24 March 2020 to 30 June 2020, and after that date, it will be payable at the rate specified in the PPA/Regulations. This only applies to payments that become past due between 24 March 2020 and 30 June 2020; it does not apply to payments that were past due prior to 24 March 2020.
 - The responsibility to pay capacity charges and transmission fees in accordance with the PPA will continue.

Ministry of New and Renewable Energy (MNRE)

- On March 20, 2020, MNRE instructed all agencies responsible for carrying out RE projects to treat any delay resulting from a disruption in supply chains brought on by the coronavirus's spread in China or any other country as an FM event and, as a result, to grant suitable extensions for the scheduled commissioning dates (Time extension in Scheduled Commissioning of RE Projects. Grid Solar Power Division (2020, March 20). *Ministry of New and Renewable Energy (MNRE).*).

- The MNRE published a notification on March 26, 2020, identifying the operation of RE power generation utilities as vital services and granting authorization for the movement of materials required by them during the nationwide shutdown (Essential operation of renewable power generation utilities. Grid Solar Power Division (2020, March 26). *Ministry of New and Renewable Energy (MNRE)*.).
- ‘Must Run’ status for RE generating stations:
 - On April 1, 2020, MNRE published an Office Memorandum (O.M.) confirming that the ‘Must Run’ status of renewable energy (RE) generating stations remains intact and that RE generators should be paid on a regular basis, as was the case previous to the nationwide lockdown (Clarification regarding payment to Renewable Energy Generating Stations (REGS). Grid Solar Power Division (2020, April 1). *Ministry of New and Renewable Energy (MNRE)*.)
 - On 04 April 2020, MNRE published an O.M. in continuation of its O.M. dated 01 April 2020, clarifying that the ‘Must Run’ classification of RE generators remains unaltered and that any curtailment for reasons other than grid safety would be considered deemed generation (‘MUST-RUN’ for Renewable Energy Generating Stations. Grid Solar Power Division (2020, April 4). *Ministry of New and Renewable Energy (MNRE)*.).
- On 01 April 2020, MNRE decided that the billing/invoicing for RE generating stations shall continue as follows (Invoice for Renewable Energy (RE) supplied: instructions regarding. Grid Solar Power Division (2020, April 1). *Ministry of New and Renewable Energy (MNRE)*.):
 - Invoices may be accepted through email where billing is handled by a Regional Energy Account or a State Energy Account, and the due date must be determined in accordance with the PPA; Invoices may be accepted by email in cases where billing is handled via Joint Meter Reading (JMR) and JMR is available. In cases where lockdown prevents JMR from being signed, an invoice produced by a RE generator using a meter reading may be approved. For newly commissioned operations, Discoms may opt to pay on the basis of the invoice from the previous month, if it is lower, or, in the alternative, on the base of the invoice for same month of the prior year, if it is lower;
 - Within 15 working days on the date the lock down is lifted, all RE developers must produce hard copies of invoices for any necessary adjustments, if any, from the following bill.

Clearly, the regulators took a pro-active role during the pandemic and tried to anticipate all the de-tracks and control them by issuing timely notifications and orders. Despite the regulators’ efforts, the lockdown continues to be a severe problem for the power industry in India and around the world. The power sector was impacted by changes in the industry’s financial models. It is typical for producing companies in the thermal power sector to pay upfront for inputs like coal and then wait 60–90 days to get the money back from Discom, the distribution utilities.

Therefore, renewable energy is already a major part of the global energy mix, and utility companies are taking steps to incorporate or enhance their use.

Rise in the Renewable Energy Sector During Covid-19

Ernst and Young's Renewable Energy Country Attractiveness Index (RECAI) measures the attractiveness of the world's top 40 countries for renewable energy investments and implementation. Focusing on the energy revolution's primary driver, renewable sources of power, India was rated fourth among the top 40 nations in the RECAI 2020 version. In comparison to the previous editions of the rankings, India has moved up to fourth place from seventh (as of Nov, 2020) (Renewable Energy Country Attractiveness Index (RECAI), 2021).

Similarly, The Covid-19 shutdowns in India temporarily switched the power mix to renewables, and the sector as a whole is now looking at alternatives to achieve a long-term net-zero foreseeable future. When the Covid-19 pandemic restrictions were eased, there was a glimpse of the future, especially of what the energy market would look like in the future, with lower electricity consumption and the operation of solar PV and wind power plants, as well as lower tariffs. Covid-19 related supply chain issues and project shutdowns, as well as increasing major risks, contributed to a 70% decline in New PV capacity installations during the very first half of 2020 as compared with the preceding 3 years (Solar PV – Renewables 2020 – Analysis - IEA). Nevertheless, the percentage values have steadily increased over time. Furthermore, the recovery from the Covid-19 outbreak offered a chance for the Renewable energy sector to improve. There are undoubtedly obstacles in the near future, but renewables have shown to be strong, adaptable, and are well prepared to embrace the opportunity and meet the difficulties that may arise in the future.

Power generation capacity from renewable energy (RE) has grown by more than five times since 2010, with the total installed capacity now at 90.39 GW (as of November 2020). 38 GW and 37 GW of installed wind and solar photovoltaic power production capacity are now available. More than 80% of the capacity for renewable energy-based power generation comes from these two sources (Kumar, 2021a). In their recent renewables market update (2020)¹³, the International Energy Agency (IEA) predicted that India would be one of the biggest contributors to the renewables uplift in 2021, with annual installations almost doubling since 2020. And, as of October, 2021, in the 57th EY Renewable Energy Country Attractiveness Index (RECAI), India has climbed one position to third place. The same can be found in the figures below (Figs. 1 and 2).

In addition, following the Covid-19 outbreak, India's solar sector is predicted to grow significantly, with solar PV generation expected to surpass coal before 2040 (Singh & Gupta, 2019). The Indian government's policy aspirations have accelerated this remarkable shift, resulting in solar PV becoming the region's most cost-competitive power source, which is only becoming better with time. According to research by IEEFA (Garg & Trivedi, 2021), renewable energy investment in India is increasing again after a pause in the previous financial year due to the Covid-19 crisis. Increased investment within India's renewable energy infrastructure is being boosted by recovering energy demand and a rise in bank and financial institutions pledges to quit fossil fuel financing (Vibhuti, IEEFA 2021).

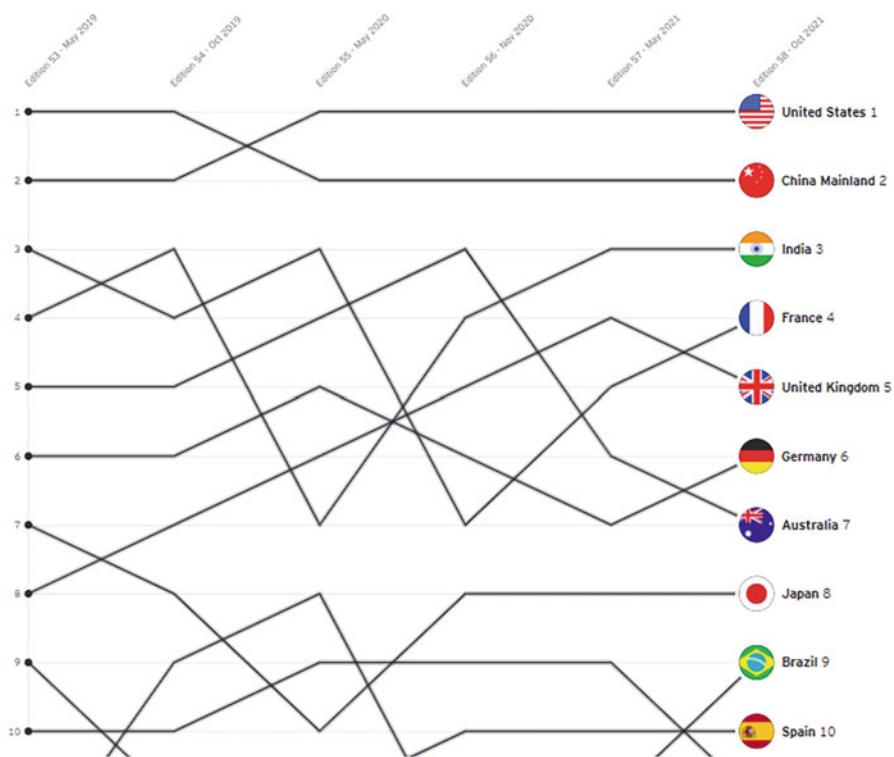

Fig. 1 EY Interactive Chart - Top 10 Ranking & Index score¹⁹

Rank	Previous rank	Movement on previous Index	Country/region	Technology-specific scores (0-100)							
				Onshore wind	Offshore wind	Solar PV	Solar CSP	Biomass	Geothermal	Hydro	
1	1	●	US	72.8	58.3	59.8	57.9	46.3	43.3	46.3	39.9
2	2	●	China Mainland	70.7	54.8	56.8	60.2	53.9	50.8	28.3	54.3
3	3	●	India	70.2	54.3	28.8	62.4	49.6	45.1	25.1	46.2
4	5	▲	France	67.4	54.8	51.9	53.1	22.7	45.9	39.0	40.6
5	4	▼	UK	67.3	57.1	61.4	46.5	14.8	54.1	28.7	38.7

Fig. 2 RECAI - Renewable Energy Country Attractiveness Index, EY¹⁹

Power from wind and solar generators is becoming more affordable at an alarming rate, which is helping to propel the worldwide clean energy revolution. International firms have also increased involvement in renewable energy auctions, allowing for more efficient and competitive tariff discovery. Other policy concerns include priority grid connections, transmission support required for wind and solar power providers, and renewable purchasing responsibilities. India is also moving away from pure solar and wind tenders and toward hybrid RE auctions that comprise solar PV, wind, storage and stranded assets for thermal power generation. This shift is taking place over time. Covid-19 did not stop India from selling an additional 8.2 GW²⁰ of PV capacity by the end of September 2020, broke the previous year's total

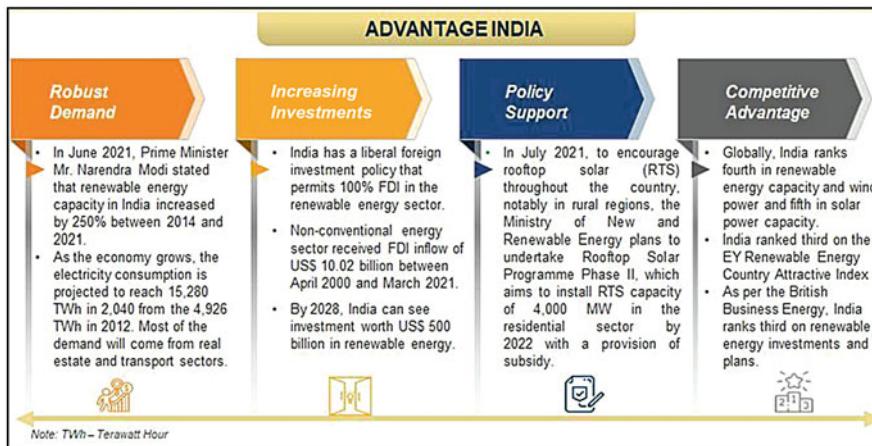

Fig. 3 Growth of Renewable Energy Industry in India: Infographic, IBEF (2021, December 16) (IBEF Infographic. <https://www.ibef.org/industry/renewable-energy/infographic>)

and resulting in continuous tariff reductions. In spite of this, pricing reductions will continue (Fig. 3).

The Solar Energy Corporation of India (SECI) and the Indian Renewable Energy Development Agency Limited (IREDA) will be given enhanced funding as mentioned in the Union Budget 2021, allowing for a greater emphasis on renewable energy (Highlights - Budget 2021–22 Provisions for Renewable Energy (RE) Sector. (n.d.). mnre.gov.in). In addition, the budget highlighted the launching of a comprehensive National Hydrogen Mission to produce hydrogen from renewable sources, which is a positive step. Several infrastructure-related efforts, such as the establishment of a Development Financial Institution for debt financing and the establishment of a central asset management organization to take over distressed assets, will have a significant impact on the electricity and renewables sectors. When considering India's renewable energy sector in the near future, policymakers should also take note that climate change issues are a much greater threat to the country's economic growth ambitions than the present pandemic's shocks.

Conclusion

The implication of Covid-19 crisis on the energy sector and shift to renewable energy transition is complicated, and it will remain so in the foreseeable future. While India's greenhouse gas emissions have decreased for the first time in four decades as a result of lower fossil fuel usage due to lower demand in the energy, industrial, and several sectors, coal continues to hold a large portion of India's energy demands. As a result, India should design a policy framework to address the increasing issues of economic growth and fulfilling energy demands while also

ensuring environmental sustainability for a smoother green transition. In addition, as pollution levels have decreased in many locations, post-Covid 19 India may see an increase in environmental awareness (Kumar, 2021b). Thus, the pandemic pushed India to improve its capacity to keep security of supply, increase system flexibility, and integrate better its energy software and hardware for effective readiness in the face of imminent threats to energy security, as stated above.

India is re-entering a very dynamic period of energy expansion while attempting to recover from the Covid-induced depression of 2020. When it comes to climate change, the mounting intensity that is pushing the global reaction has become a key issue of discussion currently. As a result of India's relatively minor contribution to global greenhouse gas emissions, a change in strategy from the country is much needed (Narain, 2021). Hence, energy-intensive sectors are implementing energy-saving strategies to reduce carbon emissions. As more nations adopt net-zero goals, the renewable sector's future appears optimistic. This might lead to market revolution and cut the cost of renewable technologies even further.

It was estimated that it will take at least 5–6 months for energy consumption to return to pre-pandemic standards. Hence, creating demand during pandemic times was also one of the government's primary priorities during this recovery phase. A lot of steps were taken in this direction and this has not only helped the sector to recover more quickly, but it has also assisted India in its long-term energy demand rise and transition (India's power consumption, 2021). Aside from the level of demands, the sector's financial inadequacies have been exposed during this pandemic. Distribution Companies, or Discoms, the weakest link in the value chain, have been experiencing growing financial difficulties and funds shortages. As a result, the power sector's financial issues are expected to have a substantial influence on the industry's situation of investment in the future. There will be an increasing amount of renewable energy generated by generators as well as by consumers, which will put further strain on electricity distribution companies (Aggarwal et al., 2021).

Likewise, there are several important issues that must be addressed as India attempts to restore its economy which raises the question, Can India continue to grow/expand in the same carbon-intensive, and unsustainable manner, or will it be feasible to shift to a low-carbon, and renewable economy? Hence, it will be desirable for a country aspiring for a \$5 trillion economy (How embracing renewable, 2020) to integrate its policy and expenditure with social, economic, and environmental components of sustainable development for such energy transition.

The following are some of the significant policy possibilities for transition of India's energy mix toward greater renewable energy adoption:

- (a) It would be crucial to incentivize renewable energy generation through subsidies or rate reduction while also limiting the use of fossil fuels.
- (b) Financial resources and instruments such as Green bonds would be appealing to investors, as governments have started emphasizing a green recovery from the Covid-19 crisis.
- (c) For the energy transition to renewables, the government might also encourage investment in cleaner energy sources and implement necessary institutional reforms.

Although these transitions are tough under any conditions, they are especially complex in India's energy sector because of its specific dysfunctions and complicated energy sector. Stronger reform on the other hand seem to be a distant reality unlikely, given the country's politically influenced power sector and its current struggles. Deeper changes in India's energy sector are thus required to assure the energy sector's long-term prosperity. India's history for energy reforms demonstrates that the country is far too huge and varied for a one-size-fits-all strategy (Turning Around the Power Distribution Sector – NITI Aayog (2021)). External insights, institutional frameworks, and new technologies would be needed, however they will not be enough to achieve India's energy sector's transformation. Both the central government and the state government would have to participate and work together. The government of India's support for the Atma Nirbhar Bharat project to promote renewable energy production demonstrates that India is prepared for a greener and sustainable future. Clearly, a decade of adjustment and development awaits the Indian electricity sector. A decade ago, India's renewable energy development was exciting, and Prime Minister Narendra Modi's steadfast goal of 450GW has kept the pace going. Since the release of the Peripheral Services Market regulation and Market-Based Economic Dispatch (MBED), there have been encouraging developments. A market-based approach to procuring power will allow new assets like batteries and demand response to contribute in delivering grid services, and it will enable the least expensive, clean energy to be procured.

These achievements show the Indian government's determination to upgrade the network and improve the sector's operational and financial performance by embracing new business opportunities and clean energy portfolios.

During this shift, India's distribution businesses (discoms) may play a pivotal role to the sector's future. The Indian cabinet's recent approval of a Rs. 3,00,000 crore electricity discom reform scheme demonstrates the significance of discom transformation efforts. Indians have a chance to benefit financially, operationally and environmentally by adopting renewable energy portfolios. The long-term dividends of a discom recovery powered by clean renewable energy portfolios will be realized in the sector's journey toward a clean energy transition.

Discoms are generally considered as a tool to increase overall sector efficiency, however privatization is not always a panacea for increasing performance. As of recently, the central government has stated that it intends to delicense distribution networks and enhance competitiveness among distribution companies so that businesses can contend to supply power through same grid infrastructure and consumers could choose the supplier who offers them the finest quality combination (Singh, 2021).

Suggestions

India's power sector, which is at the heart of the country's economy, is in dire need of more comprehensive reforms to the country's power market.

There are numerous benefits to tighter cooperation between all key parties, including the discoms, the system and grid operators, as well as the regulators through the Central Electricity Regulatory Commission, as demonstrated by the Covid-19 issue. Important power market reforms will not be successful without increased cooperation at the national, regional, and state levels.

Therefore, keeping the same in mind a few key areas to work upon has been suggested which is consonance with the IEA's India 2020- Energy Policy Review. They are:

I. BANKING ON COVID-19 ACTING AS A CATALYST TO BOOST THE POWER SECTOR RESILIENCE: The pandemic has pushed India's power market reforms forward, which have been in the works for some time. Discoms are at the vanguard of change, especially in the struggle against the pandemic, in electricity grids, and in the inclusion of variable renewables. Government must guarantee that distribution sector management is adequate to handle these issues and safeguard the industry's financial and physical resilience so that this can be accomplished efficiently. Despite the necessity of a recovery package, structural reforms are just as critical. Electricity tariff modifications can be an effective economic stimulus. As part of the Make in India initiative, they plan to boost industrial demand while also supporting small and medium-sized firms and manufacturing in the country as a whole. Using the UDAY program as a foundation, a recovery program for the electrical sector currently includes tasks for discoms to continue to cut their losses, ensure high-quality and dependable power, improve invoicing, and support digital payment options. As part of a recovery package, additional procedures must be established to guarantee that any rescues promote long term investment and an economically beneficial future.

II. REFORMING THE ELECTRICITY TARIFF SYSTEM:

A cost-reflective tariff and direct subsidy system are among the improvements praised by the IEA. The electricity industry, on the other hand, has yet to put these principles into action. Even little changes can have an impact: Instead of paying discoms price subsidies for residential customers, India's governments should look at two options: limiting cross-subsidization from industrial demand and providing direct transfers from state budgets for needy consumers.

Because of the high cross-subsidy surcharges, industry has already let go of the grid in many situations and instead has resorted to autonomy and market pricing. A lack of infrastructure and inadequate market reforms imply that development with a view to competitive electricity supply from exchanges is still restricted in India. As part of the recovery package announced in May 2020, the central government requested large public firms to give discoms with cost rebates that will be handed on to industrial consumers.. Energy prices can also help to assess the possibilities for India's energy efficiency, competitiveness and leadership in exporting.

Discoms in India have enormous and diverse customer bases, as well as significant financial obstacles, because of the country's unique demographics. State budgets do not lose money by making direct grants to the most

disadvantaged households and by simplifying power pricing for everyone. As a starting point for state governments and regulators, the government should issue new recommendations for tariff systems across the country.

III. DEVELOPING A MECHANISM OF PAN-INDIA WHOLESALE ELECTRICITY MARKET TO EASE OUT THE BURDEN OF DISCOMS:

The national grid of India is a collection of regional grids. This is reflected in the market and system operations. POSOCO utilizes a multi-tiered system, with one national dispatch center, five regional dispatch centers, and 33 state load dispatch centers. With the exception of renewable energy, the most of India's power generation occurs at the regional and national levels. Although interstate trade and liquidity have improved, power purchase costs have not. The primary goal of power trading is to exchange auxiliary services in order to keep the coordinated system stable (deviation settlement mechanism). Today, wholesale electricity transactions account for just 3% of all electricity sales.

India's power exchange is widely expected to improve trade efficiency, but liquidity is dispersed across a variety of goods and platforms. To diminish state market domination, international experience from the United States and the European Union suggests that regional trading over wider market areas can be facilitated by transmission and system operators. To meet demand in the most efficient and cost-effective way possible, a wholesale energy market based on standard criteria for dispatch and transmission capacity would be ideal.

Abstract

This chapter is designed to assist community leaders with what to expect when operating in the disaster recovery space. Local place-based community organizations, such as not-for-profits and non-governmental organizations, are pivotal to building the resilience of their communities. Although not established specifically for disaster response, the day-to-day activities of these community organizations have provided them with an unmatched understanding of their community and its needs. Following a disaster, they do not require lead-in time to familiarize themselves with the community due to already delivering essential services and the local presence of their existing operations. Frequently, they already managed

groups of trained volunteers. As such, these leaders have high levels of expectations placed upon them to assist in disaster recovery. Despite these expectations, their organizations typically remain underfunded and there is little recognition by government authorities of the actual and potential contributions they are able to make. In 2013, fires swept through the Blue Mountains NSW, destroying over 200 homes and damaging many others. Local community leaders found themselves operating in the recovery space without being linked into the official emergency management processes. When the Black Summer bushfires swept through Australia's eastern states in 2019/20, these community leaders knew what to expect, had developed various approaches to previously identified issues, and could capitalize on networks made with emergency services. Our research has informed the development of two generic guides to assist community leaders to prepare for working in the disaster recovery space. Informed by lessons learned and presented in an easy-to-adapt format, these guides are designed for uptake by local community leaders in any region.

Local community organizations · Community leaders · Preparation · Disaster fatigue · Resilience · Guide · Emergency

Introduction

Over recent decades, Australia has experienced a series of significant disasters in the form of droughts, flooding, bushfires, and pandemic. These crises have impacted individuals and whole communities, as well as the community organizations that serve them. These recent disasters have taken a heavy toll on community leaders because they are affected at multiple levels: as individuals living in a disaster-affected community and as leaders of their community service organization. As individuals, people in community leadership positions may find themselves and their families in life-threatening situations. At the same time, these leaders are responsible for keeping their service operational, collaborating with other community services, other communities, and emergency responders. Community leaders in the context of this chapter refer to individuals who are responsible for the oversight of an organization or a section of an organization in either a volunteer or paid capacity. They generally have oversight of other workers and/or programs. Thus, this chapter focuses on community leaders and their responsibilities concerning their personal and professional engagement in disaster management and, in particular, in disaster recovery.

Disaster literature includes knowledge about the resilience of individuals and how they deal with preparing for and recovering from a disaster. In addition, it is known that planning for service continuity is a core activity for leaders of local community organizations. However, there is very little by way of kits, guides, or advice for local community leaders to inform them of what to expect, personally, in terms of

demands for knowledge, time, and capacity, in the event of a disaster. Furthermore, at a more collective level, the phenomenon of communities experiencing collective fatigue after having experienced an overlapping series of crises has just begun to be acknowledged and addressed (Ingham et al., *in press*). Recognizing disaster fatigue as a phenomenon that affects how people perceive, react, adapt, and make (or do not make) decisions is paramount for people in leadership positions operating in a disaster-affected community.

The purpose of this chapter is to draw attention to the development of two distinct guides. One guide assists community leaders to prepare themselves as individuals for working in the disaster recovery space. The other guide helps community leaders identify collective disaster fatigue. Together, these guides are intended to be understood against the background of the institutional development and responsibilities of disaster management in Australia. We consider anyone who manages five or more people, in either a volunteer or career capacity, to be a community leader.

Disaster Management in Australia

In Australia, politics, decision-making, and operational tasks are regulated by law at various levels of government. The overarching Commonwealth Government is the peak policy body. In the context of disaster, the Australian Commonwealth Government provides support to the states and territories when requested, usually in the form of financial assistance. Beneath the Commonwealth Government sit the State and Territory governments. Each takes responsibility for a wide range of disaster-related activities, including the “primary responsibility for the protection of life, property and the environment within the bounds of their jurisdiction” (Elphick, 2020, p. 3). Subsidiary to the State governments, there is a multitude of local governments whose role in disaster management is to manage local disaster operations; this includes planning for local natural hazards, bridging communications between emergency services and the community, and overseeing and financing the various socioeconomic costs of recovery at a local level.

The 2003 Canberra bushfires and Cyclone Larry in Queensland in 2006 highlighted the importance of community-based facilities for recovery management, which includes both emergency services and local government agencies (Eyre, 2004; Gordon, 2004). The concept of “shared responsibility” (Council of Australian Governments, 2011; McLennan & Handmer, 2014) and joint involvement of the community sector and emergency services in emergency management have been favorably commented upon in several reports, including the Victorian Bushfires Royal Commission (Parliament of Victoria, 2009), the Queensland Floods Commission of Inquiry (2012), and the Keelty (2011) Report on the Perth Bushfires 2011. Despite this affirmation, Australia’s three levels of government lead to an unclear distribution of responsibility and unwieldy rules and regulations. In a large-scale disaster, this can be detrimental, particularly at the community level. This situation is also observable in countries with a similar sociocultural context, such as in New Zealand, where, after the earthquakes of 2010–2011 in Christchurch, many

residents felt personally disempowered. In contrast, community-led reconstruction measures were viewed more positively (Redshaw & Ingham, 2015). Firmly anchored in the community, community organizations were able to set up activities with other community organizations and manage local projects. These kinds of community connections create social support networks and participation opportunities that are demonstrated to increase the morale of the community.

In Australia, despite what one could regard as an excessive level of government, there are many community needs that no level of government takes full, if any, responsibility for. To address this gap, many volunteer, private, and not-for-profit organizations have arisen to take up the challenge of meeting community needs not fully addressed by government bodies. These organizations, while frequently having a national governance structure or a loose affiliation across regions and other organizations, are largely focused on small local communities both in terms of recruitment of volunteer and funded staff and in terms of the people whose needs they serve. Their funding is uncertain and largely community-based, and their leadership is comprised of selfless individuals of remarkable spirit and capacity. Because these groups are in contact with the most vulnerable members of the community on a day-to-day basis through the provision of services and assistance, they are well-positioned to be called upon by official recovery operations to provide essential assistance when the community is threatened by and recovering from disaster.

The Role of Neighborhood Centers in Disaster Management

Community groups include neighborhood centers and other organizations that provide a wide range of family and community services. From a historical perspective, local community services had their origins in the 1960s and 1970s. Various movements influenced the rise in community development, such as the second wave of feminism and other social reforms (Australian Neighbourhood Houses and Centres Association, 2011; Lyons, 2001; Rooney, 2011; West End Community House, 2011). Before 1970, most social services and health and leisure facilities were in the hands of religious or charitable organizations (Lyons, 2001; Rooney, 2011). Rooney (2011) emphasized the difference between local community services and previous models of service. Local community organizations were compared to religious institutions in the community and included community development and self-determination aimed at social justice. Local community organizations continue to pursue similar goals today. The Local Community Services Association (2009) and the Australian Neighbourhood Houses and Centres Association (2011) identify with shared values, such as social inclusion, community development, local participation, community management from the bottom-up, and grassroots work with the most disadvantaged and socially isolated community members. These neighborhood organizations are a crucial part of the social infrastructure at the local level as centers that can be quickly adapted to meet new requirements (Izmir et al., 2009). Despite their importance, many local community organizations are limited in their sources of

income to provide services; nearly 60% of neighborhood centers have an annual income of less than \$250,000 and 52% do not employ full-time staff (Australian Neighbourhood Houses and Centres Association, 2011). Also, most of the funding for local community organizations comes from government sources, much of it through competitive funding processes (Australian Bureau of Statistics, 2015).

Neighborhood centers have in-depth knowledge of their community, often foster well-trained networks of volunteers, and employ people from the community where they can. Neighborhood centers are regarded as taking care of the “neighborhood” as a small parochial physical locality, as well as the “community,” which comprises a larger number of neighborhoods (Redshaw & Ingham, 2017). In particular, neighborhood centers in NSW are commissioned by the Department of Family and Community Services to build networks within communities that enhance community welfare. While some of these community organizations have associations with emergency services, they are unfortunately often overlooked in the official local disaster planning mechanisms and processes. However, effective participation in emergency planning is an important contribution to strengthening the well-being of a community (Redshaw et al., 2017).

In the Australian context, neighborhood centers play a central role. Their overriding task is to reduce social and financial disadvantage, and to increase the capacity of the community (Ingham & Redshaw, 2017a). Some claim that neighborhoods have declined in importance because people are often away from home due to employment and other activities, which take advantage of increasing mobility. As a result, it is suggested that neighborly contact is less important and has been replaced by social networking via electronic media (Beck, 1997; Crow et al., 2002; Sennett, 1998). This is an important consideration as disasters generally require a place-based response and recovery effort.

Shared Responsibility

At the time of the 2013 fires in the Blue Mountains, there were no formal links between the local community and the local emergency services. The Blue Mountains are a peri-urban regional area to the west of Sydney, NSW. It includes 27 villages, has a population of 80,000, is heavily forested, and depends on tourism. The villages span a 100 km mountain ridge. There is one main traffic axis through the Blue Mountains, creating a particular challenge in the event of a disaster. Risks include road closures and power outages, which are usually the result of bushfires or severe storms (Ingham & Redshaw, 2017b). In 2013, fires in the Blue Mountains destroyed over 200 homes. Local community leaders initially worked in the recovery arena without being included in the official emergency management response and recovery operations. In contrast, during the 2019/20 Black Summer bushfires that swept through the eastern states of Australia, the local community leaders knew what to expect and had plans in place for their client group and liaising with emergency services.

The 2013 recovery experience illustrates how the two sectors of emergency management and community services can find a common operating procedure for working in disaster planning and recovery. Before the 2013 fires, the two groups had very little awareness and understanding of each other, and the move toward cooperation constituted a major paradigm shift. Ingham and Redshaw (2017a) examined possible difficulties in connecting the local community and emergency services and issues that required resolving to re-envision the role of emergency services in the community. This is a challenge in Australia because emergency management activities are not uniformly regulated and there is still great potential for improvement. Part of the paradigm shift is, for example, getting away from the perception of an emergency service organization as a rescue service and the local community as a passive entity awaiting "rescue." To change this situation, the National Strategy for Disaster Resilience (Council of Australian Governments, 2011) was developed. It mandates that communities as a whole should work toward "shared responsibility." Such a paradigm shift is difficult to make since rescue services have paramilitary origins and adopt a hierarchical structure for decision-making. This is in direct contrast to the participatory and collaborative approach of the community sector, which, based on their collective beginnings, tends to make decisions based on collegial principles of cooperation and service.

Furthermore, it has been shown that the flow of information plays a central role in managing emergencies. Information sharing is the most effective when all community members receive the same message (Schraagen & van de Ven, 2011). People in the community sector commit a lot of time to discussing and reaching a consensus on issues of importance. On the other hand, the emergency service representatives found such consultation to be an excruciating time-taking process. In addition, differences in organizational priorities made collaboration difficult; some focused on physical and structural issues associated with the restoration of properties while others concentrated on psychosocial aspects of recovery. Hence, it took time to develop a common operating approach.

The National Strategy for Disaster Resilience (Council of Australian Governments, 2011) and the Emergency management Australia handbook 6: Community engagement framework (AIDR, 2013) address the central question of who is responsible for the disaster resilience of the community. Both documents argue for "shared responsibility" and encourage local communities and emergency services to work together in building local disaster resilience. Such a shift, which ostensibly aims at building more disaster-resistant communities, can be explained against the background of the increasing frequency of major catastrophic events. Furthermore, there is potential for cost reduction if the resilience of communities can be increased through the use of unused social resources (Islam et al., 2012). Transferring responsibility for well-being and resilience to individual local communities is expected to result in improved recovery after disasters (Gil-Rivas & Kilmer, 2016; Madsen & O'Mullan, 2016). This involves activating local organizations and volunteers from different walks of life and can lead to public savings (Oliva & Lazzeretti, 2018).

Within Australia's national policy, volunteers are expected to play an increasingly important role in disaster management and recovery. Activating local volunteers,

however, means engaging in volunteer recruitment, training, and management at the community level. In the case of disasters and emergencies, a large number of volunteers are usually required very quickly, either through formal agencies or informal spontaneous undertakings. Traditionally, volunteering is an ongoing commitment to a particular community. The reality of recent disaster events has shown that volunteering tends to shift toward short-term commitments based on existing community skills and networks. In Australia, it is also noticeable that in times of crisis individuals with strong local networks and local knowledge, such as community leaders, are very effective in arranging volunteering (Ingham et al., 2021).

The next section elaborates on what personal preparations community leaders should consider before a disaster occurs.

Personal Preparation Guide for Community Leaders

People in community leadership roles are involved in disasters at both the individual and the community level; therefore, they need to make personal as well as professional preparations. During the 2013 fires, community leaders were called on to engage in disaster recovery without prior incorporation into the local formal disaster management processes. Some community leaders involved in the 2013 fire incidents in the Blue Mountains had to cope with personal family trauma and disruption at home, and then uncertainty at work, whilst daily driving through devastation and destruction to get to their workplace. At work, they spent all day with disaster-affected people before traveling home again through burnt-out streets. This constant exposure substantially increased their trauma.

To learn from this experience, the research examined the practice of these community leaders (Ingham et al., 2021). In general, community leaders are perceived as strong, reliable people who know what to expect in an emergency. After all, their services target people in distress, facing homelessness, domestic violence, and so on. However, very little research concentrates on the personal resilience of community leaders suddenly thrust into the disaster recovery arena. Additionally, very few arrangements are put in place to enable the community leaders to meet the additional demands that they are called upon to address, even though working in disaster recovery raises not only their workloads but also increases their stress levels. For this reason, ongoing research is directed at establishing what local community leaders need to increase their preparedness and ultimately enhance their human capital for working in disaster recovery (Ingham et al., *in press*).

Table 1 presents a guide designed to assist local leaders who want to prepare strategies for themselves so that when disaster strikes they are in a position to take care of their well-being as well as that of the community. The guide is intended to be “workshopped” individually or with a group of local leaders. The list is not exhaustive and within different cultural settings the issues raised may vary in level of relevance. Community leaders are encouraged to use the guide as a basis for identifying the issues and challenges, including additions to this list, that are most relevant to them. Once the issues within a given context are identified, the suggested

strategies can be adapted, or alternate strategies devised concerning the particulars of a specific situation. The overriding goal is to have community leaders begin to think about the personal challenges that they will be confronted with in the event of a disaster and to assist them to prepare so that their effectiveness in working on behalf of a community under stress will not be diminished.

The guide (Table 1) consists of seven issues presented in the left-hand column. The guide provides for each issue a list of challenges, preparation strategies, and outcomes, and is intended to be adapted and extrapolated by everyone who uses it. For example, in terms of personal well-being, the challenges for community leaders may consist in maintaining an adequate balance between personal and family time and community needs. The strategy of “establishing a modus operandi for unscheduled events” can be effective to deal with the challenge. This may lead to a workable strategy to manage the various dimensions of personal and professional life.

To complement the importance of community leader readiness at the individual and professional level, the phenomenon of disaster fatigue at a community level is presented in the next section. Informed by community leader experience in the Blue Mountains, this section looks at an affected community after a disaster from the perspective of the community as a whole and considers Community Disaster Fatigue criteria. These criteria are presented to assist community leaders to identify the onset of disaster fatigue at their worker and client group level.

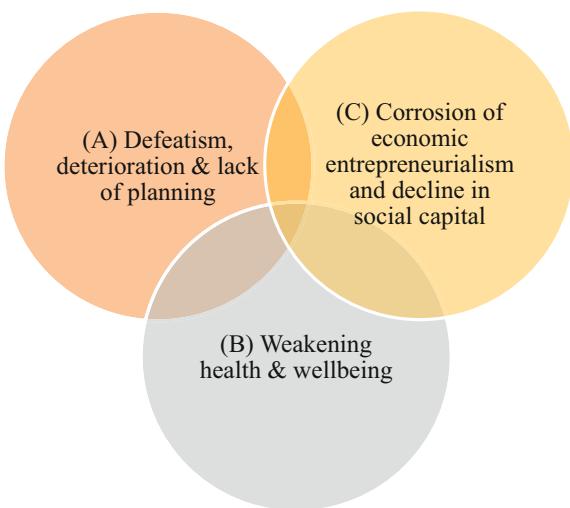

Community Disaster Fatigue

Disaster fatigue in a community affects how the community perceives, reacts, and adapts to risk and makes (or does not make) decisions and the quality of the decisions themselves. Complex disasters, for example, often lead to conflict in decision-making. In general, it can be said that household preparedness and evacuation planning is the priority of most official communications from the emergency services and increasingly, from community organizations. This messaging prioritizes a focus on physical property preparation and evacuation planning for household members. Very little attention is paid to psychosocial preparedness for disaster. The phenomenon of community disaster fatigue is introduced as an explanatory factor for the failure of a community to recover and move forward following a disaster or series of disaster events. It encompasses not only the community's ability to establish and maintain a resilience to adversity through appropriate disaster management structures, but also an apparent numbing of both its social (including health) and economic (or business) activities that can see all aspects of community atrophy and result in community stagnation.

When investigating a community that has experienced a disaster, one has to go beyond an individualized viewpoint focusing on people who experience fatigue or post-traumatic stress disorder (PTSD). Such an individualistic understanding falls short when diagnosing a crisis-affected community because a community as a whole is more than the sum of its residents. Disaster fatigue at the community level is a macro-phenomenon that manifests itself at the community or region level and must be formally defined as such, and not at the individual level (Ingham et al., [in press](#)). Hence, this is about community disaster fatigue on a collective level. Failures at this collective level due to the unresolved state of complex disasters can have long-term negative effects on the community and its ability to plan constructively for its health, economic, and social needs. For example, disaster fatigue in a community can slow down its potential redevelopment or even prevent changes in health, economic, and social practices that would be necessary to move forward from a crisis event.

Investigating the nature of a community and its organizations under “normal” circumstances, communities are usually dynamic structures and constantly adapt to changes and new issues. Thus, a healthy community strives to continuously improve and grow its standard of living. In this way, a healthy community builds its capacities by striving for social goals and the integration of different groups to achieve positive growth and adequately deal with failures (Zautra et al., [2008](#)). This natural process can be interrupted or even reversed by catastrophic events. Most of the time, communities can respond to such disturbances, defend themselves, and continue on a constructive path. To be able to deal better with disasters, it is necessary to move away from seeing disaster and resilience as something event-centered and instead to use a process-centered approach. Such a process-oriented approach makes it possible to understand resilience as something that improves the quality of life in a community, as people are connected, and thus social capital can grow (Elliott et al., [2010](#)). The challenge for a community going through a series of catastrophic events is that it must deal with preparing for the next catastrophe before it has sufficiently recovered

Fig. 1 Components of community disaster fatigue in community (Ingham et al., *in press*, p. 4)

from the previous one. In addition, disaster events can differ greatly from one another and therefore require very different responses from a community (Ingham et al., *in press*). Hence, crisis-affected communities can show signs of community disaster fatigue. Defining and investigating the signs of stress and fatigue in a community has significant implications for national, state, and local government officials and emergency services personnel tasked with dealing with a new disaster. When people in a community whose houses have not yet been restored from the previous catastrophe, whose businesses or livelihoods have not yet recovered and whose neighbors are still in need, where children are only just going back to school, and social life is still blocked or is severely disturbed, dealing with a new disaster becomes difficult and one can speak of collective disaster fatigue.

Figure 1 depicts the concept of community disaster fatigue. The three issues identified of (A) defeatism, deterioration, and lack of planning; (B) weakening health and well-being; and (C) corrosion of economic entrepreneurialism and decline in social capital, are components of community disaster fatigue. Each is an issue that, when present, the community must address, targeted solutions are usually available for each. However, the presence of two of these components increases the complexity of recovery as the solution for one problem may not be appropriate for the other and, indeed, practical solutions for any one problem may be ineffective when the problem is found in combination with one of the others. When all three issues combine, the community may simply abandon any effort at recovery as it lacks the resources to deal with this level of complexity. Overall, a community's disaster fatigue manifests itself on a collective level through the collapse of resilience. While a healthy community exhibits collective strength in mental health, well-being, and socioeconomic strengths, a complex disaster can disrupt the cohesion of a community and weaken its resilience. As a consequence, domestic violence can rise after a

Table 2 Collective indicators of disaster fatigue (Ingham et al., *in press*)

Lens through which disaster fatigue was viewed	Collective indicators of disaster fatigue
<i>Defeatism, deterioration, and lack of planning (A)</i>	<p>Dissatisfaction with disaster risk governance in terms of recovery progress, resulting in group protest causing disruption</p> <p>Lack of response by the community</p> <p>Increasing levels of unemployment</p> <p>Communities lacking focus or purpose</p> <p>Declining ability and opportunities for community-based initiatives; reduced participation in regional and state-level decision making</p> <p>Increased demands on police and other public officials</p>
<i>Weakening mental health and well-being (B)</i>	<p>On a collective scale known as public health</p> <p>Increased demand for various mental health and community support services</p> <p>Mistrust of other communities fed by social distancing, e.g., not wanting tourists to visit as they may bring COVID-19</p> <p>Reduction (either temporary or permanent) in organized social activities</p> <p>Widespread nonparticipation in organized activities</p> <p>Collective trauma and helplessness (Chang 2017; McFarland and Norris, 2006)</p> <p>Collective complicated grief</p> <p>Extra burden on social and community support services</p>
<i>Corrosion of economic entrepreneurship and decline in social capital (C)</i>	<p>Waning production in local businesses</p> <p>Dissolution or a prolonged hiatus of previously active community groups</p> <p>Lack of safe housing (Gearhart et al., 2018)</p> <p>Lack of community networks and social support (Gearhart et al., 2018)</p> <p>Suboptimal decision-making due to poor information flow and time pressure</p> <p>Increased political polarization</p>

disaster (Gearhart et al., 2018). Individual needs arising from the breakdown of social relationships then place an additional burden on community support services. In this respect, the increasing demand for social services can serve as an indicator of disaster fatigue in the community.

Research on the fires in the Blue Mountains in October 2013 led to the creation of a Community Disaster Fatigue Guide. The study of leaders involved in the fires in the Blue Mountains informed the list of collective indicators of disaster fatigue displayed in Table 2 (Ingham et al., *in press*, p. 13). These indicators can be used to determine whether a community is in a state of disaster fatigue. Table 2 is intended to provide an initial checklist for community leaders and people involved in community decision-making so that they can recognize signs of disaster fatigue in their

community at an early stage and take steps for its management before it becomes unmanageable.

Currently, many community organizations within the Blue Mountains include building individual and community resilience as a part of their core business. They do this in the knowledge that a community that is resilient in daily life is also more resilient during and after a disaster. Consequently, community services deliver disaster preparedness programs and consider them integral to core business instead of it being “an ‘add-on’ activity” (Ingham & Redshaw, 2017a, p. 59).

Discussion

Research demonstrates that in disaster management individuals, community services, including volunteer organizations, and the community as a whole are strongly interconnected (Ingham et al., *in press*). Community leaders are particularly challenged because they are affected by a disaster at all levels: in their personal lives as an individual community member, as the head of a crisis-affected community organization, and in their collaborations and networking with other communities and state and federal agencies. On the individual level, people in a complex disaster situation are looking for guidance to get through the crisis. At the same time, community leaders and their organizations face high expectations to help their communities with disaster recovery. Such community organizations, however, tend to remain underfunded and the real and potential contribution they make is poorly recognized by the government agencies. On a community level, a disaster remains in the collective memory of a community for a long time in the form of “memories, the memorials and the evidence of burned houses, blackened landscapes and empty cleared blocks” (Ingham & Redshaw, 2017a, p. 62).

It has been recognized that building resilience in daily life as a complement to building resilience for disasters requires an integrated approach. However, the “current climate of rather short contracts and funding limited to recovery processes with an ‘end date’ fails to recognise the integrated nature of such connections in building resilience during daily living and the flow-on effect into disaster resilience” (Ingham & Redshaw, 2017a, p. 61). Therefore, the concept of recovery as an endpoint needs to be questioned as recovery should be something that is continually evolving with the constantly developing community.

So far, the important differences between the ways community organizations and emergency services operate have been discussed in terms of hierarchy and decision-making. As a result, it is suggested that a common operating picture needs to be established before a disaster, as heralded in Australia’s National Strategy for Disaster Resilience (Council of Australian Governments, 2011). A recommendation, therefore, consists in the integration of disaster risk reduction into the “core business” of community organizations through the establishment of partnerships and a working relationship with local emergency services organizations in-between disasters. Such joint local disaster planning initiatives on the community level strengthen the connection and commitment of the various stakeholders. To capitalize on the local

knowledge of community leaders, community leaders require recognition from their emergency service partners and the provision of appropriate training and funding from the government.

Conclusion

Both the Personal Preparation Guide and the Community Disaster Fatigue Guide have been developed from research with one community; however, they are intended to be applied to other communities. These other communities can be both within Australia, and indeed in an international context, as the issues confronting community leaders when facing devastating events may bear many similarities. However, even in situations where the community context may be very different, each guide presents a methodology to be adopted and applied, taking account of the local context, to ensure that the universal issues of leader vulnerability and community fatigue are addressed and dealt with so that the impact of a disaster can be, to that extent, limited.

Resilient community leaders are integral to the recovery of their community; thus, the implications of the Personal Preparation Guide and the Community Disaster Fatigue Guide are far-reaching in terms of preparing and retaining community leaders for the long-haul task of community recovery. Implementing these guides will help ensure that the impact of a disaster on them personally is minimized, thereby increasing their efficiency to continue operating efficiently and effectively on behalf of a community in need.

Learnings for investigations about the past show that there is a need to clarify the roles and responsibilities of community organizations and emergency services in times of disaster. In addition, a community preparing for, responding to, and recovering from a disaster should be recognized as a fully involved entity, not something that recovery operations and emergency services “work on” and then disappear from. And finally, the financial and human cost to the community services sector should be taken into account when they are called upon to assist with government-provisioned surge capacity demands involving community organizations.

Abstract

Disasters expose underlying weaknesses in systems and processes. When the dispute resolution framework is not set up to be robust in “normal times,” it is inevitable that the entities tasked with dispute resolution will fail to cope with the enormous increase in disputes after a disaster. Lengthy delays in resolving disputes leave a trail of destruction and exacerbate the suffering of the victims. At worst, the failure of the dispute resolution system may “become the disaster” affecting the physical and mental health of claimants on top of their economic loss. This has broader implications for the community and society as a whole. This chapter briefly explores some of the problems that arise when post-disaster disputes are not resolved effectively and efficiently, drawing on lessons learned from New Zealand’s 2010/2011 Canterbury earthquake sequence.

Introduction

Efficient and effective dispute resolution in the aftermath of a disaster is a key factor in the resilience of a society and its recovery. The specific context for such dispute resolution varies across jurisdictions, but the key problems remain the same: delays in economic recovery, uncertainty about long-term plans for victims, and the psychological inability to “move on” (see, e.g., the many longitudinal studies around the long-term impact of Hurricane Katrina; Galea et al. 2008). It is notable in particular that although medical evidence seems to suggest that the psychological impacts of a disaster can fade swiftly (Rubonis & Bickman, 1991), when the economic and social consequences linger, so do the psychological impacts (Lima et al., 1987). Delayed dispute resolution is therefore a serious impediment to disaster recovery.

For this reason, the experiences of Aotearoa New Zealand provide both lessons for this jurisdiction and for the wider world. Eleven years on from the Canterbury earthquake sequence of 2010/2011 and 7 years after the “Kaikoura earthquake” of 2016, for many victims of the disaster the event has not concluded. A significant number of disputes, particularly relating to insurance claims, are still ongoing which impacts on recovery. Clearly, the existing framework for resolving these disputes has not worked well. This is not a controversial point. One of the key findings of the Royal Commission into how the main earthquake insurer dealt with disputes was that “dispute resolution was ineffective which had a significant detrimental impact on claimants and the region’s recovery as a whole” (Public Inquiry into the Earthquake Commission, 2020, part 6, pp. 186–194).

This chapter briefly explores these issues with a focus on insurance and the responses developed in Aotearoa New Zealand, before placing them in the context of disaster law and recovery more generally.

The Aotearoa New Zealand Insurance Context

The Canterbury earthquake sequence, which began in September 2010 and continued for over 18 months, was to become the largest disaster in post-war New Zealand history. As such, it provided the biggest test for New Zealand’s unique post-war approach to disaster insurance. In response to several significant earthquakes during the period 1929–1942 (the 7.8 magnitude Murchison earthquake in 1929, the 7.8 magnitude Napier earthquake in 1931, and the Wairarapa earthquakes – two of greater than magnitude 7 – in 1942), a National Disaster Fund, financed by levies paid by New Zealand residents as part of their home insurance policies, was established in 1945 (EQC, n.d.-a). The fund continues to this day and is managed by the Earthquake Commission (EQC), a Crown entity (a public body, independent

of government but part of the state sector), which provides insurance to residential property owners affected by natural disasters (of any sort) for the first NZD 150,000 of their claim. At the time of the earthquakes, EQC paid the first NZD 100,000 of the claim and the balance was covered by the private insurer. That amount was increased in 2019 to NZD 150,000 by the Earthquake Commission Amendment Act 2019, and in October 2022 it is set to rise again to NZD 300,000 (see Clark, 2021). The fund was established to encourage private insurers to remain in the New Zealand market, an aim that has been largely achieved. For this reason, despite the fact that New Zealand has significant hazard risk, it retains a high level of insurance cover in the event of “natural” disasters. Up until 2010, the fund had not experienced large claims and had a healthy balance of NZD 6.1 billion. This situation changed dramatically as a consequence of the Canterbury earthquake sequence, after which the fund was entirely depleted. EQC now aims to rebuild the fund to NZD 1.75 billion by 2030 (EQC has reinsurance, but it must meet the cost of all claims up to NZD 1.75 billion before it can call on its reinsurance cover; EQC, n.d.-b). Although this high level of insurance has generally been seen as a way of mitigating the impact of disasters in New Zealand, as the seismic events over the last 11 years have shown, this advantage came at a significant cost.

Prior to the Canterbury earthquake sequence, the framework for resolving insurance disputes was by way of standard dispute resolution processes, including private mediation and generalist financial service provider dispute resolution schemes (any insurer who provides services to consumers must belong to an approved dispute resolution scheme under the Financial Service Providers (Registration and Dispute Resolution) Act 2008; see Insurance Council of New Zealand, n.d.). Complaints arising from these dispute resolution mechanisms could be taken to the (industry-funded) Insurance and Financial Services Ombudsman or to the (public) New Zealand Ombudsman, in the case of EQC. In addition, the less formal Disputes Tribunal (a division of the District Court) could be utilized for claims up to NZD 30,000, with the formal courts available for larger and more complex claims (the District Court for claims at the time up to NZD 200,000 and the High Court for larger or more complex disputes).

In “normal times” this framework for dispute resolution seemed to work adequately. However, prior to the earthquakes there were already warning signs that the courts were coming under increasing pressure with their workloads. The mounting delays in hearing cases were occurring without the added burden of a monumental increase of claims arising from a disaster (Controller and Auditor General, 2009).

Why Efficient and Effective Insurance Dispute Resolution in Post-Earthquake Canterbury Failed

It is well established that system weaknesses are highlighted and exacerbated in any disaster. In fact, disasters do not occur naturally. To use the words of Ilan Kelman, societies “choose” to allow them to happen, by their policy decisions (Kelman, 2020). This was clearly borne out in the experience of claimants engaging in dispute

resolution in the aftermath of the Canterbury earthquakes. Quite simply, Aotearoa New Zealand was unprepared for the volume and complexity of the disputes that arose. The main barriers to the efficient resolution of post-disaster disputes were a lack of options for dispute resolution and severe delay in getting disputes resolved.

Dispute Resolution Framework not set up for Disasters

The existing dispute resolution framework was not conducive to resolving large numbers of disputes in an efficient and effective way. Many of the earthquake-related issues that arose could have been resolved through mediation as they were simply not suited to an adversarial court system, yet initially there was no choice. The majority of issues were in respect of property and business and therefore fell outside the financial limits of the speedy, inexpensive, and informal Disputes Tribunal and the less costly District Court. Consequently, the High Court suddenly became the “go-to” for dispute resolution, which made the process expensive, resource intensive, formal, and slow (Finn & Toomey, 2022).

Delay

A range of factors caused delays in the resolution of disputes. The complexity of the issues, a lack of technical experts, and vulnerable claimants were common problems. Substantial damage to residential houses and commercial buildings meant assessments could only be carried out by experts. These experts did not have capacity for the volume of claims which arise in a disaster situation, and they struggled to meet the huge demand. This meant there were significant delays in obtaining expert reports, with anecdotal evidence of one report taking 11 months to be completed (Little, 2018). These reports were crucial to the mediation or court process. There were also issues with experts disagreeing on the damage and the strategy for remediation, which increased the time that it took to resolve the dispute.

Other complex issues arose too. Many claimants had grievances with their insurance companies around whether the loss was covered by their specific insurance contracts, in addition to the time taken to process and pay claims. Furthermore, issues arose from the fact that the earthquakes were large and the sequence prolonged. The September 2010 earthquake was a major event followed by 18 months of aftershocks, including some significant and damaging events in February, June, and December 2011. Buildings and homes damaged in the first earthquake were then further damaged in subsequent aftershocks, which led to multiple claims over several events. This created confusion around the liability of insurers for multiple events and the interplay between the two insurers (EQC and the private insurance company) for the claims. All of these complex issues were significant barriers to the efficient and effective resolution of disputes.

Tactical approaches used by insurance companies added to the difficulties in resolving disputes and prolonged them. Many cases were also delayed by the

perceived need for court decisions to clarify the law although, in the event, many of such cases were settled just before trial (usually by the insurance providers), to avoid the creation of any precedent (Finn & Toomey, 2015).

Delays in resolving disputes were also caused by the sheer volume of claims coming before the High Court, which it struggled to manage. In addition, there were disruptions to hearings because the court buildings in the central city were inaccessible and court staff had to find alternative venues at various places around the city, which were not necessarily fit for purpose.

Addressing the Issues: Too Little Too Late?

The framework for dispute resolution in existence at the time of the earthquakes had systemic problems that needed to be addressed. It is therefore not surprising to find that, when the Canterbury earthquake sequence hit, the dispute resolution mechanisms were ill prepared to cope with the onslaught of claims that had to be resolved. The courts recognized this early on and took action immediately. The government was not as quick to act. This hesitant approach added to the delay in resolving disputes and is most likely one of the reasons why there are still earthquake-related claims being processed today (over 10 years after the event).

The new initiatives established in response to the disaster seem to have worked well and lessons can be learned from them for future events. Advisory services for claimants were established in the form of the Residential Advisory Service and the Greater Christchurch Claims Resolution Service. A specialist tribunal was established to specifically deal with earthquake-related disputes. The judiciary created a unique system for managing the huge numbers of earthquake-related cases filed in the High Court. These initiatives are explored briefly below.

Residential Advisory Service

In 2013, an independent specialist service called the Residential Advisory Service (RAS) was established by the Canterbury Earthquake Recovery Authority together with support from insurers, the Christchurch City Council and EQC, to assist property owners of earthquake-damaged homes. In 2015, the government took over the operation and funding of this entity. The RAS offers a free and independent advisory service with its purpose being to assist homeowners with the progression of their claims with EQC and their insurer. It provides the services of a broker who assists by arranging meetings with all parties involved in the claim. The service provides access to legal support through Community Law (a legal aid service with charitable status and significant public funding) and technical assistance for engineering issues. It has been perceived as a successful initiative for dispute resolution and has generally been positively received by its users (Stevenson, 2018; Public Inquiry into the Earthquake Commission 2020, p. 190; RAS, n.d.). Since the establishment of the Greater Christchurch Claims Resolution Service (discussed

below), the RAS now deals with claims relating to disasters other than the Canterbury earthquake sequence.

Greater Christchurch Claims Resolution Service

Eight years after the earthquakes, in 2019, the government established the Greater Christchurch Claims Resolution Service (GCCRS) to specifically assist with earthquake-related dispute resolution. It was one of a number of initiatives carried out in response to the 2018 Independent Ministerial Advisor's Report to speed up the resolution of outstanding insurance claims to EQC. It is operated by the Ministry of Business, Innovation and Employment (MBIE), together with support from Treasury, EQC, private insurers, Community Law, and Engineering New Zealand. The GCCRS is another service that fills the gap in dispute resolution between the RAS and the tribunal/court system. It provides homeowners with free facilitation and determination services including engineering and legal advice as well as well-being support. It leads the claim process by coordinating with all agencies involved to work through the issues. If the dispute cannot be resolved by negotiation, the GCCRS provides an internal dispute resolution service involving mediation, determination by arbitration, or a combination of both. User exit surveys have recorded that as at 2020, 86% of homeowners said they would recommend the GCCRS to others and 74% reported their well-being had improved as a result of the support they received from GCCRS (MBIE, 2020, p. 47).

Canterbury Earthquakes Insurance Tribunal

The government's response to the huge increase in court cases was very slow. It did recognize that claimants needed options for dispute resolution outside the court system, yet it was not until 2019, some 8 years after the earthquakes, that a specialist tribunal was established – the Canterbury Earthquakes Insurance Tribunal (Canterbury Earthquakes Insurance Tribunal Act 2019; Khouri, 2017). This tribunal was created to provide a fair, speedy, flexible, and cost-effective way to resolve disputes. Unfortunately, the government may have underestimated the demand for this service, and in its first year of operation the tribunal experienced delays in hearing cases, which added to the frustration of claimants.

Nevertheless, the tribunal has been a successful initiative in resolving earthquake-related disputes (Canterbury Earthquakes Insurance Tribunal, 2021). It has provided an alternative service for claimants than costly court proceedings and has additionally provided important rulings on legal issues where called upon to do so.

The one major limitation of the tribunal is that it was set up in the aftermath of, and in response to, a specific disaster. It has been set up for the special and limited purpose of resolving disputes over insurance claims arising from the Canterbury earthquakes between the specific dates of 2010 and 31 December 2011. Any claims relating to the later Kaikōura earthquake in 2016 or to do with properties where

earthquake-related damage has been discovered after a property has been “on sold,” for example, are outside its jurisdiction.

High Court Earthquake List

Very soon after the Canterbury earthquake sequence occurred, it became apparent that the courts were becoming overwhelmed with the volume of disputes. The judiciary recognized that a better system of managing the claims needed to be implemented to ensure a more streamlined process in operation. This recognition, combined with the Chief High Court Judge’s commitment to ensuring earthquake cases would be dealt with as swiftly as the court’s resources would permit, paved the way for the creation of the first High Court Earthquake List in 2012 (the year following the earthquakes). The purpose of this list was to ensure earthquake-related cases received fast-track case management by expeditious processing at the early stages of the cases, through to trial, and to ensure that priority be given to urgent cases or those with precedential value. The list is still operational today and provides an example of an innovative response to disaster-related dispute resolution that worked and continues to work relatively well (Kos, 2016; New Zealand High Court, 2020).

Despite the success of the Earthquake List, resolving disputes in the courts also came with problems. One glaring issue was the significant power imbalance between the insured and insurers. Large insurance companies being repeat players in the litigation scene (to use Galanter’s classic typology) were often pitted against inexperienced first-time litigants (Galanter, 1974). Many disputes were long, drawn out and expensive and often affected the mental and physical health of the claimants.

It did not end there. To add to the stress of the earthquake-affected community, there emerged another group of cases involving defective earthquake repairs, which further exacerbated the existing problems.

Conclusion: Learning from Aotearoa New Zealand’s Mistakes

The framework that existed in Aotearoa New Zealand for resolving insurance disputes did not provide efficient and effective dispute resolution for victims of the Canterbury earthquake sequence. The fact that there are still claims before the courts and tribunal over 10 years after the event is clear evidence that New Zealand did not get this right. To build a dispute resolution system resilient to future disasters requires reflection, change, and preparation. The following are suggestions, building upon the Canterbury experience, to achieve this end goal.

First, it is important to get it right from the start. This means that the dispute resolution framework should be planned in advance to ensure it can address the needs of its community in a time of disaster. Unnecessary disputes should be avoided by considering and clarifying in advance those issues that are likely to be problematic in a disaster. In essence, it is important to reduce the need for disputes in normal

times where possible because the need will be significantly worse in a time of crisis. However, as part of a disaster preparedness strategy, it is essential to ensure there are dispute resolution mechanisms able to cater to the different types of disputes that will emerge and that the dispute resolution mechanisms available are resourced to cope with the inevitable large influx of claims in the aftermath of a disaster.

Second, the dispute resolution framework should aim to enable disputes to be resolved quickly and cost-effectively in “normal” times and then be able to “step it up” when needed in a disaster. The formal court process struggles to cope as the main dispute resolution mechanism. It is not set up to provide the quick, informal, and cost-effective resolutions to disputes claimants may seek. Instead, claimants should be empowered to be in control of their dispute by the provision of free impartial, independent advice and support services including legal and technical expertise. This helps to address the power imbalance between the parties and places the claimant squarely in the forefront of the process, although is still only a solution that addresses the symptoms of the problem, not the cure for it.

Third, avoid creating new processes and mechanisms for resolving disputes midway through the disaster and in the years following. Hastily introducing new models during a time of crisis takes too long to implement and risks creating confusion unless they have been part of pre-planning. In the Aotearoa New Zealand situation, with the exception of the High Court Earthquake List, the response was too late.

Disasters expose underlying weaknesses in systems and processes. It is therefore essential that fundamental issues in dispute resolution mechanisms are addressed before disaster strikes. These issues include the fact the system clearly favors large players, allows game playing and tactics that preserve the power imbalance between parties, and, most significantly, creates delay in the resolution of disputes. Ensuring that lessons are learned from past experiences and applied in advance to make dispute resolution mechanisms fit for purpose in “normal times” is easier than trying to make a flawed system work in a crisis. If the mechanisms do not work in a disaster, the consequences of the hazard are exacerbated, as are its effects on the affected community and, potentially, far more widely. In worst case scenarios if the dispute resolution mechanisms fail, they, themselves, can “become the disaster” in a situation where there is already a huge amount of suffering. Either way, if states do not resolve these issues before a disaster strikes, they once again “choose” to inflict a further disaster upon the victims of nature’s hazards, causing more harm, stress, and suffering to those who have suffered enough.

Abstract

COVID-19 has uncovered cracks in the Indian legal system and the public healthcare system. The Government of India, on March 24, 2020, imposed a lockdown across the entire country to contain the outbreak of the virus. Interestingly, this lockdown was imposed by invoking not only Section 2 of the Epidemic Diseases Act of 1897 but also the Disaster Management Act of 2005 to handle the pandemic. In the present chapter, it is argued that the Indian legal system has proved insufficient to handle the situation created by the pandemic and totally ignores the right to health of citizens. A pandemic like this not only affects the health of people but also leaves the economy in shambles. The sudden lockdown of the nation took the unorganized sector by surprise. Thousands of migrant workers and domestic workers were left to the mercy of their employers. In the chapter, we try to argue that an appropriate health emergency law could accommodate many demands which emerge during a pandemic.

Introduction

COVID-19 is an infectious disease caused by a virus called coronavirus. China announced an outbreak of COVID-19 on January 7, 2020, and on March 11, 2020, the World Health Organization declared COVID-19 a pandemic. The World Health Organization issued simple guidelines relating to sanitizing and washing hands frequently and social distancing as preventive measures. These were followed by all countries. To contain the outbreak of the virus, the Government of India followed suit and imposed a countrywide lockdown. This lockdown was imposed by invoking Section 2 of the Epidemic Diseases Act of 1897. The Epidemic Diseases Act of 1897 was enacted by the British for dealing with the bubonic plague in Bombay in 1896. It is one of the shortest pieces of legislation. Section 3 of the Act empowers both central and state governments to do anything in order to control the spread of epidemics. Any person who disobeys government orders will be penalized under Section 188 of the Indian Penal Code (IPC). No public officer will be charged for doing anything in good faith under the Act. Recently, the parliament amended the Act by an ordinance which was passed in the context of attacks on health workers. The Epidemics Diseases Amendment Act of 2020 defines healthcare service personnel and includes measures for the prevention of violence against them. It also expands the power of the central government to prevent and contain the spread of epidemic diseases. It made such violent acts against healthcare service personnel and property as non-bailable and a cognizable offense punishable with a fine between 50,000 and 2,00,000 and imprisonment of 3–5 years. The healthcare service personnel are also entitled to compensation for injury or damage of property. It is very fascinating to note that even in the backdrop of a grave health emergency, the government chose to keep the “epidemic” undefined. This leads to lack of clarity and objectivity and enables the government to misuse it in situations it deems fit. The law empowers the government to take all necessary actions which it deems fit for containing and preventing the outbreak of epidemic diseases. The government has interpreted this as then power to order lockdowns and quarantine rules. However, the functions of the government are not enumerated. It neither imposes any obligation on the government to impose lockdown within a stipulated time frame nor does it contain any kind of checks and balances to ensure accountability of the authorities. Also, the law recognizes only land and sea routes and does not consider air routes because at the time of its enactment in 1897, air travel was not very prevalent.

The Indian Penal Code (IPC) acts as ancillary to the powers of the government under the Epidemics Diseases Amendment Act. Section 188 of IPC makes willful disobedience to the orders issued by a public officer an offence punishable with 1 month imprisonment or a fine amounting to 200 rupees. If the disobedience endangers the life, safety, and health of another human or it causes affray or riot, the punishment for the same would be a fine of 1000 rupees or a jail term for a duration of 6 months or both. Sections 269 and 270 of the IPC also empower the state to punish any malignant or negligent act which spreads an infectious disease endangering the life of others with a fine or imprisonment of 6 months to a maximum duration of 2 years or both. Section 271 empowers the state to punish willful

disobedience to orders for quarantining vessels to prevent the spread of infectious diseases.

For the purpose of containing the spread of COVID-19, the Government of India apart from invoking the Epidemics Diseases Amendment Act, the National Disaster Management Authority (NDMA) also invoked its powers under Section 6 of the Disaster Management Act of 2005. Section 6 of the Act empowers the NDMA to formulate policies and plans and lay down guidelines for managing a disaster so as to ensure a timely and effective response to disasters. On March 24, 2020, NDMA directed ministries, departments of the Government of India, state governments, and state authorities to take measures for ensuring social distancing for containing the spread of COVID-19 in the country.

The legal framework for containing epidemics and disaster management in India is largely punitive in nature and lacks human rights approach. It largely comprises powers of the authorities to penalize people who violate the orders passed by them. A legal framework serves three-dimensional purposes, i.e., risk reduction, preparedness, and how to respond. A good law serves all three purposes. It has to be both preventive and punitive in nature. In this chapter, it is argued that COVID-19 aggravated existing vulnerabilities and exposed the inadequacies of the legal framework which failed to address the human rights of people. The chapter focuses on the right to health during COVID-19 and makes a case for a special health emergency law to prevent violation of the right to health during pandemics.

What Is Right to Health?

The right to health is part of the grand narrative of global justice which focuses on the individual as opposed to the country, community, or culture. WHO defines health as “A state of complete physical, mental and social well-being and not merely the absence of disease or infirmity” (Saracci, 1997). Article 25 of UDHR has a very holistic view of the right to health and provides that, everyone *has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing, and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age, or other lack of livelihood in circumstances beyond his control*. It can be noticed that good health is the outcome of a well-fitting comprehensive policy on different aspects of life and thus need all-around state initiatives in all related fields. Article 12 of the ICESCR also provides that the states shall try to attain the highest standards of physical and mental health for their citizens. Section 12(2)(c) states that “The steps to be taken by the States Parties to the present Covenant to achieve the full realization of this right shall include those necessary for the prevention, treatment, and control of epidemic, endemic, occupational and other diseases.” The CESCR General Comment No. 14: The Right to the Highest Attainable Standard of Health (Art. 12) provides that health is an essential human right that is indispensable for the realization of every other human right. It highlighted the four facets of the right to health which lay down the pathway for the states to work on:

1. Availability.
2. Accessibility.
3. Acceptability.
4. Quality.

In the context of health emergencies, these are the four deliverables that become the essence of the right to health. The four aspects consider both individual's preconditions, for example, socioeconomic and biological, and the capacity of the state to fulfill its obligations.

Right to Health in India

COVID-19 has once again fueled the right to health debate all over the world. Article 25 of UDHR entails the right to a decent standard of living must be enjoyed by everyone. The state should provide basic necessities like clothing and food, other utilities like medical care and housing, and a social security network to people who cannot provide for themselves. Article 12 of the International Covenant on Economic, Social and Cultural Rights says that all state parties shall identify and provide for the right to the physical and mental health of its citizens. India is a founding member of the United Nations and has also signed and rectified ICESCR. However, there is no explicit provision in the Constitution of India for the right to health. However, there are several judicial decisions that have interpreted the right to health as an integral part of the right to life under Article 21 of the Indian Constitution. In *Bandhua Mukti Morcha V UOI (1984)*, the Supreme Court held that the right to dignity and health fall under the ambit of the right to life under Article 21. In *Parmanand Katara V UOI (1989)*, it was held by the Supreme Court that no doctor of any hospital employed at a private or government hospital can reject treatment to a patient. The Court further widened the scope of the right to health by observing in *Paschim Banga Khet Mazdoor Samiti V State of West Bengal (Paschim Banga Khet Mazdoor Samiti V State of West Bengal, 1996)* that the Government is responsible for ensuring that every person gets appropriate medical assistance aiming to provide public welfare at large. In *State of Punjab V Mohinder Singh Chawla (1997)*, it was held by the apex court that the right to life encompasses the right to health which is an integral part of the right to life and the government is under a constitutional mandate to provide for healthcare facilities. The failure of authorities to provide appropriate healthcare can be considered a violation of the right to life.

Apart from judicial decisions, the Directive Principles of State Policy also indirectly manifest the right to health. Although non-justifiable by the force of law, Directive Principles are important for the good governance of the country (Article 37). The idea behind Directive Principles of State Policy is that of the "welfare state." The Principles concerning right to health are the following:

Article 38: The State shall promote the welfare of its people.

Article 39: The State shall ensure the health and strength of workers, men and women, and the tender age of children are not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength.

Article 47: The State shall strive to raise level of nutrition and the standard of living of its people and the improvement of public health as among its primary duties and, in particular, the State shall endeavor to bring about prohibition of the consumption except for medicinal purposes of intoxicating drinks and of drugs which are injurious to health.

We find the reflection of these Directive Principles of state policy in several legislations. For example, the Mental Healthcare Act of 2017 created a justiciable right to mental healthcare. The Act ensures affordable mental healthcare and easy access to services. The Act protects people from inhuman and degrading treatment and provides for free legal services. Similarly, the National Food Security Act of 2013 showcases the paradigm shift from a welfare approach to one based on rights. Under the Act, 75% of the rural population and 50% of the urban population can obtain food grains at a subsidized cost under the Targeted Public Distribution System ([GOI](#)).

Recent welfare schemes like *Ayushman Bharat* also focus on the right-based approach toward health. It envisages establishing as many as 150,000 primary healthcare and wellness centers for providing good healthcare. It also seeks to implement Pradhan Mantri Suraksha Bima Yojana which provides health insurance coverage to the tune of Rs. 5 lakhs per year to more than 10 crores impoverished families in India. However, it must be noted that the right to health is not an exclusive fundamental right under the Constitutional scheme.

Right to Health During COVID-19 in India

A disease which affects a huge number of persons in a region, community, or population is called an epidemic. An epidemic becomes a pandemic when it is spread over multiple countries. According to Nelson et al. ([2007](#)), a health emergency is characterized by both its consequences and causes along with the precipitating events. An outbreak of a disease or a situation can become an emergency when its consequences have an overwhelming impact on the capabilities of the existing infrastructure to address them. Article 12 of the International Covenant on Economic, Social and Cultural Rights requires the states to take actions for *prevention, treatment, and control of epidemic, endemic, and occupational and other diseases*. During COVID-19, most of the states struggled to provide medical care and healthcare equipment like oxygen cylinders, ventilators, etc. As far as the right to health, it can be understood that healthcare is provided to everyone equally and no one must be subjected to any discrimination on economic condition, disability, class, gender, caste, economic condition, etc. ([Pūras et al., 2020](#)). A rights-based response

to COVID-19 must also ensure access to correct information about the virus, availability of facilities, and vaccination drives (Human Rights Watch, 2021).

The first response to COVID-19 was to impose lockdown. The impact of lockdown on the lives of people raises serious questions on its impact on human rights. COVID-19 and human rights can be looked into from three dimensions, i.e., (1) restricting individual rights to protect public health; (2) impact of lockdown on sociopolitical rights like right to housing, employment opportunities, food, water, and social security; and (3) international assistance and collaboration (Sekalala et al., 2020). But as discussed above, the legal framework does not address the issue of human rights while addressing and managing pandemics.

Being prepared for a public health emergency is not just the betterment of the existing capabilities but should also focus on four key aspects: mitigation, preparedness, response, and recovery. There are two kinds of measures: structural and nonstructural. Guidelines, policies, and laws are nonstructural measures, and strengthening human resources and good infrastructure are considered structural measures (Sahoo et al., 2020). Public health legislations play important role in the containment of the diseases.

As discussed above, the quarantine rules were enforced in order to curb the spread of COVID-19. However, it is argued that the Indian legal response to COVID-19 has ignored the philosophical understanding of the term “public health.” Public Health is “the science and art of preventing disease, prolonging life and promoting health through the organized efforts and informed choices of society, organizations, public and private, communities and individuals” (Winslow, 1920). So this prevention of disease and promotion of health in “public health law” terms is considered to be the duty of the state. As the definition provides, it requires organized efforts from various players in the society, and with that collaboration, the state can exercise its powers and duties (Gostin Lawrence & Wiley, 2008: 4). The purpose of public health law is to create an “infrastructure” wherein the legal authorities created will exercise their power to promote health. This can be done through agencies established for the maintenance of data, an inspection of patients for diseases, granting of licenses to public health officials and clinics, carrying out educational activities for spreading awareness regarding a disease, etc. It can also be an “interventional” purpose wherein efforts are taken to restrict a particular disease, i.e., maintaining the proper quality of water in waterborne diseases, social distancing, or quarantine of people in case there is a spread of communicable disease, etc.

If we specifically look at India and how it deals with public health, the obfuscation starts with the power to make law itself. In our scheme of things, the parliament has limited power to legislate on the state list. The state list has enumerated entries on which the states have exclusive jurisdiction to legislate which includes public health, hospitals and dispensaries, and water and sanitation. Now the issue arises as to how can the parliament legislate on a state list subject that is of our concern, public health. The Constitution of India has a provision that provides if there is a need for legislation to be made on the state list in “necessary or expedient in the national interest,” the Rajya Sabha may by a two-thirds majority allow the parliament to pass legislation on the state list.

The only legislation we have in India to tackle such epidemics directly is the pre-independence Epidemic Diseases Act (EDA) of 1987 (hereinafter “the Act”), which has been used for a century to deal with diseases such as malaria and cholera in India. Enacted after the bubonic plague in Mumbai which later spread to other parts of India, it has not undergone any substantial amendment. Moreover, no rules or regulations have been made under the Act. Certain rudimentary elements to deal with epidemics have been mentioned in the Act such as restrictions on travel, inspection and quarantine, and separate accommodation for those infected. For violations of the provisions of this law, the penalty is pari passu read with Section 188 of the Indian Penal Code dealing with disobedience of government order.

Apart from it being a century-old law, it has other limitations. Firstly, it does not define essential terms such as “infectious,” “dangerous,” “contagious diseases,” etc. let alone “epidemic.” This creates an ambiguity as to which category the disease can be put so as to choose the degree of restrictions or measures required to arrest or suppress it. Secondly, it provides no procedure as to how the essential services or vaccine (if available) can be supplied to the general public in order to maintain a lockdown or effective quarantine in cases of communicable diseases. Thirdly, there is no protection of human rights for people who are working in these situations for the betterment of public health. Among all, the major drawback of the Act is that it describes only the “powers” of state and central government, failing to enumerate the duty of the government to prevent or control the epidemic.

A limitation of this Act that cannot be independently accorded to the Act itself is that if District Magistrate passes an order under Section 144 of the Criminal Procedure Code, and the state or central government promulgates an order under the Act, which order will have primacy. There is a fundamental administrative flaw that needs to be addressed so that it does not touch upon the ever-sensitive federalism nerve but promotes cooperative federalism.

To address the issue of attacks on healthcare personnel and certain quarantine and travel restrictions, the president amended the Act through an ordinance (Ordinance, 2020). It provides stricter punishment of jail term for a minimum duration of 6 months and a fine which may extend to 5,00,000 rupees for committing an act of violence to or grievously hurting any healthcare professional who is serving the people. It defines what healthcare service personnel means, hence eliminating the ambiguity that may be caused. Though this can be considered a progressive step, there are major flaws in the Act which require a complete overhaul. Now, as all states have their healthcare setup and hierarchy already in operation, amending the Act to suit the system will make less sense. The Disaster Management Act of 2005 was also invoked to manage COVID-19. Interestingly, the DMA (2005) was never conceptualized to deal with health emergencies. But it was invoked to enforce lockdown to contain the outbreak of COVID-19.

In the absence of a strong legal framework to protect rights during COVID-19, the Indian judiciary responded to varied matters having impact on human rights. In Shashank Deo Sudhi V UOI (2020), the Supreme Court directed that all citizens eligible under the Ayushman Bharat Pradhan Mantri Jan Arogya Yojana and other

economically weaker sections as notified by the government to conduct COVID-19 test of people free of cost. Andhra Pradesh High Court also directed the state government to ensure the availability of personal protective equipment (PPE) to doctors, nurses, and other healthcare staff working in government and private hospitals ([Corona Virus-COVID-19 Pandemic v. Government of Andhra Pradesh, 2020](#)).

Conclusion

Several federal countries like Canada, Australia, the USA, and England have exclusive laws to deal with health emergencies ([Tewari, 2020](#)). India is also in urgent need of an exclusive and comprehensive law to address health emergencies that can avoid regional disparities and enforce the right to health of its citizens in its truest sense. It is imperative to view the management of health emergencies from the “rights-based” approach. The present Indian legal framework as discussed can only impose restrictions in terms of managing health emergencies. It fails to create a framework that can ensure better expenditure on healthcare infrastructure, rights of patients, and duties of the government during a health emergency.

In 2017, the Union Government drafted the Public Health (Prevention, Control, and Management of epidemics, bioterrorism, and disasters) Bill of 2017. It aimed to empower local government bodies for recognizing the right to health. It was expected to repeal the Epidemic Diseases Act. However, the Bill was never tabled in the parliament. Since health is a “state” subject, many states like Gujarat and Karnataka have drafted their own health legislations. The National Health Bill of 2009 also aimed at providing a legal framework for the essential public health services by recognizing the fundamental right to health. It also outlined collaborative federal machinery to provide healthcare during health emergencies, but this Bill also never saw the light of the day because states saw it as an encroachment on their sacrosanct domains. The biggest hurdle in drafting a public health emergency law is the nonrecognition of the right to health as an exclusive fundamental right. The recommendation to recognize the right to life as a fundamental right was made by a High-Level Group on the Health Sector constituted under the 15th Finance Commission in September 2019. It also suggested shifting “health” from the “state” list to the “concurrent” list. It will strengthen people’s access to healthcare.

The National Human Rights Commission, in the wake of COVID-19, constituted a committee on the impact of the COVID-19 pandemic on human rights and future responses. On the basis of the assessment done by the committee, NHRC issued an advisory on the “right to health in the context of COVID-19.” It recognized the fact that even before the outbreak of COVID-19, the Indian healthcare system had been struggling to meet the healthcare requirements of the population. COVID-19 has further worsened the situation. The outbreak of an epidemic shifts the attention from other health emergencies and all resources are diverted to contain the epidemic which creates havoc. Emergency trauma care also gets affected due to a shortage of staff and diversion of resources. The advisory is quite comprehensive and focuses

on the most important aspect of the right to health, i.e., access to healthcare. It provides for the right to treatment without discrimination, access to vaccination, access to healthcare in public health facilities, the need to ensure confidentiality and human dignity, and the right to privacy of patients among several other important advisories (NHRC, 2020). The advisory is worthy of being converted into law on the subject of the public health emergency. COVID-19 has given the Indian government an opportunity to do away with the archaic colonial law and draft a special health emergency law that is rooted in the right to health of its citizens.

Abstract

Sri Lanka is hailed for its richness in environmental beauty and abundant biodiversity. As a country, it is one of the safest places to live in with its geographical location, climate patterns, and the lack of potential for some natural disasters such as volcanoes and earthquakes. However, it has recently been devastated by several natural disasters such as floods and droughts which have taken a heavy toll on the livelihoods of the people living in affected areas. While these disasters could be termed as “natural” in some sense, when one considers the broader picture, human activities have had a profound impact on the occurrence and the frequency of these natural disasters which goes unnoticed at times. Therefore, this research is focused on discussing the liability of those who contribute to creating natural disasters through their own activities by causing harm to the natural environment. Using a doctrinal approach embedded in qualitative methodology, this chapter attempts to design a liability regime for

those who either directly or indirectly contribute to the creation of natural disasters. The results reveal that the existing legal system fails to impose pecuniary liability upon those who either directly or indirectly contribute to the creation of natural disasters and that the use of the “polluter pays” principle is inadequate at times since all harm that is caused to the environment cannot be rectified with compensation. Therefore, it is suggested that awarding exemplary damages, shifting the burden of proof upon the exploiters of natural resources to prove that such exploitation does not cause or aid in the creation of natural disasters, and environmental taxation should be better utilized in making this novel concept a reality which is nonetheless a sine qua non for environmental protection and governance.

Introduction

The environment, as simple as it may sound, has had a really challenging time in the recent past due to the activities of mankind which have caused a great deal of destruction to it. In the discourse of the environment, environmental degradation and its destruction take a central place in the grand scheme of things. So profound is this adverse impact on the environment, that it has changed from the common heritage of mankind to the common concern of mankind (Thilakarathna, 2019). Much of this environmental degradation has been caused by many human activities that have gone out of proportion. Environmental degradation can be identified as “the deterioration of the environment through depletion of resources which includes all the biotic and abiotic elements that form our surrounding that is air, water, soil, plant animals, and all other living and non-living element of the planet of the earth” (Maurya, 2020). The alarming nature of the problem was realized in the 1960s when many countries had solely focused on rebuilding their countries after the devastations caused by the effects of the second world war. While countries were less conscious about the damage that they were causing to the environment in the race to rebuild their nations, soon it became evident that what they were doing was causing harm to the environment at unprecedented levels which led the world leaders to come together and do something about it, resulting in the United Nations Conference on the Human Environment of 1972, commonly known as the Stockholm Declaration which focused on the environmental issues and discussed such issues as international concerns. This initiative marked the start of a dialogue between the developed and developing countries on the link between economic growth and the protection of the environment, thus allowing for a discourse on sustainable development. While it has continued the pursuit with the Rio Declaration of 1992,

Johannesburg Accord of 2002, and the 2012 Accord of Rio-De Janeiro, many environmental issues have remained unsolved and much of it can be attributed to the uncontrolled, overwhelming, and unsustainable activities of mankind. One of the main reasons for the inability to put an end to this destruction can be attributed to the fact that much of what has been caused by mankind to the environment goes without being properly punished. This in turn would deter others from causing such devastation to the environment. Environmental harm has remained a crime without a perpetrator. Unlike the crimes that we encounter regarding property and body, environmental crimes (and environmental harms) are much more versatile, and they leave long-lasting and irreversible effects upon the environment which are often incapable of being resurrected through compensation (Nurse, 2022). To this end, one must find a proper way of making those accountable for causing environmental harm, especially those who are responsible for man-made natural disasters, which has become a growing concern in the discourse related to environmental protection. In this respect, the present chapter aims at discussing the possibility of making those responsible liable for man-made natural disasters. It argues that there are certain human activities that might, as a single occurrence, not warrant any interventions, but may nevertheless be responsible for man-made disasters. As such, perpetrators of such activities should be held liable and accountable for their actions as well as their omissions.

Human Activities and Their Adverse Impact on the Environment

The adverse effects caused by human activities have been well documented. When one compares the growth of the human population with the environmental degradation, there is a strong positive correlation between the two, meaning that, with the expansion of human population, the environment has also had to face the wrath of the struggle of the mankind in utilizing limited resources offered by the environment. While it is accepted that exploitation of the environment itself would not be possible without causing any harm to the environment, the extent to which the environment has been overexploited and polluted does bring serious concerns for mankind. While concepts such as inter and intragenerational equity have put emphasis on the need for utilizing the environmental resources in a sustainable manner, they have not yielded the expected results. Much of this can be attributed to the fact that more than the direct impact caused on the environment by human activities, the indirect effect which is caused is more significant. For example, effects on soil and water quality are indirect and complex, and subsequent impacts on natural, ecological, and socioeconomic conditions are intricate. While it might be easy to measure the direct effects of human activities on the environment, such as the amount of carbon dioxide emission through the utilization of fossil fuels, the indirect effects may cause incidents like global warming. Moreover, the depletion of the ozone layer might be difficult to precisely calculate, as there are other causes which would also be responsible for such environmental harms (Royall, 2013).

Human Activities and Man-Made Disasters

Many human activities are directed at profit maximization, and as such, the cost-benefit analysis of most activities would be based more on anthropocentric considerations than on ecocentric ones. Even the judiciaries have hinted that most of the laws that are man-made tend to utilize an anthropocentric approach (T.N. Godavarman Thirumulpad vs Union Of India & Ors, 2012). However, even with such a cost-benefit analysis that utilizes an anthropocentric approach in deciding to go ahead with a certain activity that may have serious repercussions on the environment, it should not go unpunished if it results in or does cause a considerable amount of environmental harm, whether such harm is caused immediately or if it is caused because of accumulation. Evidence have shown that there are numerous human activities that have led to man-made natural disasters.

The term “manmade natural disasters” connotes that, while the disaster is caused by natural events such as a flood or a drought, the real culprit is not nature itself but the human being who has acted or failed to act in a certain manner which has forced nature to behave in a manner which has caused such a disaster. Not all natural catastrophes are the work of fate – some are man-made. However, the distinction is not always straightforward, particularly in the case of floods, landslides, or wildfires. Human activities that cause natural disasters such as floods, landslides, and droughts are difficult to directly connect with such incidents, as there are several other factors which would cause such disasters. For example, floods can be attributed to human activities such as deforestation, overexploitation of natural resources, and even some natural causes such as soil erosion. When there is a combination of effects, it becomes difficult to directly hold liable those who have acted to the detriment of the environment. However, that is not to say that those who have acted or failed to act in a particular manner and have indirectly contributed to man-made natural disasters should be allowed to be free from any form of liability whatsoever. A recent study conducted by the UN University has found that for many of the natural disasters that occurred in the period of 2020–2021, much of it was to be blamed on human activities which have had a cumulative effect on these natural disasters. For example, the recent heatwave in the Arctic and the cold wave in Texas that occurred in 2021 are two incidents that have occurred thousands of miles apart, but are related to one another, and can have consequences for people living in distant places. The study has also found that there are three root causes that affected most of the events in the analysis: human-induced greenhouse gas emissions, insufficient disaster risk management, and undervaluing environmental costs and benefits in decision-making (UN, 2021).

The above analysis indicates that human activities, regardless of having been committed in a distant place, could have consequences in distant places or places that might not have been on the radar of those who have done or failed to do certain activities which have caused damage and destruction to the environment. In this regard, it would become imperative to hold those accountable for causing such natural disasters which are a result of such human actions or omissions.

Liability Regime Under Environmental Law

The liability for causing harm to the environment can be implemented as both criminal and civil liability. In considering the criminal liability, for acts such as killing or smuggling of protected species and plants, the authorities impose both physical and financial punishments and fines on the perpetrators. On the other hand, when considering the civil liability for environmental harm, it primarily focuses on imposing financial liability on those who either directly or indirectly cause harm to the environment. However, one of the more significant issues in the liability regime concerning environmental damage lies in the quantification of damages, as many of the legal instruments try to give a threshold for imposing liability for environmental harm. For example, the National Environment Act No. 47 of 1980, with its regulations and directives, prescribes certain ceilings that must be met to require an applicant to obtain an Environmental Protection License (EPL), while activities falling below such a threshold – though it may have adverse impacts upon the environment – do not require such a license.

Another issue to be considered is the basis for imposing liability upon those who cause harm to the environment which may lead to man-made natural disasters. If one were to insist on a fault-based liability regime for environmental harm and man-made natural disasters, it would be too difficult to hold the perpetrators responsible for their actions or omissions which would cause environmental damage eventually leading to a man-made natural disaster, since proving fault and causation would be difficult (UNEP, 2003). This must be also considered with the fact that much of the environmental harm which would eventually have the capability of resulting in a man-made natural disaster would be created not by individuals acting in an isolated manner, but by major industries and multinational corporations which would be able to spend big in claiming their innocence. On the other hand, if one were to argue for a liability regime based on strict liability in imposing liability upon those who cause environmental damage or destruction which could lead to man-made natural disasters, such would be more viable than a fault-based regime, wherefore strict liability would only require the proof of the action irrespective of the intention, and especially in cases of environmental damage, that should be the approach as it would also help to take out the inequality of the power between the perpetrator and those who are affected by their actions.

Even if one were to agree upon a basis for imposing liability, the need for proving the nexus between the cause and effect would remain. In simple terms, this would mean that anyone claiming to hold those liable for causing environmental harm that leads to man-made natural disasters would have to prove that the natural disaster occurred due to the activities or the omissions of the perpetrators and that there is a direct link between the two. To prove such a contention, it would be paramount to have scientific evidence with absolute precision as there would be no room for speculation, and once speculation begins, the benefit of the doubt will always favor the perpetrators (Cane, 2001). However, it is to be noted that if there is a lack of scientific evidence which could conclusively prove that the actions or the omissions of the perpetrators have had a direct effect on the environmental damage which has

resulted in a man-made natural disaster, it should not always be in the benefit of the perpetrators, as pointed out under principle 15 of the Rio Declaration of 1992 which states that “[w]here there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” This principle could be used to argue that where there is a lack of scientific evidence to sustain a claim for imposing liability upon those who have contributed to man-made natural disasters should not be a bar for imposing liability on them merely due to a lack of scientific evidence which links their actions or omissions to the harm that they have caused. Under the existing regime governing responsibility of those who have caused damage to the environment, it is somewhat difficult to hold them liable for the harm that they have caused to the environment which could lead to a man-made natural disaster as it is very challenging to prove the nexus between their actions or omissions with the harm caused to the environment.

“Polluter Pays” Principle and Liability for Environmental Harm

In attributing liability to those who cause environmental harm, the “polluter pays” principle has gained acceptance in the international arena, and some argue that it is considered a principle of customary international law (Dupuy, 2019). The “polluter pays” principle simply denotes that they who cause harm must also take action/ compensate for restoring the environment to its original status. However, this the principle is used in a broader sense in the environmental context within the ambit of externalities. When one compares the gains or profits made by manufacturers through production which creates negative externalities, they only bear a small portion of the negative externalities that they generate in proportion to their gains or profits. However, when it comes to others who do not make any gain or profit through such production would nonetheless have to bear the brunt of the negative externalities that are caused to the environment. In essence, the “polluter pays” principle tries to internalize the negative externalities (Alam, 2013). The “polluter pays” principle first emerged explicitly in 1972 in a Council Recommendations of the Organization for Economic Co-operation and Development (OECD) (Gaur et al., 2022). The same Organization in 1992 according to this principle declared that “the polluter should bear the expenses of carrying out the . . . measures decided by public authorities to ensure that the environment is in an acceptable state. In other words, the cost of these measures should be reflected in the cost of goods and services which cause pollution in production and/or consumption.” Such measures should not be accompanied by subsidies that would create significant distortions in international trade and investment (OECD, 1992). The main point to be emphasized here is the fact that the “polluter pays” principle should only be utilized where it is possible to rectify the harm caused to the environment through compensation. In a broader sense, it means that internalization of negative externalities should only be allowed if it is economically possible from the perspective of the environment, and where a certain threshold is to be exceeded where it becomes not possible of compensating

the damages caused, one should not be able to buy the harm that they are going to cause to the environment. In such an instance, it is best to prevent the harm from occurring rather than imposing liabilities upon the polluters as compensation would not become adequate to rectify the harm caused to the environment.

The “polluter pays” principle has been utilized by the Sri Lankan judiciary on numerous occasions (Edirisinghe & Wijesooriya, 2019; Wijesooriya, 2019), including the celebrated case of (Bulankulama and Others v. Secretary, Ministry of Industrial Development and Others, 2000) where Justice Amarasinghe held that “the costs of environmental damage should be borne by the party that causes such harm rather than being allowed to fall on the general community to be paid through reduced environmental quality or increased taxation in order to mitigate the environmentally degrading effects of a project.” In the *Chunnakam* case (Ravindra Gunawardene Kariyawasam v Central Environmental Authority and Others, 2019), the court held that the “polluter pays” principle has been recognized in many parts of the world, including many cases in India and the Rio Declaration of 1992 under Principle 16 refers to the said principle and that there is no issue with utilizing the said principle in the present case. In the more recent case of *Wilpattu* (Centre for Environmental Justice V Anura Satharasinghe and Others, 2020), the issue was related to a resettlement plan for settling internally displaced people in the north. The minister in charge of industry and commerce has taken steps to relocate the IDP’s in a forest land which was protected under the Forest Ordinance No. 16 of 1907 (as amended). The Court found that the minister had acted ultra vires in respect of the powers granted to him under the statute and that he should be held personally liable to replant the trees that were either cut down or destroyed because of the resettlement plan and that this should be done within 2 months from the judgment. The Court extensively referred to the “polluter pays” principle in arriving at its decision. However, even at the beginning of 2022 there is no report as to whether the Court order has been complied with.

Possibility of Using the “Polluter Pays” Principle Concerning Man-Made Natural Disasters

As discussed above, the polluter pays principle, in general, is a remedial method rather than a cure. When it comes to environmental matters, and especially conservation of the environment, preventive methods are always to be encouraged rather than remedial methods which seek to compensate for the losses generated, which on most occasions will become futile when it comes to the environment. This fact was nicely elaborated in the Indian case of (M.Velu vs The State Of Tamil Nadu, 2010) where the Court held that taking preventive measures is always better than taking curative measures and the judiciary sitting as a Green Bench has a social duty to intervene in cases concerning development projects that adversely affect the environment and to prevent environmental harm if such developments projects were to be allowed. Poulopoulos has also shown the importance of prevention as a principle of environmental law whereby it is always considered more appropriate to prevent

environmental harm than to rectify it through compensation (Poulopoulos, 2016). In addition, to apply the “polluter pays” principle, the polluter would have to be clearly identified and the fault of the polluter would also have to be established. Further, there would be a need for precise calculation as to how much harm has the polluter caused to the environment to appraise their liability. The matters would be further complicated with the fact that, when it comes to proving that human actions or omissions to cause harm to the environment are one of the main reasons for the occurrence of a man-made natural disaster, where the involvement of human beings in the creation of the natural disaster would have to be established to apply the “polluter pays” principle would become still more difficult to prove.

Though it is conceded that the “polluter pays” principle might not be best suited to hold those liable for creating man-made natural disasters, it does not take away the requirement or the necessity for holding those who are responsible for causing such harm to the environment which could lead to man-made natural disasters since it would create a crime without an offender. It emphasizes the fact that there should be new principles and policies developed to tackle this matter since the involvement of human activities and omissions cannot be disregarded when it comes to the occurrence of man-made natural disasters. The following section focuses on some of the suggestions for building a regime that could be utilized to make those accountable for creating man-made natural disasters.

Suggestions at Holding Those Accountable for Man-Made Natural Disasters

It must be noted that defining exactly what is a man-made natural disaster might not be something easy, or even easier said than done. However, the proven fact that there are many human activities that would become the root cause of many natural disasters such as floods, wildfires, and droughts cannot be disregarded. Therefore, it becomes imperative that there should be a regime to hold those accountable for causing such harm to the environment which would result in such man-made natural disasters. For instance, in the abovementioned Wilpattu judgment, the Court only focused on restoring the trees that were cut down to make premises to resettle the IDPs. It failed to appreciate the broader implications that could result from such acts of deforestation which could eventually lead to droughts and floods. The suggestion is that, in such kind of cases where there is sufficient scientific data to prove cause and effect, the damages that are to be ordered should be exemplary meaning that they should go beyond the immediately foreseeable damages that are caused to the environment. Therefore, it is suggested that a modified principle derived from the “polluter pays” principle should be utilized in holding those accountable for man-made natural disasters. The lack of scientific data connecting the causes with effects of man-made natural disasters is another area to be discussed.

As discussed above, the mere lack of scientific evidence in proving that such harmful activities would not result in the creation of man-made natural disasters should not be required to be proved by those who allege the existence of such a

nexus, but it should be something which would have to be proven by those who are in the process of exploiting the environment for a gain. Therefore, the burden of proof must be shifted from the plaintiffs to the dependents in the case of environmental harm. If we are to see some results in such an instance, it would be up to the party exploiting the environment and provoking man-made natural disasters who would have to ultimately prove that their actions are not a cause whether direct or indirect to the creation of such catastrophes. A related issue in connection is the thresholds that are used at allowing for environmental exploitation.

The threshold approach in environmental law requires the exploiters of the environment to adhere to certain limits when they are exploiting the environmental resources. The threshold approach is also linked with the inter- and intragenerational equity which requires the current generations to utilize the environmental resources without hampering the ability of other generations to enjoy a same kind of utilization regarding the environmental resources. However, it is suggested that the threshold approach should always be taken from the perspective of the environment and not from the perspective of gain or advantages that are purely calculated from a human perspective. Therefore, it is suggested that the threshold approach should be strictly utilized with an ecocentric mindset, wherefore any activity which has a greater potential in the creation of man-made natural disasters should be prevented rather than allowed to be carried out with a threshold limit. Environmental taxation should also be examined in the reduction and deterring of environmental activities which have the potential of causing man-made natural disasters.

Environmental taxation could be utilized as a method of reducing and deterring exploration activities of the environment that has the potential of creating man-made natural disasters. As a suggestion, it can be argued that if there is an activity with a high possibility of creating a man-made natural disaster, such activity should be heavily taxed to discourage its future practices.

It is to be noted that while some of the suggestions made in this section may seem one-sided only concerning the environmental aspect without the others, the damages caused to the environment are so extensive that there is a need for taking affirmative actions for restoration and the protection of the environment to the detriment of other rights, which have been so far utilized at the destruction of the environment by such activities which profit some and cause harm to all including those who have profited. Therefore, ideas such as making those accountable for creating man-made natural disasters should be developed and sustained to protect and advance the riches of the environment.

Conclusion

The idea of making liable those who contribute to creating man-made natural disasters could be taken as a novel idea. However, there are many examples that could be shown to prove that there are certain human activities and omissions which could eventually contribute to creating man-made natural disasters, and there is a need for making those accountable who have contributed to creating such disasters.

The “polluter pays” principle can be identified as a principle of international environmental law that seeks to internalize the negative externalities caused by humans to the environment through a variety of actions or omissions. However, the “polluter pays” principle lacks the ability to extend itself to cover incidents of such activities or omissions of individuals which could contribute to the creation of man-made natural disasters. Therefore, it was suggested that an extended version of the “polluter pays” principle should be utilized in awarding exemplary damages to those who contribute to create man-made natural disasters. In addition to this, shifting the burden of proof upon those exploiting the environmental resources to prove that their activities would not be a reason for man-made natural disasters and implementing a more coherent system of environmental taxation have been suggested as alternatives. While this chapter is written from a legal perspective which is a limitation of the study, a true analysis would require a collaborative effort inculcating different perspectives including environmental, scientific, and management-related fields for providing a workable solution to the issue of finding an appropriate mechanism for holding those accountable for man-made natural disasters. In conclusion, it can be said that the idea of making those accountable for man-made natural disasters is a project that needs to be collaborated on and advanced for the greater betterment of environmental protection which is to be considered through different perspectives at finding an optimal solution.

Abstract

Earth jurisprudence is a philosophy of law and governance that perceives human beings only as a part of the wider Earth community. It emphasizes the necessity of deviating from the legal frameworks which keep the protection of human interests

A. Edirisinghe (✉)

General Sir John Kotelawala Defence University, Colombo, Sri Lanka

as its core objective. Today, more than nine jurisdictions around the world have embraced Earth jurisprudential principles through various constitutional, legislative, judicial, and institutional means. In May 2021, Sri Lanka faced one of the worst maritime environmental disasters in its history as “MV X-Press Pearl,” a Singaporean containership, burnt for several days just outside the port of Colombo with tons of hazardous and highly reactive chemicals, bunker oil, and containers carrying plastic pellets aboard. The incident which occurred in shallow waters endowed with high biodiversity caused unprecedented and irreversible damage to the marine environment, species, and resources. It reiterated that environmental disasters affect not only human beings but all other living and nonliving species who share the planet with them. Therefore, it is unequivocal that these nonhuman beings shall be empowered to protect themselves against anthropogenic environmental disasters. This chapter ascertains how Earth jurisprudence can be used to protect the oceans and ocean species in Sri Lanka from anthropogenic maritime disasters and to remedy the damage that they have already sustained. The author utilized the black letter approach to research and international and comparative research methodology to carry out the research. The chapter mainly focuses on Sri Lanka and refers to Ecuador, New Zealand, and India in drawing lessons for law reform. The chapter will provide guidance to protect the Sri Lankan oceans for more than the instrumental values that they hold.

Earth jurisprudence · MV X-Press Pearl · Marine environmental disasters · Protection of oceans

Introduction

Since the late 1990s, there has been an effort among a set of legal scholars to develop a new jurisprudence or a legal philosophy that recognizes human beings as an inextricable strand in the larger community of the Earth. This ideology termed “Earth jurisprudence” was initially proposed in *The Great Work* authored by Thomas Berry (1999) and, subsequently, developed mainly in the scholarly works of Cormac Cullinan and Peter Burdon. Earth jurisprudence fundamentally upholds that the present legal systems and legal orders represent an anthropocentric view and it is “supporting exploitation rather than protecting the natural world from destruction” (Berry, 2006: 107). It perceives that the separation between nature and human beings and the assumption that man is superior to nature are the fundamental causes of the present environmental crisis (Burdon, 2010: 62). Accordingly, it emphasizes that law and governance shall aim to achieve well-being of the comprehensive Earth community and not simply its human component. This jurisprudential ideology has now been accepted and upheld by many jurisdictions around the world.

This chapter seeks to ascertain how Earth jurisprudence can be integrated into the contemporary legal framework in Sri Lanka to protect its oceans and ocean species. In doing so, it considers the MV X-Press Pearl incident which caused an unprecedented marine environmental disaster. The chapter aims to ensure that the oceans and all those who inhabit them will not fall victim to another anthropogenic maritime disaster and that the damage which has already been suffered by them will be adequately rectified.

The chapter proceeds under seven headings. Part 1 introduces Earth jurisprudence and its origin and development. Part 2 explores the scope and the key principles of Earth jurisprudence and their relevance for the protection of oceans. Part 3 provides a brief account of the MV X-Press Pearl disaster and its environmental implications while establishing why Earth jurisprudential principles are relevant to the incident. Part 4 analyzes how the existing marine environmental protection legal framework in Sri Lanka provides for the protection of more than the instrumental values of oceans. Part 5 evaluates how Earth jurisprudence is recognized in Ecuador, New Zealand, and India and what comparative insights could Sri Lanka glean from these three jurisdictions. Part 6 lays down suggestions to integrate Earth jurisprudence into the present legal framework of Sri Lanka to protect its oceans against anthropogenic maritime disasters. The final part of the chapter lays down the conclusions.

Earth Jurisprudence: Philosophical and Theoretical Origins and Development

Earth jurisprudence is a philosophy of law and governance that perceives human beings only as a part of the wider Earth community (Cullinan, 2011: 13). Koons, referring to Cullinan and Nash, defines Earth jurisprudence as “an inclusive and system based theoretical perspective that supports robust environmental regulation and recognizes a kinship with the field of environmental ethics” (2011: 45).

Burdon recognizes several underlying reasons for the origin of this theory. First, Earth jurisprudence was developed as a response to the present environmental crisis. Earth jurisprudence believes that the fundamental cause of the present environmental crisis is the separation between nature and human beings (Burdon, 2010: 62). Second, Earth jurisprudence can be considered a form of critical legal theory. Proponents of Earth jurisprudence criticize the law for legitimizing certain social relations and hierarchies (Burdon, 2012: 30). In fact, the advocates of Earth jurisprudence hold that the “separation and hierarchical ordering of the human and nonhuman worlds” lie at the very foundation of many Western legal theories (Graham, 2003: 19; Burdon, 2012: 28–29). Third, Earth jurisprudence can be regarded as a development from the environmental movement and environmental philosophy (Burdon, 2012: 30).

Initially, many of these ideas were not well-received. Nevertheless, Earth jurisprudence has eventually become increasingly popular, finding its way into the legal frameworks of many jurisdictions around the world. An important thing to be noted

here is that in many jurisdictions this recognition took place at an intersection where the contemporary legal frameworks absorbed the concepts from the traditional legal frameworks of Indigenous communities (O'Donnell, 2020: 647). While the principles presented in Earth jurisprudence do appear novel and innovative in Western legal philosophies, they formed a part of many Indigenous ontologies for centuries if not for millennia. For these communities, nature is not only a living being but also a conscious, sentient, and agentic being (Booth, 2008: 799).

After examining the origin and the development of Earth jurisprudence, the chapter now turns to explore the main principles of Earth jurisprudence and their relevance for the protection of oceans against anthropogenic maritime disasters.

Elements of Earth Jurisprudence and Their Relevance for the Protection of Oceans

There are many scholarly works defining the features of Earth jurisprudence in a variety of ways. Almost all of them uphold similar ideologies with slight differences in their expressions and wordings. The following discussion will explain four key features of Earth jurisprudence and their relevance for the protection of oceans.

Legal Personhood and Rights of Nature

First, one of the main features of Earth jurisprudence commonly recognized by scholars is legal personhood and rights of nature. Legal personhood and rights of nature simply means that nature must have a personhood recognized by law that is distinct from the legal personhood of human beings and must hold corresponding rights. The contemporary legal frameworks, influenced by legal positivism, place all rights and values in the man (Burdon, 2011:63). Berry (1999: 72) holds, “[a]ll rights have been bestowed on human beings. Other than human modes of being are seen as having no rights. They have reality and value only through their use by humans.” It appears from these ideas that the contemporary legal frameworks uphold only the instrumental value of nature. One of the best ways of remedying this is the recognition of legal personality and legal rights of nature.

Who can be a legal person is one of the most intense debates in legal scholarship. However, the legalists adopt a fairly straightforward approach in this regard. For them, anything or anyone can be a legal person and hold corresponding rights as long as it is compatible with the purpose of any particular law (Naffine, 2009: 21). This view is affirmed by many proponents of Earth jurisprudence and the rights of nature. For instance, Tănasescu (2022: 22) argues that a legal person is that entity that the law declares to be a legal person. O'Donnell (2020: 648) affirms this idea holding that from a legal perspective, the legal person is nothing more or less than a construct of law. Accordingly, oceans can be legal persons if they are constructed as such by the law.

It is also recognized that if nature is perceived as a legal person, then it must have a set of corresponding rights. According to O'Donnell (2020: 648), what brings the abstraction of the legal person into being is the assignment of rights and duties. Following the scholarly work of Berry, this study recognizes that oceans, as a component of the universe, already hold certain rights: the right to be, the right to habitat, and the right to fulfill their role in the ever-renewing process of the Earth community (Cashford, 2011:9).

What is the relevance of legal personhood and the rights of nature for the protection of oceans? Constructing oceans as a legal subject, with rights and powers of their own, is a way of empowering them (O'Donnell, 2019: 185). It will make sure that the oceans are more visible to the law (O'Donnell, 2019: 24) and they can fight for their own preservation and protection and the injuries suffered by them will not always be considered relative to human beings.

Great Jurisprudence

Second, Earth jurisprudence recognizes two levels of law that arise from the interdependent relationship between man and nature. The first level of law is great law which contains the rules and principles of nature (Burdon, 2011: 60, 2014: 81). The concept of great law was first introduced by Berry who holds that "Earth is our primary teacher as well as the primary law giver" (Berry, 1999: 64). The term "great jurisprudence" or "great law" was coined subsequently by Cullinan (2011: 13) who defines it as "fundamental relationships and principles that constitute the Earth community." The second level of law is human law which contains binding rules and principles promulgated by the law-making authority of a community (Burdon, 2011: 67).

Earth jurisprudence emphasizes that human law shall be consistent with great law due to two underlying characteristics of the former. First, as pointed out by Burdon (2011: 60, 2014: 82), "human law derives its legal quality and the power to bind in conscience from the great law." Second, human laws which contravene the fundamental principles and relationships that constitute the Earth community can be considered a corruption of law and will therefore be illegitimate and unlawful.

Thus, the human law governing oceans must acknowledge the inseparability, interrelatedness, and interactions between and among human beings, oceans, and ocean species and restore man to "a place of intimate intercourse with the vast organism that constitutes the Earth" (Worster, 1994: 82). If this link is ignored, and humans dominated the oceans and exploited them as they wish, the negative consequences can be enormous.

Community Ecological Governance

The third element of Earth jurisprudence focused on in this research is community ecological governance. There are traditions, cultures, and religious practices which

see nature for more than its materialistic value. The idea of community ecological governance stems from observing these Indigenous customs and practices which maintain close, intimate relationships with nature. Such relationships are “far from being, competitive, destructive, and exploitative and allow for mutual co-existence and nourishments” (Mason, 2011: 41). These communities live in intimate communion with nature, without formal laws or rules compelling them to behave as such. Consequently, it becomes impossible for them to do things that sever this intimate relationship. Even though they do not use the term “Earth jurisprudence” explicitly, their way of living is the true spirit of Earth jurisprudence (Mason, 2011: 40–43).

Community ecological governance requires not only interest-led consultation but also consultation with local communities, nature, and its laws in the ecological law-making process. Thus, “laws must respect traditional knowledge, cultural heritage, benefit sharing, human rights, nature rights, self-determination, and community land rights” (Filgueira and Mason, 2011: 199). The concept of community ecological governance thus emphasizes two basic ideas. First, community knowledge holders and elders must be consulted, and their knowledge must be respected in the development of the laws aimed at the regulation of the affairs between man and nature. Second, it is pivotal to revive the relational stewardship responsibilities to nature contained within Indigenous and traditional laws and ontologies.

How does community ecological governance become relevant in the protection of oceans against anthropogenic maritime disasters? The traditional value systems will be able to guide contemporary communities away from the Western ideologies which perceive exploitation of the Earth to be a natural trait of human beings (Booth, 2008: 799). They will guide the communities to protect the oceans for the intrinsic and relational values that they hold.

Restorative Justice

The fourth indicator of Earth jurisprudence adopted in this research is restorative justice. According to Marshall (1996:37), “restorative justice is a process whereby all parties with a stake in a particular offence come together to resolve collectively how to deal with the aftermath of the offence and its implications for the future.” Restorative justice can be utilized across a wide variety of offences and a wide variety of victims (including individuals, communities, and the environment) and a wide variety of outcomes (Hamilton, 2008: 269).

The adoption of the concept of restorative justice in environmental issues over retributive justice allows the offender or the wrongdoer to make amends as quickly as possible and to rejoin the Earth community, healing the severed relationship in the interest of the well-being of the whole (Mason, 2011:43). This research holds that in determining the harm caused by anthropocentric maritime disasters, not only the damage suffered by the human communities but also the damage suffered by the oceans itself must be considered. Measures must be taken to cure the damaged oceans and restore the intrinsic values of the ocean ecosystems.

The above discussion recognized four key elements of Earth jurisprudence as laid down by different legal scholars and established their relevance for the protection of oceans. The next part of the chapter explains the MV X-Press Pearl disaster which was termed “the worst maritime disaster to have struck Sri Lanka” (UN Environmental Advisory Mission, 2021: 3) and establishes how the Earth jurisprudence debate is relevant to the incident.

The MV X-Press Pearl Disaster and Earth Jurisprudence

On 20 May 2021, Singapore-flagged MV X-Press Pearl containership experienced a chemical fume eruption while it remained anchored around 9 nautical miles (17 kilometers) northwest of the Port of Colombo in Sri Lanka’s national waters. On 25 May 2021, the ship got caught in an intense fire. At the time, it was carrying 1486 containers containing hazardous and noxious substances including 25 tons of nitric acid, caustic soda, methanol, 9700 tons of potentially toxic epoxy resins, micro-plastics, and 87 containers carrying several types of plastic pellets aboard (The UN Environmental Advisory Mission, 2021: 5–6). The ship continued to burn for around a week, irrespective of the efforts to extinguish the fire (*Centre for Environmental Justice, 2021*: 11). After the fire was doused, the vessel was attempted to be towed to a deeper water refuge which unfortunately failed, resulting in the partial sinking of the vessel. By 17 June 2021, the entire vessel sank and settled in the seabed only with its castle and some of its cranes partially visible (The UN Environmental Advisory Mission, 2021: 5).

The immediate consequences of the incident were thick plumes of black smoke, the potential spill of dangerous and hazardous substances on board the vessel into the ocean, large quantities of plastic pellets and other debris from the ship washing ashore, and an oil slick continuously leaking to the ocean from the ship (The UN Environmental Advisory Mission, 2021: 5). The long-term impacts of the incident are more far-reaching. The UN Environmental Advisory Mission focuses on seven main environmental consequences of the disaster: oil pollution, chemical pollution, risks arising from the shipwreck and lost containers, plastic pollution, impacts on wildlife and sensitive environments, impacts on fishery resources, and air pollution. While an in-depth discussion of these effects is not possible within the length of this chapter, it must be emphasized that these consequences affect humans and non-humans related to the ocean ecosystems alike.

In order to ensure that oceans will not be ravaged for human benefit, it is vital that Sri Lanka think beyond an anthropocentric legal framework and uphold the essence of Earth jurisprudence. The next part of the chapter discusses how the features of Earth jurisprudence discussed in Sect. 3 of this chapter are reflected in the present legal framework of Sri Lanka aimed at the protection and conservation of oceans against maritime disasters similar to MV X-Press Pearl.

The Role of the Contemporary Marine Environmental Protection Laws in Sri Lanka in the Protection of Intrinsic and Relational Values of the Oceans

In ascertaining the potential of the contemporary legal framework in Sri Lanka in protecting the intrinsic and relational values of the oceans against MV X-Press Pearl or similar disasters, attention must be given to the Constitution of Sri Lanka and the key legislations governing the area, namely, Marine Pollution Prevention Act, No. 35 of 2008, and Fisheries and Aquatic Resources Act, No. 02 of 1996.

The Constitution

The 1978 Constitution of Sri Lanka does not reflect great jurisprudence or expressly recognize legal personhood and rights of nature. First, as far as great jurisprudence is considered, the constitution has only three weak references to the environment. The first two references embodied in Articles 27(14) and 28(f) recognize the shared responsibility of the state and community to protect the environment, but these provisions are not enforceable before any court or tribunal. The third reference imposes duties on the parliament and the provincial councils to make laws to protect the environment in consultation with one another. These limited references reflect the insignificance attached to the rules of nature in the constitution. Second, while the Sri Lankan judiciary expanded the *locus standi* in environment-related cases to include anyone acting in the interest of the general community, it has never expanded legal standing to nature or parts of nature or recognized them as legal persons.

Third, whether the constitution expressly encourages the use of Indigenous customs and traditions in environmental governance is problematic. However, the judiciary in Sri Lanka has emphasized the significance of drawing on ancient wisdom in the *Bulankulama* case. *Bulankulama* is a fundamental rights petition filed against the decision of the government to lease out a phosphate mine situated in the area called Eppawela to a foreign company. In the case, honorable Amerasinghe J. cited the separate opinion of Judge Weeramantry in *Gabcikovo-Nagymaros Project* in saying:

[t]he ingrained values of any civilization are the source from which its legal concepts derive and the ultimate yardstick and touchstone of their validity . . . the time has come when these must be integrated into the corpus of the living law. The task of the law is to convert such [ancient] wisdom into practical terms. (*Bulankulama v Secretary, Ministry of Industrial Development*, 2000: 255)

The ancient wisdom of Sri Lanka emphasizes deep relational values in nature. As pointed out by Edirisinghe and Lim (2021: 150), “it was not uncommon in ancient Sri Lanka to treat nature on par with or even as superior to human beings.” Nevertheless, these native ontologies and practices rarely found their way into the interpretation of the constitution.

Fourth, as far as restorative justice is considered, the judiciary, in one of the recent cases, emphasized that the polluter has a duty to restore the environment to its previous condition (*Centre for Environmental Justice*, 2020). The case is a writ application filed against an alleged illegal settlement of internally displaced persons in a forest complex adjoining Wilpattu National Park. The court issued a writ of mandamus and ordered the Conservator General of the Department of Forest Conservation to implement a tree planting program “in any area equivalent to the reserve forest area used for resettlement of internally displaced persons” (*Centre for Environmental Justice*, 2020: 12). The court further directed the seventh respondent of the case, the then Minister of Industry and Commerce, to bear the full cost of the above tree planting program since he has been instrumental in using the forest land for non-forest purposes. The decision is debatable on the ground whether a tree planting program in any area equivalent to the deforested forest area can be taken as a true restoration of the invaluable forest that was lost. Yet, the decision of honorable Justice De Silva shall be considered a significant landmark in the environmental jurisprudence in the country for its recognition of the duty of the polluter to restore the environment in clear and cogent terms.

The researcher does not wish to establish that the constitution is incapable of dealing with maritime disasters like MV X-Press Pearl. The limited constitutional provisions aimed at the protection of the environment referred to above have been successfully utilized in many environment-related cases. There are two basic ways in which the public can hold the government authorities of Sri Lanka accountable for their failure to prevent the MV X-Press Pearl disaster and compel them to take appropriate measures to remedy the damage. They can invoke the equality clause embodied in Article 12(1) of the Constitution together with the constitutional duty imposed on every person in Sri Lanka to protect nature in terms of Article 28(f) of the Constitution. In fact, there is already a fundamental rights petition filed by the Centre for Environmental Justice claiming that actions and/or omissions of the relevant government authorities constitute a violation of the fundamental rights guaranteed to the petitioners, the citizenry of the country, and the future generations under Article 12(1) of the Constitution (*Centre for Environmental Justice*, 2021: 21–22). Second, the people can invoke the writ jurisdiction under the constitution and compel the government authorities to exercise the powers vested in them to protect the marine environment against the consequences of the disaster.

The argument here is that these remedies are human-centered. Consequently, the issue will be looked at from an anthropocentric viewpoint. It promotes the misconception that only man matters and the rest of the ocean matters only if it is linked to the interests of man. Oceans do not have their own right to exist and flourish neither all the other species depending on the oceans. This fosters human supremacy in ocean governance and empowers humans to protect their interests against the maritime disasters that they created. The oceans, on the other hand, suffer from pollution and are legally handicapped to fight against it. The recognition of environmental restoration by the Sri Lankan judiciary shall however be appreciated since it sets a precedent of compelling the polluter to bear the costs of restoring the

pollution-ravaged oceans in the X-Press Pearl incident. Nevertheless, Sri Lankan Constitution has a long way to go in protecting the oceans for their own interests.

Following the above discussion on the constitution, this chapter now turns to discuss whether the Marine Pollution Prevention Act reflects Earth jurisprudential principles and protects the more than instrumental values of oceans against anthropogenic maritime disasters.

Marine Pollution Prevention Act, No. 35 of 2008

Marine Pollution Prevention Act, No. 35 of 2008 (hereinafter referred to as MPPA), provides for the prevention, reduction, and control of marine pollution in the territorial waters, any other maritime zone, the foreshore, and the coastal zone of Sri Lanka (Preamble). It also provides for the establishment of the Marine Environment Protection Authority (hereinafter referred to as MEPA). The MPPA provides both criminal and civil liability in the cases of certain types of pollution.

Section 26 of the Act imposes criminal liability for the discharge or escape of pollutants into the territorial waters of Sri Lanka. Section 27 prohibits the dumping of any pollutant into the territorial waters of Sri Lanka or any other maritime zone except in accordance with a permit issued by MEPA. Both sections make the offender liable for a fine. Section 30 imposes civil liability on the polluter for any damage caused to the marine environment or its interests by the pollution and the costs of any measures taken for the purposes of preventing, reducing, or removing any damage caused by the pollution.

These provisions carry certain links with restorative justice which can be established through much deliberation. The damage caused by MV X-Press Pearl unambiguously falls within the scope of Sects. 26, 27, and 30. In terms of Sect. 30, the polluter is expected to bear all the costs of pollution. Therefore, even though it is not expressly enumerated, it can be assumed that it also includes the cost of environmental restoration. The act however is not reflective of the other three principles of Earth jurisprudence recognized in this chapter.

The next part of the chapter focuses on the third legal instrument relevant to the MV X-Press Pearl disaster, which is the Fisheries and Aquatic Resources Act.

Fisheries and Aquatic Resources Act, No. 02 of 1996

The presence of the word “resources” in the title of the Fisheries and Aquatic Resources Act, No. 02 of 1996 (hereinafter referred to as FARA), itself suggests the presence of the anthropocentric characteristic of finding the worth of nature merely in its material value. This is further manifested in the purpose of the act: “to provide for the management, regulation, conservation, and development of fisheries and aquatic resources in Sri Lanka” (FARA, 1996: preamble). Filgueira and Mason (2011: 200) recommend, “looking at the Earth as a living being and stop using the

word ‘resource’ when we speak about nature is one practical method of adopting Earth jurisprudence.”

The MV X-Press Pearl incident has violated several provisions embodied in FARA. Section 27(3) prohibits the dumping of poisonous, explosive, or stupefying substance or other noxious or harmful material or substance in Sri Lankan waters. Section 37 makes it an offense to “discharge waste or any other polluting matter or disturb, interfere with or destroy, fish or other aquatic resources or their natural breeding grounds or habitat in fisheries reserves without a valid permit.” Both provisions make the MV X-Press Pearl disaster an offense under Sri Lankan law, but from an anthropocentric viewpoint. The two provisions form a part of a legal framework that perceives ocean species as resources and, therefore, protects them on the basis of their relative significance or the instrumental values for human beings. FARA is clearly a part of the existing Western legal orders which provide specific legal protection for certain entities.

Thus, it is certain that the legal framework of Sri Lanka does not necessarily reflect Earth jurisprudential principles with regard to the protection of oceans. It does recognize restorative justice but still has a long way to go in embracing and accepting man to be just a part of nature and protecting the oceans for more than the instrumental values that they hold. The next part of the chapter seeks to examine how Earth jurisprudential approaches are adopted through constitutional, legislative, and judicial means in three selected comparative jurisdictions, namely, Ecuador, New Zealand, and India. It also ascertains what comparative insights could Sri Lanka learn from these jurisdictions.

Earth Jurisprudence in Other Jurisdictions

Many jurisdictions around the world are now increasingly recognizing and integrating the principles of Earth jurisprudence into their domestic legal frameworks. When observing how different jurisdictions are bringing Earth jurisprudence into their respective legal frameworks, three fundamental approaches can be identified. They are through the constitution, legislation, or through judicial activism. This part of the chapter selected three case studies to demonstrate each of these approaches.

Constitutional Recognition: Ecuador

Ecuador recognizes the rights of nature in its constitution which has been in place since 2008. Rights of nature making their way into the constitution is particularly impressive and equally significant because “Constitutional guarantees are usually at the apex of the hierarchy of norms established by legal systems and trump any conflicting norm of lower value” (Shelton, 2010: 266).

These constitutional provisions are basically derived from the belief of *Pachamama*. According to Indigenous Andean cosmovision, *Pachamama* is a

female deity of the Earth who presides over agriculture, embodies the mountains, and causes natural disasters (Jenkins, 2015: 450). Guzman holds:

The institutionalization of the rights of nature was a result of intercultural dialogue since indigenous organizations indirectly participated in the drafting process of the Constitution. Therefore, indigenous people in Ecuador and their nature ontologies had a significant influence on this emerging theory. (Juan José Guzmán, 2019: 79)

This demonstrates the use of community ecological governance in practice and the acceptance of ancient wisdom in the highest law of the country.

According to Article 10 of the Constitution, nature is entitled to claim the rights recognized for it by the Constitution. Chapter 7 of the Constitution lays down the rights held by nature. These include:

[R] rights of nature to exist, persist, maintain and regenerate its vital cycles, structure, functions and its processes in evolution, rights of nature to be restored, the right of the people to demand the recognitions of rights for nature before the public organisms, the duty of the State to promote respect towards all the elements that form an ecosystem and to apply preventive and restrictive measures on activities that might lead to the extinction of species, the destruction of ecosystems and the permanent alteration of natural cycles, and the right of persons, communities, people, and nations to benefit from the environment and the natural wealth. (Constitution of Ecuador, 2008: Art 71–74)

The Ecuadorian Constitution thus recognizes nature as a legal person, its crucial rights, restorative justice, and community ecological governance. All these together facilitate the man to maintain intimate relationships with nature.

Legislative Recognition: New Zealand

New Zealand is a perfect example to demonstrate how the Earth jurisprudential principles are integrated into the legislative framework. In New Zealand, two pieces of legislation; the Te Urewera Act of 2014 and Te Awa Tupua (Whanganui River Claims Settlement) Act of 2017 followed an Earth jurisprudential approach for the protection of two significant members of the Earth community.

The Te Urewera Act seeks to establish and protect the legal identity of the Te Urewera National Park which is the ancestral home of the Tūhoe people of Aotearoa New Zealand (Tănăsescu, 2020: 439). In terms of Sect. 11 of the Act, Te Urewera is recognized as a legal entity. The academic literature holds that the declaration of something as a legal entity does not carry the same legal implications as recognizing something as a legal person since a living entity would not hold any legal rights or duties without being conferred the status of a person (O'Donnell, 2020: 650). However, it shall be noted that the legislation uses the words "legal entity" and "legal person" interchangeably. In the exact words used in Sect. 11 of the Act, "Te Urewera is a legal entity, and has all the rights, powers, duties and liabilities of a

legal person.” Therefore, it can be assumed that the legislators intended Te Urewera to be a legal person capable of holding rights and duties.

The second legislation, the Te Awa Tupua (Whanganui River Claims Settlement) Act of 2017 declares Te Awa Tupua to be a legal person. Section 12 of the Act recognizes Te Awa Tupua as “an indivisible and living whole, comprising the Whanganui River from the mountains to the sea, incorporating all its physical and metaphysical elements.” Collins and Esterling (2019: 202), however, hold that “while the use of legal personality appears to provide the river with authority and control over itself, in practice its legal rights are limited. This is because the Te Awa Tupua Act does not vest ownership of all parts of the River in Te Awa Tupua.” Referring to Sect. 41 of the Act, they state that what is transferred to Te Awa Tupua is what is owned by the government, which comprises only “parts of the riverbed and the *pakohe*, gravel, sand, and shingle in or on the vested land.” Nevertheless, the recognition of these two members of the community of beings as legal persons shall be accepted as a progressive step forward in the attempt to adopt Earth jurisprudential principles in contemporary legal frameworks.

The other significant feature of the legislative recognition of the rights of nature in New Zealand is the role played by Indigenous communities and their knowledge in the process. Section 13 of the Act recognizes intrinsic values which represent Te Awa Tupua. According to Professor Bosselmann (2017: 165), these intrinsic values are directly drawn from Indigenous literature. This integration of the knowledge of Indigenous communities who lived in harmony with these rivers and lands for centuries is clearly an adherence to the principle of community ecological governance emphasized in Earth jurisprudence.

Judicial Recognition: India

India recognized Earth jurisprudential principles in 2017, in two landmark cases, *Mohd Salim v State of Uttarakhand and others* (2017) (hereinafter referred to as *Mohd Salim* case) and *Lalit Miglani v State of Uttarakhand and others* (2017) (hereinafter referred to as *Lalit Miglani* case). The High Court of Uttarakhand recognized the Ganges and Yamuna Rivers as legal persons in the two cases.

The first case, *Mohd Salim*, was filed against the industrial pollution of the Ganges and Yamuna Rivers and the failure of the relevant authorities to take effective measures to clean up the rivers. The court, delivering its judgment, held that “an extraordinary situation has arisen since rivers Ganges and Yamuna are losing their very existence” (*Mohd Salim*, 2017: 4). The court then highlighted that the rivers are considered divine and, therefore, worshipped by the followers of Hinduism in India. The court accordingly granted legal personhood to the two rivers and declared several administrative authorities to be *in loco parentis*, or the human actors acting on behalf of the rivers, to conserve and protect the two rivers and their tributaries (*Mohd Salim*, 2017: 11–12).

The second case, *Lalit Miglani* took a step ahead of the *Mohd Salim* case and conferred rights on the entire ecosystem associated with the rivers Ganges and Yamuna. The court invoked its parens patriae jurisdiction and declared that:

the Glaciers including Gangotri and Yamunotri, rivers, streams, rivulets, lakes, air, meadows, dales, jungles, forests, wetlands, grasslands, springs and waterfalls are a legal entity/legal person/juristic person/juridical person/moral person/artificial person having the status of a legal person, with all corresponding rights, duties and liabilities of a living person, in order to preserve and conserve them. (*Lalit Miglani*, 2017: 64)

Similar to the previous *Mohd Salim* case, *Lalith Miglani* judgment also referred to and relied on Indian mythology and religious beliefs drawing on ancient wisdom prevalent in the communities.

This recognition of the legal personhood of nature in India was, however, stayed by the Supreme Court in the special leave petition, *the State of Uttarakhand* 2018 v *Mohd Salim*. Nevertheless, in 2022, a decision by the Madras High Court in *A Periyakaruppan v The Principal Secretary to Government* once again revived the rights of nature dialogue in India and declared that nature has personhood in the eyes of the law. It also accorded nature with “the rights akin to fundamental rights/legal rights/constitutional rights for their survival, safety, sustenance and resurgence in order to maintain its status and to promote their health and wellbeing” (*A Periyakaruppan*, 2022: 21).

While Ecuador, New Zealand, and India have not recognized Earth jurisprudence specifically with regard to the oceans and their protection, they do provide some significant lessons which can be applied in the context of the protection of oceans against anthropogenic maritime disasters. The next part of the chapter will lay down suggestions to reform the Sri Lankan law pertaining to the protection of oceans and ocean species to better reflect their own interests drawing on the lessons from these three comparative jurisdictions.

Recommendations

The main recommendation of the study is that Sri Lanka must integrate Earth jurisprudential principles of legal personhood and rights of nature, great jurisprudence, community ecological governance, and restorative justice into the ocean protection legal framework. This could be done in the following three methods.

Judicial Recognition

The first method of incorporating Earth jurisprudence into Sri Lankan law shall be through judicial activism following the example set by India. The judiciary has always played a progressive role in environmental protection in Sri Lanka filling the

gaps in the written law through creative interpretation. Thus, it is suggested that the judiciary recognize and apply Earth jurisprudential principles for the protection of the oceans. Oceans in Sri Lanka shall be recognized as legal persons with their own rights to exist, persist, and participate in the evolution of the Earth community. Moreover, the court shall uphold restorative justice once again and shall compel the parties responsible for the MV X-Press Pearl disaster to restore the affected marine environment to its previous condition. In doing so, the court shall draw on ancient wisdom in Sri Lanka which recognized nature on a par with man long before Earth jurisprudential concepts emerge in the contemporary legal world.

Legislative Recognition

Second, it is suggested to follow the New Zealand approach and recognize Earth jurisprudence through legislative enactments. The author suggests a new legislation with the following salient features.

First, this piece of legislation shall recognize oceans as living persons with rights, who can sue for their own preservation. The legislation shall recognize three basic rights of the oceans: the right to exist, persist, and participate in the evolution of the Earth community. All the other rights required for the effective exercise of these three fundamental rights shall also be recognized. Second, the legislation shall recognize restorative justice and shall emphasize that the pollution-ravaged oceans can demand the polluters to restore their condition to pre-pollution stage. Third, the legislation shall respect and draw on the ancient wisdom in Sri Lanka which does not see a division between man and nature, encourage community participation in the governance of oceans, and most importantly, ensure the maintenance of a mutually enhancing relationship between the ocean and human communities. Fourth, the enactment shall establish in clear and cogent terms that the rights of human beings to use oceans for their sustenance are not really rights but special privileges which come with a greater responsibility to keep the balance of oceans and ocean ecosystems intact. Finally, the legislation shall respect and uphold great jurisprudence; oceans shall be governed in such a way that is consistent with fundamental laws and principles governing the universe.

Constitutional Recognition

The third suggestion is bringing a constitutional amendment introducing a separate chapter to the constitution that recognizes the rights of the whole Earth and the Earth community and not just of the oceans and ocean species following the Ecuadorian Constitution. This chapter should recognize great jurisprudence, rights and legal personhood of nature, community ecological governance, and restorative justice in environmental destruction.

Conclusion

MV X-Press Pearl disaster has caused an unprecedented damage to the Sri Lankan oceans and all those who form a part of these oceans. The far-reaching implications of the incident will adversely affect the ocean and marine lives for many years to come. These species and the ocean itself were stripped of their values, health, and perhaps even their continuous survival. The best method to empower oceans to fight against this level of pollution is the express recognition of Earth jurisprudence in the domestic legal framework. It respects oceans and ocean species as a salient and integral part of the wider Earth community, just like the man himself. Unfortunately, Earth jurisprudential principles are not comprehensively reflected in the contemporary legal framework aimed at the protection of oceans in Sri Lanka. The time has come when these crucial principles must be integrated into the corpus of the contemporary law in Sri Lanka, following the examples set by the international community, to preserve oceans and all its members for the sake of all of the Earth community.

Abstract

No crisis ever before has put the whole of humankind into such a vulnerable position as caused by the COVID-19 catastrophe. It placed everyone under a sense of fear, want, and marginalized dignity of life of individuals. The states being responsible under the doctrine of *parens patriae* to protect human lives and as guarantors of liberties of individuals faced an unprecedented challenge and were trapped in the state of helplessness. It warrants a revisit of “social contract theory” to ensure “freedom from fear” and “freedom from want” in addition to enlarging the scope of the obligation to guarantee the protection of life, liberty, and protection. The chapter underlines the scope of the state’s obligations to reduce risk, manage disaster, and rehabilitate. Adoption of the Hyogo Declaration, 2005, Sendai Framework, 2015, and Sustainable Development Goals, 2015, at the international level depicts and reiterates international solidarity to preserve the dignity of human life and strengthen the resilience to mitigate the gravity of disasters. The compatibility of the Indian legal framework on disaster management with the principles of international humanitarian law has been evaluated.

Introduction

Dignity is indeed an inherent attribute of human personality in a civilized society. The conception of dignity certainly necessitates freedom from fear and want. The preamble to the UDHR sets out the goal to establish a civilized society in the post-Second World War scenario. It clearly states the obligation of the member-states to guarantee the inseparable rights of an individual in pursuit of justice and peace in the world. The COVID-19 pandemic compelled humanity and almost every institution across the globe to redefine its goals, revisit the priorities, and restructure the procedure of realization. No crisis ever before has put humankind into such a

vulnerable position as the COVID-19 catastrophe. Neither any part of the world nor any walk of life such as governance, health, finance, trade, commerce, education, and transportation remained immune to its grip. It placed the whole mankind under a sense of fear, want, and marginalized dignity. The states, being responsible under the doctrine of *parens patriae* to protect human lives and guarantee the dignity of individuals, faced an unprecedented disaster and were trapped in a state of helplessness.

The responsibility of the UN itself, states, international organizations, non-governmental organizations, scientific and technological societies, humanitarian groups, investment institutions, etc. towards disaster management has been spelt out in several resolutions of UNGA. The need for a multi-disciplinary and multi-dimensional global strategy promoting international and intra-national coordination to deal with different kinds of disasters was pointed out in the report titled “Our Common Future” (WCED, 1987), and it was acknowledged by UNGA through its resolution A/42/427 (UNGA, 1987a, b). Later during the 96th plenary meeting of UNGA in December 1987, the idea of a global program for natural disaster reduction was conceived to strengthen the collaborative efforts among culturally and economically diverse nations. Furthermore, the UNGA adopted a resolution A/42/169 to designate the next decade as an international decade for natural disaster reduction and to foster international cooperation and concerted effort to assemble, disseminate, and apply the scientific and technical knowledge about the causes and effects of natural disasters (UNGA, 1987a, b). Subsequently, the resolution nos. 44/236 and 46/182 adopted in December 1989 and December 1991 respectively demonstrate the efforts for the development of an integrated approach for disaster management and heralding a global culture of prevention. The movement was further strengthened by Agenda 21, Rio Declaration, Yokohama Strategy and Plan of Action for a Safer World 1994, Hyogo Framework for Action 2005–2015: Building the Resilience of Nations and Communities to Disasters 2005, Sendai Framework for Disaster Risk Reduction 2015–2030, Sustainable Development Goals, 2015, and Paris Agreement at the international level which depict international solidarity, its commitment to preserve the dignity of human life, and strengthen the resilience to mitigate the gravity of disasters (UNGA, 1994, 1999, 2000, 2002, 2003, 2004, 2005, 2015).

Henceforth, the international fraternity has been consistently taking measures to monitor, revisit, and reshape its framework on disasters management. The exercise of revisiting *social contract* in the form of a variety of resolutions resulted in the addition of obligation of the member states for rehabilitation, disaster response, and risk reduction at international and intranational levels. Accordingly, the Member States also reshaped their legislative and policy mechanism towards disaster mitigation and prevention based on measures concerning preparedness, response system, management plans, functioning of communication network, community-based mitigation, and capacity building of stakeholders. India being a signatory to different international instruments also reshaped its legislative and policy framework on disaster management. The laws dealing with disaster management in India can be studied under two categories: indirect laws and direct laws. The expression “indirect laws” has been used for the scattered and sector-specific approach to address threats

posed by disasters in a fragmented way like fire, explosive flood, the dam burst, tsunami, cyclone, lightening earthquake, snow avalanches, landslide, chemical, industrial, nuclear, biological, poisoning accidents, stampede, epidemics, pest attack, etc. Above threats are also covered under selective provisions of certain general laws, e.g., Indian Penal Code, 1860; The Indian Evidence Act, 1872; The Explosive Act, 1884; The Epidemic Disease Act, 1897; The Destructive Insects and Pests Act, 1914; The Poisons Act, 1919; The Petroleum Act, 1934; The Drugs and Cosmetics Act, 1940; The Factories Act, 1948; The Model Town and Country Planning Act, 1960; The Atomic Energy Act, 1962; The Civil Defense Act, 1968; The Insecticides Act, 1968; The Wild Life (Protection) Act, 1972; The Code of Criminal Procedure, 1973; The Water (Prevention and Control of Pollution) Act, 1974; The Forest (Conservation) Act, 1980; The Air (Prevention and Control of Pollution) Act, 1981; The Bhopal Gas Leak Disaster (Processing of Claims) Act, 1985; The Narcotic Drugs and Psychotropic Substances Act, 1985; The Railways Act, 1989; The Railways Accidents and Untoward Incidents (Compensation) Rules, 1990; The Public Liability Insurance Act, 1991; The Chemical Weapons Convention Act, 2000; The Protection of Plant Varieties and Farmer's Rights Act, 2001; The Biological Diversity Act, 2002; The Weapons of Mass Destruction and their Delivery Systems (Prohibition of Unlawful Activities) Act, 2005; The Food Safety and Standards Act, 2006; and The Civil Liability for Nuclear Damage Act, 2010; (NDMA, 2015). On the other hand, "direct law" conveys the idea of an integrated and coordinated approach to manage disaster to minimize the loss to life and property. The Disaster Management Act, 2005, falls under the category of direct laws as it was enacted to respond to the call of the international fraternity to provide legal backup to disaster management measures. The scope of discussion in this chapter has been confined to the Disaster Management Act, 2005. The forthcoming discussion deals with the evolution of standards and norms of international level through Yokohama, Hyogo, and Sendai Framework. It underlines basic principles of disaster management and also maps the integration of these principles in the national framework on disaster management in India. Highlighting the four objectives of the Act, the next part of the discussion uncovers structural and operational framework – mitigation and adaptation, disaster risk reduction and damage control and build back better, along with financial and institutional mechanism. The compositions, jurisdictions and functions of the three tier mechanism have been explained. Furthermore, the binding nature of the provisions of the Act has been elaborated with the help of enforceable measures. These measures provide the punishment in respect of the violation or deviation from the standards of behavior expected in these statutory norms.

International Norms on Disaster Management

International norms on disaster management can be precisely specified as under (Fig. 1):

To realize the above principles at the national level, the obligations of the member states under three landmarks can be described as under:

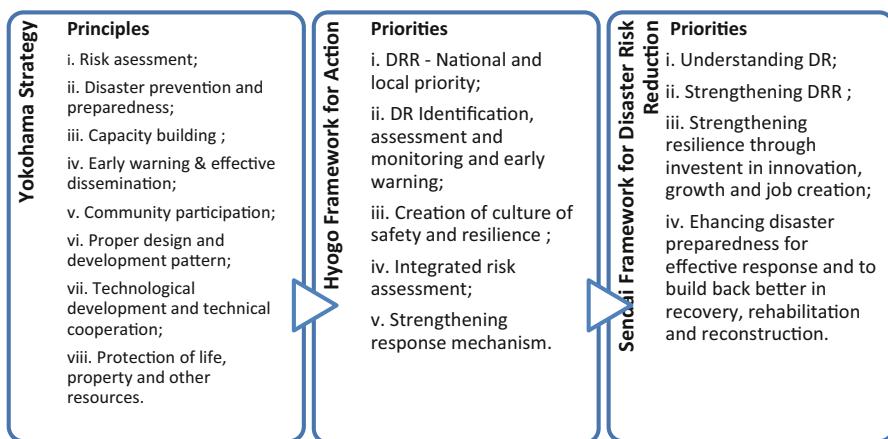

Fig. 1 Fundamental Principles of Disaster Management

Yokohama Strategy – It encouraged the demonstration of strong political will to minimize vulnerabilities, introduce legislation, and formulate multi-dimensional comprehensive policies ranging from national to community levels. The review of the implementation of the Yokohama Strategy highlighted gaps in organizational, legal, and policy sectors of governance, risk identification, assessment, monitoring, early warning, knowledge management and education, etc. (A/CONF.206/L.I).

Hyogo Framework – It emphasized upon creation of a strong capable national integrated disaster risk reduction mechanism with adequate statutory backup consisting of proper regulations and well-defined mechanisms to promote compliance, incentivization of risk reduction, and mitigation activities (UNDRR, 2005).

Sendai Framework – It reiterated the primary responsibility of member states to prevent and reduce disaster risk through cooperation, sharing responsibility by stakeholders, protection of life, property and right to development, inclusive participation, strong legislative and executive back up at a national and municipal level, intra-agency and inter-agency coordination, cost-effective investment on capacity building and infrastructure development, and support of developed nations to realize the ultimate goal of *build back better* (UNDRR, 2015).

Indian Perspectives – Taking note of the vulnerability of India to disasters such as 58.6 percent of the landmass prone to earthquakes of moderate to high intensity, over 40 million hectares (12 per cent of land) prone to floods and river erosion, cyclones on account of 7516 km coastline, droughts and approximate 5700 km coastline prone to tsunamis as observed in the new millennium, and 68% cultivated area prone to drought along with risk from landslides and avalanches, the GoI resolved to revisit its relief centric approach in disaster management (NPDM, 2009). The traditional relief-centric approach based on deployment of specific response teams, mobilization and movement of resources, alternative and effective communication, and proper dissemination of information proved ineffective disaster management. The mandate of the Yokohama strategy was to take mitigation

measures for the prevention of hazards from turning into disasters. The lessons taught by the disastrous effects of tsunami, earthquakes, unprecedented rains, seasonal floods, droughts, land-sliding, and rail accidents compelled the government to change its stance from relief centric to a holistic approach covering prevention, mitigation, preparedness, response, relief, and rehabilitation at par with international standards. The government prepared a strategic roadmap in October 2002 to reduce the country's vulnerability to disaster. The State Governments were directed to develop similar roadmaps on the above parameters. The State of Gujarat (then the immediate victim of the Bhuj earthquake) enacted legislation, namely, Disaster Management Act, 2003.

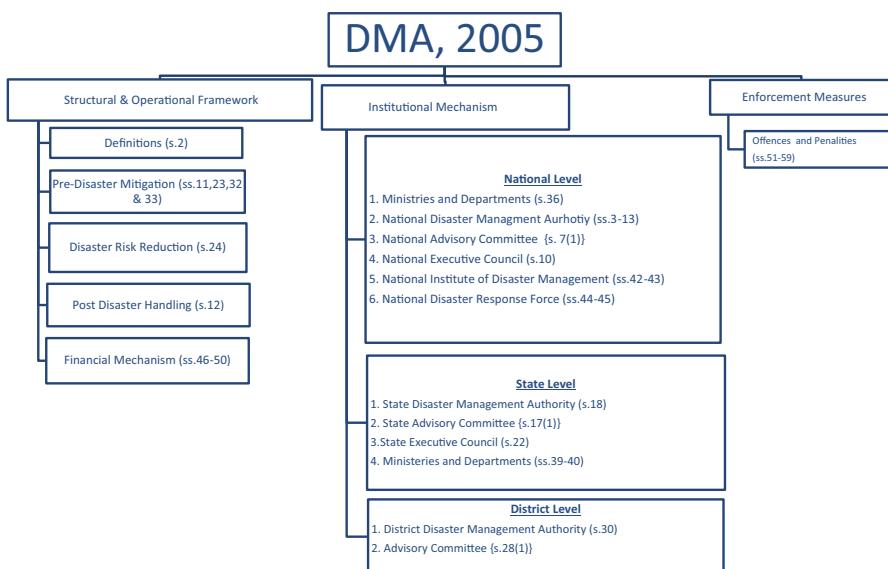

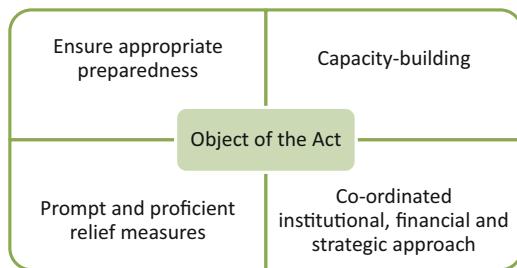

To begin with the constitutional scheme towards the management and handling of disasters in India, the Seventh Schedule of the Constitution does not contain any specific entry on disaster management. Nonetheless, the Parliament derived its competence to enact the Disaster Management Act, 2005, from the liberal interpretation of entry 23 (social security and social insurance) of Concurrent List, Article 21 (right to life and personal liberty), Article 38 (State's obligation to provide for the welfare of the people), and Article 51 (to honor international treaty obligations) of the Constitution. There are two more entries in the State List empowering the state governments to make laws concerning disaster in a sectoral context, such as entry 14 – agriculture, including water protection against pests and plant diseases – and entry 17, water, including water supply, drainage, and embankments (NDMA, 2015). Based on a conjoint reading of these entries, it was recommended by the Standing Committee of the Ministry of Home Affairs to ensure more prompt and professional response and relief measures with legislative back-up. Therefore, the Disaster Management Act, 2005, was passed with the purpose to provide institutional mechanism and coordination for prevention and mitigation, measures for ensuring preparedness, and capacity building of stakeholders to manage disasters (DRSC, 2005).

The Preamble: The objectives of the Act as spelt out in the Statement of Objects and Reasons are “to enact a law on disaster management to provide for a requisite institutional mechanism for drawing up and monitoring the implementation of disaster management plans, ensuring measures by various wings of government for prevention and mitigation effects of disasters and for undertaking a holistic, coordinated and prompt response to any disaster situation” (LS, 2005). The objectives of the Act have been explained in Fig. 2:

The structure of the Act can be elaborated with the help of the following flowchart (Fig. 3):

The figure presents a comprehensive view of the Act under three heads – structural and operational framework, institutional mechanism, and enforceable measures. It demonstrates the integration of the standards laid down in the Yokohama Strategy, the Hyogo Framework, and the Sendai Framework on disaster risk reduction. A detailed discussion on the provisions of the Act can be made as under:

Structural and Operational Framework: The structural and operational framework provides insights into the practical aspects of actual implementation and enforcement of the different provisions of the Act to realize the objective of effective

Fig. 2 Objectives of the Act**Fig. 3** Scheme of the Disaster Management Act, 2005

management of disaster. Before proceeding further, it will be apt to understand the meaning of certain words and expressions repeatedly used in the operational and enforceable part of the Act. These words and expressions have been defined in the definition clause as under:

Definition Clause: Though S.2 of the Act enumerates 20 definitions yet only a few *important* definitions are being elaborated here to develop the understanding of the different provisions:

The expression “Capacity Building” has been defined under s.2(b) of the Act. It has been used 19 times in the Act. The use of the word *includes* in the definition makes it inclusive and dynamic. The object of defining the expression is to recognize the importance of equipping the stakeholders with minimum basic skills to contribute effectively to disaster risk and reduction. The definition signifies the underlying approach of the legislature to envision building build of the resilience of the nation

and communities to disasters. It emphasizes upon the need for identification and creation of resources along with training of human resources for effective handling of disasters.

S.2(d) defines the word “Disaster.” It is the most used expression (299 times) in the Act and demonstrates its importance as it uproots human life. The use of the word *means* in the language indicates that the definition is exhaustive and comprehensive. The expression “disaster” has been given a wide connotation by including various kinds of events or incidents under its purview. The scope of the provision is large enough to cover the occurrence not only on account of natural or man-made reasons but also accident and negligence resulting in adversely affecting the interests of the community. It covers disasters, the nature and magnitude of which is beyond the managing capacity of the community of the affected area.

The expression “Disaster Management” has been defined under s.2(e) of the Act. It has been used 122 times in the Act. The entire Act revolves around the concept of management of disasters. It is an exhaustive definition covering various facets of disaster management like prevention, mitigation, disaster risk reduction, capacity building, preparedness, rescue, relief, rehabilitation, and reconstruction measures.

The next important expression is “Local Authority” given under s.2(h) of the Act. The definition is in consonance of the role of the local and ground level stakeholders in response and management of the disaster as spelt out under Hyogo and Sendai Framework. The expression “local authority” is inclusive, and it has been used 13 times in the Act recognizing the role played by the local authority in times of disaster. The local authorities possess first-hand knowledge of the community’s socio-economic infrastructure and environmental requirements.

The word “Mitigation” has been defined in an exhaustive sense under s. 2(i) and used at 57 places in the Act. Mitigation measures play a vital role in reducing the risk and impact of disasters threatening the community as a whole. Furthermore, the word “preparedness” has become relevant in post Hyogo scenario, and it has been used 35 times in the Act. Its meaning is exhaustive emphasizing the diligence and prompt action to deal with the sinister disaster situation and its effects. It focuses on understanding the impact of a disaster on the community and the outreach to respond and recover from a disaster. In tune with the mandate of build back better, the term “reconstruction” has been defined in a comprehensive sense to cover disaster recovery. It has been used 8 times in the Act and carries thorough implications in disaster management. A disaster disrupts human lives, and therefore, restoration of all the services and revitalization of the economy is important. The reconstruction measures can be integrated into long-term development plans to reduce the impact of future risks posed by disaster.

Principles of Operational Framework: A global paradigm shift from the relief-centric approach to an integrated approach towards disaster management was witnessed as a follow-through of the Yokohama Strategy. This integrated approach encapsulated prevention, preparedness, and mitigation warranting cooperation and contribution of all stakeholders. The GoI also responded positively to the time-honored goal to streamline its development agenda by giving adequate space for

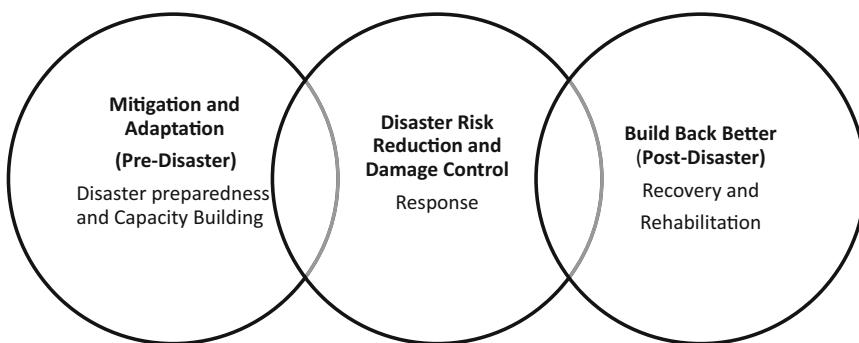

Fig. 4 Principles of Operational Framework

disaster risk reduction. The Indian outlook towards disaster management operational framework has been depicted in Fig. 4):

Disaster Prevention, Mitigation, and Adaptation: The Act contains a multipronged mitigation approach to build the resilience of stakeholders and communities to disasters. It aims to prevent hazards from turning into disasters through planned development, mitigation planning in high priority development projects, and involvement of the state, district, local, and indigenous resources to contribute to strengthening preventive and mitigation mechanisms. The Act envisions different kinds of disaster management plans to be prepared by the NEC, the ministries and the departments of Central and State Government, SEC, and DDMA. The NDMA approves disaster management plans prepared by the NEC, the ministries, and the departments of the Central Government. The SDMA approves the disaster management plans prepared by the SEC, the ministries and the departments of State Government, and the DDMA. These plans integrate preventive and mitigation measures into development plans along with measures for preparedness and capacity building to respond to any threatening disaster situation (ss.11, 23 & 30). These plans are regularly reviewed by the respective authorities [ss. 11(4), 23(5) & 31(4)].

Disaster Risk Reduction and Damage Control: Loss to life and property can be minimized by the immediate and effective response. The Act provides an integrated, synergized, and proactive mechanism to take care of the special needs of vulnerable sections. The responsibilities of the SEC are to reduce the risk of disaster, contain the damage, control and restrict vehicular traffic in the affected area, movement of persons, temporary construction of bridges, conduct search and rescue operations, abolition of unsafe structures, removal of debris, providing shelter, food, drinking water, and essential medical services as per guidelines laid down by NDMA and SDMA, giving directions to the concerned department, district, or other authorities having jurisdiction on the affected areas to take necessary measures for rescue, evacuation, providing immediate relief to save lives, resources for emergency response, rescue, relief, procuring on exclusive or preferential use of amenities from any authority or any person, involve

NGOs, and proper dissemination of the information to the public to respond to the disasters (s.24).

Post-Disaster Basic Principle: Build Back Better: S.12 of the Act lays down guidelines for the minimum relief standards necessary for post-disaster assistance to the affected population.

The NDMA lays guidelines for minimum standards of relief to the persons affected by disaster, protecting the affected communities, combating disruption of lives and property, and dealing with the effects of threatening disaster situations. The standards may include access to shelter, food, drinking water, medical cover, and sanitation, special arrangements for widows and orphans, and *ex gratia* assistance to the victims (s.12). The NDMA also possesses the power to recommend relief in repayment of loans or grant fresh loans to the affected persons on concessional terms for rehabilitation (s.13). Similarly, S. 19 of the Act specifically deals with the developing standards of relief by the State Authority by following guidelines of the NDMA. These standards can be periodically reviewed to address the contemporary needs of communities affected by disasters. These two sections underscore the adoption of the “build back better” principle in their scope and cover various kinds of activities such as technology and project impact assessment; physical, socio-cultural, or economic environment, psycho-social support, and trauma counseling; the role of NGOs and corporate sector; review and redefining recovery with safe development in the area of roads, housing, drinking water resources, sanitary, drainage, and availability of credit facilities; supply of raw material in various fields – agriculture, trade, and business – and upgradation of storage, processing, and marketing for livelihood restoration of affected, marginalized, and vulnerable sections (NPDM, 2009).

Financial Mechanism: For proper implementation and enforcement of preparedness, identification of risk and vulnerable areas, response, relief, reconstruction, and rehabilitation, a sound financial mechanism is indispensable. Keeping in view the significance of financial backup to implement the provisions of the Act, Chap. IX provides for the constitution of different kinds of funds, namely, the National Disaster Response Fund, the National Disaster Mitigation Fund, the State Disaster Response Fund, the District Disaster Response Fund, the State Disaster Mitigation Fund, and the District Disaster Mitigation Fund (ss.46–48). The NDRF has been created under the National Disaster Response Fund. This fund is also available to NEC for emergency response, relief, and rehabilitation following the guidelines of the Central Government in consultation with the NDMA [s.46(2)]. The language of S.50 provides adequate flexibility to use the respective funds by the authorities in case of immediate or emergency procurement of resources necessary for the relief by relaxing the rigor of financial rules like inviting of tenders, etc. For illustration, during COVID-19, the Ministry of Finance relaxed certain conditions of procurement of necessary goods and services (MoF, 2020). Furthermore, the Disaster Management Policy permits the State Governments to use 10% of the funds allotted under the different central schemes for disaster management in case of need (NPDM, 2009).

Institutional Mechanism: The aforementioned structural framework can be implemented and executed through the institutions. The Act emphasizes the decentralization of powers with a systematically designed hierarchical framework for effective functioning of the institutions to fulfill the mandate of reducing not only the impact of disasters but also ensuring preparedness, identification of disaster-prone areas, implementing early warning system, dissemination, and proper strategic measures for disaster management. The role of the institutional mechanism can be explained under the following heads:

The functions enumerated in Table 1 are inclusive. The language of ss. 35 (1–2) and 38 (1–2) empower the Central Government as well as the State Governments to take all measures necessary or expedient for the realization of the objectives of this Act. Furthermore, s. 35 (3) imposes a duty upon the Central Government to extend appropriate support to other countries affected by a major disaster (Table 2).

Table 1 Measures by the Central and State Governments

Nature of functions	Central government	State government
Coordination of actions of various ministries, departments, government authorities, and NGOs related to disaster management	{s.35(2)(a)}	{s.38(2)(a)}
Integration of measures for disaster prevention and mitigation into multiple development plans and projects	{s.35(2)(b)}	{ss.38(2)(e)} & {39(2)(f)}
Allocation of funds for disaster prevention, mitigation, capacity-building, preparedness	{s.35(2)(c)}	{s.38(2)(d)}
Ensure that ministries and departments take necessary measures for preparedness to effectively respond to disaster	{s.35(2)(d)}	{ss.38(2)(g) & (i)}
Cooperation and assistance to State Governments and coordination with the UN agencies and government of foreign countries for the Act	{ss.35(2)(e) & (g)}	
Cooperation and assistance in disaster management to different national, state, and district authorities and committees and to ministries and departments of GoI	—	{ss.38(2)(b) & (c)}
Deployment of the armed forces and the civilian personnel for the Act	{s.35(2)(f)}	—
Establish institutes for research, training, and developmental programs in the field of disaster management	{s.35(2)(h)}	—
Establishment of adequate warning systems to the level of vulnerable communities	—	{s.38(2)(h)}
Any other matter necessary and expedient for the effective implementation of the Act	{s.35(2)(i)}	{s.38(2)(l)}
Ensure in times of sinister disasters the resources of different departments of State are made available to the NEC, the SEC, and the District Authorities for the effective response, rescue, and relief	—	{s.38(2)(j)}
Rehabilitation and reconstruction aid to the victims	—	{s.39(2)(k)}

Table 2 Responsibilities of the Ministries or Departments of GoI and State Government

Nature of functions	Central government	State government
Necessary measures for the prevention of disasters, mitigation, preparedness, and capacity-building according to the guidelines of the National Authority	{s.36 (a)}	{s.39(a)}
Integration of measures for disaster prevention or mitigation into multiple development plans and projects according to guidelines of NDMA	{s.36 (b)}	{s.39(b)}
Effective and prompt response to any threatening disasters – (i) under the guidelines of NDMA and NEC; (<i>Central Government Departments</i>) (ii) under the State Plan and the guidelines of NEC and SEC; (<i>State Government Departments</i>)	{s.36 (c)}	{s.39(d)}
Review enactments, policies, rules, and regulations and incorporate necessary provisions for disaster prevention, mitigation, or preparedness	{s.36 (d)}	{s.39(e)}
Allocation of funds for prevention and mitigation of disasters, capacity-building, and preparatory measures thereon	{s.36 (e)}	{s.39(c)}
Assistance to the NDMA and State Government (<i>Central Ministries and Departments</i>) and the NEC, the SEC, or the DDMA (<i>State Ministries and Departments</i>) in drawing up plans and training of personnel, carrying out rescue and relief operations, assessing the damage from a disaster, rehabilitation, and reconstruction	{s.36 (f)}	{s.39(f)}
Provisioning for resources in consultation with the SDMA for implementation of District Plan by its authorities at district level	–	{s.39(g)}
Make available its resources to the NEC and the SEC (<i>Central Ministries and Departments</i>), the NEC, the SEC, or the DDMA (<i>State Ministries and Departments</i>) for providing emergency communications, transporting relief goods and personnel, providing evacuation of persons or livestock from threatening disaster situation or disaster, rescue, temporary shelter, and other immediate relief, essential services – drinking water, health care, setting up temporary bridges, jetties, and any other action necessary for disaster management	{s.36 (g)}	{s.39(h)}
The ministries or departments of GoI to prepare disaster management plan following the national plan with specifications regarding the integration of mitigation measures as per the NDMA and the NEC guidelines, role and responsibilities towards preparedness and capacity-building, annual review and update of the plan, and submission to the NDMA for approval The departments of State Government have to perform an additional task of identification of types of disasters to which different parts of State are vulnerable	{ss.37 (1) (a) (i) to (V), (b) (c) & (2)}	{ss.40 (1) (a) (i) to (v), (b), (c), (2) & (3).

Three-Tier Disaster Management Authorities

The Act provides for the establishment of three-tier disaster management authorities – the NDMA, the SDMA, and the DDMA. The Chairperson of the NDMA is the Prime Minister of India (s.3), while about the SDMA and the DDMA, the respective Chief Minister (s.14) and the Collector or District Magistrate or Deputy Commissioner (s.25) respectively is the Chairperson.

The NDMA is responsible for laying down the policies, plans, and guidelines for disaster management and effective response to the disaster. To give effect to the objective mentioned above, the NDMA lays down policies and approves the National Plan and plans prepared by the Ministries and Departments; lays down guidelines for the SDMA to frame their State Plan and different Ministries or Departments of the GoI coordinates, enforcement and implementation of the policy, and plan for disaster management; recommends funds for mitigation; provides support to the countries affected by disasters; takes measures for prevention, mitigation, or preparedness and capacity-building for dealing with the threatening disasters situation; and lays down broad policies for the functioning of the NIDM (s. 6). Likewise, the SDMA possesses all the powers and performs the above functions at the state level (s.18) excluding the function of providing support to other countries given in clause (h) of the s. 6(2).

The NDMA and SDMA perform their respective functions to manage and respond to the disasters with the help of different authorities such as the NEC and the SEC (Executive Councils), the NIDM, the NDRF, the DDMA, and Local Authorities. The Act establishes the NEC (s.10) and the SEC (s.22). The Executive Councils shall perform the responsibility for implementing the policies and plans of the respective authorities (NDMA & SDMA) and ensure the compliance of directions issued for the management of disasters in their respective jurisdictions. The NIDM functions under the broad guidelines and policies laid down by the NDMA and is responsible for planning and promoting training and research in the area of disaster management, development of national-level information mechanisms on disaster management policies, prevention, and mitigation {s.42(9)(a)}. Furthermore, NDRF is a specialist task force that works under the supervision, direction, and control of the NDMA (ss.44–45).

The DDMA acts as the district planning, coordinating, and implementing body and takes all measures necessary for disaster management according to guidelines laid down by the NDMA and SDMA. Besides the functions of preparation of disaster management plan, coordination, implementation, and monitoring of various plans by the different departments at the district level and local authorities, it identifies the areas vulnerable to disasters and buildings to be used as relief centers and camps, reviews capability for responding to disaster and preparedness, facilitates community training and early warning systems, and ensures participation of NGOs and social welfare institutions [s.30].

To ensure ground-level implementation of the Act, the local authorities shall ensure the skill development of officials in disaster management; proper management of resources; and confirmation of prescribed standards in construction projects

(s.41). The local authorities have to carry out relief, rehabilitation, and reconstruction activities following the State and District Plan (s.41).

Enforceable Measures: For ensuring the compliance of obligations specified under the Act, the Act also contains penal provisions to address failure in performance of obligations, violations, and contraventions of the provisions of the Act. These provisions classify the offenses and prescribe the punishment for each offense as under (Table 3):

The above provisions of the Act are comprehensive and address a wide range of offending activities frustrating the purpose of the Act. The Act cover offences committed by government departments, companies, and corporate bodies as well (ss. 55 & 58). In case, an offence or contravention under the provisions of this Act is committed by a government department or the company or the corporate body, the Act makes provision for proceeding against the head of the department, person-in-charge of the company, or director or manager of the corporate body unless the contrary is proved as to their involvement in the alleged contravention. Nonetheless, insertion of exception clauses for heads of the department and in-charges of the company or corporate bodies along with imposing a bar on a complaint to be filed by

Table 3 Offences and penalties

S. no.	Offence	Punishment
1	Obstruction in the discharge of functions of any officer or employee of the institutional framework defined under the Act {s.51(a)}	Imprisonment up to one year or with fine or with both
2	Refusal to comply with any direction given by or on behalf of Central Government, State Government, NEC, SEC, or DDMA resulting into loss of lives or imminent danger thereof{ s.51(b)}	Imprisonment for up to two years
3	False claim for obtaining relief, assistance, repair, reconstruction or other benefits consequent to disaster from any authority (s.52)	Imprisonment up to two years or with fine or with both
4	Misappropriation or appropriation of entrusted money, material, or other things given in custody for providing relief to the affected, for own use or disposal of such item in custody or compelling another person to do so (s. 53)	Imprisonment up to two years or with fine or with both
5	Making or Circulation of false alarm or warning as to disaster, its severity or magnitude leading to panic (s.54)	Imprisonment up to one year or with fine
7	Refusal to perform or withdrawal by oneself from performing the duties assigned to any officer in an official capacity or ceases to perform duty without express written permission of superior officer or lawful excuse (s.56)	Imprisonment up to one year or with fine
8	Contravention of the order of NEC, SEC, or DDMA, etc. u/s 65 regarding the use of any resource, premise, or vehicle needed for a prompt response, rescue operation, or rehabilitation or reconstruction (s.57)	Imprisonment up to one year or with fine or with both

a common man (as spelt out under s. 60) are the provisions that relax the rigor of the law. For ensuring effective, prompt, and dedicated response to the disaster for minimization of loss to property and persons, the law should be rigorously implemented. The appearance of such exception clauses in provisions concerning liability depicts the adoption of the doctrine of strict liability while looking at the gravity of such incidents; the doctrine of absolute liability could have served the purpose of the Act in a better way. Such exception clauses may carry room for breeding corruption and poor implementation of such an important law.

Conclusion

Given the foregoing discussion, it can be submitted that the Disaster Management Act, 2005, is a comprehensive legislation and demonstrates the incorporation of most of the strategic dictums of Yokohama Strategy, Hyogo Framework, and Sendai Framework. The fundamental postulates of international disaster management framework such as disaster prevention, preparedness and mitigation, disaster risk reduction as national and local priority covering identification, assessment, and monitoring of disasters, early risk warning, strong collaborative institutional mechanism, and use of knowledge, innovation, and education to build a culture of safety, effective and quick response, and resilience have been incorporated in the Act itself. Another important feature of the Act is that it prohibits discrimination on the ground of sex, caste, community, descent, or religion (s.61). This provision represents the spirit of inclusive governance underscored in Sustainable Development Goals and Articles 14–17 of the Constitution of India. Also the priorities adopted in Sendai Framework such as understanding disaster risk, strengthening disaster risk governance for proper management, and investing therein along with enhancing disaster preparedness for effective response and rehabilitation through “Build Back Better” have also been included in disaster management policy and disaster management plans of different ministries such as National Disaster Management Plan, 2016 (NDMP), National Agriculture Disaster Management Plan, 2020 (NADMP), Ministry of Railways Disaster Management Plan, 2019 (MoRDMP), etc. During the COVID-19 pandemic, the NEC constituted Empowered Groups by exercising its powers conferred under s.10(2)(h) and (i) of the Act to take comprehensive and integrated response (MHA, 2020).

Additionally, the NPDM provides for vulnerability mapping and analysis through hazard zonation by utilizing GIS-based databases like NDEM and National Spatial Data Infrastructure NSDI to reduce the risk posed by disasters and control the damage. The policy contains several measures to realize the objectives of the Act through early warning system, consistent monitoring of critical infrastructures like dams, roads, bridges, flyovers, railways lines, power stations, water storage towers, irrigation canals, delta water distribution networks, river and coastal embankments, ports, civil utilities, domain-specific disaster management plans, animal care-shelter and fodder developing a culture of preparedness for disaster management through planning based on bottom-up approach and operationalization of plans. The Act

makes it mandatory to include “disaster management” as a “standing item” in the agenda of meetings of Inter-State council, Zonal Council, and “reporting item” National Development Council to integrate disaster management in all development plans. Besides, the policy provides a classification of the level of disasters, incident command system suitable to the level of disaster, prompt and effective medical response team information management, etc.

To sum up, it can be submitted that the creation of a culture of safety through preparedness, resilience, and rehabilitation is a continuous process demanding constant review and upgradation of the disaster management framework. Accordingly, efforts have been from time to time to reshape the Indian disaster management framework in consonance with international standards.

Abstract

Disaster management is no longer based on traditional relief, rehabilitation, and rescue operation. It is more tilted towards disaster risk reduction, smart early warning system, emergency response, fast evacuation, transfer to safety of a cyclone shelter, and adoption of pre-disaster and post-disaster plan. It's a major paradigm shift. Such a strategy change has been able to reduce loss of lives and properties to a great extent in recent years. Disaster plans and policies adopted by various governments did reflect this paradigm shift in line with globally adopted Hyogo Framework and Sendai Framework. In Bangladesh, the "Standing Orders on Disaster 2010" and Bangladesh National Plan for Disaster Management, 2010–2015 and other guidelines stressed emphasis on disaster risk reduction. They also underscored the need to strengthen coping strategies and emergency response measures. The chapter argues that the paradigm shift from post-disaster relief and rehabilitation to disaster preparedness, risk reduction measures, smart early warning systems, and promptness of the volunteers and local administration did substantially reduce death and destruction in recent years. The chapter further unearthed the coping strategy, the local coastal communities are applying, as they are trying to survive over the generations. Community-based disaster

management proved to be very handy and useful in case of periodic hazards. Instead of structural solutions, the chapter in conclusion recommended implementation of various policy guidelines adopted by the government, inter-agency collaboration, community participation in disaster management, and good disaster governance.

Keywords

Community-based disaster management · Disaster governance · Disaster risk reduction · Emergency response · Hyogo Framework · Paradigm shift · Sendai Framework

Introduction

Bangladesh is a country frequently visited by climate change-induced disasters. The country is frequently visited by disasters like floods, cyclones, tornados, and tidal surges. Hazards like drought and desertification also periodically visit the country. During monsoon, floods are generally accompanied by river-bank erosion. These disasters continuously interrupt lives and livelihood of the coastal, charland, and drought-prone areas of the country. Because of its location on the conical shaped Bay of Bengal, the country attracts regular cyclones and tidal surges. There are around 35 million people in the coast of Bangladesh stretched over 710 km from Satkhira to Saint Martin's island. Out of them, seven million people are living in high-risk zone (Rasheed, 2011).

Tropical cyclones named Sidr and Aila hit the coastal areas of the country in 2007 and 2009, respectively. They caused havoc on human lives and properties, but in comparison to earlier cyclones, the loss was much less. Around 3,363,406 and 190 people lost their lives, respectively, during Sidr and Aila (GOB, 2010). Decreased death and destruction was possible due to effective coordination and networking among various tiers of the government machineries, NGO volunteers, and activist groups engaged in disaster risk reduction and emergency response. Around 3,30,000 and 1,38,882 people died, respectively, in the coast of Bangladesh during the cyclones of 1970 and 1991, respectively (GOB, 1990, 2009a). However, loss has been substantially reduced in recent years due to effective disaster management during pre-disaster, disaster, and post-disaster period, implementation of disaster risk reduction, and emergency measures.

According to experts, disasters are not always seen as "extreme events" created by the nature. They are of the view that due to faulty implementation of development projects, procrastination in undertaking repair and maintenance works, poor collaboration between various agencies of the government, disasters take place. Fredrick Cuny (1983) gave a classic example, which stated that an earthquake in California in 1971 of 6.4 magnitude in richer scale caused only 58 deaths, while another earthquake in 1973 of lesser magnitude of 6.2 destroyed the central city of Managua, Nicaragua, killing 6000 people. This very example suggests that impacts of a

disaster depends on people's vulnerability and people's ability to cope with the disaster. Disasters are now considered as events not necessarily created by the nature but due to faulty implementation of development projects undertaken without social and environmental considerations. A project implemented without conduction of Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) is likely to turn into a disaster; we call it as "development disasters." Experts are of the view that risks unmanaged or mismanaged for a considerable long period of time would cause a disaster.

Policy makers and planners are increasingly subscribing to this paradigm shift from relief and rehabilitation to disaster risk reduction, emergency response, and cyclone preparedness program. Following this paradigm shift, long-term mitigation and adaptation measures are being taken. The process of this transformation may take some time. Both the government and the development partners are to change their priority for an effective disaster governance. In order to mainstream the paradigm shift in to various plans and policies of the government, good disaster governance is necessary.

The chapter is mainly based on secondary sources of literature and author's personal experience while working with the community members. Based on digested knowledge received from primary and secondary sources of literature, the overall goal of this chapter is to examine effectiveness of the argument that the policy departure from traditional relief and rehabilitation to disaster risk reduction did actually bring any benefit to the affected communities. The chapter argued that the paradigm shift from responding after a disaster to pre-disaster preparedness and mitigation activities is extremely necessary for an effective disaster governance.

Global Scenario

Natural disasters in recent years both in frequency and ferocity are on the rise due to global warming and emissions of greenhouse gases. Disaster risk reduction has become a global concern these days. In the backdrop of such an alarming situation, a number of international conferences are held attended by world leaders aiming at reducing the wrath of disasters. Hyogo Framework (2005–2015) adopted in Japan in 2005 urged the global communities to pursue an "integrated multi-hazard approach" in order to reduce the incidence and severity of disasters. A unique opportunity was created to promote a strategic and systematic approach in reducing vulnerabilities and risks to hazards. The framework underscored the need for building the resilience of nations and communities to disasters (Hyogo, 2005).

Hyogo Framework for Action was followed by adoption of Sendai Framework for Disaster Risk Reduction in March, 2015 (Sendai, 2015). The 15-year Plan put emphasis on disaster risk management, while the earlier plans dealt with disaster management only. The plan urged the global community for reduction of disaster risk by preventing new and existing risk and to strengthen resilience of the community. It provided a set of guiding principles, which included the primary responsibility of states was to prevent and reduce disaster risk. Further to that both natural

and man-made disasters have been included within the purview of disaster risk reduction.

These two frameworks acknowledged contribution of indigenous knowledge and practices (IKP) of the local community concerning disaster risk reduction, climate change adaptation, and natural resource management. Sendai Framework underscored the need to integrate IKP and coping strategy of the local community in disaster-prone areas. Sendai highlighted on the role of the stakeholders in disaster management. It put stress on the role of the local and indigenous peoples, their experience, and traditional knowledge in implementation of various international agreements. In this regard, the Framework suggested that measures are to be taken to validate the IKP through scientific knowledge. It advocated for mainstreaming disaster risk reduction in all national plans, policies, and guidelines.

The twenty-first Conference of the Parties (COP-21) to UN Framework Convention on Climate Change held in December 2015 in France adopted the “Paris Agreement,” which suggested a greater role and involvement of the local community in disaster risk reduction. Country parties agreed to limit global warming well below 2 °C compared to pre-industrial level. They agreed that mitigation to climate change by reducing carbon emissions was the ultimate form of disaster risk reduction. It is to be mentioned that reducing greenhouse gases to 1.5 °C would immensely contribute to reduction to disasters. Paris Agreement has been made effective since 2020.

Bangladesh Scenario

Bangladesh is one of the few countries, which took a pragmatic approach in revising and updating its plans and policies targeting reducing disaster impacts. In line with the Hyogo Framework, Bangladesh adopted the Standing Orders on Disaster (SOD, 2010), describing the duties and responsibilities of various levels of the Government from local union level to central level involved in disaster risk reduction, disaster preparedness, and emergency response. The Orders clarified the risk reduction measures and outlined activities for different tiers of the government agencies during the warning, disaster, and post-disaster period (SOD, 2010). It is now a globally accepted model of guidelines for the volunteers and officials engaged in disaster management. In recent days, casualties have reduced to a great extent due to a shift from relief and rehabilitation to disaster warning and disaster risk reduction, as laid down in SOD.

National Plan for Disaster Management (NPDM) 2010–2015 is another important document, which works as a “model to guide disaster risk reduction and emergency response” (GOB, 2010). The model has three key components, which are defining the risk environment; managing the risk environment; and responding to the threat environment. NPDM focused on the likely threats and consequences thereof. It identified the risks and suggested actions in order to eliminate, reduce, or manage risk. The plan further promoted “community-based adaptation” and encouraged the disaster management officials to practice disaster risk reduction and emergency response.

Emergency response described warning period (alert and activation); disaster onset (response); and post-disaster period (relief, early recovery, and rehabilitation). Emphasizing on the disaster risk reduction, the government further adopted the Bangladesh National Disaster Management Guidelines in 2015. The guidelines put more emphasis on disaster risk reduction, food, and livelihood security. The guidelines stressed the need to accelerate adaptation measures to climate change and reduce the risk to disaster (GOB, 2015). It is to be mentioned here that the National Plan for Disaster Management (2016–2020) with caption, “Building Resilience for Sustainable Human Development,” in its mission statement stated that the Plan would achieve “a paradigm shift in disaster management from conventional response and relief to more comprehensive risk reduction culture, and to promote food security as an important factor in ensuring the resilience of communities to hazards” (GOB, 2016).

It is to be noted that the plans and policies are for implementation and cannot be enforced without proper legal support. Mindful of this shortcoming, the government enacted the Disaster Management Act in 2012. The act had a provision for setting up of an authority to try the offenders for failing in their duties to reduce disaster risks and protect lives of the people. The proposed authority would try officials for their failure in disaster predicting and adopting contingency measures (GOB, 2012). Invoking the Act, the Government can declare an area as a “Distressed Area” preventing people from undertaking destructive activities. Under the Act, a national fund would be formed on disaster response, relief, and rehabilitation.

Best Practices in Disaster Management

Bangladesh has incorporated disaster management into poverty reduction strategy and in national plans, like the 5-year plans and long-term visionary plans. NPDM 2010–2015 is being revised to align itself in line with the Sendai Framework, Climate Change Agreement, and the Sustainable Development Goals (GOB, 2016). Some of the best practices (GOB, 2009a) in DRR being followed by Bangladesh are to (a) understand the paradigm shift in disaster management from relief and rehabilitation to disaster risk reduction; (b) ensure early warning dissemination through CPP volunteers; (c) empower local communities and their resilience in order to undertake a community-based disaster management; d) reduce the risk factors by building cyclone shelters, flood shelters, *killas* (raised earth), and disaster-proof low-cost rural housing; and e) introduce saline-tolerant, flood-tolerant, and drought-tolerant varieties of crops and massive afforestation to combat onslaught of tidal surges.

Various plans, policies, and strategies aptly described this new paradigm shift in disaster management. They are the National Adaptation Programme of Actions (NAPA), 2009, and Bangladesh Climate Change Strategy and Action Plan (BCCSAP), 2009) (GOB, 2009c, d). Realizing that the challenges and impacts of climate change and disaster are of development concern, both NAPA and BCCSAP addressed the key elements that create synergies between disaster risk reduction and

climate change adaptation (Islam et al., 2013). In an effort to compare impacts of the four major cyclones in the last 40 years and their aftermaths on the coast of Bangladesh, it is found that due to lack of proper strategy and directions 3,30,000 people died in Great Bhola cyclone in 1970 and another 1,38,882 people died in Gorky in 1991 (GOB, 2010). As we undertook a paradigm shift in disaster management in line with good practices, only 3406 people died in cyclone *Sidr* in 2007 and another 190 in *Aila* in 2009 (GOB, 1990, 2009a). Relatively low number of deaths caused by *Sidr* and *Aila* is widely considered as the result of government's efforts in cyclone forecasting, early warnings, and prompt evacuation. Moreover, 43,000 CPP volunteers stationed in the coastal islands are playing an important role in attending the threatened communities and circulating cyclone warning and evacuation orders via megaphones, handheld bullhorns, bicycle-mounted loudspeakers, and house-to-house contacts. Moreover, storm forecasting and warnings issued by the Storm Warning Centre of the Department of Metrology have been very effective and users-friendly.

Community-Based Disaster Management

Due to periodic cyclones and tidal surges, the coastal community has developed some age-old practices in facing natural disasters. "Community-based adaptation" to climate change is local-level practices, based on the priorities set by the communities themselves (Reid et al., 2014). According to Pandey (Undated), Community-Based Disaster Management (CBDM) is based on grassroots consultation in a participatory way. Gero et al. (2011) observed that community-based disaster risk reduction aims to reduce the vulnerability and enhance the resilience of local communities to the impacts of disaster. CBDM helps the local community to understand its vulnerabilities to natural disasters and to develop critical survival strategy and resilience in facing a disaster.

During a disaster, women and children because of their vulnerability need special care and attention as they are less mobile than men (GOB, 2009b). Hassan (2000) observed that people in the coastal islands can withstand a disaster because of their short-term survival strategy. Their survival strategies include holding on coconut trees with a rope in tidal surges, seeking refuge in nearby embankments or higher place, holding on floating logs, thatched roof, and straw piles. They cling to floating bunches of coconuts as they look for a safer place during the tidal surge.

Over the generations, the villagers have learned techniques of preserving food during and after a disaster. They bury dry foods, mainly thatched rice, underground in mud-sealed earthen pots. They salvage the foods, when the water is gone. Water is mostly contaminated during a cyclone and concomitant tidal surges. People suffer from diarrhea. They harvest rainwater and drink coconut water to quench their thirst. Similar to food preservation, their survival strategy includes wearing of *Salwar* and *Kameez*, which help them to swim and not traditional *Sarees* (traditional female dress in south Asia). Haque (2013) maintained that outside help and relief goods generally appear much later of the event. During this intervening period, their

age-old knowledge and practices help them to survive. They eat stems and roots of edible plants. Nasreen (2000) observed that women in flood-hit areas use herbal medicines for prevention of diarrhea and dysentery. They put juice of certain leaves to stop bleeding in injuries.

They are good construction engineers too. While constructing a house, they use local thatching materials and ensure that the roof has a slope towards the wind and not against. They plant indigenous varieties of plants surrounding their homesteads. For example, in *haor* wetlands in the north-east, local varieties of trees like *Hizol*, *Karoch*, and *Barun* are planted, which could withstand flash floods. Local grass *Nalkhagra* helps them to protect the houses from *Afaals* (wave actions) (Haque, 2000, 2019). They raise the plinth level of their houses and construct *killas* (raised earth) for shelter of their cattle heads during a disaster.

Conclusion

In effecting this paradigm shift, the mindset of the people needs to be changed. Over dependence on the donors and development partners needs to be stopped. Instead of waiting for the government, people themselves are to take community-based actions to combat a disaster. Lack of inter-agency coordination to be avoided. Women, children, and the handicaps need special care and attention. Indigenous communities with linguistic and religious barrier need special assistance.

In a coastal country like Bangladesh, disasters like cyclones, tornadoes, and tidal surges would regularly visit, and they cannot be controlled. Death and damages could be reduced through better management practices. It is true that effective implementation, updating, and enforcement of the rules and regulations are badly needed to adjust and accommodate with the changing scenarios. Regular updating requires grassroots consultations with the community. CBDM is fairly in a nascent stage and needs to be documented, promoted, and propagated. It has been proved that instead of typical structural methods, people in the coast through their indigenous knowledge and practices along with better management practices did survive many natural disasters.

It is suggested that further studies could be undertaken to develop a full-fledged CBDM to be based on following an elaborate methodology of consultation with the grassroots people in the coast. Following official adoption of CBDM, efforts are to be taken to mainstream community-based adaptation measures in national plans and policies of the government.

Abstract

Tropical cyclones and typhoons have wreaked havoc in South-East Asia, East Asia, and South Asia. Several areas of the region are frequently affected by natural calamities, which have a disastrous effect on socio-economic, cultural, and environmental effects. The COVID-19 pandemic added another layer of complexity to disaster management efforts, as nations had to deal with both the pandemic and threats connected to climate change. India, Pakistan, Bhutan, Nepal, Bangladesh, and a few other countries have been victims of natural calamities like earthquakes, floods, and cyclones. There are many similarities and challenges caused by frequent disaster in India and its neighboring two countries in terms of geographical conditions and economic issues. This chapter aims to make comparative analysis of the legal framework related to disaster

management in these countries. The law related to disaster management in all these countries have been introduced during the period between 2005 and 2010. The comparative study of this legal framework in all these nations have been made with the objectives to know the actions taken by them for the management of disasters. The chapter also aims to analyze the legal framework of these countries to study the scope of the definition of the term disaster, the aims and objectives of the law, the structure for disaster management authorities, the provisions for post-disaster actions and their coverage and limitations, and also the description on typology of disasters. It also tries to analyze the provisions related to community resilience covered under the laws of these nations. Based on the analysis, it tries to conclude with recommendations to identify the best practices adopted by each country for disaster management and to prepare a comprehensive and common action plan to be adopted by all these nations to mitigate and prevent disasters.

Keywords

Disaster management · Disaster mitigation · South Asia · International framework

Introduction

Since the dawn of humankind, disasters have caused severe harm to human life, property, and resources. In the last few decades, the world has experienced natural and man-made disasters at a large extent. The Chernobyl nuclear plant disaster of 26 April, 1986 (Erin Blakemore, National Geographic, 2019), the Bhopal Gas Disaster in 1984, the frequent earthquakes, floods, tsunamis, pandemic, and wars have caused great loss to the humans. The society and nations have always responded to manage such disasters. The technological innovations in the last few years have increased the hope of mankind for better management of the disasters. It is high time to prioritize to save the world from such disasters through effective disaster management framework. Particularly comprehensive measures are required to combat social and economic issues caused by disasters in South Asia which is a disaster-prone area. The main reasons of the present study are to see whether a common model of legislations can be developed across the South Asian region carving out existing legal systems for overseeing mitigating disasters at this region by enlisting the structures and processes of contemporary legal framework with specific focus on Pakistan, India, and Bangladesh. This chapter is divided into three main parts, i.e., (1) introduction of research methodology and rationale of study, (2) the concept of disaster management and comparative analysis, and (3) conclusions and recommendations are drawn from the analysis of the existing data on frameworks operational in these countries.

Rationale for the Study

The purpose of this comparison is to know the best legal measures adopted by these nations for disaster management and to recommend and amend necessary provisions to be adopted in the Indian legal framework based on this study. The nature of disasters experienced by countries like Bhutan, Bangladesh, and Pakistan is more or less similar to the conditions in India. The similarities of economic, political, and social conditions of these countries and the nature of disasters experienced by the citizens are reasons for selecting these countries for the comparative study. Again, the other reasons of the present study are to see whether a common model of legislations can be developed across the South Asian region carving out existing legal systems for overseeing the mitigation of disasters in this region by enlisting the structures and processes of contemporary legal frameworks.

Research Methodology

The present study used the doctrinal methods and desk review for exploring the relevant literature for the regulatory framework of disaster management legislations existing in the Southern part of Asia specifically Pakistan, India, and Bangladesh. Other sources of secondary literature like reports, documents, working papers, and other relevant sources have also been used and analyzed for the present study.

Research Questions

The key research points for the present research are the following: how far the existing regional framework of legislation of countries, namely, Pakistan, India, and Bangladesh, oblige to fulfill the mandate of international treaties in context to safety and security of its vulnerable population.

It delves into structure of the legal framework for disaster management for effective disaster management and disaster risk reductions in Pakistan, Bangladesh, and India. It also tries to identify the special features of disaster management law of each of these nations and best practices followed by them. The present research also tries to investigate the scope for the comprehensive common practices to be followed by these nations to combat the issues related to climate change and other disasters and management thereof.

Concept of Disaster and Disaster Management

According to United Nations Office for Disaster Risk Reduction (UNDRR), researchers and bodies working on the same have tried to conceptualize the twin term of disaster and disaster management in the context disaster risk management.

“Disaster” is a serious disruption of the functioning of society, causing humongous human, material, or environmental losses which exceed the ability of affected society to cope using only its own resources. Disaster is any incident which threatens human safety and/or damages, or threatens to damage, buildings, collections, equipment, and systems (Eden & Matthews, 1996). Disaster includes an unusual, natural, or man-made event caused by frustration of technological systems, which temporarily overwhelms the response capacity of human communities, groups of individuals, or natural environments and which in turn causes massive damage, economic loss, disruption, injury, and/or loss of lives (Parker, 1992). So, a disaster is damage caused by natural forces, natural calamities, or by human intervention. It can be both man-made and natural. Disaster management is a challenge for any society or nation. Disaster management can be defined as the body of policy and administrative decisions, the operational activities, and the actors and technologies that pertain to the various stages of a disaster at all levels (Lettieri et al., 2009). The Asian Development Bank (ADB) in its Disaster manager’s handbook has defined disaster management with a practical approach to help provide a common concept throughout the disaster management activities. It has been defined as “an applied science which seeks, by the systematic observation and analysis of disasters, to improve measures relating to prevention, mitigation, preparedness, emergency response and recovery chronologically.” The handbook laid out the characteristics which are common to the definition of disaster as *disruption to normal life, human effects, effects on social structure, and the community needs*. So, broadly there are four components of disaster, i.e., hazard, exposure to hazard, vulnerability, and coping capacity of the people to face the disaster with available knowledge, skill, and resources (Milutinovic & Garevski, 2009). Hazards of any disaster may include damage to property, loss of human lives, economic loss, displacement, etc. Vulnerability can be seen as potential of damage. It is the potential threat to people and property by the disaster (Lazarevski & Gjorgon, 2017). In recent years, the focus has been changed from disaster management to risk reduction through disaster resilience. Natural calamities are harmful when they cause hazards. So, it is required to reduce risk of hazards of any disaster and equally important to make the people ready to adapt to and face it with available resources and skill. It is applicable for both natural hazards and man-made hazards. Precautionary measures from the government and coping capacity of the community to tackle the hazards can be proved very effective in reducing the risk of the disaster particularly for the disaster-prone countries of South Asia.

The Status of Disaster Hazards in South Asian Region

The South Asian countries frequently face the hazards of disasters – natural and man-made as well. In recent years, the impact of climate change and rising temperature has been witnessed through the rise in sea level and increased frequency of

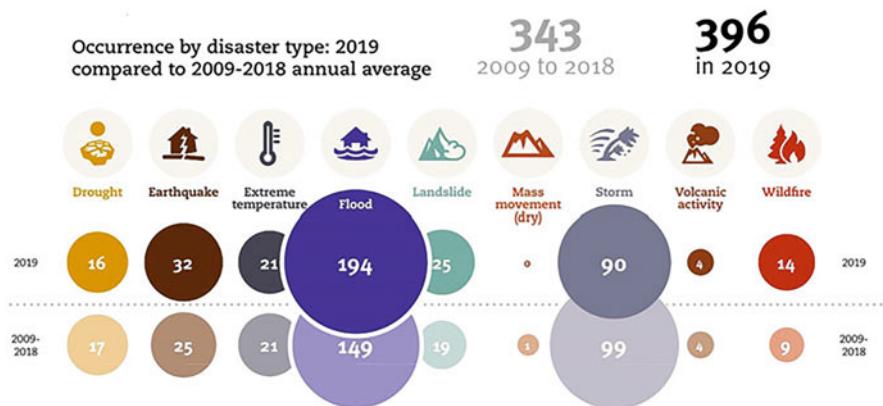

Fig. 1 Comparative status of occurrence of disasters in the period 2009–2018 and in the year 2019. (Source: Occurrence by disaster type 2019. Image: CRED. <https://www.un-spider.org/news-and-events/news/cred-publishes-2019-disaster-statistics> available at <https://www.un-ssspider.org/sites/default/files/ND19-2.jpg> accessed on 22.2.22)

floods in this part of the world. The South Asia Disaster Report, 2008 (See Duryog Nivaran & Practical Action, South Asia Disaster Report 2008), indicates that total 128 natural disaster incidents were recorded between 2006 and 2008. Total 8000 people lost their lives in 86 incidences of flood. India and Bangladesh were major areas of natural disasters during this as estimated by South Asia Disaster Report, 2008. As per the records of the year 2020 published by Asian Disaster Research Centre, total 163 disasters have been recorded in the Asian Region (Natural Disaster Data Book, 2010). There is a never-ending upward trend of disasters over the decades. More recently, climate change impacts are evident through frequent hazards due to floods and cyclones in the Southern most regions of the continent. The following comparative status of the disaster data for different periods validates the increasing trend (Fig. 1).

Trade Insight of DRR efforts indicate about the above that the South Asia region falls under high-risk zone of the world.

The South Asian Countries have to develop an effective framework for the disaster risk management. The establishment of South Asian Association for Regional Cooperation (SAARC) and later in 2006 Disaster Management Centre was a right step toward that direction. It aims at providing suggestions on policy, advocacy, and research actions required for the risk management system.

Many of the South Asian Countries have developed the law for disaster management, but how far they are (un)able to address the issues related to human victims of such incidents is to be seen or examined. Are they in a position to reduce climate vulnerability? To understand this, a comparative analysis of the disaster management law of various countries of South Asia has been made.

The Comparative Analysis of the Disaster Management Law in Pakistan, India, and Bangladesh

The comparative analysis of the disaster management law of Pakistan, India and Bangladesh has been examined on the following points:

1. The purpose of the Act
2. The scope of the law
3. The level and structure of the disaster management authorities
4. The role of involving the communities in the disaster management through legal framework
5. Special features of each law
6. The overall coverage of law for preventive and mitigating measures for the disasters

The scope of the comparison is limited only to the specific laws related to disaster management in each of the countries mentioned above. The aim of the comparative study is to understand the good practices followed through each law and to adopt the best practices to be adopted from each law. It also aims to recommend certain common measures which all three countries can initiate in common to prevent and mitigate disasters.

Pakistan

Historically, Pakistan has been a natural disaster-prone country. Before the enactment of Pakistan Disaster Management Act [PDMA], 2010, the Calamity Act of 1958 was in existence to deal with disasters. The integrated approach to manage disasters was introduced through the National Disaster Management Ordinance 2006 (NDMO) which was converted into PDMA Act in 2010.

The law related to management of disaster in Pakistan was passed *ex post facto* in 2010. Earlier, it was in effect from August 2007.

The main agency to look after disaster was entrusted with the title National Disaster Management Act, 2010.

Majority of the countries have come out with laws from 2005 to 2010 as these same countries were undergoing climate change and other natural disasters during the same periods.

Pakistan is one of the signatories to the UN Hyogo Framework for Action (HFA) 2005–2015.

The Act is a reactive step and tries to respond to the gaps in the available legal framework to tackle disasters. The Act was passed to manage the issues related to disasters to which the earlier legal framework does not respond or for which it is inadequately equipped. The Act has no specific objectives.

The definition of the disaster given in the Act is comprehensive as it includes both natural and human-made disaster. There are ambiguities in the definition as it includes some accidental incidents making the understanding more complex which is either not clearly defined or indecisive in its capacity. The word “substantial” used

in definition also needs to be more concise/precise and clear. It does not help in interpreting the word at administrative and legal level.

The three-tier structure has been provided by the Act for the management of disasters in the country.

National Disaster Management Commission [NDMC] is the highest policymaking body for disaster management and to take care of the issues related to integration of disaster risk management, implementation of policy, and development plans for disaster management. The policy decisions are implemented through National Disaster Management Authority [NDMA].

The Provincial Disaster Management Commission [PDMC] works at provincial level. The disaster management authorities are working at national, provincial, and district level and also at grassroots tahsil level. The National Disaster Management Authority works at national level in coordination with the National Disaster Management Commission. The Provincial Disaster Management Authority is functioning at the provincial level, and the District Disaster Management Authority is working at the district level. All the three authorities have powers to establish a technical committee for effective coordination for the implementation of the Act. Apart from this, there will be union councils at the village level and community organizations also have the mandate to give its input and work in sync with others. So, one can assume that the structure is well defined from top to bottom for the implementation of the Act.

The Act also suggests for establishment of National Institute of Disaster Management for research, development, and training and for National Disaster Management Fund under section 27.

The provinces are also required to establish Provincial Disaster Management Fund to deal with issues related to disasters.

Section 5 and 25 of the Act suggests for preventive and mitigating measures to be taken for disasters. But there is a lack of detailed provisions suggesting measures to be taken to implement these sections and detailed measures for Disaster Risk Reduction [DRR]

At present, most of the South Asian countries are facing issues related to global warming and climate change. The present Act does not contain any direct provision related to prevention and mitigation of issues related to climate change which is the major cause for natural disasters. The Act does not contain the provision with detailed plan on developing community resilience.

India

India is also one of the disaster-prone countries with its multiplicity of diverse geo-climatic zones. It experienced severe earthquake in 2001. In the wake of it, the state of Gujarat in India enacted a Disaster Management Act for Gujarat in 2003. To further strengthen the mechanism in 2005, the Union Ministry of Home Affairs enacted the National law, i.e., National Disaster Management Act with a soul mission of “To build a safer and disaster resilient India by a holistic, pro-active, technology driven and sustainable development strategy that involves all stakeholders and fosters a culture of prevention, preparedness and mitigation.”

The definition of disaster provided under the Act is not inclusive.

The Act also provides for three tier structures for disaster management: National Disaster Management Authority [NDMA] is constituted at the national level for formulating and enforcement of the plan and policy for disaster management as per the provisions in section 6 of the Act. It is assisted by the National Executive Committee (NEC) which provides assistance in implementing the plans and policies framed by the NDMA.

At each state level, the State Disaster Management Authority is established which follows the directions of the National Disaster Management Authority and National Executive Committee to take measures for disaster management. The Act also provides for the establishment of State Executive Committee [SEC]. The SDMA has the power to review the development plan to ensure that it is integrated with disaster prevention and mitigating measures. This power of SDMA has wider scope than the powers with NDMA.

The Act provides for the establishment of the District Disaster Management Authority at each district level. The DDMA has wide powers to take preventive measures. The act follows top-down model approach in decision-making and implementation of the Act, but DDMA has been exceptionally vested with wide range of powers to take preventive and mitigating measures for the disasters. It is a positive feature of the Act as the local issues can be well addressed at the local level by the local authorities due to diverse factors affecting the varied geo-climatic zones and related issues and challenges arising out of it. But effective involvement of local authorities is essential which is not provided or mandated by the Act which is counter productive in the long run for implementation of such operations.

The Act also provides for the creation of National Disaster Response Force [NDRF] in the year 2006. In a very short span of time, NDRF has rescued over 1.44 lakh precious human lives and also evacuated more than 7 lakh stranded persons from disaster situations within the country and abroad which is a very positive impact of this provision as witnessed during the last 15 years.

The Act also provides for constitution of National Disaster Mitigation Fund under NDMA and National Disaster Response Fund under NEC.

Looking at the huge population, larger geographical area with diverse climatic conditions, and the magnitude and impact of disasters, the National Disaster Management Act of 2005 has been successful in responding to the crises proactively and promptly.

Bangladesh

Bangladesh is one of the disaster-prone countries like India and Pakistan. In 1993, Disaster Management Bureau was established. In 2000, Comprehensive Disaster Management Program was created. After this, Ministry of Food and Disaster Management was established in 2005. The Disaster Management Act came into effect in 2012 in Bangladesh.

The Bangladesh National Disaster Management Act was enacted in the year 2012, but before the Act was passed the Government had a “Bangladesh Climate Change Strategy and Action Plan (BCCSAP) 2009” which was linked to the climate

change and the potentials for the disaster and considered as one of the primary pillars of disaster management.

Bangladesh is one of the signatories of the UN Hyogo Framework for Action (HFA) 2005–2015 and follows the SAARC Sendai Framework for Disaster Management, the basic principles of which are also reflected in the 5-year plan of Bangladesh.

The Act is divided into a three-tier structure for the management of disasters in the country. “The National Disaster Management Council (NDMC)” is the Council that will regulate the focus on long-term strategic goals for disaster management and addressing the commitment and demonstration of key issues along with establishing the relations between visions, goals, and strategies of the government to the strategies and aligning priorities of national and international drivers. See Haque and Bhuiyan (► Chap. 126, “Managing Disasters in Bangladesh: Legislative Framework and Judicial Developments”).

The NDMC has the power to lay down the guidelines and strategies as well as the approaches used for the emergency response, current disaster risk reduction, and preparation programs.

“The Department of Disaster Management” and “National Disaster Management Research and Training Institute” implement disaster risk reduction programs, and emergency humanitarian aid, rescue, and rehabilitation programs.

The Research and Training Institute will implement pertinent initiatives, such as studies on enhancing disaster management techniques as well as the impacts of climate change and disasters. The DDMC operating at the district level should formulate the procedures along with the plans for recovery which delineates damage assessment procedure, and such plans shall be updated and reviewed annually.

“The National Disaster Response Co-ordination Group (NDR-CG)” and “Local Level Disaster Management Committee and Group” have the primary role of assessing the catastrophic occurrences in different parts of the region, and activating the disaster response and swift rescue procedures, simultaneously making sure that the resources are dispatched for the disaster, and proper transmission of warning signals should be considered.

By organizing the post-disaster relief efforts and guaranteeing prompt delivery of extra supplies and tools to regions where communications are hindered, the coordination group should also oversee the post-disaster rescue and search activities. Along with offering advice on risk reduction and disaster preparedness measures, they help sustain information flow in emergency situations like disasters.

Conclusion and Recommendations

After analyzing the legal framework for disaster management existing in Pakistan, India, and Bangladesh, it is observed that the laws in all three countries follow top-down approach model for implementation of the objectives of the laws. All these laws have national, provincial, and district or local authorities to plan and make policy to implement the law related to disaster management.

All the three countries mentioned above have well-developed legal frameworks with proper statutory authorities to implement the provisions of the legal framework as discussed above. The structure and the functions of the authorities are well defined. The expectations from the statutory authorities are clearly laid down. On these points, uniformity in the legal framework of all the above countries is apparent.

But there is lack of uniformity in approach to inclusion of linkages of climate change with disasters and statutory measures for the same in all three nations' legal framework. Except for the legal framework of Bangladesh which addresses in detail climate change and its linkages with disasters in the act, policy, and planning, this provision is not included or is at nascent stage in the legal framework of India and Pakistan.

These frameworks do not include the disasters due to development and displacement which is a very subtle but consistently ongoing issue.

All the three nations have very robust mechanism for disaster management, but there is a difference between comprehensive planning and execution for disaster mitigation and prevention. Except for the disaster management law of Bangladesh, all other laws do not directly and in detail discuss the linkage of disasters due to climate change and mitigating measures for the same. Contrastingly, the National disaster management law of Bangladesh defines climate change and also includes it in detail in the Act to their advantage.

There is less participation/ involvement of people in disaster management authorities established at national, state, or district level under the disaster-level legal framework of all these countries investigated here.

There is a need to empower the local authorities more in comparison to state and national authorities. The bottom-up approach model is essential as all these nations have excellent potential of community participation in resolving the issues.

There is also a need of effective capacity building provision under the legal framework for disaster management in all the three countries.

It is likewise essential to formulate uniform policy to include disaster prevention and mitigating measures in the development planning framework. Environment Impact Assessment (EIA) can also be included as one of the mandatory provisions of process for industrial and infrastructure development activities carried out by these countries to further their economic growth.

It is equally essential to integrate the measures to prevent climate change with the disaster management laws. The industrial policies and related framework should also be framed in the context of the provisions of the disaster management laws.

The technological innovations and its sharing, exchange, and transfer with neighboring countries are also required as Pakistan, Bangladesh, and India share common challenges of disasters and are also affected commonly. India and Bangladesh have signed Memorandum of Understanding in 2021 for taking measures through cooperation for disaster management, resilience, and mitigation. This MOU aims to extend cooperation in the field of advanced information technology, early warning systems, remote sensing and navigation services, and expertise for disaster preparedness, response, and mitigation and move toward real-time data

sharing. Similar measures should be taken for concrete joint action plan by neighboring countries.

The technological and AI support system should be enhanced for disaster management and preventive measures. Artificial intelligence and innovative technology can bring a paradigm shift in the area of agriculture, water, energy, land, and forest use in these regions as we have seen that the communities here are predominantly based on traditional farming which demands huge use of all such resources.

The collateral of disasters like loss of basic education, poor health due to disaster-induced mobility and migration, food crises and hunger, and reviving major chunk of natural resources like reservoirs, dormant rivers, streams, lakes, ponds, and natural forest has to be one of the primary focuses of public policy framework in the South Asian region.

Above all, linking livelihood through sustainable ways of living to future disaster calls for legal safeguard to avoid and mitigate climate disaster in the future which lies ultimately with awareness and actions of the community inhabiting in these regions as all share common vulnerabilities and fragility in terms of disasters and other hazards (man-made or otherwise).

Joint collaborative framework and creative financial mobilization with flexible interpretation of legal nuances of all these countries would certainly help in creating a better disaster-resilient citizenry to live their life in more sustainable ways.

To broadly conclude, there is an urgent need of ensuring that disaster risk reduction is a national and a local priority with a strong institutional basis for implementation of policy, identifying, assessing, and monitoring disaster risks, enhancing early warning, use of knowledge, innovation, and education to build a culture of safety and resilience at all levels, reduction of the underlying risk factors, and strengthening disaster preparedness for effective response mechanism at all levels across all the countries examined for this purpose.

Part X

International Law and Collaboration During Disasters

Introduction: International Law and Collaboration During Disasters

120

Muhammad Ekramul Haque

Disaster management works at its pinnacle only with efficient international cooperation and collaboration. Many disasters have instilled in them so many multifaceted factors that it is almost impossible for a nation to tackle them on their own, and that is where regional and international cooperation comes into play. This cooperation is necessary at all national levels, which might require a coordinative body between the many branches which work even on local and national levels. The existence of current contemporary legal frameworks in this regard forms a kind of backbone in terms of the navigation a country might need when maneuvering through the waters of novel legislation in this field. The International Disaster Response Law (IDRL) guidelines, developed by the International Federation of Red Cross and Red Crescent Societies, play a crucial role in promoting a common understanding of the legal obligations and responsibilities of states, international organizations, and humanitarian actors in disaster situations. Other pivotal legal instruments which are underscored by international cooperation and collaboration in disaster management are the United Nations International Strategy for Disaster Reduction (UNISDR), which paid specific heed to a comprehensive approach attending to disaster risk reduction, preparedness, response, and recovery, and the United Nations Disaster Assessment and Coordination (UNDAC) system, which laid the bricks to support disaster-affected countries in assessing needs, coordinating humanitarian responses, and providing technical support to national authorities. The European Union has developed its share of tools for international cooperation as enshrined in the Disaster Assistance and Protection Program (DAPPED) which includes provisions for rapid

M. E. Haque (✉)

Department of Law, University of Dhaka, Dhaka, Bangladesh

e-mail: ekram.haque@du.ac.bd

response, coordination, and is designed to complement the efforts of affected countries and other international actors. Establishing the International Relief Union in 1921 marked the beginning of the origins of international disaster law, paving the way for the subsequent development of a sophisticated branch of international law over the course of the next century, although the whole system “[does] not constitute a coherent whole and most of those with a binding character are unevenly distributed across different geographical areas” (Giustimiani, 2021). Despite concerted efforts, a comprehensive legal framework surrounding disasters has yet to be formulated, as a result soft international law remains as a predominant component within the broader realm of international disaster law. The guidelines for the domestic facilitation and regulation of international disaster relief and initial recovery assistance (IDRL Guidelines), adopted in 2007, are milestone international legal standards regarding disaster management, although these are nonbonding soft international laws (<https://disasterlaw.ifrc.org/idrlguidelines>, accessed on 12 April 2023). Disaster management strongly needs collaboration and thus this is an integral part of international disaster law (Singh, 2018).

As there is no uniform law dealing with disaster matters, the International Law Commission (ILC) attempted to make developments in this facet. ► [Chapter 124, “The International Law Commission and International Disaster Law,”](#) has elaborated the works done, so far, by the ILC. This chapter focused on the Draft Articles on the Protection of Persons in the Event of Disasters (DAPPED) adopted by the ILC. The DAPPED has adopted some novel approaches which are significant additions to the international disaster law gene pool. The DAPPED has the future potential of being adopted as a binding convention, till then it will continue to impact international disaster law as a nonbinding soft international law.

Disasters inexorably impede the full realization and attainment of a variety of human rights, thereby exerting a deleterious and pervasive influence on the lives of those effected. Hence, it is paramount that international disaster laws provide provisions and mechanisms to protect human rights in a disaster situation. ► [Chapter 128, “International Human Rights Law \(IHRL\) in Disaster Risk Reduction \(DRR\) Planning,”](#) has clearly established a nexus between international human rights law and disaster risk reduction planning. It is argued that proper integration of IHRL in DRR planning can prevent infringement of many human rights and can eventually ensure better protection of human rights.

Again, international cooperation and solidarity are essential conditions for the protection of human rights during disasters. ► [Chapter 123, “International Law, Human Rights, and Public Health Emergencies During Disasters: A Developing Country Perspective,”](#) has pointed out the issue of possible human rights violations during public health emergencies at the time of disasters and argued that solidarity and international cooperations can reduce the risk of human rights violations in developing countries. The author has rightly concluded that solidarity is a duty under international law which exists equally during the pre- and postdisaster periods.

According to international law, the right to health holds an inimitable status as a vital human right. ► [Chapter 130, “COVID-19 Pandemic and Health for All,”](#) has portrayed that a set of human rights, including the right to health, is affected by

disasters. Taking the example of the COVID-19 pandemic, the author of this chapter has established a jurisprudential development of international law regarding disaster. It is argued that each state owes a strict legal obligation under international law to protect the human rights of the people, including the right to health. This right-based approach eventually imposes a legal obligation on the state to protect the right to health and other human rights during disasters. On the basis of this right-based approach, it is finally argued that a right-based disaster management policy should be adopted to face disasters including one like COVID-19 pandemic.

Many principles of international humanitarian law act as parts of international disaster law in different ways. ► [Chapter 135, “Humanitarian Relief in the Time of Covid: The Law and the Reality,”](#) has identified how international humanitarian legal principles can be applied in different disaster situations. It is also argued that different states can be benefited by the use of international humanitarian laws during the periods of disasters.

The International Disaster Response Law (IDRL) guidelines deal with, *inter alia*, duty of a state to protect the internally displaced persons (IDPs) in the event of disaster. However, the author of ► [Chap. 125, “Duty of the State to Protect Internally Displaced Persons in the Event of Disaster,”](#) shows that the relevant IDRL guidelines are not novel principles, rather they are made based on the existing principles of international law. ► [Chapter 132, “Disaster Displacement and International Refugee Law: Locating Legal Protections in the Context of Climate Change Migration,”](#) has further clarified the legal protections under International Refugee Law (IRL) in the context of disaster-driven human displacement (DHD) and climate change migration.

Encompassing a country’s domestic perspective, this section has included a number of chapters on different issues of disaster management. It has already been pointed out that soft international legal standards continue to impact different national legal systems to make laws in conformity with those standards. ► [Chapter 117, “Disaster Management Laws: International and Indian Perspectives,”](#) has examined the compatibility of the Indian disaster management laws with international law, especially with the principles of international humanitarian law. It is argued that the fundamental principles of international law regarding disaster management have been adopted in the Indian laws, and, specifically speaking, the Disaster Management Act, 2005, a comprehensive Indian legislation, generally complies with international legal standard on disaster management including the Yokohama Strategy, Hyogo Framework, and Sendai Framework.

The chapters on Bangladeshi legal regime include ► [Chaps. 121, “Legal Aid Services for Disaster-Induced Gender-Based Violence in Coastal Bangladesh,”](#) ► [126, “Managing Disasters in Bangladesh: Legislative Framework and Judicial Developments,”](#) ► [127, “Persons with Disabilities in COVID 19: Bangladesh Perspective,”](#) ► [129, “Nuclear Disaster: Assessing the Compliance of Global Nuclear Safety Regime in Bangladesh,”](#) ► [131, “Climate Change and Disaster Management in Bangladesh,”](#) and ► [134, “Corporate Responsibility to Protect Human Rights: Evaluating the Legal Framework of Bangladesh in Light of International and Regional Standards.”](#) These chapters deal elaborately with various issues from

domestic perspective, which will be a useful resource to see how a country faces pertinent issues surrounding disasters. There is a chapter from the Sri Lankan perspective, which has portrayed armed conflict as human-made disaster and has examined how the civilians can be protected in such situations under international law. The sole chapter written on the Indonesian system has examined the doctrine of executive immunity in times of COVID-19 from an Indonesian perspective. The chapter on “A Comparative Analysis of Disaster Legislation in South Asia” is significant as it analyses disaster legislation from a holistic South Asian perspective. As regional cooperation plays a crucial role in disaster management, such a study will undoubtedly be pivotal in managing disasters in South Asia.

Finally, although this section has not been an exhaustive compendium of all relevant issues regarding international law and collaboration during disasters, this has included the study of some basic issues from a jurisprudential perspective, like the discussion on the right-based approach or examining different issues from international legal perspective, and an investigation to determine the relationship of international disaster law with international human rights law, humanitarian law, and refugee law. The country-specific chapters will set a fundamental premise as to the research in this field and facilitate further study surrounding congruent issues from different national perspectives.

Abstract

Natural disaster triggers need for control in abusive households, intensifying domestic violence. This chapter analyses how natural disaster-induced gender-based violence (GBV) affects women in the coastal region of Bangladesh, with special focus on the challenges of access to legal support. Using Human Rights Based Approach (RBA) and mixed methodology, the authors analyze how existing patriarchy and dysfunctional local governance create a serious reluctance to access the state legal aid system to address GBV.

Keywords

Rights-based approach · Access to justice · Women · Domestic violence · Legal aid · Legal consciousness

Introduction

The World Risk Report 2021 ranks Bangladesh as the 13th highest disaster-prone country globally (Relief Web, 2021, p. 7). Annually experiencing multiple large-scale disasters and affecting millions of people, Bangladesh is one of the few states with specific executive wings focused on disaster management. Recently, Cyclone Bulbul (2019), Cyclone Fani (2019), Cyclone Mora (2017), Tropical storm Dianmu (2016), and Roanu (2016) with Cyclone Aila (2009) and Cyclone Sidr (2007) claimed the highest human, environmental, and infrastructural casualties (Relief Web, 2009). The 1991 Cyclone and 1970 Cyclone Bhola claimed about 150,000 and 500,000 lives, respectively, with far reaching socio-political and economic consequences. The discussions on natural disasters in Bangladesh have traditionally focused on climate change and development issues, with Sustainable Development Goals (SDGs) now receiving more focus. However, one aspect remains very little discussed: gender-based violence (GBV) in disaster contexts.

In a nutshell, this study found that domestic violence (including sexual assault and dowry-related violence) increased following the disaster(s). However, because GBV is a social problem in Bangladesh with high levels of violence already existing, it is not always easy to distinguish the GBVs occurring specifically as a result of disaster, although the increased impoverishment was a direct result of disaster and a direct cause of GBV. This chapter utilizes the framework of the human rights-based approach (RBA), which uses the lenses of quality, transparency, accountability, and empowerment to assess the GBV and its relation with natural disasters.

We begin the chapter by contextualizing gender-based violence within the Bangladeshi coastal villages prone to river erosion. Section “[Introduction](#)” describes the research area and introduces the research objectives and methodology. Then we address the relevant theories on gender-based violence and disaster through a short but focused literature review. Here we trace the development of rights-based approach to human rights, its main benchmarks and components, and the theory’s evolution in connection with natural disasters by referring to some key empirical works. The third section introduces the readers to the national legal framework on disaster management and its (lack of) attention to gender-based violence. Section “[Access to Legal Support for GBV Protection During Disasters: Case Studies from Bangladesh](#)” is the heart of the chapter where we discuss the case studies from Bangladesh with detail analysis. This part also analyzes how the lack of a proper legal framework affects people’s legal consciousness and access to justice rights. Section “[How Lack of Legal Aid Services Affects Disaster Induced Gender-Based Violence](#)” applies to rights-based approach to analyze how lack of legal aid affects disaster-induced gender-based violence in the village. Finally, we conclude by summarizing the key findings from our field data.

Context

This study intends to address the scholarly gap existing in Bangladesh on the connection between disasters and GBV. As a catalyst for triggering GBV, natural disasters have an equal or even bigger role than armed conflict and political disturbance. Moreover, while natural disasters are “not products of inequality; their impacts can fall very unevenly on different members of society” (Farber & Chen, 2006). While rushing to shelter during natural disasters, often the most vulnerable, including women, children, individuals with physical disabilities, are left behind, making them even more vulnerable to violence (IFRC and ICRC, 2015, pp. 16–17). Shelters get extremely crowded, where sexual predators and families, unaccompanied women and children are all housed together, which exposes people to increased risk of GBV. For people in abusive domestic relationships, disaster means increased tension and stress, triggering a need for control and power which induces further violence from the abuser. Disaster also breaks down whatever little legal infrastructure is available in the remote areas of a country like Bangladesh. This appears as a factor in the intersectionality of the victims (such as women, poor, abused, displaced by disaster). Thus, while people are more vulnerable, getting redressed is equally more challenging. This affects the victims and survivors of GBVs’ right to equality, right to health, right to safety and security, and right to access to justice.

This study tries to explore the following:

1. Identify the impacts of disasters on GBV in the study area
2. Reveal the accessibility or nonaccessibility to the legal support by the victims

3. Analyze the context, reasons, and facilities to access/nonaccess to the legal support by the victims
4. Analyze the impact of accessibility of legal support on the victims from a Rights Based Approach (RBA).

Methodology

We have applied mixed methods for data collection and qualitative methods for case studies. We included quantitative survey of community members by a professional surveyor, followed by a combination of key informant interviews with a structured questionnaire and focus group discussions (FGDs) at the community level with the affected community. The survey was later followed up by one focused group discussion and two qualitative interviews (one female and one male).

As researchers, we encountered limitations such as silence around discussing GBV and short time allocated for the data collection. We travelled to the locality for the KII and in-depth interviews, and we found some interesting insights as to the levels of awareness on access to legal aid for addressing GBV-related issues during times of disaster, which we discuss later in this chapter.

Understanding the Target Community: Housing and Socio-economic Condition

The research was conducted over 4 months in the Kachia Village of Bhola Sadar Union. Bhola sadar Upazila (Bhola district), with an area of 413.16 km², Kachia Union (GO code 58), has an area of 4170 acres, with a total population of 13,560 people and an official literacy rate of 67.12%, BBS 2022 (BBS, 2011). The Kachia village is the main village in the union. The sample size for household survey was 82, where one member from each household has been surveyed. The margin of error has been taken at 5%, the confidence level 95%, and the response rate 50% (Fig. 1).

The study area is disaster prone. In the past 10 years, 82 households have fallen victim to floods, while 75 households have lost land to riverbank erosion. This hampers their economic growth and stability. The disaster-induced financial loss has been the chief factor behind their impoverishment, as seen from the charts below (Tables 1 and 2).

The average socio-economic condition of the target community is very poor. 74 out of 82 households were displaced families induced by riverbank erosion, and 42 households out of 82 have rented land (around 80 sq. feet) for 3000 taka (approx. 38 USD) for a year, while the displaced people themselves bore the expense for buying household materials. Most of these people were farmers, but now most of them being landless have resorted to myriad professions such as auto driver, barber, fishing (both fisherman and fishing boat labor), housekeeper, day-laborer, assistant to local lawyer, poultry, and rickshaw-puller.

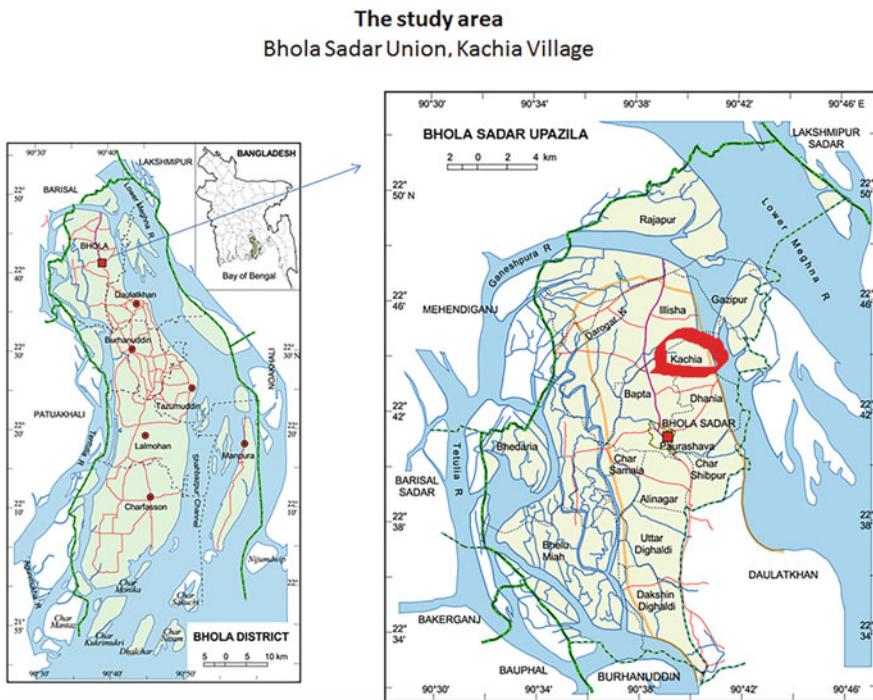

Fig. 1 Image: administrative map of the study area. (Source of the map: Banglapedia)

Table 1 Riverbank erosion-induced displacement

Category	Number of respondent	Percentage of respondent (%)
Yes	74	90.2
No	8	9.8
Total	82	100.0

Table 2 Disaster-induced displacement frequencies

Category	Number of respondent	Percentage of respondent (%)
Loss of entire house/part of it	74	79.3
Loss of livestock	8	11.0
Loss of cultivable land	82	75.6
Damage to crop	65	68.3
Loss of family member	9	2.4
Health complications	62	58.5
Other problems	56	2.4
Total	356	297.5

Rights-Based Approach, GBV, and Natural Disaster

Rights-Based Approach as a Theory

Natural disasters are traditionally seen as creating challenges mainly related to humanitarian concerns and calling for humanitarian assistance. In this context, little attention is given to human rights protection, which has appeared to be a grave need and concern for the survivors of natural disasters (IASC, 2011).

With the advent of the right to development as a human right, we saw the debate on a rights-based approach to development where the protection of the people's rights is considered paramount in development considerations. Introduction of human rights law into international law created a people-centric approach (Goonesekere, 1998). Whereas international law traditionally treated the states as the primary subjects and left the individual to the sole jurisdiction of their states, human rights shifted the focus on individuals, bringing back agency and creating accountability of the states. While the larger part of human rights discourse focuses on civil and political (CP) rights, the economic, social, and cultural (ESC) rights consist of an equally vital part of the human rights paradigm. CP rights are associated with the notion of negative action by the state, a vital aspect that distinguishes these rights from the ESC rights, the social-welfare centered delivery of services necessary to fulfill the basic needs such as food, health, shelter, and education (Goonesekere, 1998, para. 4).

As per the rights-based approach (RBA), development is not in conflict with human rights; rather development is a process to ensure the ultimate fulfillment of those rights. According to the OHCHR, RBA seeks to redress discriminatory practices and unjust distributions of power that impede development progress (OHCHR, 2006). In case of gender equality, RBA ensures that development process ensures and includes women participation and empowerment.

The main principles of the RBA framework are fourfold: equality, transparency, accountability, and empowerment. In cases of disaster management and GBV response, equality refers to ensuring rights holders receive the services they are entitled to, transparency means those affected by the disaster and GBV have full access to information in order to make informed decisions, accountability refers to holding duty bearers (i.e., State agencies who can distribute those resources) responsible for doing or not doing their part, and empowerment means post disaster the community members can participate in the rehabilitation process in order to ensure sustainable effects (Rice et al., 2017, p. 118).

How Natural Disaster Affects GBV: Theories and Experiences from Around the World

Cardona observes that "Disaster is a contested notion" and can be more easily conceptualized than defined (2004, p. 37). Scholars define it differently: To Rahman, "disaster" is a "summative concept" or a "sponge word" (Rahman et al., 2015, p. 185).

According to Quarantelli, disaster is “an event, concentrated in time and space, in which a community experiences severe danger and disruptions of its essential functions, accompanied by widespread human, material or environmental losses, which often exceed the ability of the community to cope without external assistance” (1998). Therefore, disaster is a natural or man-made event, directly related with vulnerability, to which the affected individual or society is unable to cope with, resist, and recover from its impacts (Blaikie et al., 1994, pp. 29, 320). However, vulnerability of an individual or group depends on “the interaction of the hazards of place (risk and mitigation) with the social profile of communities” (Cutter et al., 2000). While discussing vulnerability, older people, children, female, or minority groups (disabled and others) are more vulnerable to natural disasters (West & Orr, 2007). However, being a woman does not lead to disaster vulnerability; rather gender becomes a strong factor to create differences between men and women along with socio-cultural and economic factors, gendered responsibilities and roles, social attitude, and norms periods (Nasreen, 2010; MacDonald, 2005). Bradshaw and Fordham observed that in disasters, casualties are higher among female groups compared to males, especially where women’s socio-economic status is low (2013). However, “women who survive there may be longer-term and more intangible ‘secondary’ impacts such as a rise in violence or greater insecurity in employment” (Bradshaw & Fordham, 2013).

Gender-based violence increases in disasters: during and postdisaster periods (CARE International, 2013; Enarson, 2012; Goulds, 2013; Wiest et al., 1994). The experience of several disaster shows the increase of domestic violence, verbal and sexual abuse, dowry abuse, isolation, rape, and forced marriage: Hurricane Katrina in 2005, Indian Ocean tsunami in 2004, New Zealand snowstorm in 2006, China earthquake in 2008, the 2010 Haiti earthquake, and the BP oil spill in Florida in 2010 (MacDonald, 2005 p. e178; Houghton et al., 2010; Chan & Zhang, 2011; Madre et al., 2011). Goulds mentioned that when poverty strikes in disasters, child marriage becomes a coping strategy (2013). Besides, changes in household dynamics create an unequal power relation and context for domestic violence – such changes include men failing to fulfill his gendered role as the bread winner while more women get NGO loans and reliefs for family income. However, it should be noticed here that GBV is common to most of the societies during nondisaster periods and has a long history: In this case, Bangladesh is not exceptional.

The forms of violence include physical, sexual, economic, emotional, and controlling behavior. According to the Bangladesh Bureau of Statistics, about 72.6% of married women are abused by their husbands at least once in a lifetime (BBS, 2016). However, such statistics do not present the whole picture. Traditionally it is expected to keep domestic violence within family or society rather than report it to the police or media (Hossain & Suman, 2013). Only 12.9% out of 41.7% injured victims reported to the authority (BBS, 2015). These conditions raise questions about the extent of GBV during and post disasters in Bangladesh.

There is no government database on changing GVB conditions during Bangladesh disasters except some sporadic research. According to Nasreen, GBV increases during floods in Bangladesh (Nasreen, 2010). Rashid and Michaud explain

how female adolescents face GBV while taking shelter in floods (2000). GBV also increases during cyclones and riverbank erosion. Akter et al. studied the impacts of riverbank erosion on rural women and revealed the close relationship between financial insecurity and domestic violence like wife battering and abandoning wife (2019). In another study, riverbank erosion victims identified five sectors of insecurity after disasters and GBV is one of them (Rahman et al., 2015). This research reveals a higher number of domestic violence among the riverbank erosion victims.

Rights-Based Approach to GBV in Disasters

Adopting an RBA in policy and legislative framework includes gender mainstreaming to ensure gender equality. GBV depicts the imbalance of power and inequality resulting from the social depiction of masculinity as the powerful and prominent gender. In a conservative society like Bangladesh, (this study is limited to the experiences of cis-gender heterosexual women) preventing GBV would primarily require specifically calculating women's needs and requirements in terms of program design, policy making, and legislative framework (UNGA, 1998, para. 4). This leaves the transgender and gender fluid people beyond help.

According to the working paper by UN Women, a human rights-based approach in fighting GBV requires developing the capacities of "duty-bearers," that is, the state and its agencies responsible for implementing the law. These would include, *inter alia*:

- Ensuring that police understand the reality of domestic violence and that they must intervene in domestic violence situations, even when it occurs in the privacy of a home, when a woman makes a complaint.
- Ensuring that health care providers assist women in making their own decisions about reporting abuse and that the health care providers may step in when necessary.
- Ensuring that the justice administration system and the legal system (especially relating to laws on sexual violence, the type of evidence admitted into courts, and the nature of prosecution) consider the gender-based nature of violence and understand that women survivors face stigma and discrimination that may deter them from reporting or filing a case right away (UN Women, 2010).

RBA works hand in hand with the rights-holders as well, ensuring the capacities of "rights holders" are also developed by:

- Ensuring services are available, accessible, and known to women and girls
- Undertaking legal rights training for women and girls
- Engaging with customary, traditional and religious leaders (who ascribe to human rights and gender equality) to reach underserved populations, such as the elderly, women with disabilities, ethnic minorities. (UN Women, 2010)

The natural disaster response policies designed by the state adopt a traditional top-down approach which addresses the affected population as victims rather as rights holders. This approach has a significant impact on the policy and response mechanism by not incorporating the basic principles of the RBA. However, before analyzing the lack of RBA approach, we will discuss the legal framework for gender-based violence and disaster management in Bangladesh.

The National Legal Framework: The Role of Law and Policy in Discussions on Inequality in Terms of Gender, Sex, and Locality

Bangladesh does have a comprehensive disaster management program, a well-developed plan, mainstreaming strategies, and disaster management institutions, but the whole operation of the disaster management is highly centralized. The objectives of the disaster response mechanism are to coordinate agency efforts at different stages in the disaster management cycle, including disaster management practices, disaster mitigation, emergency preparedness, emergency response, disaster management mechanism, early recovery, and immediate rehabilitation (Habib et al., 2012, p. 29). According to the Preamble of the National Planning for Disaster Management Bangladesh, the disaster management vision is:

...to reduce the risk of people, especially the poor and the disadvantaged, from the effects of natural, environment and human induced hazards... to a manageable and acceptable humanitarian level and to have in place an efficient emergency response management system.

The Bangladesh Government's regulatory framework includes:

- Disaster Management Act 2012
- National Plan for Disaster Management 2006–2012
- National Disaster Management Policy 2015
- Standing Orders on Disasters (SOD) – guidelines for Government at all Levels

The Disaster Management Act 2012

The DMA 2012 establishes the roles and responsibilities of Ministries, committees, and appointments. Among the major objectives of the Act are preparing for managing the response to the effects of a disastrous event, assisting in effectively responding to and recovering from a disaster or an emergency, and establishing risk reduction as a core element of disaster management (Habib et al., 2012, p. 32).

The Act in its definition clause defines several significant concepts, such as rehabilitation, services, security. These clauses testify that legislation acknowledges toned for holistic protection of the victims through psychosocial wellbeing. This allows the state enough elasticity to include more services, including legal services.

Ensuring these would translate into the empowerment principle of the RBA. However, we argue that mere words are not sufficient to encompass the legal protection or safety in cases of GBV response, but it can be argued that in potent cases the definition should be broadened to include such security measures. However, it also needs to be noted that in GBV cases, the services required are often postevent, that is, responsive as much as preventive.

National Plan for Disaster Management (NPDM) 2016–2020

The current NPDM was preceded by the NPDM 2010–2015, the first policy document for comprehensively addressing the disaster risks in the country. This plan led to the establishment of a legal basis for DM through the Disaster Management Act 2012 and reflected the basic principles of the SAARC Framework on Disaster Management (SAARC, 2015) and Hyogo Framework of Action 2006–2015.

The current 2016–2020 framework and other mechanisms require more emphasis on managing risks in a gender responsive manner (Ahmed, 2019, p. 2). The current plan also considers national, regional, and international frameworks, particularly the Sendai Framework for Disaster Risk Reduction (SFDRR). This plan prioritizes the following hazards: flood, cyclone, earthquake, riverbank erosion, landslide, salinity intrusion, drought, tsunami, arsenic contamination, human-induced hazards. The NPDM takes a “whole-of-government” approach, and it also attaches importance to engagement of the private sector (Ahmed, 2019, p. 3). The NPDM mentions legal measures as one of the ways to “prevent new and reduce existing disaster risk... reduce hazard exposure and vulnerability to disaster... and thus strengthen resilience” (NDPM, 2015, clause 81). The plan mentions gender as a consideration for ensuring people-centered, multihazard, multisectoral forecasting and early warning systems (NDMP, 2015, Priority 4).

It is noteworthy that nowhere in the NPDM gender is considered in conjunction with legal aid or legal assistance, especially, legal aid does not appear among the different types of assistance to be provided during periods of disaster.

Standing Regulatory Orders 2010

The Standing Orders on Disaster describe the detailed roles and responsibilities of committees, Ministries, and other organizations in disaster risk reduction and emergency management and establish the necessary actions required to implement Bangladesh’s Disaster Management Model. However, in reality, budget allocation, deciding on relief items, finalizing disaster management mechanisms lie with the discretion of the higher authorities at central level so that the local government institutions are involved only at a theoretical level. Local actors are at mercy of the central disaster management authority to respond to the needs of the victims (Daily Star, 2008).

International Agreements and State Implementation

In December 2015, the International Conference of the Red Cross and Red Crescent saw States and the Movement adopt a ground-breaking Resolution on “Sexual and Gender Based Violence: Joint Action on Prevention and Response.” This resolution was a direct outcome of the studies we undertook in Bangladesh, Samoa, Myanmar, and elsewhere (Sabina, 2016, p. 24). Overall, there are low levels of awareness on gender needs and GBV risks and patterns among key disaster responders, including the government and Bangladesh Red Crescent Society (BDRCS) staff (IFRC, 2016, p. 12).

This results in a generalized understanding of GBV vulnerability across key stakeholders, where interviewees present women and children as most vulnerable. An understanding of how boys, men, and minority groups, such as lesbian, gay, bisexual, transgender, and intersex (LGBTI), are affected.

Common Gaps and Challenges in GBV Frameworks During Disasters

From a legal perspective, research has underlined the importance of developing a comprehensive and gender-sensitive legal framework for disaster management. Lack of official and proper data affects addressing GBV, especially in disaster periods. The colonial laws and social prejudices also make it very difficult to report GBV, notably sexual violence. In a study by the IFRC in Bangladesh, it was found that long legal delays and threats against victims and witnesses obstruct access to justice for GBV (IFRC, 2015).

Given the stigma associated with GBV, it is not surprising that little if any data are available on GBV in disasters. Another factor is the breakdown of systems for reporting GBV during and after a disaster. Officials are usually fully occupied in disaster response, they either have no time to maintain records or accord them lower priority, and often the officials themselves are affected during disasters (UNDP and Other UN Bodies, 2012, p. 9).

Access to Legal Support for GBV Protection During Disasters: Case Studies from Bangladesh

As seen from the above discussion, the victims in the study area are victims of intersectionality: they have suffered from GBV and natural disasters. Both these adversities have affected the women in the study area primarily on financial grounds (i.e., disaster leading to poverty leading to domestic violence) which due to their gender identity have manifested in a specific form of violence from which men generally do not suffer in Bangladesh (ASK, 2021).

While Bangladesh has laws for protection and rehabilitation of victims of GBV and victims of natural disasters, the two groups are treated exclusively of each other. As such, laws dealing with GBV do not consider the victim’s financial aspects,

whereas laws dealing with natural disasters rarely consider legal aid/services to be an emergency service during the times of disaster. The existing legal framework is insufficient for protecting and rehabilitating such intersectional victims.

In any legal system, the laws affect the society as much as social perspectives affect the laws (Friedman, 1969), (These phenomena are known as the “internal” and “external” points of view in sociolegal jurisprudence. Roscoe Pound was the first jurist to talk about how there is a gap between legal change and social change, leading to different perspectives on how legalities are deemed differently by common people and legal professionals/institutions (see Friedman, 1969).) leading to how people experience and approach the laws in a given society or community (Merry, 1990, p. 5). (This is known as legal consciousness, a framework applied in sociolegal studies. Legal consciousness studies “the ways in which law is experienced and interpreted by specific individuals as they engage, avoid, or resist the law and legal meanings.”) This legal consciousness is produced and revealed in what people *do* and what they *say*, (Fritsvold, 2009, p. 810), and our findings show that social and religious norms influence people’s experience of law, which often means not resorting to law.

Lack of Participatory Process

Qualitative interviews with the local stakeholders depict serious lack of participation from the rights holders in the study area. The community members, both male and female, do not know about the legal processes for addressing GBV during and post natural disasters. Neither villagers nor the local government officials and representatives know that the legal aid offices are supposed to operate at a union level. The Union Parishad (UP) Chairman’s office rarely took initiatives to mobilize the UP level legal aid office, and the district level legal aid office’s promotional activities do not penetrate deep into villages situated in the remote corners of Bhola. On the day of our field visit, the UP chairman’s office conducted an awareness raising session on disaster management. The UP member observed that local people rarely consider legal aid a necessary disaster management service and do not think GBV as an issue worth addressing during disaster management or after.

No Holistic View

The disaster management programs in Bangladesh mostly focus on the emergency relief and rehabilitation needs of the people and strive to control the human and economic casualty of disasters. Programs guided by RBA take a holistic view of the context within which it would be operating, including environment, the community, civil society, local and national authorities. It further considers the socio-political and legal framework that determines the relationship between those institutions and the resulting claims, duties, and accountabilities. The policies are not tweaked according to the socio-cultural needs of the communities for which they operate. Consequently,

the local political henchmen and leaders adopt the response plans at their discretion with little consideration for women victims.

Lack of Transparency and Accountability

RBA in policy design ensures that the particular human right(s) in question gets addressed through clear indicators and benchmarks, and specifies who is accountable. Specifying the accountability makes the process more transparent and empowers communities to hold the duty-bearers accountable so that rights violations get attention and recognition.

The GBV in the study area rarely ends up in the state-sanctioned formal justice administration sector. Most cases are communally mitigated through the intervention of the UP Chairman. While the UP chairman has no legal jurisdiction or authority to address such cases, there is no way to hold him accountable, because the community members consider him the sole authority in such issues. This is a clear case of nonparticipatory practices at the local government level, where the power imbalance affecting the rights-holders results in their forfeiting the right to access to justice (Fig. 2).

The police take a lax approach to domestic violence and other GBV. While domestic violence, rape, and physical assault related to dowry demands are non-compoundable offences, the police often compound them through the intervention of the Officer in Charge and female friendly police officer, a practice not backed by law. (Interviews with the OC of the Bhola Sadar Police Station, 23 December 2019.) Deep-rooted patriarchy and lack of feminist understanding of law affect how police

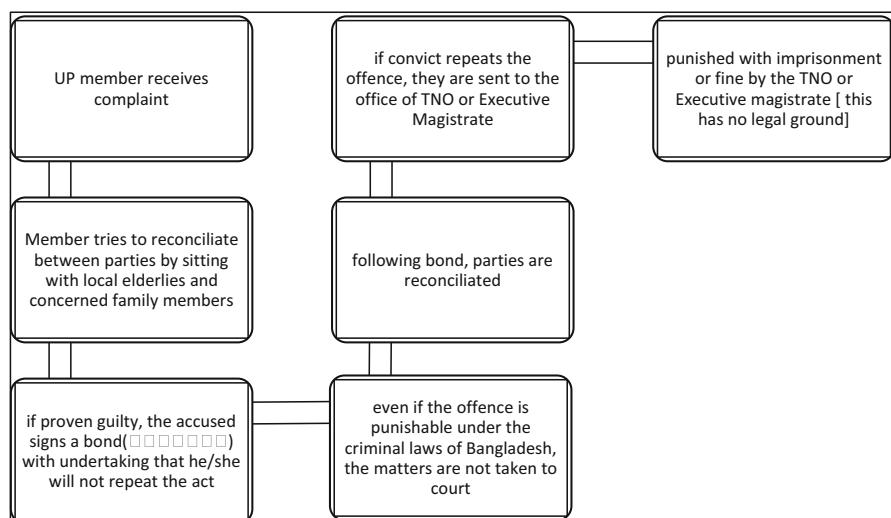

Fig. 2 Informal dispute resolution system as practiced in the target community

approach GBV cases. Two police officers mentioned adultery by women as a prime reason behind domestic violence. The local UP members prevent the villagers from approaching the police, (Interviews with Sub-Inspector and Assistant Sub-Inspector Bhola Sadar Police Station, 23 December 2019.) and therefore, people file cases as a last resort, after the local reconciliation fails to bring them justice. (As of December 2019, four suits were filed under Nari-o-Shishu Nirjaton Daman Ain related to dowry. There were three rape cases.) Even the district legal aid office and the magistrate courts are pro-reconciliation.

Not Producing Sustained Results

Bangladesh's existing social norms and patriarchy often fight against state sanctioned laws and rules. Our interviews show that many respondents hold women responsible for GBV. On the condition of anonymity, we received reports that there are judges at the district court who believe rapist can be absolved of their crime upon marrying the rape victim. (Interview at the Bhola District Court premises, 23 December 2019.) Respondents have highlighted following points:

- Many wives behave subversively with their husbands.
- River-bank erosion unemployment often pushes people for job hunting in cities. Long distance relationships result in psychological distancing and domestic violence.
- Marriages are unofficially solemnized without *kabin* registration, especially in the *char* area. Later husbands deny the marriage and beat the wife.
- Cases received at the District court show that the existing crime rate has an intrinsic relation with domestic violence, where men resort to criminal conspiracy to dispose of their wives. The following case study is interesting on this point:
A fisherman's wife had asthma. The fisherman's mother in law incited the fisherman to remarry her daughter (the fisherman's sister in law). The fisherman suffocated his wife. The case is pending before the Tribunal now.

How Lack of Legal Aid Services Affects Disaster Induced Gender-Based Violence

RBA operates on the premises that to achieve sustained progress, human rights principles must feature in governance (OHCHR, 2006, p. 7). However, the Disaster management Act 2012 and the Standing Orders of 2010 do not emphasize women as a marginalized population during periods of natural disaster. There are no provisions in the legal framework that may ensure the risk of GBV and further exposure to it be curbed down for women and similarly threatened gender groups during crises.

Equality

When responding to the needs of the community members during or post disaster, state services should be delivered in a way that prevents discrimination on grounds of race, sex, age, or other social categories (IASC, 2016, principle 1.1).

The first impetus is to save lives (both human and livestock) and property during natural disasters. With life comes security and bodily integrity of persons. These lifesaving measures are universally recognized as the first line of disaster management response, including evacuation (Ferris, 2012, p. 3). Evacuation process needs to follow standards so that people may uphold their rights, that families are not separated, and that people feel safe living in temporary shelters with other community members. Temporary shelters should be planned and managed to protect against gender-based violence.

Our study found both these aspects in the study area. While the danger signals are announced and people instructed to evacuate, the community members worry about protecting their homes and properties against petty crimes like theft and looting (IASC, Principle, II.1), as well as for the *parda* and safety of their female members (IASC, Principle, I.9). Often, male members move out first to make a subjective evaluation if evacuation would indeed be necessary, and often opt not to evacuate to ensure the women are safe inside the family home. While the IASC Guidelines mention that persons unwilling to leave should not be evacuated against their will unless such forced evacuation is in accordance with law, the evacuation notices are given following the procedural standard in Bangladesh. Hence, people choosing not to evacuate for want of safety of women is a grave violation of their right to safety and security.

The temporary shelters are not well equipped to ensure female needs. In many coastal areas of Bangladesh, school buildings serve as temporary shelters which do not cater to specific gender needs like menstrual hygiene, sanitary napkins. Over-crowded shelters expose girls to further vulnerability through sexual assault and rape. While the national policies provide for life-saving assistance like dry food, safe drinking water, oral saline, blankets, and drugs, there is no mention of special accommodation for women, which prevent women and men from receiving these services. Postdisaster situations, the underlying link between loss of property by disaster and increase of domestic violence as a form of GBV has not been sufficiently explored in Bangladesh. To make these cases of GBV justiciable, they have to be presented under the guise of dowry violence. (Interviews in Kachia, 23 December 2019.)

The GBV has far reaching consequences for women and girl children in the locality. Many women, fearing for the safety and security of their daughters, send them off to cities as domestic aides. This forced migration perpetuates the cycle of GBV because the deprivation of education means the girls grow up often to face the same powerlessness of their mothers. We found that while people are more open about violent consequences like child marriage, dowry, sending off daughters to cities as domestic help, women rarely opened up about the physical assault and battery from their husbands. Physical assault is acceptable as a way of life and the

persisting fear of sharing the experience with outsiders. The respondents rarely consider domestic violence as gender-based “violence.”

Transparency

Transparency is important for ensuring nondiscrimination and challenging unequal power structures in the community (Berman, 2008, p. 11). The principles of equality and nondiscrimination require the duty bearers, that is, the state, to ensure that social protection programs meet the elemental standards for all rights holders: accessibility, availability, and acceptability (CESCR, 2007). Services available to the community need to be accessible and useful. Accessibility has further conditions set by the General Comment 19, which are not fulfilled:

- a. Coverage: All community members, especially the individuals belonging to the most disadvantaged groups, must be covered by the services.

Theoretically, the DMA 2012 covers all persons affected by natural disasters, focusing on vulnerable groups. In terms of GBV protection, the Domestic Violence Prevention Act 2010, the Dowry Prohibition Act 1980, and the *Nari O Shishu Nirjaton Domon Ain* 2000 are available. Furthermore, the Legal aid and Services Act 2000 provides for legal aid committees at national, district, upazilla, and union level. However, the Union level legal aid committee was nonexistent in Kachia.

- b. Eligibility: The selection used to identify beneficiaries within a program must be reasonable, proportionate, and transparent.

The GBV laws lay down specific offences against women.

- c. Affordability: Any protective services requiring contributions in the form of direct or indirect charge must be stipulated in advance and must be affordable for all.

Legal aid and Services Act 2000 has specific provisions saying destitute people and victims of domestic violence are eligible for receiving legal aid (LASA, 2000, Sect. 2 (a)).

- d. Participation and information: Beneficiaries of programs must be able to participate in the program’s administration and have the right to seek, receive, and impart information on entitlements clearly and transparently.

In Kachia, most people approach the court through *muhuris*, that is, court clerks, and have no idea about the legal aid scheme. Though there are regular advertisements in the local print media about legal aid services, the low literacy rate makes it unlikely to reach the intended target group beneficiaries.

- e. Physical access: Benefits must be provided promptly, and beneficiaries must have physical access to receive benefits and information, with particular attention to disaster-prone areas (CESCR, 2007, para. 27).

In Bangladesh, the DMA 2012 covers all people and the Disaster Management and Relief officer work from the district and upazilla level. However, the legal aid office is only functional at the district level; the distance makes seeking legal aid services cumbersome for vulnerable people. Our discussions with the legal aid officer (in charge), Bhola, show that the District level legal aid committee is quite active. The committee has a meeting every 3 months, although the law stipulates monthly meetings (LASA, 2000, Sect. 11(2)), where beneficiaries participate.

Accountability

Accountability in a human rights-based framework relates to states setting up systems to ensure human rights are not violated and that redress is provided to those who are wronged (Concannon & Lindstrom, 2011, p. 1176).

Fieldwork shows that people have a low tendency of redressing GBV and other disputes through legal services. While people did not identify legal aid services as a necessary service spontaneously, the majority acknowledged it when questioned about their necessity. People do need legal services intervention. However, the idea of legal services is quite traditional and informal regarding access to justice. As opposed to addressing social problems and criminal activities, family disputes are considered a private issue by the respondents and as such preferred not to disclose to the *thana pulish*, that is, police, court, and legal aid officers (Table 3).

Table 3 Reasons for avoiding Legal services for addressing domestic violence

Category	Number of respondents	Percentage of respondent (%)
Fear of losing social respectability	3	3.7
Husband will no longer accept/take back if wife seeks legal help	15	18.3
Mutual reconciliation	23	28.0
Too much expensive	4	4.9
Court does not give proper solution	1	1.2
Chairman solves problem	14	17.1
Police demands money for assistance	0	0.0
Seeking legal remedy is complicated and troublesome	3	3.7
Village elders can help solve the problem	1	1.2
Husband will not accept her anymore	1	1.2
Political influence prevents proper justice	1	1.2
Reconcile thyself	1	1.2

The table depicts the idea of family as a private sphere and, consequently, family disputes as a private matter, not inviting external intervention. The local UP chairperson and the influential political leaders operate as de facto dispute resolution authorities.

Empowerment

A human rights-based approach to disaster response includes the active, free, and meaningful participation of all parts of society, including impacted communities, grassroots organizations, minorities, rural populations, and women (Concannon & Lindstrom, 2011). Various factors influence survivors' access to support services, including social norms, logistical challenges, lack of awareness, preference for community-led justice processes, prior relationship between perpetrator and survivor (if any), trust in the police, and family support. The preference to use traditional customary practices, arbitration, and sentencing (salish) in rural areas presents challenges for women and girls' access to justice. According to an expert, women and girls in Bangladesh are disproportionately impacted by disasters, but women's contributions to disaster risk reduction are often overlooked (Ahmed, 2019, p. 2).

Existing patriarchal views also hamper the legal empowerment of community women. The legal aid officer working with the Bhola District Court faced formidable challenge of balancing the application of law against existing social mores, affecting the cultural acceptability of judicial and legal services.

Conclusion

This study shows that despite the prevalence of laws and policies, the awareness about gender-based violence and formal access to justice mechanisms is below par in the remote areas of Bangladesh. Through qualitative and quantitative study, we analyzed how social prejudice, patriarchy, and dysfunctional local government have contributed to a serious threat of life and liberty to women in the study area. This affects gender equality with far-reaching consequences for rights to education, information, health, and access to justice. The current legal framework is inadequate and insufficient to cater to a wholesome social need, breaching Bangladesh's constitutional and international pledges.

Abstract

The Indonesian constitution provides the basis for the president as the executive to issue the executive laws and any policies to take measures in dealing with the COVID-19 impacts. The chapter will provide an analysis of how and what are the limits of the executive powers in Indonesia in dealing with COVID-19 as well as how the legal framework in Indonesia provides the basis of any measures taken by the executive in Indonesia. There are at least two important issues; the first is whether or not the executive has any limits in taking measures dealing with COVID-19; in this context, does the principle of executive immunity apply and in what conditions and circumstances? The second issue would be about how other branches (the legislative and the courts) would be the counterbalance vis-a-vis the executive branch. In Indonesia, since the beginning of COVID-19, there have been many executive laws and policies issued by the executive. Measures taken have covered various aspects ranging from social, economic, monetary and fiscal policy, tax, and any kinds of social restrictions in the health policies including vaccines. The issues in this chapter will be analyzed mostly from the normative

perspective. The analysis will focus on the extent to which the constitution permits the executive to issue measures on all kinds of policies delivered in laws. It will assess whether the laws are compatible with dealing with the situation and the implementation of the laws.

Keywords

The executive · Executive immunity · The Indonesian constitution · Emergency law · Executive immunity and pandemic

Introduction

The COVID-19 pandemic pushed the Indonesian president to declare a “public health” emergency through Presidential Decision No. 11/2020. The public health emergency declaration was issued on March 31, 2020, based on Article 4 (1) of the Indonesian constitution which gives the executive power to the president of Indonesia and in accordance with Law No. 6/2018 on the health quarantine. Furthermore, Law No. 4/1984 designates the minister of health as the responsible person for taking any measures to anticipate and overcome the emergency. The role and responsibility of the minister of health are also mentioned in Government Rules No. 41/1991 on the prevention of infectious disease. At the more technical level, the Ministry of Health Act No. 1501/MENKES/PER/X/2010 on the infectious disease which causes the epidemic and the efforts to overcome it mentioned that the minister of health is the minister who has a responsibility when there are extraordinary circumstances as a result of the endemic within a certain area of Indonesia. The current and most relevant law concerning the countermeasures of COVID-19 is Law No. 24/2007 on disaster countermeasures. The law determined that the epidemic of a disease like the plague is one of the man-made (nonnatural) disasters.

Decision-making takes place in a special manner during an emergency; hence the government becomes a subject of legal immunity (Hoffman, 2007). According to the Indonesian constitution, there is no provision concerning executive immunity. However, Article 12 of the constitution stipulates that the president as the executive has the power to declare an emergency. This clause gives loopholes for the executive to take any measures with limited responsibility. An emergency law is not only for an emergency but could also be made at any time of a serious urgent situation according to Article 22 (1) of the Indonesian constitution. In addition, the urgent situations have been determined by the constitutional court in Court Decision No. 138/PUU-VIII/2009. In the court’s decision, the court rules on at least three urgent situations, namely, (1) urgent circumstances as a result of a legal issue which requires a fast and accurate solution according to the law, (2) there is still no law concerning any specific issue that could lead to a legal vacuum or there is insufficient law dealing with the situation, and (3) the legal vacuum could not be resolved if the law has to be made by normal mechanisms of the law-making process since the situation is urgent and needs an immediate law to deal with it.

As Indonesia struggled with the pandemic COVID-19, the president has issued two Government Regulations in Lieu of Law (PERPU). The two PERPUS do not contain the objectives to address specific issues of anticipation of the COVID-19 per se. Among these two laws, one aims to solve the instability of the state economy by anticipating the national economic threats (PERPU 1/2020). This emergency law strengthens the committee of financial system stability which has already been legally established by Law No. 9/2016 on the prevention and anticipation measures of the financial system crisis. Article 27 Sec. (2) shields the members, the secretary, the member of the secretariat of the committee, the official or the ministry of the financial staff, Bank Indonesia, the Authority of Financial Services, and the agency of curator and other officials relevant to the implementation of the PERPU from any legal responsibilities in the civil or criminal area; as long as they are doing their duties, good faith is shown, and they do not conflict with the laws. In addition, Article 27(3) of the Emergency Law 1/2020 shields the executive from any administrative claims in the administrative court. Dealing with an unprecedent event such as the pandemic is a great challenge for the government. Under this state of emergency, society tends to have a high dependency toward the directions that governments take. Given the situation, policy-makers should be given the necessary flexibility to ensure that appropriate measures are being taken. However, despite being granted the immunity, the government must abide by the law and should act in good faith. Violations toward law or abuse of power by the executive branch will not go unpunished even at the time of pandemic.

The Nonnatural Disaster Under Indonesian Laws and COVID-19

According to the Indonesian Disaster Management Law (Law 24/2007), a disaster takes its form in naturally or unnaturally caused events or series of events that threaten and distract the life and livelihood of the community and may result in human casualties, environmental destruction, property loss, and psychological impact. Furthermore, disasters may be classified into natural disasters, nonnatural disasters, and social disasters. Natural disasters include earthquakes, tsunamis, volcano eruptions, floods, droughts, hurricanes, and landslides. On the other hand, according to the law, nonnatural disasters are, namely, the failure of technology, failure of modernization, epidemic, and disease pandemic, whereas social disasters may be caused by human beings and include social conflicts between groups or between communities and terrorist organizations.

COVID-19 may not be the only pandemic that has happened in Indonesia. It was in 1918–1919 when Indonesia faced the influenza pandemic which may have been the most lethal short-term epidemic of the twentieth century (Chandra, 2013). The pandemic of COVID-19 was serious enough on its own to have been defined as a nonnatural disaster according to the scope of the disaster in Indonesian law. The Indonesian president (President Joko Widodo) in April 2020 laid out the legal basis in the form of an Executive Law of Presidential Decree (KEPPRES) 12/2020. The president ordered that all the local governments in the provinces, municipalities, and

cities be the decision-makers in the special task force team to deal with COVID in their relevant jurisdiction. However, in making any policy countermeasures to combat COVID-19, they have to take into consideration the policy issued by the central government. The order is one of the consequences of the unitary form of the state. To this extent, the local policy has to be under the central policy issued by the government of the Republic of Indonesia.

State Emergency v Public Health Emergency

Bjørnskov and Voigt have argued that governments that are democratic are more likely to declare an emergency than those that are autocratic (Bjørnskov & Voigt, 2018). In Indonesia, there are different terms for a state emergency and a public health emergency. However, the constitution only stipulates a general term for a state emergency. According to Article 12 of the Indonesian constitution, the president may declare a state of emergency, whereas the condition for a declaration of a state of emergency and all consequences resulting from the declaration are regulated by law. At this point, the constitution only prescribes a general scope of state of emergency. Other than that, the specific scopes of state emergency are defined by laws. The declaration of a public health emergency is under the scope of a state of emergency. The declaration may be issued in a particular situation when there is an extraordinary threat to public health under the threat of contagious diseases and/or events caused by nuclear radiation, biological contamination, chemical contamination, bioterrorism, and food that threaten the health and potentially spread across regions or countries.

The scope of a public health emergency is set according to Law 6/2018 on the health quarantine. The Indonesian president (President Jokowi) declared the public health emergency in March 2020 as a response to the contagious virus of COVID-19 pandemic (Djalante et al., 2020). The declaration on the public health emergency confirms its legal basis. It has several consequences including the policy of large-scale social restriction. The public health emergency finds different terms from the state emergency. According to Article 1 (2) Law 6/2018 on quarantine, the public health emergency may refer to the situation where the public health or community health is threatened by an extraordinary event of contagious and infectious diseases and/or an event caused by nuclear radiation, biological contamination, chemical contamination, bioterrorism, and food contamination which may endanger public health and potentially cause cross-border transmission.

On the other hand, the state emergency finds its constitutionality according to Article 12 of the Indonesian constitution which stipulates that the president can declare a state of emergency. Any conditions and consequences are regulated by law. Furthermore, the legal basis of the state of emergency is found in the Emergency Law No. 23/1959 which stipulates that the president as the commander in chief could declare all or part of the territory of the Republic of Indonesia under a state emergency with the level of civil emergency or war/military emergency defined in three situations, if:

- (a) In the legal term of peace and security of all, the territory or part of territories of the Republic of Indonesia is under threat by insurgencies, internal conflicts, or natural disaster which potentially could not be overcome by ordinary military equipment
- (b) War or threat of war which potentially provokes disturbances or sexual outrage arises within the territory of the Republic of Indonesia by any means
- (c) The state is under threat or particular situations which are potentially harmful to the entire life of the state

Currently, Article 51 in Law No. 24/2007 also authorizes local government to enact the declaration. To this extent, the public civil emergency has a different level of threat, but both are equal in the intensity of the situation which potentially threatens the state and community.

Executive in Times of COVID-19

Starting from the beginning of the pandemic, the president of the Republic of Indonesia announced the first Indonesian case of COVID-19 in March 2020. As the follow-up measure dealing with the pandemic, the president signed and issued the Presidential Decision 11/2020 on the Public Health Emergency (KEPPRES 11/2020). With KEPPRES 11/2020, the president of the Republic of Indonesia decided that coronavirus disease 2019 was the disease that caused a public health emergency. It is also the legal basis for the president to declare the state of a public health emergency. As a consequence, the president took measures and assigned the head of the National Disaster Management Agency to lead the COVID-19 task force. It is established by the Presidential Decision 7/2020. The task force is to speed up, and focus, integrated and synergistic measures for dealing with COVID-19. It is because measures taken to deal with COVID are covering all aspects which means all departments including the local government. The task force is under, and directly responds to, the president based on Article 2 KEPPRES 7/2020, coherent with Article 10 of the presidential decision that states that the task force reports to the president and, if it is needed, a report on an extraordinary situation must be provided.

The task force consists of directors (the ministers of the Coordinating Ministry of Human Development and Culture; Coordinating Ministry for Political, Legal, and Security Affairs; Ministry of Health; and Ministry of Finance) and coordinators (the acting chief is the head of the National Disaster Management Agency; deputies – assistant operations commander of the Indonesian National Armed Forces and operational assistant to the chief of the Indonesian National Police with members consisting of a person in charge from the Coordinating Ministry for Human Development and Culture, the Ministry of Health, the Ministry of Home Affairs, the Ministry of Foreign Affairs, the Ministry of Transportation, the Ministry of Communication and Information Technology, the Ministry of Education and Culture, the Ministry of Religion, the National Disaster Management Agency, the Republic of Indonesia National Armed Forces, the Indonesian National Police, and the staff of

the Presidential Office). At the local government level, the governor and mayors/regents may establish a local COVID-19 task force after the recommendation and consideration from the chief of COVID-19. The local COVID-19 task force has to coordinate, in close collaboration with the ministry, the government and, among local government, the private sector and other relevant institutions. The presidential decision specifies that measures taken in dealing with COVID-19 at the local level must take into consideration the direction from the COVID-19 task force.

On other aspects, a special committee for economic stability has been established with the emergency law issued by President Number 1/2020 as the very first measure taken after the start of the pandemic, which also had been converted into Law No. 2/2020. The first measure taken by the president aimed at securing the stability of the economy. The law was issued on the basis that the pandemic threatened the stability of the macroeconomy of Indonesia with potential risk to domestic economic activities. Therefore, the establishment of a special committee for the stability of the financial system was thought of as an important effort. The mitigation measure is for anticipation of negative impacts on the state finances and the economic stability of Indonesia.

Executive Powers During Public Health Emergency

As discussed earlier, the executive power in Indonesia has a broader scope in the area of executing laws and running the state administration according to the constitution. The president as the head of government as well as the head of state has the power to take any measure in time of emergency including in the situation of pandemic (Aziz et al., 2020). In principle, the executive branch is the pivotal branch in a time of pandemic. The executive includes the president, the ministers, and other executive departments under the president such as special committees and local government. Notably, Locke in de Wilde (2010) argues that the emergency law might usually be implemented in the event of an emergency. However, according to Law No. 6/2018 on health quarantine, Article 4 clarifies that the central government and the local government are responsible to protect the health of the people of Indonesia from any threats of diseases and/or any risk factors of health that can cause a public health emergency. The central government in this context refers to the president. This article is the legal basis expressing the scope of powers which includes taking any measures to safeguard public health and to anticipate any risk caused by any diseases. Coherently, Law No. 24/2007 has covered the aspect of disaster management long before the enactment of Law No. 6/2018. To this extent, any measures in any aspect could be qualified as legal. Furthermore, Article 5 of the Law No. 6/2018 provides a legal basis in the time of a public health emergency, for the government to take responsibility for the conduct of an integrated system of health quarantine. To do so, the local government may be involved. In the time of a public health emergency, the government is responsible to ensure the availability of resources to support the health quarantine mechanism.

Moreover, Article 11 of the Health Quarantine Law may include the scope as well as the limitation for the executive powers. The article requires that the government, in conducting the power and its authority, has to be accurate based on threat and impact analysis and the effectiveness of measures. It also has to consider the resources, technical matters in accordance with state sovereignty, security, and economic social and cultural life. The scope of measures includes any measures with regard to the quarantine, isolation, vaccination or prophylaxis, referral, disinfection, and/or decontamination of people according to symptoms and indications, large-scale social restrictions, and mitigation measures of disinfection, decontamination, disinfection, and/or extermination of virus vectors in baggage, cargo, containers, transportation means, facilities, goods, postal packages, and transport equipment. In addition, the government may also take any measures in accordance with health and security needs and control of environmental media as deemed fit. Responsibility for any measures of health quarantine is in the hands of the public officer or public health quarantine which is under the relevant minister who answers to the president.

The scope of authority of the executive powers may be extended in a more detailed and technical matter. In the time of pandemic, the government through the public officer may impose a mandatory vaccination not only for Indonesian people but also for those people wishing to enter or to leave Indonesia. With regard to the large scale of social restrictions, the law on Article 59 stipulates that the scope of authority includes putting a limitation for school activities and workplace, limitations on religious activities, and limitations on public activities or public facilities. In general, the law provides the legal basis for the expansion and discretionary authority of the ministers to take other necessary and additional measures. According to the Health Quarantine Law, the government may impose a large scale of social restriction in times of pandemic. The government will be able to put certain limitations on the suspected areas of the virus to prevent possible spread.

The large scale of social restrictions is specifically regulated in the government regulation of 20/2021 on large scale of social restrictions to limit the spread of COVID-19. Article 2(1) regulates that the minister of health approves the local government policy to have large scale of social restrictions or limitations on the movement of the people and goods in a province or municipality/particular city. The regulation gives the authority to the local government with the approval from the minister of health with regard to the imposing of the social restriction, although exercising that authority should consider the epidemiology; threats; effectiveness; available resources; technical matters; political considerations; economic, social, and cultural matters; and defense and security. In implementing large-scale social restrictions, the closure of workplaces and schools and restrictions of religious activities and public facilities are allowed but with restrictions. However, the government should not overlook educational needs, work productivity, and religious activities. The most important thing is that the government must have regard to facilitating the fulfilment of the basic needs of the people.

Article 6(1) stipulates that the governor/mayors may propose the enactment of large social restriction to the minister of health. In approving this, the minister has to

consider the recommendation of the chief of the COVID-19 task force. The central government and the local government altogether are responsible for implementing the timely measures for quarantine for pandemic for public protection and anticipation of any risks which potentially cause a public health emergency. To this extent, the government has to observe the diseases and all risks that threaten public health. It means that the health quarantine and any relevant measures are the government's response against the pandemic. During the pandemic, the government of Indonesia imposed a large scale of social restriction mostly in the 10 epicenters of virus transmission in the country. The large scale of social restrictions was to limit the spread of the virus in some provincial, city, and regency governments (Muhyiddin & Nugroho, 2021).

It started in April 2020, when the first case appeared in Indonesia. The large scale of social restriction could be imposed under two conditions. Firstly, the number of cases and/or the number of related deaths had increased and spread significantly and, secondly, whenever there was an epidemiological link with similar events in other regions or countries. At this point, the local government in the region may extend the powers and impose any measures to mitigate the impacts of the pandemic as well as reduce the virus transmission. For example, the Jakarta government put a limit to religious rights by prohibiting religious praying in all mosques and other religious places. Jakarta's authority also puts a strict limitation to the mobility rights and temporary suspension of office and tourism activities (Syafri et al., 2020). Specific and technical measures also could be imposed by the government, including the postponement of any official visits, remote schooling, unessential facility closures, and other measures taken in dealing with the situation. On the other epicenter region, West Java, the authority issued Governor Regulation 36/2020.

Other measures were taken including measures in the area of social protection and poverty, state revenue and tax collection, fiscal policies, stock exchange, inflation, monetary policy, and exchange rates (Olivia et al., 2020). Other than those areas, the executive branches also enforced a new approach to the protective and developmental models of social policy (Yuda et al., 2021). In terms of immunity, the public officers are responsible for the health quarantine and have no executive immunity. Article 76 only mentions that they only have the right of legal protection and health protection from any risk of organ damage. The principle of executive immunity does not apply to this legal responsibility. Article 76 Sec. (2) states that sanctions may be imposed against officers who act against the law.

Executive Immunity During Public Health Emergency

A review of executive immunity in the judicial power by Columbia Law School (1951) states that general immunity is not granted to cabinet officers, however, because of the constitutional separation of powers. The president, as a branch of government, has a very crucial standing in the constitution (Amar & Katyal, 1995). There are two types of immunity – absolute or qualified – according to the discretionary duty at issue. Only qualified immunity applies to an official acting in good

faith. Absolute immunity, on the other hand, prevents any judicial inquiry into the subjective intentions of an officer (Keller, 2021). Absolute doctrine does not apply to the executive under Indonesian law but qualified does. In the “qualified” immunity concept, discretion is granted in a quasi-judicial manner, but not if an officer’s actions are motivated by “malice” – a distinction from absolute immunity (Mandery, 1994). Article 27 (the attachment to Law No. 2/2020) stipulates that in principle, executive immunity includes the cost spent by the government and/or the institution of the KSSK to implement the state budget policy in the area of tax and state expenditure including the local budget policy.

Article 27 attachment of Law Number 2 of 2020 regulates immunity, among others, as follows: (1) costs that have been incurred by the government and/or the committee (KSSK) member institutions in the context of implementing state revenue policies including policies in the field of taxation, state expenditure policies including policies in the field of regional finance, financing policies, financial system stability policies, and national economic recovery programs are part of the economic costs of saving the economy from the crisis and are not state losses. Furthermore, Sec. (2) of the article stipulates that the committee (KSSK members, KSSK secretary, KSSK secretariat members, and officials or employees of the Ministry of Finance, Bank Indonesia, the Financial Services Authority, as well as the Deposit Insurance Corporation and other officials), related to the implementation of this government regulation in place of law, cannot be prosecuted in any courts if in carrying out the duties, they act on the basis of good faith and follow the provisions of the laws and regulations. Moreover, Sec. (3) of the article states that all actions, including decisions taken based on this government regulation in place of law, are not objects of a lawsuit in the state administrative court.

Article 1 Sec. (3) of the Indonesian constitution clarifies that Indonesia is a state ruled by law, which means that everything follows the law, the executive immunity included. Article 27 which refers to the immunity clause may be one of the bases for executive immunity in times of public health emergency. In the classical theory, the doctrine of executive immunity may have its roots from the ancient doctrine of “the queen can do no wrong.” In an environment of normal conditions, declaring an emergency allows an immediate response (Greene, 2018). According to the constitution, the immunity clause may overrule any of the constitutional provisions particularly Article 27 and Article 28 D (1) which regulate equality before the law. However, Article 12 may be the basis of the executive immunity since it provides the basis for the state to have the right to take any measure to stabilize the situation and maintain peace and security. Article 27 of the annex of Law No 2/2020 provides a legal basis that any cost spent by the government in a time of a pandemic, including the policy on the area of taxation, local budget, and the national economic recovery, may not be considered as a state loss.

As a consequence, the state auditor may not evaluate the spending of any budget concerning the budget spending in a time of a pandemic, and so there are no checks and balances to the budget spending by the parliament. To this extent, the executive immunity includes the scope that there is no monitoring and evaluation of the state budget spent by the government in times of a pandemic, particularly the budget for

taking any measures in the name of the efforts for dealing with a public health emergency. This may be conceptualized as an authoritarian economy. Furthermore, the executive immunity may also base its legality in government regulation no. 4/2008 for the financial system of social security. This may give immunity against legal process to the minister of finance, governor of the central bank, and/or other parties executing their duties according to the emergency law because of their decision-making in a time of a pandemic.

In a time of a pandemic, the budgeting power which belongs to the parliament may also be switched to the president according to Article 27 of Law 2/2020. The president may unilaterally change the budget in a time of a pandemic. There are several aspects beyond reasonable doubt of adopting executive immunity. One is because of the difficulty of decision-making during difficult situations. As the decision-maker, the executive has limited choices. When the president of Indonesia decided to have large scale of social distancing, it was believed to be the best solution. Moreover, no legal consequences threaten this. However, some may demand the government to be brought to the administrative court. During the community activity restriction enforcement, several small entrepreneurs brought claims against President Jokowi to the administrative court claiming compensation. The restriction is based on the numeric severity level which indicates the numbers of cases, hospital occupancy, death rate, and other indicators.

The executive immunity shields the executive as long as good faith is present. In Indonesia, this situation may be influenced by the criminal code which gives the legal basis for any acts by public officers whenever it is derived from their duties and whenever it is an official order under legitimate authority. In civil procedures, with abuses of powers being the exception, public officers may not be sued during a financial crisis. Based on the description, in assessing a violation of the principle of equality before the law in Article 27 Paragraph (2) of Law Number 2 of 2020, the standard is whether the provisions that are considered to distinguish the treatment have met the rational and objective standards. Law Number 2 of 2020 was issued as a response to save the national economy and maintain financial system stability in COVID-19 pandemic conditions. The pandemic also brought the need for preventive policies on the economic system. The necessary policy could be seen as unusual under normal conditions. However, based on certain considerations, those policies were urgently needed to prevent a negative economic impact. Therefore, to maintain the integrity of policy-makers, it is necessary to guarantee the immunity of their policies, although unlimited authority is not a solution either. Therefore, Article 27 Paragraph (2) also contains restrictions – good faith. It can be concluded that the reasons underlying the provisions of Article 27 Paragraph (2) have met the rational and objective standards, and therefore these provisions do not conflict with the principle of equality before the law.

The Constitutional Court Decision No. 37/PUU-XVIII/2020 reviews Law Number 2 of 2020 concerning the stipulation of Government Regulation in Lieu of Law Number 1 of 2020. The existence of Article 27 of attachment to Law 2/2020 is

intended to provide confidence for parties who in carrying out their duties and authority by attachment to Law 2/2020 have been based on good faith and following statutory regulations. This is in line with the legal principle of limited immunity for the state and/or its representatives, not absolute immunity so it violates the principles of justice and equality in law and government as understood by the petitioners. From the perspective of immunity theory, the legal protection provided in Article 27 Paragraph (2) belongs to the category of limited immunity. This theory of limited immunity provides protection/immunity to the state and its representatives against the legal remedies of other parties as long as the acts meet the requirements; they must have good faith and carry out their authorities by the laws. On the other hand, the immunity may be illegal and beyond the laws, if the mens rea is malicious and the action is against the legislation.

Courts on Executive Immunity

The Court Decision No. 75/PUU-XVIII/2020 on the judicial review on Law No. 2/2020 on the enactment of the Emergency Law No. 1/2020 on the state budget policy and the financial stability of the economic system in a time of a pandemic and/or on the effort to deal with any threats against the national monetary or monetary stability system vis-a-vis the constitution. In addition to the Constitutional Court Decision Number 26/PUU-XI/2013, the court has also examined Article 16 of the advocate law and gives the following considerations: “that protected in Law 18/2003 does not necessarily make advocates immune from the law. Because the right to immunity depends on whether the professional work is carried out in good faith or not.” In the elucidation of Article 16 of Law 18/2003, it is stated, “What is meant by good faith is carrying out one’s professional duties for the sake of upholding justice based on the law to defend the interests of his clients.” Thus, the notion of good faith given in the elucidation of Article 16 of Law 18/2003 requires that even when defending the interests of his clients, advocates should remain based on the rule of law. Not only in the two decisions on Article 16 of the advocate law but the court also even gave its interpretation of the phrase of good faith in Article 16 of the advocate law on the material review of Article 21 of the anti-corruption law. This means that the immunity fails when “good faith” is not fulfilled. Therefore, there is no reason to postulate the unconstitutionality of Article 21 of the PTPK law on the basis of the immunity rights possessed by advocates because the norms of the act in place do not affect the validity of the said immunity rights.

The constitutionality of immunity rights is placed in Law 2/2020. Granting immunity through statutory regulations on certain subjects is possible and does not conflict with the law. The concept of immunity can also be found in several considerations of the constitutional court. The Constitutional Court Decision No. 57/PUU-XVI/2016 judicial review of Law Number 11 of 2016 concerning the waiving of tax states, “... the implementation of a Tax Amnesty cannot be reported,

sued, investigated, or prosecuted, both civilly and criminally if carrying out duties is based on good faith. . . .” With the same regard, on the court’s decision of 26/PUU-XI/2013 on the judicial review on Law No. 18/2003, the court affirms the legal protection against any legal process or prosecution for the lawyer whenever they are on duty and in the office with good faith.

Therefore, the executive immunity in a time of a pandemic only refers to it being applied with good faith. The scope of executive immunity is limited in Law UU 2/2020 in Article 27 Sec. (1), (2), and (3) of Law No. 2/2020 which says, “(1) The costs arising from the Government’s financial rescue policies related to the crisis are referred to as part of the economic costs to save from the crisis, not state losses. (2) Policy-making officials cannot be prosecuted by criminal and civil law if in carrying out their duties they based their work on good faith and following the legislation. (3) All actions including decisions taken based on this Government Regulation in place of Law are not objects of a lawsuit that can be submitted to the state administrative court.” Thus, the granting of immunity rights in Law 2/2020 aims to enable the government to carry out the policies that have been taken to save the state’s condition, in this case, the state’s financial policy in conditions of the COVID-19 pandemic based on Law 2/2020. The construction of the regulation of the government’s immunity rights in Article 27 of Law 2/2020 is also under the existing concept of immunity, namely: a) immunity is given only concerning the implementation of Law 2/2020; b) immunity is given if the task is carried out based on good faith; c) it must comply with statutory provisions.

Immunity rights are considered necessary for state officials to carry out their duties by the concept of proper immunity. The immunity rights of state officials are not without limits and accountability but fenced off with signs of good faith and the provisions of applicable laws and regulations. Immunity rights in Article 27 Paragraph (1) of Law 2/2020 are not absolute and do not eliminate elements of state losses. If Article 27 Paragraph (1) of Law 2/2020 is considered to have eliminated the essential element of corruption, namely, “the existence of state losses” as regulated in Article 2 Paragraph (1) and Article 3 of Law Number 31 of 1999, then it is necessary to examine the definition of state losses which is the essential element of corruption in Article 1 Number 22 of Law Number 1 of 2004 concerning the state treasury, “Losses of the State/Region are a shortage of money, securities, and goods, which are real and definite in amount as a result of actions against the law either intentionally or negligently.”

Conclusion

Executive immunity may apply in Indonesia due to its legal basis. The Indonesian constitution does not explicitly stipulate it, but it implicitly derives from the emergency clause which stipulates that the president may declare a state of emergency and the condition for a state emergency declaration and all consequences resulting from the declaration are regulated by law. To this extent, the executive immunity in

Indonesia may be derived from the legislation. In the situation of COVID-19, the law in Indonesia is explicitly classifying the situation as a nonnatural disaster. Therefore, the executive branch has a pivotal role in dealing with the situation. The executive branch, which belongs to the president, enacted the public health emergency and put effort into dealing with the consequences. In taking measures by the public health emergency, the law has shielded the executive branch (the president, the relevant ministers, and public executive officers) with the executive immunity. The law affirms the implementation of executive immunity in the emergency with good faith. There are several legal rationalities to apply the doctrine. First, in a public health emergency, the executive branch as decision-maker has limited choices. Second, preventing the spread of the virus and anticipating the number of cases are urgent. Another rationality is that it is difficult to take any decision in uncertain times. However, executive immunity does not exempt the government from any legal process. Whenever the situation is back to normal, a citizen may sue or claim compensation from the government as the executive branch in Indonesia if there is any constitutional loss or legal injury.

Abstract

The interface between international law, human rights, and public health emergencies during a disaster is intricate. This chapter explores the dynamics of such an interface from a developing country perspective. It contends that despite the blunt provisions of international law the human rights in these countries are exceedingly susceptible to violation during such emergency and without accentuating the duty of solidarity under international law these countries would not be able to tackle the human rights violations for several reasons, including economic, sociopolitical, and strategic. The significance of this chapter lies in exploring the resilience of the duty of solidarity under international law to secure human rights in developing countries in both pre- and post-public health emergencies.

Introduction

A public health emergency is an extraordinary event that constitutes a public health risk through the international spread of disease or other serious causes of concern (WHO, 2019). Public health emergencies can originate from a wide array of causes, including outbreaks of life-threatening epidemic diseases, natural disasters, and other environmental factors (Kim-Farley & LeBlanc, 2021; Eccleston-Turner & Wenham, 2021). International Health Regulations also provide that some public health emergencies may become of international concern when an extraordinary event is poised to “constitute a public health risk to other States through the international spread of disease and to potentially require a coordinated international response” (WHO, 2007).

A public health emergency, during which an overwhelming number of people may need medical attention, healthcare systems get overburdened, and public life may come to a stalemate, demands a multilayered response spanning from the stage of prevention to the stage of remedy at all levels of social and political life (National Academics of Sciences et al., 2022; Jennings et al., 2016; Reilly & Markenson, 2011). As such, a multilayered response to public health emergencies involves a wide range of international laws and human rights regimes; therefore, the international laws, human rights, and public health emergencies stand in a complex relationship.

The world has experienced the intricate interconnectedness of international law and human rights with public health emergencies during the latest Covid-19 pandemic (Mannan et al., 2021). The Covid-19 crisis across the globe also revealed how a minor crack in the relationship of international law, human rights, and public health could lead to an inevitable disaster reinforcing the intricacy and sensitive nature of such a relationship. The nexus between international law, human rights, and public health emergencies could be traced from the fact that international human rights law guarantees everyone the right to the highest attainable standard of health and obligates governments to take measures to prevent threats to public health and provide medical care to those who are in need.

Human rights also recognizes that in the circumstance of serious public health threats and public emergencies threatening the life of the nation (UN Commission on Human Rights, 1984), restrictions on some rights can be justified when they have a legal basis, are strictly necessary, based on empirical evidence and neither arbitrary nor discriminatory in application, of limited duration, subject to review, respectful of human dignity, and proportionate achieve the objective (Human Rights Watch, 2020) which is binding on WHO Member States, also provide for the prevention

and management of public health risks arising from the cross-border spread of disease, while avoiding “unnecessary interference with international traffic and trade” during a public health emergency (WHO, 2007).

International law and human rights offer a comprehensive framework for dealing with public health emergencies, as, on the one hand, they impose positive obligations on the states to protect people’s lives during public health emergencies, and, on the other hand, they provide guidelines on how to restrict some social and political rights striking a balance between the concerns of a state and its citizen. These positive obligations and necessary restrictions are closely intertwined to create a conducive environment that ensures a space of mutual respect between the concerned government and its citizen by promoting and protecting human rights and securing social and psychological well-being when they are in dire need of them owing to a sudden breakdown of sociopolitical structure for an emergency and its obvious impacts.

Ensuring this conducive environment is extremely challenging and crucial in developing countries owing to fragile health infrastructure, lack of surplus resources, and massive economic disparity among the people in these countries. It is also difficult owing to an underlying impasse between international law, human rights, and public health emergencies. This chapter explores the dynamics of such an interface from a developing country perspective. It contends that despite the blunt provisions of international law the human rights in these countries are exceedingly susceptible to violation during such emergency and without accentuating the duty of solidarity under international law these countries would not be able to tackle the human rights violations for several reasons, including economic, sociopolitical, and strategic. The significance of this chapter lies in exploring the resilience of the duty of solidarity under international law to secure human rights in developing countries in both pre- and post-public health emergencies.

International Law, Human Rights, and Public Health Emergencies in Developing Countries

Theoretically the interconnection between international law, human rights, and public health emergencies is well established, but in the real world, the way they interact and impact each other is not identical in the global south and north. Statistics from various human rights reports show that poor human rights records of developing countries coincide with their miserable public health conditions (Reza et al., 2020). Researchers are often left in a conundrum while sorting out the underlying reasons for such a parallel relationship between poor human rights observance and poor public health conditions. Some argue that it is poor compliance with the international law that leads to poor public health conditions, while others conclude that lack of economic resources is primarily responsible for poor public health infrastructure. However, a wiser view concludes that sheer incompliance with international law, lack of adequate resources, and poor public health infrastructure

constitute a triangle of causation, leaving the developing countries in an unending cycle of misery.

The developing countries barely can maintain a functional state mechanism with proper public services due to inadequacy of resources, which ultimately results in an underfunded public health sector poorly equipped to deal with any emergency health crisis. On the one hand, lack of decent education coupled with employment crises lead toward rampant corruption and absence of rule of law, and, on the other hand, lack of politically aware middle class often facilitates authoritarian regimes to undermine international laws and human rights in developing countries. Besides, it is also well proven that poverty and ill-health are strongly interlinked: lack of education, lack of nutritious food or safe water, and unhygienic living conditions often have a negative impact on the health of populations – with the effect that poor people suffer the highest burden of disease. Contrarily, poor health invariably increases vulnerability to poverty and increases the risk of poverty being transmitted to the next generation (WHO, 2008). Given the above circumstances, the developing countries are entangled in the perpetual whirlpool of poor public health and human rights crisis.

During any health disaster, the situation in developing countries worsens to an unbearable degree for various reasons, such as lack of strong democratic culture, states' inability to deal with the emergent social and economic reality, lack of adequate health infrastructure, and scarcity of resources. As the statistics show that developing countries have poorer democratic culture (Institute for Democracy and Electoral Assistance, 2021), being insecure about losing the political status quo, the authoritarian or semi-authoritarian regimes in those countries become more repressive in fear of any potential political uprising and hence become more apathetic toward human rights and international laws. For instance, according to the democracy index (Economist Intelligence Unit, 2021), the Covid-19 pandemic has caused an unprecedented rollback of democratic freedoms and human rights, mostly in developing countries, in 2020 (The Economist, 2020).

International travel restrictions imposed due to any global pandemic such as Covid-19 also adversely affect the developing countries by stagnating economies that are substantially reliant on foreign remittance and trade. Most importantly, in the time of a health disaster, lack of economic affordability often forces the developing countries to relocate their resources to the health sector instead of investing them in other democratic institutions and thereby causing human rights failure during public health emergencies. Religious bigotry, along with weak democratic institutions, sometimes results in the subjugation of human rights of religious communities by making them scapegoats of government's failure, the recent example of a hate campaign toward Muslims in India could be an example of this (OECD, 2020). All propaganda machines of the Indian ruling party BJP with the assistance of many mainstream media had categorically targeted the Tablighi Jamaat (an Islamic preaching movement of Sufi tradition) by accusing them of intentionally spreading coronavirus all across the country, resulting in mass bullying of the Muslim community in India. The imposition of forced cremation on Sri Lanka's Muslim community and denying them of their right to burial according to Islamic rituals was

another tragic example of how any public health crisis could make any minority community extremely vulnerable to human rights violation in countries with fragile democratic institutions (BBC, 2020).

The emergent economic crisis resulting from any health disaster further compels developing countries to disregard international laws in many areas of public affairs. Some emerging developing nations such as China and India were seen to be reluctant to comply with international laws as they were afraid to lose economic growth had they fully complied with WHO guidance and relevant provisions of International Health Regulations (IHR) (OECD, 2020). Such reluctance is also found across Asia, where many states are not the parties to core human rights instruments, including the International Covenant on Civil and Political Rights (ICCPR) and International Covenant on Economic, Social and Cultural Rights (ICESCR). Apart from this, the principle of sovereignty and noninterference further cause the states to disregard or manipulate the legitimate attention of the right seekers during an emergency.

Global politics, regional geopolitics, and national democratic culture also significantly contribute to the worsening human rights situation of developing countries. Given the fact that developing countries are heavily reliant on global powers and enjoy less autonomy in international affairs due to economic dependence and fragile democratic institutions, the added vulnerability of any emergent health crisis makes the developing countries even more subservient to the political interests of global and regional powers. The vaccine diplomacy in the context of the Covid-19 pandemic also culminated in a strenuous “politics of crisis” adversely affecting many developing countries around the world (Crisis Group, 2020). For instance, the geopolitical factors have influenced Bangladesh’s decision-making regarding vaccine procurement rather than public health concerns, as in the early stage of the pandemic, China had offered vaccines to Bangladesh, but it did not respond to the Chinese gesture out of Indian pressure and rather ordered vaccines for Indian SERUM institute. Later on, Bangladesh had suffered from a severe shortage of vaccines when India suddenly stopped supplying vaccines to address its own virus outbreak (Khatun, 2021). Apart from Bangladesh, many other developing countries across Asia, Africa, and Latin America, being at the crossroads of complex global and regional geopolitics, suffered from a similar shortage of vaccines and other medical essentials during the Covid-19 pandemic.

However, the following discussions explore the potentials of international solidarity in addressing human rights violations and public health emergencies during disasters in developing countries.

Tackling the Human Rights Violations and Public Health Emergencies During Disasters Through the Duty of Solidarity

In a globalized world of interconnected threats and challenges, it is in each country’s self-interest that all of them work collectively based on the principle of solidarity (Alam, 2021). Hence, the cause of larger well-being can only be achieved by broad, deep, and sustained global cooperation among states. Such cooperation is possible

only if every country's policy consideration is not confined to the needs of its own citizens but also the needs of others (UN Report, 2005). The need for such global cooperation was felt most intensely when humanity was faced with an unprecedented pandemic like the Covid-19 as it has brought forth a wide array of complex economic, scientific, and medical challenges the world has never seen.

The spirit of international solidarity was embedded in the very DNA of international, and hence, the values of solidarity have been reflected in all major universal conventions. The obligation of states to cooperate is anchored in Articles 1, 55, and 56 of the UN Charter. Article 1 provides for international mechanisms to promote the social and economic advancement of all peoples and regards international cooperation in solving economic, social, cultural, or humanitarian problems as a fundamental objective of the United Nations. Article 55 of the Charter further obligates the UN to promote higher standards of living, full employment, and conditions of economic and social progress and development; solutions to international economic, social, and health-related problems; international cooperation; and universal respect for, and observance of, human rights and fundamental freedoms.

Under Article 56, "members pledge themselves to take joint and separate action in cooperation with the Organization for the achievement of the purposes set forth in Article 55," imposing a legal obligation on states (Simma & Other, 2002). Apart from the UN Charter, there are numerous international treaties and conventions that reinforce the duty of solidarity under international laws. Given the wide emphasis of solidarity under international laws, it can be argued that obligation of international cooperation and solidarity, where they concern the most fundamental human rights, can go beyond the limits of State borders, as they are owed *erga omnes* (to all humanity) rather than merely *inter partes* (UN Resolution, 2002).

However, the idea of international solidarity is not limited to international assistance and cooperation, aid, charity, or humanitarian assistance; it is a wider concept and principle that includes sustainability in international relations, especially economic relations, the peaceful coexistence of all members of the international community, and equitable sharing of benefits and burdens (OHCHR, 2011). Related to the concept of international solidarity is the principle of burden sharing that entails constructive engagement and cooperation of state and non-state actors in the jurisdictions of needs (Alam, 2021). Accordingly, there is ample scope for international solidarity through cooperation in the field of science, medicine, and protection of human rights during the time of public health disasters. Some of the ways in which international solidarity can help in tackling fragile human rights situation and protecting public health during a health disaster has been elaborated in the following.

Increasing the Surveillance and Monitoring of Human Rights Situations Across the Globe Through International Solidarity During Disasters: As has been stated earlier that with the sudden outbreak of any public health emergency the human rights observance in developing countries suffers from massive setback, in such conditions, enhanced surveillance of such critical situations could ensure greater accountability of ruling regimes in those countries. Constant monitoring through media reports along with the sanctions of diplomatic pressure can reduce the risks of

potential human rights violations to a great extent. The international community can employ local and multinational NGOs to further increase the surveillance of human rights (Goold & Lazarus, 2019; Standford et al., 2021; Murphy, 2018) compliance across the globe with a special emphasis on developing countries where democratic institutions are mostly fragile.

International Solidarity in the Field of Information Technology and Digital Communication to Strengthen Human Rights Reporting Mechanism: As the authoritarian or semi-authoritarian regimes in developing countries are more likely to censor the neutral coverage of media and suppress the free voices of the masses during any sort of civil unrest or public emergency, the online modes of public communications such as social media, blogs, and other digital platforms could be utilized as alternative forums for informing the global community about the actual scenario on the ground. Hence, the international community can harness the strength of digital communication by empowering the masses to connect with the global community and bypass all forms of government censorship. Tech giants like Facebook and Google may introduce many special features to facilitate real-time updates of what is happening around the world evading all forms of unjust censorship imposed by any authoritarian regime. However, while crafting such evasive features or facilitating the above reporting mechanisms, the legitimate concerns of state sovereignty under international law should not be overlooked.

Mounting International Pressure on National Stakeholders Through Sanctions and Diplomacy: Since the end of the cold war era, as the countries are more fearful of losing trade volume than facing wars, economic and political sanctions have been a more effective way of furthering any international agenda. For example, in the latest war between Russia and Ukraine, instead of going for a direct military confrontation with a nuclear superpower like Russia, the western world had rather opted for imposing numerous economic and political sanctions on the invading state in order to neutralize its biting force (Aljazeera, 2022). Given the effectiveness of economic sanctions in the modern world to further any legitimate political objective, it is highly feasible that the same strategy could be employed to hold the countries accountable for infringing human rights during any public health emergency.

Hence, if major global powers come to a consensus on imposing economic or political restrictions on any developing nation that uses the crisis as a shield for abusing human rights, such incidents of violations would come to a significant halt. However, while imposing any such sanction, the international community must remain respectful of the legitimate concerns of state sovereignty and must not encroach upon the limits set by established rules of international laws. Apart from sanctions, sometimes a good deal of friendly diplomacy can resolve many complex issues where even sanctions fail to nail the deal. So, the international community should give adequate diplomatic efforts to stop human rights violations during any public health emergency. In pursuit of such diplomacy, the international community may employ both state and nonstate actors for the fruitful realization of the objectives in this respect. However, in either cases of sanction or diplomacy, the powerful actors of the international community must abstain from weaponizing these tools for

achieving their own political objectives other than the well-being of the common people.

International Solidarity in the Field of Health Science and Other Relevant Studies: As due to the ever-evolving nature of epidemiological diseases, medical science is struggling to deal with the challenges of public health emergencies; countries with less scientific advancement suffer most from the sudden outbreaks of any health crisis. Apart from medical science, other branches of scientific studies and technical expertise also help significantly in addressing any public health disaster and making proper crisis management plans for the future. Since most of the developing countries lack any well-developed scientific and technological infrastructure, without a strong and coherent solidarity in the field of medical science and technology, humanity shall never be able to achieve resilience against the unending chain of global health disasters. Therefore, the international community should come forward to train and equip the developing nations with more advanced medical and pharmaceutical technologies so that they become self-reliant on their own resources during any public health crisis rather than begging from others.

Enhancing International Cooperation in Digitalization of Works and Expanding the Scope of Online Jobs: As the world enters the era of the fourth industrial revolution bringing a massive paradigm shift in the global job market, digitalization becomes crucial for any economy that wants to compete in the evolving realm of modern economy. While explaining the significance of the fourth industrial revolution, the author of the book *The Fourth Industrial Revolution* Mr. Klaus Schwab observed that “to a large extent, the millennial generation is setting consumer trends. We now live in an on-demand world where 30 billion WhatsApp messages are sent every day and where 87% of young people in the US say their smart phone never leaves their side and 44% use their camera function daily. This is a world which is much more about peer-to-peer sharing and user-generated content. It is a world of the now: a real-time world where traffic directions are instantly provided, and groceries are delivered directly to your door. This ‘now world’ requires companies to respond in real time wherever they are or their customers or clients may be” (Schwab, 2016). McGinnis observes that “the Fourth Industrial Revolution is a way of describing the blurring of boundaries between the physical, digital, and biological worlds. It’s a fusion of advances in artificial intelligence (AI), robotics, the Internet of Things (IoT), 3D printing, genetic engineering, quantum computing, and other technologies. It’s the collective force behind many products and services that are fast becoming indispensable to modern life. Think GPS systems that suggest the fastest route to a destination, voice-activated virtual assistants such as Apple’s Siri, personalized Netflix recommendations, and Facebook’s ability to recognize your face and tag you in a friend’s photo. As a result of this perfect storm of technologies, the Fourth Industrial Revolution is paving the way for transformative changes in the way we live and radically disrupting almost every business sector. It’s all happening at an unprecedented, whirlwind pace” (McGinnis, 2020).

However, given the above features of Fourth Industrial Revolution, the winners will be those who are able to participate fully in an innovation-driven economy by providing new ideas, business models, products, and services with high levels of

technological sophistication and IT skills (Schwab, 2016). As has been illustrated earlier that modern public health emergencies cause massive economic disruptions, resulting in the stalemate of public life due to health safety measures such as quarantine and lockdown; therefore, digitalization of economy and expanding the scope of online job opportunities would magically reduce the freezing impacts of such public health emergencies. Reports also show that while every other field of economy had experienced massive downfall during the latest pandemic, most of the online-based platforms have seen unprecedented growth despite economic stalemate. It is also known that scarcity of resources due to economic slowdown during the pandemic is deeply and intricately connected with human rights violations in developing countries. So, considering the immense potential of digitalization, international communities must come forward to assist the developing countries in digitizing their economy and thereby reduce adverse consequences on the economy.

Flexibility in Global IP Regulations to Ensure Maximum Availability of Medical Innovations for Developing Countries: Most health-related disasters require urgent availability of specific medicines, vaccine doses, or other essential medical equipment such as ICU, oxygen cylinders, and ventilators. As we know that developing new vaccines, rare medicines, and other complex medical essentials requires advanced scientific expertise and high-tech industrial hubs, only rich countries with surplus resources can afford to ensure prompt availability of such medical essentials during any public emergency. In such cases, developed countries with advanced technological hubs often obtain the upper hand in the politics of crisis by creating a monopoly over medical essentials and subordinating poorer nations subject to their political interests. For instance, in the latest Covid-19 crisis some 6 billion doses out of the 8.6 billion confirmed sales were preordered by governments in high- and middle-income countries, as most of the vaccine manufacturing, research, and development companies were heavily concentrated in high-income countries (Nature, 2021).

This trend is not confined to any specific occasion; rather, the world has witnessed similar practices in all aspects of international politics for decades where developed countries try to gain full advantage of their privileges. In such situations, international solidarity by agreeing to patent waiver in the field of medical innovations by developed countries would end the unethical monopoly of global north to a great extent during disasters and would bring much-needed relief to the developing nations. Though generous practice of patient waiver is never easy for the involved stakeholders in these situations as it requires sacrificing millions of dollars of economic revenue, this is where international solidarity must set its best possible example by preferring humanity over temporary commercial gains.

Direct and Indirect Financial Assistance for Developing Countries: As has been elaborated earlier that those economic constraints lie at the core of all crises during the time of disasters, having a universal framework for global economic solidarity is quintessential for maintaining human rights *status quo* as well as for tackling the public health disasters across the developing nations. Along with providing direct financial assistance, the developed countries could facilitate in situ growth of vulnerable developing economies during disasters that would give them greater

autonomy in preparing indigenous solutions for their own crisis management instead of relying on imposed ones. For example, direct financial assistance in the form of monetary loans can help the developing countries to keep their economies going by maintaining the flow of currency. Such financial loans can be sourced both from international institutions such as the IMF and World Bank and as well as from developed countries with rich economies. Developed countries can also provide indirect financial assistance in the form of tax and tariff waiver while importing commercial goods from developing countries. For instance, developed countries such as the European Union can help Bangladesh by reducing import duties on the garment products as Bangladesh's economy is largely reliant on the Readymade Garments (RMG) sector. Such direct and indirect financial assistance would greatly reduce the sufferings of toiling masses living in developing countries that would help to minimize adverse consequences of public health emergencies.

The duty of solidarity has the potential to prevent human rights violations before the emergency occurs through developing the necessary infrastructure and other sociopolitical and economic tools in the developing countries. It can also substantially contribute to minimizing the cost of such an emergency if it could not at all be prevented during the post-emergency period.

Pre-Public Health Emergencies: Duty of Solidarity Before Emergency

Given the nature and characteristics of recent public health disasters, public health experts opine that human-made actions such as environmental and ecological disruptions, deforestation, and destruction of biodiversity are more responsible for these calamities than acts of God (Berardelli, 2020). As the root causes of health disasters are discoverable, public health emergencies are not completely unpredictable, rather they are preventable by addressing the underlying factors that cause the disasters. For instance, Dr. Peter Daszak, a professor at Columbia University and president of the EcoHealth Alliance, commented that conversion of tropical forests into agricultural land and livestock farms is responsible for 30% of known emerging diseases (Berardelli, 2020). Another major factor that contributes to the outbreak of the health crisis is unregulated international trade in pet and livestock animals along with unsanitary conditions. In the above scenario, strong international solidarity in identifying and diagnosing the above contributing factors can help in formulating and implementing a comprehensive plan of action for future prevention of public health disasters. In this regard, in line with Professor Daszak's proposal, the following areas of international solidarity have been recommended below: first, launching a global effort to identify the potential viruses in wildlife that could cause the next possible epidemic outbreak as scientists estimate that there are 1.7 million of such potential viruses. Secondly, working with, and observing the communities that are the hotspots of emerging diseases and also identifying the risk behaviors that cause the viruses coming into contact with human population from wildlife. Finally, preemptive efforts to develop vaccines not only to prevent the already known

diseases, but also the new viruses we discover in wildlife for future protection (Berardelli, 2020).

Lack of early preparedness is another significant factor that leads to catastrophic consequences for developing countries. For example, in the latest Covid-19 pandemic most of the nations were taken by sheer surprise as they were underprepared for a crisis of such magnitude. The underpreparedness of many developing as well as developed countries could be elaborated by the following facts that they underestimated the danger when the virus outbreak happened, did not have proper crisis management plans for the pandemic, suffered from the shortage of essential medical supplies, and lacked adequate public health expenditure due to budget deficits (OECD, 2020). Therefore, the international community should cooperate to build capacity for early preparedness for possible disasters. Besides, international efforts should be made to formulate a comprehensive framework for solidarity under international law as there is no separate and consolidated corpus of international law for global solidarity during public health disasters, other than some sporadic provisions from different treaties.

Post-Public Health Emergencies: Duty of Solidarity After Emergency

Like the pre-emergency period of disasters, the post-emergency phase of any public health disaster is equally important for proper management of any crisis. Given the paralyzing effects of contemporary public health emergencies on all spectrums of public life, all countries, especially the developing countries, suffer from a long chain of awful consequences. The unending stress on the economy is the most notable aspect of any such crisis, and since the public health disasters tousle any country's economy, leading to chaos in all other spheres of public life as every aspect of modern life is intricately dependent on the economy.

Hence, international cooperation should be actively pursued with the spirit of solidarity in introducing a framework of long-term economic recovery in the post-disaster phase and finding a viable solution thereby (Skogly, 2006; Roemer et al., 2020). The international community should make a specific plan of action for the post-emergency phase to rebuild the economies that have been ravaged by the devastating impacts of such a public health emergency. Special financing initiatives taken in this regard must include developing countries, taking notes of their dissimilar capacities and needs into consideration. Multilateral financing and special debt relief measures should be adopted commiserating with specific needs of all developing countries. The post-emergency rehabilitating financial schemes should also not disregard the contemporary pressing issues such as enabling green industrialization to address global climate change. Otherwise, the developing countries would set back the de-carbonization progress achieved in the pursuit of financial recovery, which would eventually lead to newer crises due to inevitable environmental disruptions.

However, apart from economic consequences, public health emergencies also leave deep wounds on the moral, social, cultural, and political fabrics of any society.

The social instability resulting from economic stalemate during any public health emergency eventually erodes the overall value system of the society, leading to creepy cultural and moral consequences for the society. Hence, the international community should not completely overlook the moral and cultural consequences of the crises by limiting its focus purely on economic affairs. Finally, the efforts of international cooperation should focus on transformative recovery instead of being confined to restoring the status quo. Hence, efforts should be made to transform the lessons learned from the experience of any crisis into a plan of action leading toward a better future.

Conclusion: Ensuring Human Rights to Health During Public Health Emergency in a Developing Country

With the increased frequency of public health disasters over the last few decades, public health emergencies are on the trajectory of becoming the biggest existential threat to the entire human race in near future. What used to be a local health problem once, now with the sheer speed of globalization and modernity, it turns into a global concern within a few days. Now no nation can ignore a health emergency only because it takes place in another part of the world, as in such an interconnected global village, the old binary of “we vs. them” is no longer a functional reality. Given the above reality, coming to international solidarity during a public health emergency is not a humane option, rather an inescapable responsibility without performing that no one would be safe in the disastrous future.

This chapter has explored how international solidarity can work within the framework of international law in different phases of public health emergencies. The chapter also argued with an implying conclusion that without strong bondage of international solidarity nations neither will be able to prevent nor recover from the rubble of any public health disaster. The ongoing Covid-19 pandemic is the latest example of our time that reinforces the importance of global solidarity in tackling any public health emergency. Besides, this digital age of information technology, where the sufferings of people around the world are being televised, is the most suitable time for building global solidarity by harnessing the spirit of shared human values and making people convinced that we all belong to the same humanity.

Abstract

International Disaster Law (IDL) does not provide a uniform legal framework contained in a single instrument. Instead, it comprises various treaties, customary international law, general principles of law, and soft law instruments. In order to forge a uniform instrument for regulating disaster relief and disaster risk reduction, the International Law Commission (ILC), upon the recommendation of the UN General Assembly, incorporated “Protection of persons in the event of disasters” into its program of work in 2007. ILC appointed Eduardo Valencia-Ospina (Colombia) as the Special Rapporteur for the topic. Finally, ILC adopted the Draft Articles on the Protection of Persons in the Event of Disasters (DAPPED) in 2016 and recommended the UN General Assembly consider the possibility of developing a Convention based on it in the same year. Now, DAPPED is under the consideration of the Sixth Committee of UNGA. DAPPED added a novel discourse to IDL. The present chapter will, following introductory words, highlight the drafting history of DAPPED. Then, it will provide an overview of the contents of DAPPED and its normative framework, respectively. The final section of this chapter will deal with the possibility of convening a

International Disaster Law · International Law Commission · Draft Articles on the Protection of Persons in the Event of Disasters

Introduction

Despite the fact that disasters are one of the oldest phenomena of the human environment where human beings inhabit, the efforts to mitigate the disaster risks and regulate the needs of the persons affected in the aftermath of disaster via international law instruments have been very recent phenomena. It does not imply the absence of an international legal regime on disaster risk reduction and disaster relief forming International Disaster Law (IDL). Instead, IDL can be described as a *pot pourri* of multilateral, regional, or bilateral treaties, state practice, guiding principles on internal displacement, various UN General Assembly (UNGA) resolutions, and soft law guidelines and principles that shed light on different legal aspects of disaster management (Allan & O'Donnell, 2012: 345). Sivakumaran (2017) considers that the existing regime of IDL adopts a “piecemeal approach.” With a view to formulating a coherent and uniform body of IDL to mitigate the disaster risk and to provide protection to the victims in the event of disasters, the International Law Commission (ILC), the subsidiary body of UNGA entrusted with the mission of codification and progressive development of international law, incorporated the topics “protection of persons in the event of disasters” into its long-term program of work in 2007. After a decade of work, the ILC adopted the Draft Articles on the Protection of Persons in the Event of Disasters (DAPPED) in 2016 and made recommendations to the UNGA for “the elaboration of a convention on the basis of the draft articles.” Generally, the work of ILC is very authoritative in the international plane due to its rigorous working methods and the use of both soft and hard law norms in the formulation of its instruments. More importantly, the majority of the instruments produced by the ILC have been very influential in the codification and crystallization of international law in different fields of law in the forms of customary international law and treaty law (Azaria, 2020; Bordin, 2014; Caron, 2002). Though the legal status of the contents of the DAPPED and its future as a convention is open to debates, it can be said, *a priori*, that the DAPPED is an essential legal instrument in the field of IDL. In this background, the chapter will first describe the procedural history of ILC’s work on DAPPED. Then, it will move to depict the contents of DAPPED in the light of its commentary. It will then endeavor to spot the normative sources used in the Draft Articles (DArts) and the natures of obligations contained in those provisions. The chapter will end with the prospects of DAPPED in the realm of international law, especially with reference to the possibility of forging a uniform, universal treaty basis.

The Drafting History of DAPPED

Upon a recommendation of the UN Secretariat to include “Protection of persons in the event of disasters” in its long-term program of work in 2006, the ILC adopted the decision to incorporate that topic in its program of work in 2007. Henceforth, the UNGA took note of the same in its sixty-first session in the same year. The ILC appointed Eduardo Valencia-Ospina as Special Rapporteur for the purpose. The Special Rapporteur produced eight successive reports in 2008, 2009, 2010, 2011, 2012, 2013, 2014, and 2016, and the Drafting Committee of the ILC made seven reports including the DArts adopted by the first and second readings in 2009, 2010, 2011, 2012, 2013, 2014, and 2016. The DArts adopted by the ILC received comments from several Governments, International Organizations, and Non-governmental Organizations ([Analytical Guide to the Work of the International Law Commission: Protection of persons in the event of disasters](#)). Finally, the ILC adopted the final text of 18 DArts along with their commentaries on its second reading in 2016. Simultaneously, it made a recommendation to the UNGA for developing a Convention based on DArts.

The Overview of DAPPED

DAPPED comprises a preamble and 18 DArts together with its commentaries. The Preamble highlights the nature of the instrument, the ambit of the application, and the fundamental principles that shaped the foundation of the instrument. The first preambular paragraph delineates the mandate of the UN in the progressive development and codification of international law, and by doing so, it suggests that DAPPED incorporates both progressive development and codification of international law. The second preambular paragraph highlights that DAPPED applies in the situations of both natural and man-made disasters having both short-term and long-term impacts. The third preambular depicts the essential needs of the persons whose lives, well-being, and property have been affected by the disaster and the respect for the rights of such persons. The fourth preambular paragraph reminds the importance of solidarity, coexistence, and cooperation in international society in all phases of a disaster. However, the final preambular paragraph reiterates the status of the principle of sovereignty at the heart of disaster management and hence reaffirms the primary role of the disaster-affected State in the provision of disaster relief management.

DArt 1 incorporates the scope of application of DAPPED. Its scope *ratione materiae* covers the rights and obligations of the disaster-affected States towards the persons present in their territory or jurisdiction regardless of their nationality and those of third States, intergovernmental organizations, NGOs, and other entities with the capacity to cooperate in the disaster management. Its scope *ratione persone* has been narrowed down to natural persons, but it also focuses on the activities of States and intergovernmental organizations on the primary basis and those of NGOs and other private entities or civil societies on the secondary basis. It excludes the relief

and consular assistance provided by third States to their nationals abroad. Its scope *ratione temporis* comprises, as understood from the wording “in the event of,” the post-disaster period and early recovery phase. However, considering its framework on Disaster Risk Reduction (DRR), it variably applies to the pre-disaster phase. Its scope *ratione loci* extend primarily to the areas affected by disasters, but it also applies to the assisting States and the transit States.

DArt 2 supplements DArt 1 by providing additional guidelines on the scope of the DAPPED. It clarifies its purposes, i.e., (1) the “adequate and effective” disaster response and (2) DRR, and its objects, i.e., the fulfilment of the essential needs of the disaster-affected people commensurate with the full respect for their rights. As mentioned earlier, the DAPPED is mainly concerned with disaster relief management. Nevertheless, the DRR occupies a vital area of its scope. On the other hand, DArt 2 has made an impeccable conflation of “need-based approach” and “rights-based approach,” making them complementary, not exclusive. The term “rights” should be interpreted as “human rights” with reference to the provision of DArt 5. DArt 3 provides the definitions of Disaster, Affected State, Assisting State, Other Assisting Actors, External Assistance, Relief Personnel, and Equipment and Goods for the purpose of DAPPED. The definition of disaster is the key to understanding the scope of the DAPPED, and the first part of the next section will deal with it.

DArts 4–6 enumerate the founding principles that apply in the event of disasters. DArt 4 states about the protection and respect of “the inherent dignity of human persons” during disasters. The principle of human dignity lies at the core of almost all the universal and regional human rights instruments and eventually encroaches into the regime of international humanitarian law embodied in the Four Geneva Conventions 1949 and its Two Additional Protocols 1977. The obligation of the provision includes both a negative obligation (respect) and a positive obligation (protect). It denotes that the States shall not only refrain from violating the human dignity of the affected persons, but they shall also be equally obliged to protect against the violation of such principles. Finally, “in the event of disasters” should not be understood to include the post-disaster phases only, it should also be interpreted to incorporate the pre-disaster phases, especially the DRR.

DArt 5 provides for the protection and respect of the human rights of the disaster-affected persons during the disasters. Like DArt 4, DArt 5 incorporates both negative and positive obligations. However, it qualifies “human rights” by adding “in accordance with international law.” It may have two understandings. First, all the States do not have similar human rights obligations due to their status of ratifications and reservations. Besides, the human rights obligations of international organizations and other actors have different underpinnings. Additionally, it also hints at the potential roles of customary international law. Thus, the phrase “in accordance with international law” helps to determine the exact description of a State or other assisting actors involved in the event of disasters. Second, it also reminds the potential application of other rules of international law, as hinted by DArt 18(1), while dealing with refugees and internally displaced persons affected by disasters. DArt 6 enlists principal humanitarian principles applicable during disasters, i.e., the principles of humanity, neutrality, and impartiality in conjunction with the principle

of non-discrimination. The principles of humanity, neutrality, and impartiality have been in vogue in humanitarian actions for a long time. Though they have roots in international humanitarian law, they have evolved to fit into the field of humanitarian assistance with their own credentials. The principle of non-discrimination is also very vital in humanitarian assistance. However, the inclusion of “taking into account the needs of the particularly vulnerable” in DArt 6 denotes that the principle of non-discrimination should include the notion of positive discrimination in pertinent cases.

DArt 7 deals with States’ duty to cooperate with other States, with the UN, with the Red Cross and Red Crescent Movements, and with other assisting actors. Reference of the “duty to cooperate” can be found in several international law instruments, and it can be said to be a well-established principle of international law. Furthermore, the proper appreciation of the principle of “duty to cooperate” in the context of disasters can be seen as the key to effective disaster relief management. DArt 8 complements DArt 7 by providing the list of forms of cooperation: humanitarian assistance, coordination of international relief actions and communications, and making available relief personnel, equipment and goods, and scientific, medical, and technical resources.

DArt 9 states the measures to be taken before the event of disasters for reducing the risk of disasters. It enumerates that States shall take appropriate measures, including the adoption of the legal framework and the prevention, mitigation, and preparation for potential disasters. It goes further to state that the DRR measures include the conduct of risk assessments, the collection and dissemination of risk and past loss information, and the installation and operation of early warning systems.

DArt 10 outlines that the affected States have the duty to ensure the protection of affected persons regardless of their nationality and the provision of their relief assistance in their territory or under their jurisdiction. Regarding disaster relief assistance, the affected States bear the primary obligation in directing, controlling, coordinating, and supervising such activities. It appears that DArt 10 stresses the importance of the territorial sovereignty of the affected States in the operation of disaster relief assistance. However, in the event when the national response capacity of the affected States appears to be manifestly inadequate to deal with the impacts of a disaster, DArt 11 provides that those affected States have the duty to seek assistance from other States, the UN, and other assisting actors to the extent to its inadequacy. The phrase “as appropriate” implies that the affected States enjoy discretion to determine whomsoever to approach. When such a request for assistance is made to a State, the UN, or other assisting actors, the addressee of the request, as DArt 12(2) asserts, shall expeditiously give due consideration to such request and notify its decision to the affected State. DArt 12(1) adds that any States, the UN, or other potential assisting actors may, independent of the request for assistance and the question of the capacity of the affected State, decide to assist the affected State and make a unilateral offer of assistance to it. DArt 13 chalks out the role of “consent” concerning an offer for external assistance. First, it affirms that the requirement of “consent” of the affected States is essential for accepting external assistance. When such an offer for external assistance has been made to an affected State, it cannot

withhold its consent on an arbitrary basis. It adds that the affected States to whom an offer for assistance has been made have an obligation to inform their decision on such offer in a timely manner. The phrase “whenever possible” in DArt 13(3) implies that such obligation is an obligation of means, not an obligation of result.

DArt 14 accentuates the nature of conditions to be imposed by the affected States on the provision of external assistance. An affected State has the discretion to impose conditions on the provision of external assistance according to the provisions of DAPPED, applicable rules of international law, and its national laws and commensurate with the needs of the affected persons and the quality of the assistance. The formulation of such conditions shall stipulate the scope and type of external assistance. DArt 15(1) requires that the affected States make necessary arrangements within their legal systems to facilitate the prompt and effective provision of external assistance. Such arrangement shall facilitate (1) regarding relief personnel, privileges and immunities, visa and entry requirements, work permits, and freedom of movement and (2) regarding equipment and goods: customs requirements and tariffs, taxation, transport, and the disposal thereof. DArt 15(2) ordains the affected States to ensure the accessibility of the relevant legal framework for ensuring their compliance. DArt 16 underscores that the affected States have an obligation to ensure the protection of the relief personnel and of equipment and goods in their territory or under their jurisdiction or control. The phrase “take the appropriate measures” suggests that such obligation is an obligation of means, i.e., the States shall do their best to ensure the protection of relief personnel and of equipment and goods in question. DArt 17 recounts that any affected State, the assisting State, the UN, or other assisting actor may terminate external assistance at any time following appropriate notification and upon consultation with regard to such termination and the modalities of termination.

DArt 18(1) illuminates the relationship between the norms contained in the DAPPED and other rules of international law. This provision may be interpreted in several directions. First, the application of DAPPED will not prejudice the application of other rules of IDL in the form of international, regional, or bilateral treaty law, customary international law, or the general principle of law. Second, it implies that international law on other subject matters (e.g., refugee law) continues to apply to disaster-affected persons. Third, it also indicates that DAPPED is a part of the IDL and the norms of IDL continue to develop outside of the scopes of DAPPED. However, DArt 18(2) qualifies the scope of DArt 18(1) by excluding the applicable rules of international humanitarian law (IHL). The following section will shed light on the exclusion of IHL from DAPPED in detail.

The Normative Framework of DAPPED

The normative framework of DAPPED can be well understood with reference to the definition of disaster, the exclusion of IHL from its scope, the nature of the obligation, and the nature of the constituent norms. The inclusion of a definition of “disaster” is one of the novelties of DAPPED. DArt 3(a) defines “disaster” as “means

a calamitous event or series of events resulting in widespread loss of life, great human suffering and distress, mass displacement, or large-scale material or environmental damage, thereby seriously disrupting the functioning of society.” According to this definition, a disaster for the purpose of DAPPED must meet two requirements: (1) threshold of a calamitous event or a series of events and (2) nature of the impacts of such event or events. DAPPED sets a very high threshold for a calamitous event to qualify as a disaster. If a calamitous event or a series of events does not reach the threshold of causing one of four possible outcomes, i.e., (1) widespread loss of life, (2) great human suffering and distress, (3) mass displacement, and (4) large-scale material or environmental damage,” it will fall within the definition of a disaster. The phrase “a series of events” denotes that a series of small-scale calamitous events that reach the threshold of a disaster will be deemed to be a disaster within the meaning of DAPPED. This definition of disaster includes both natural and human-made disasters. It applies equally to sudden-onset events (e.g., earthquake or tsunami), slow-onset events (e.g., drought or sea-level rise), or frequent small-scale events (e.g., floods or landslides). If a disaster, irrespective of its origin or nature, does not reach the threshold of the abovementioned outcomes, it will not get the benefit of DAPPED. For example, if a calamitous disaster occurs in the middle of an ocean or on an uninhabited island and does not result in any of the four outcomes, that event will not get covered by DAPPED. Regarding the second requirement, i.e., the nature of the impacts of a disaster, DAPPED clarifies that a disaster must cause serious disruptions in the functioning of societies. It denotes that if any disaster reaches one of the four thresholds but does not cause serious disruption of the functioning of society, it will still be outside the purview of DAPPED. However, the term “society” remains unclear. Bartolini (2017) suggests that “society” should be, upon the implication adduced from the contemporary practices, interpreted as “community” or “society at any scale” rather than “entire society.”

Generally, incidents of armed conflicts can be considered human-made disasters. In those cases, there arises a question on the applicability of DAPPED to the disasters resulting from armed conflicts. The exclusion of the application of IHL from DAPPED signifies that the disasters resulting from armed conflicts are excluded from the definition of disaster *per se*. IHL provides a specific and solid legal framework to protect persons affected by disasters resulting from armed conflicts (Fisher, 2007: 349–351). Besides, its norms predate the DAPPED and are widely recognized. The application of IHL in the event of disasters resulting from armed conflict provides additional protection to the victims, even if such a disaster occurs concurrently with another type of disaster. However, it does not render that DAPPED will remain completely inapplicable. It continues to apply where IHL does not apply. If the impact of an armed conflict reaches the threshold of disasters, the IHL provides a stricter legal regime for humanitarian assistance. It can be exemplified by the instances of humanitarian assistance to be provided in the occupied territories or rebel-controlled territories. In those cases, the application based on the primacy of the affected State may lead to uncomfortable situations. (Bartolini, 2017: 1113–1114).

DAPPED incorporates both vertical and horizontal dimensions of obligations. Its vertical dimension of obligation thrives on emphasizing the relationship between the

assisting actors and the affected persons while dealing with the protection of the latter's rights. DArt 4 (human dignity), DArt 5 (human rights), and DArt 6 (humanitarian principles) exhibit the vertical dimension of obligations contained in DAPPED (Kälin, 2019: 28–50). Bartolini (2017) highlighted that these principles are reminders of the obligations from other sources without providing any detailed substances. Kälin (2019) added that the non-specification of the abovementioned principles might invite complexities in their application to practical settings. The horizontal dimension of DAPPED entails the regulation of the legal relationship between an affected State and assisting actors in the event of disasters. The provisions of DArt 8 to DArt 17 contain the horizontal dimension of obligations. However, there are divergent views regarding the status of such obligation in international law. While the ILC commentaries on DAPPED listed several international law practices claiming to support the horizontal dimension of obligation, Tladi (2017), who was also a Member of the ILC during the adoption of DAPPED, commented that neither customary international law nor treaty law supports the existence of such a nature of the obligation.

The legal nature of the norms contained in the DAPPED can be understood from the working method of the ILC. The mandate of ILC aims at both the codification and the progressive development of international law. The preamble of DAPPED also highlighted this *modus operandi* of ILC. Thus, the Draft Conclusions or Draft Articles of the ILC contains both *lex lata* and *lex ferenda* in general (Azaria, 2020). Sivakumaran (2017) already showed that the existing sources of IDL derive from different treaties, customary international law, general principles of law, and soft law instruments. The formulation of DAPPED benefited from such sources (Pronto, 2019). It is also evident from the ILC commentaries on DAPPED.

A (Long?) Walk to Codification

Article 23 of the Statute of the International Law Commission 1947 provides that ILC may make four possible recommendations to the UNGA following the adoption of its Draft Conclusions or reports: (1) to take no action, the report having already been published, (2) to take note of or adopt the report by resolution, (3) to recommend the draft to the Member States with a view to the conclusion of a Convention, and (4) to convene a conference to conclude a Convention. In the case of DAPPED, ILC decided to recommend to the UNGA to elaborate a Convention. The UNGA Res. 71/141 (19 December 2016) took note of DAPPED and invited the Governments to submit comments on ILC's recommendation to conclude a Convention based on DAPPED. It also decided to include this issue in the provisional agenda of its seventy-third session (2018). The UNGA Res. 73/209 (14 January 2019) took note of the views and comments expressed in the Sixth Committee at the seventy-third session of the UNGA and the comments and observations already received from Governments on DAPPED. It also requested the UN Secretary-General to invite the Governments that are yet to submit their comments and observations. It further decided to include the item in the provisional agenda of its seventy-fifth

session (2020). In the seventy-fifth session, the UNGA, on the recommendation of its Sixth Committee, decided to defer this agenda item to the seventy-sixth session (2021). It was decided in the seventy-sixth session (2021) of the UNGA that a working group of the Sixth Committee of the UNGA will examine DAPPED and consider ILC's recommendation to elaborate a Convention based on DAPPED and in the light of views and comments expressed in the debates of the Sixth Committee and the comments and observations already received from Governments on DAPPED in four full consecutive days at the Seventy-Eighth and seventy-ninth sessions of UNGA, and the said working committee will report to the Sixth Committee on the outcome of its deliberations at the seventy-ninth session (2024) to enable the UNGA to devise a further course of action on DAPPED. (A/75/435).

At the current stage, the States appear to take four positions on the elaboration of a Convention based on DAPPED. The first group of States made positive evaluations of the contents of DAPPED without indicating their positions on the treaty negotiation. The second group of States showed their readiness for the treaty negotiation. The third group of States reiterated that they preferred to have time for the digestion of the norms in State practice. The last group of States raised doubt about the possibility of a future Convention (Bartolini, 2016, 2017: 1130–1133). Thus, the possibility of a future Convention on the Protection of Persons in the Event of Disasters cannot be dismissed.

Pending the possibility of a future Convention, the Draft Articles and Reports prepared by ILC may continue to impact the development of international law in another way. Generally, the Draft Articles already possess a sort of authority in international law due to the nature of the representation of the Members and their elections, the engagement of States and relevant actors concerning their preparation, and the nature of the sources used in such preparations (Bordin, 2014). This phenomenon explains why international courts and tribunals frequently rely on the works of ILC in their decisions, sometimes as a source of customary international law. (Azaria, 2020: 178–181) This can be best illustrated by Articles on Responsibility of States for Internationally Wrongful Acts 2001 (ARSIWA). Though the scope and nature of the norms contained in ARSIWA are different from DAPPED, it can be expected that the latter will encourage uniform State practices in the form of national legal frameworks or bilateral or regional treaties and may even lead to the crystallization of customary international law.

ANNEX: Draft Articles on the Protection of Persons in the Event of Disasters

Adopted by the International Law Commission at its sixty-eighth session, in 2016, and submitted to the General Assembly as a part of the Commission's report covering the work of that session (A/71/10), para. 48. The report will appear in Yearbook of the International Law Commission, 2016, vol. II, Part Two.

Bearing in mind Article 13, paragraph 1 (a), of the Charter of the United Nations, which provides that the General Assembly shall initiate studies and make recommendations for the purpose of encouraging the progressive development of international law and its codification,

Considering the frequency and severity of natural and human-made disasters and their short-term and long-term damaging impact,

Fully aware of the essential needs of persons affected by disasters, and conscious that the rights of those persons must be respected in such circumstances,

Mindful of the fundamental value of solidarity in international relations and the importance of strengthening international cooperation in respect of all phases of a disaster,

Stressing the principle of the sovereignty of States and, consequently, reaffirming the primary role of the State affected by a disaster in providing disaster relief assistance,

Article 1

Scope

The present draft articles apply to the protection of persons in the event of disasters.

Article 2

Purpose

The purpose of the present draft articles is to facilitate the adequate and effective response to disasters, and reduction of the risk of disasters, so as to meet the essential needs of the persons concerned, with full respect for their rights.

Article 3

Use of terms

For the purposes of the present draft articles:

- (a) “Disaster” means a calamitous event or series of events resulting in widespread loss of life, great human suffering and distress, mass displacement, or large-scale material or environmental damage, thereby seriously disrupting the functioning of society;
- (b) “Affected State” means a State in whose territory, or in territory under whose jurisdiction or control, a disaster takes place;
- (c) “Assisting State” means a State providing assistance to an affected State with its consent;
- (d) “Other assisting actor” means a competent intergovernmental organization, or a relevant non-governmental organization or entity, providing assistance to an affected State with its consent;
- (e) “External assistance” means relief personnel, equipment and goods, and services provided to an affected State by an assisting State or other assisting actor for disaster relief assistance;
- (f) “Relief personnel” means civilian or military personnel sent by an assisting State or other assisting actor for the purpose of providing disaster relief assistance;

- (g) “Equipment and goods” means supplies, tools, machines, specially trained animals, foodstuffs, drinking water, medical supplies, means of shelter, clothing, bedding, vehicles, telecommunications equipment, and other objects for disaster relief assistance.

Article 4

Human dignity

The inherent dignity of the human person shall be respected and protected in the event of disasters.

Article 5

Human rights

Persons affected by disasters are entitled to the respect for and protection of their human rights in accordance with international law.

Article 6

Humanitarian principles

Response to disasters shall take place in accordance with the principles of humanity, neutrality and impartiality, and on the basis of non-discrimination, while taking into account the needs of the particularly vulnerable.

Article 7

Duty to cooperate

In the application of the present draft articles, States shall, as appropriate, cooperate among themselves, with the United Nations, with the components of the Red Cross and Red Crescent Movement, and with other assisting actors.

Article 8

Forms of cooperation in the response to disasters

Cooperation in the response to disasters includes humanitarian assistance, coordination of international relief actions and communications, and making available relief personnel, equipment and goods, and scientific, medical and technical resources.

Article 9

Reduction of the risk of disasters

1. Each State shall reduce the risk of disasters by taking appropriate measures, including through legislation and regulations, to prevent, mitigate, and prepare for disasters.
2. Disaster risk reduction measures include the conduct of risk assessments, the collection and dissemination of risk and past loss information, and the installation and operation of early warning systems.

Article 10**Role of the affected State**

1. The affected State has the duty to ensure the protection of persons and provision of disaster relief assistance in its territory, or in territory under its jurisdiction or control.
2. The affected State has the primary role in the direction, control, coordination and supervision of such relief assistance.

Article 11**Duty of the affected State to seek external assistance**

To the extent that a disaster manifestly exceeds its national response capacity, the affected State has the duty to seek assistance from, as appropriate, other States, the United Nations, and other potential assisting actors.

Article 12**Offers of external assistance**

1. In the event of disasters, States, the United Nations, and other potential assisting actors may offer assistance to the affected State.
2. When external assistance is sought by an affected State by means of a request addressed to another State, the United Nations, or other potential assisting actor, the addressee shall expeditiously give due consideration to the request and inform the affected State of its reply.

Article 13**Consent of the affected State to external assistance**

1. The provision of external assistance requires the consent of the affected State.
2. Consent to external assistance shall not be withheld arbitrarily.
3. When an offer of external assistance is made in accordance with the present draft articles, the affected State shall, whenever possible, make known its decision regarding the offer in a timely manner.

Article 14**Conditions on the provision of external assistance**

The affected State may place conditions on the provision of external assistance. Such conditions shall be in accordance with the present draft articles, applicable rules of international law and the national law of the affected State. Conditions shall take into account the identified needs of the persons affected by disasters and the quality of the assistance. When formulating conditions, the affected State shall indicate the scope and type of assistance sought.

Article 15

Facilitation of external assistance

1. The affected State shall take the necessary measures, within its national law, to facilitate the prompt and effective provision of external assistance, in particular regarding:
 - (a) Relief personnel, in fields such as privileges and immunities, visa and entry requirements, work permits, and freedom of movement; and
 - (b) Equipment and goods, in fields such as customs requirements and tariffs, taxation, transport, and the disposal thereof.
2. The affected State shall ensure that its relevant legislation and regulations are readily accessible, to facilitate compliance with national law.

Article 16

Protection of relief personnel, equipment and goods

The affected State shall take the appropriate measures to ensure the protection of relief personnel and of equipment and goods present in its territory, or in territory under its jurisdiction or control, for the purpose of providing external assistance.

Article 17

Termination of external assistance

The affected State, the assisting State, the United Nations, or other assisting actor may terminate external assistance at any time. Any such State or actor intending to terminate shall provide appropriate notification. The affected State and, as appropriate, the assisting State, the United Nations, or other assisting actor shall consult with respect to the termination of external assistance and the modalities of termination.

Article 18

Relationship to other rules of international law

1. The present draft articles are without prejudice to other applicable rules of international law.
2. The present draft articles do not apply to the extent that the response to a disaster is governed by the rules of international humanitarian law.

Abstract

This chapter attempts to discern the predominant norms of the International Disaster Response Law (IDRL) that (the norms) principally deal with the State's duty to protect the Internally Displaced Persons (IDPs) in the event of disaster and demonstrates that the newly developed IDRL has not developed any new legally binding norms or new legal bindingness in the existing norms relating to IDPs; rather, it mostly reiterates the existing corpus of norms with legal bindingness from other regimes of international law, mainly International Human Rights Law

(IHRL). The discussion on IDRL in the chapter revolves around the Draft Articles on the Protection of Persons in the Event of Disaster (Draft Articles), the major holistic international legal instrument on IDRL. In framing the norms related to protection of IDPs, the Draft Articles highly rely on the Guiding Principles for the Internally Displaced (Guiding Principles), a non-binding soft law instrument adopted by UNGA. The protection norms derive their legal bindingness directly from international human rights law (IHRL). Under the IHRL regime, the States enjoy a considerable range of leeway in derogating and restricting the rights on certain grounds which may be utilized as justification for human rights violation. The Draft Articles impose the primary duty of protection on the affected State, while assisting States have a voluntary duty to assist the affected State by the virtue of the principle of international cooperation and assistance.

Keywords

Internally displaced person (IDP) · International Disaster Response Law (IDRL) · Disaster displacement · Human rights

Introduction

Internally displaced persons (IDPs) and their protection regime tend to be viewed as a matter of policy question within the affairs of domestic authority rather than a legal one. Nonetheless, IDPs have been recognized as a specific category through the Guiding Principles on internal displacement (the Guiding Principles), a “soft law” instrument of international law on IDP protection within the framework of United Nations (UN) system. With the development of International Disaster Response Law (IDRL), protection of disaster-displaced persons has been gaining momentum in international law. Internally displaced persons (IDPs) in the event of disaster have come under the umbrella of IDRL, which is the core focus of the chapter.

The chapter provides an overview of the situational realities of disaster displacement revolving around the complex dynamics and multi-causality of the problem. It identifies the special needs of the disaster affected IDPs in the process and borrows some policy options that need to be engaged with to tackle the problem. The second section describes the protection regime under the Guiding Principles on internal displacement. The third section highlights on protection regime of IDPs in the event of disaster under the corpus of IDRL. The chapter endeavors to demonstrate that the abovementioned protection regime does not possess any legal bindingness by the virtue of itself, rather derives it from other sources of international law. In doing so, the chapter focuses on the Draft Articles on the Protection of Persons in the Event of Disaster (the Draft Articles) for two reasons: firstly, the Draft Articles are the sole holistic and universal instrument of IDRL; and secondly, the Draft Articles are combination of codification of the existing norms and progressive development of IDRL regime.

Disaster Displacement and Its Reality

International Law Commission (ILC) defines “disaster” in the Draft Articles as “a calamitous event or series of events resulting in widespread loss of life, great human suffering and distress, mass displacement, or large-scale material or environmental damage, thereby seriously disrupting the functioning of society.” An apparent reading of the definition establishes a causal relation between “disaster” and “mass displacement.” Disaster displacement may be better construed as involuntary or forced displacement of people from their place of habitual residence as a result of disaster or to escape the aftermath of disaster (Kalin & Chapuisat, 2016). Disaster displacement has taken the place of one of the biggest humanitarian challenge in the present time given its magnitude and complex dynamics (Kalin & Chapuisat, 2020). The magnitude of the problem of displacement can be fathomed through empathic understanding of the large number of the persons displaced in the event of disaster and the multi-causal dynamics of the event that occurred due to the interplay of multiple factors in multiple disaster scenarios which eventually result in multiple displacement scenarios.

The Reality

According the reports of Internal Displacement Monitoring Center (IDMC), between 2008 and 2014, around 184 million people were displaced due to sudden-onset disasters. The average number of people displaced due to weather and climate-related hazards is 22.7 million during the period of 2009–2019, a total of 249.7 million people were displaced only in the last decade. The World Bank estimated that without any timely measures, the number of displaced will be over 143 million within 2050 in the sub-Saharan Africa, South Asia, and Latin America. However, the gathered data does not reflect the actual number but the part of it. Especially, data collected on internal and protracted displacement is meagre. There is only one non-Governmental Organization (NGO)—Internal Displacement Monitoring Center (IDMC) that is keeping proper record and information of IDPs. The lack of information and data relating to IDPs has been pushing the issue into oblivion (Ferris, 2015). Nonetheless, the UN Secretary-General’s Agenda for Humanity identified reducing displacement as one of the core responsibilities of the international community with a commitment to ameliorate Internal Displacement by at least 50 percent by 2030.

Disaster displacement occurs when the disaster affected people are forced to leave their domicile due to exposure to the impact of natural hazard. There may be three disaster scenarios: (i) sudden-onset natural disaster including earthquakes, tropical storms, floods, and landslides; (ii) slow-onset natural disaster, such as drought, recurring floods, salinification of ground water and agro land, sea level rise, and coastal erosion; and (iii) scenario combining the elements of slow and sudden-onset hazards (Kalin & Chapuisat, 2016). Regarding the factors behind displacement, the Nansen Initiative Protection Agenda identified that it is the interplay of the three

factors: (i) exposure to the disaster, (ii) vulnerability of the affected population, and (iii) natural hazard that lead to the situation of displacement (Kalin & Chapuisat, 2020). The second factor (of vulnerability of the affected population consists all the socioeconomic and political factors that render the population vulnerable to disaster. A population is said to be vulnerable when it has weak resilience to withstand the effects of disaster. There may be multiple factors associated with vulnerability in case of disaster displacement which include poverty, marginalization, poor urban planning, population growth, weak governance, human rights violation, and so forth (Goodwin-Gill & McAdam, 2021). Interplay of these scenarios and factors ensues displacement which may be occurred b: (i) spontaneous flight by the population from the disaster affected area, (ii) ordered and enforced evacuation by the States, and (iii) involuntary planned relocation of the population by the States (Kalin & Chapuisat, 2016). Exposure to slow-onset disaster or combination of sudden and slow-onset disaster may protract the period of disaster, eventually displacement for a long period (Kalin & Chapuisat, 2018). For instance, disasters like salinity intrusion or desertification render the affected place inhabitable for a protracted period of time.

Special Needs of Displaced Persons due to Post-displacement Vulnerability

Persons displaced in the event of disaster need special protection and humanitarian assistance given their post-displacement vulnerability. Displaced persons generally lose their place residence and property which make them distinct from other people (Kalin & Kunzil, 2019). The initial struggle of displaced persons is to immediate and unprepared escape from the danger zone and find a shelter. Such disastrous experience of flight leads to post-traumatic and other forms of psychological disorders. In the process of flight, they may lose their family members and community ties. Displaced persons may lose access to the basic needs including proper shelter for residence, livelihoods, education, healthcare, and so forth. The protection related to shelter of the displaced persons is found to be one of the most poorly addressed issue of humanitarian response (Mooney, 2005). The shelters provided to the displaced persons are generally of extremely poor condition; very few of them are sheltered in formal camp where most remain in temporary makeshift lodging. The vulnerable state of the displaced persons additionally renders them susceptible to discrimination, exploitation, and further victimization. The rate of gender-based violence, forcible recruitment, trafficking, and other forms of abuse is higher against the IDPs (Mooney, 2005).

Policy Options for Disaster Displacement

In the submission to the high-level panel on internal displacement, set up by the UN Secretary-General, Professor Kalin et al. proposed three policy options to prevent displacement: (i) reducing hazards, (ii) reducing exposure to disasters, and

(iii) reducing vulnerability against disasters. When displacement cannot be prevented, protection and assistance regime comes into play (which may be called the fourth policy option) (Kalin & Chapuisat, platform). The first policy option of reducing hazardous incidents or disasters is associated with sustainable management of the environment and prevention of climate change which is not covered by this chapter. The second policy option requires reducing exposure to the disaster by moving the affected persons out of harm's way to safe place through planned relocation which must be followed by repatriation after the effects of disaster cease to exist. To reduce the vulnerability of the displaced people (which is the third policy option), it is essential to identify the vulnerable class and enhance their capacity by building social resilience through rule of law and good governance (Dhumal, 2018). The fourth policy option deals with the protection and humanitarian assistance of the displaced persons. The persons displaced by disaster are entitled to human rights and humanitarian assistance to meet their basic needs until they find durable solutions through safe return or resettlement and integration that end their displacement (Kalin & Kunzil, 2019). To various degree, all the four policy options are mirrored in the IDRL. The chapter focuses on the third and fourth policy option and their reflection on the Draft Articles and the Guiding Principles.

Internal Displacement

The Guiding Principle on Internal Displacement (the Guiding Principle) defines internally displaced persons (IDP) as, “persons or groups of persons who have been forced or obliged to flee or to leave their homes or places of habitual residence, in particular as a result of or in order to avoid the effects of armed conflict, situations of generalized violence, violations of human rights or natural or human-made disasters, and who have not crossed an internationally recognized state border.” Most of the disaster displacements are internal due to displaced peoples’ tendency to remain close to their home and hope to return as soon as the situation develops (Orchard, 2019).

IDP has long been treated firmly as the “domestic affair” of the national authority and an issue of policy question rather than a legal one (Kalin, 2006). The special protection and assistance provided to IDPs are mostly on ad hoc basis (Orchard, 2019). There is no lead international agency dedicated to the plight of the IDPs. Prior to 2005, various agencies of UN collaborated with each other and shared the responsibilities for the protection of the IDPs under the banner of so-called collaborative approach. In 2005, the Inter-Agency Standing Committee initiated “Cluster Approach” which is actually division of the labor among the UN and other agencies (Ghráinne, 2021). As of now, only one NGO-Internal Displacement Monitoring Center is now playing the primary role in collecting and providing data and information. The UN Human Rights Commission adopted a soft law instrument, the Guiding Principles on Internal Displacement (the Guiding Principles) back in 1998 which still serves as the major UN instrument for IDPs.

The Guiding Principles on Internal Displacement

The Guiding Principles on Internal Displacement is a corpus of 30 principles which, in a broad sense, may be compressed into three norms (Orchard, 2019). The first norm recognizes IDPs as a distinct group who has specific needs and requires specific protection through international actions through the definition clause. The second norm entitles IDPs to the enjoyment in full equality of the “same rights and freedoms under international and domestic law as do other persons in their country” (Principle 1). According to Kalin, IDPs require more specific address (which is yet absent), given their special needs (Kalin, 2005). The third norm recognizes the need of assistance of IDPs and the (direct or indirect) responsibilities of both domestic state and international community.

The matters that the Guiding Principles address are protection against displacement (Principles 5–9); protection during displacement (Principles 10–23), the framework for humanitarian assistance (Principles 24–27), and protection during return, local integration in the locations where persons have been displaced, and resettlement in another part of the country (Principles 28–30). Principle 6 states that IDPs have the “right to be protected against being arbitrarily displaced from his or her home or place of habitual residence.” In cases of disasters, an evacuation will be regarded as arbitrary displacement unless the safety and health of the affected have been ensured. Further, displacement shall last no longer than required by the situation at hand. Responsible authorities must ensure all feasible measures to minimize displacement and provided the displaced with proper accommodation, satisfactory conditions of safety, nutrition, health, and hygiene. They shall not be separated from their family members. Principle 8 states that “displacement shall not be carried out in a manner that violates the rights to life, dignity, liberty and security of those affected.”

The Guiding Principles emphasize on IDP’s right not to be discriminated in any ground, especially on the ground that they are internally displaced (Principle 4). Principle 3 states that IDPs have the right to request and to receive protection and humanitarian assistance from national government. The Guiding Principles recognize IDP’s right to live with dignity, integrity, liberty, and security, right not to be taken hostage or in slavery, right to be free from torture, forced labor, violence, sexual exploitation, and any degrading treatment. They are entitled to freedom of thought, religion, opinion, and expression, right to seek employment, and right to vote. Freedom of Movement of the IDPs includes interning and free movement in and around open camp, freedom of choosing residence, right to seek safety in another part of the country, and right to leave country and seek asylum in any other country. IDPs are entitled to safe access to food, shelter, clothing, healthcare, and education. They have the right to property which includes the right to get back the property they left behind. Every IDP has the right to be recognized as a person before the law and right to have all the legal documents issued. They have the right to remain together with their family. Principle 28 enshrines that after ceasing of the cause of displacement. IDPs have the right to return to their original place of residence or begin a new life in the area where they are relocated and integrated. The responsible authority

must ensure the safety, security, and liveable conditions are recreated in the place of return.

The Guiding Principles are mostly restatement of the existing provisions of International Human Rights Law (IHRL), International Humanitarian Law (IHL), and International Law for the Refugees, in a more detailed and need-specific way (Kalin, 2008). Yet, it is an open question that whether the Guiding Principles contribute any advance to the existing body of law related to IDP. The answer is affirmative according to Orchard. The Guiding Principles replenish the gaps and gray areas identified by Compilation and Analysis of Legal Norms (1996) undertaken by Francis Deng, the former Representative of the Secretary-General for IDP (Kalin, 1998). For instance, the Guiding Principles develop application of principle of non-refoulement in the context of internal displacement (Orchard, 2019). Cantor made a case for IDP's right to safe and voluntary return under Principle 28 as one of the "hardening of the soft law" instance (Cantor, 2018), though Kalin and Chapuisat still consider this as an "unfulfilled promise" of the international community towards IDP (Kalin & Chapuisat, 2018).

Other Regional Instruments

Among the regional instruments associated with IDP, the Great Lakes Protocol and the Kampala Convention (both of them are operative in Africa) are worth mentioning. Both of the instruments adopt the Guiding Principles' definition of IDP. The Kampala Convention, which has been adopted as a treaty with thirty-five signatories at present, recognizes the Guiding Principle as well. The Convention commits to obligate the State parties to enact national legislation to domesticate the Guiding Principles. Kalin commended the provision as one step further than the UN, which can serve as an example for other regions (Kalin, 2007).

International Disaster Response Law (IDRL)

The work of producing the Draft Articles on the Protection of Persons in the Event of Disaster (2016) has been undertaken by the International Law Commission (ILC) with an aspiration to develop a universal and holistic body of International Disaster Response Law (IDRL) and fill up the long "yawning gap" of the fragmented body of IDRL (de Guttery, 2012; Sivakumaran, 2017). Yet there is no overarching convention in IDRL, rather it is being governed by subject-specific and disaster-specific treaties; regional, sub-regional, and bilateral treaties; soft law; and policy documents. The ILC referred and recommended the Draft Articles to the UN General Assembly to be elaborated and adopted as a convention. No agreement has been reached by the State parties in this regard yet (Bartolini, 2017).

Apart from the ILC, International Federation of Red Cross and Red Crescent Societies (IFRC) has developed "Guidelines for the Domestic Facilitation and Regulation of International Disaster Relief and Initial Recovery Assistance" (IFRC

Guidelines) and “Model Act for the Facilitation and Regulation of International Disaster Relief and Initial Recovery Assistance” (IFRC Model Act) as “a reference tool for voluntary use by disaster management officials and/or legislators who wish to develop domestic legislation, regulation, and/or procedures in their countries for managing potential future international disaster assistance” (IFRC, 2013). Sendai Framework for Disaster Risk Reduction 2015–2030, a policy agreement, was adopted and endorsed by the UN General Assembly with a view to enhance disaster resilience and reduce vulnerability to the effects of disaster, implemented by the United Nations Office for Disaster Risk Reduction (UNDRR). There are numbers of other regional and subject-specific instrument like Nuclear Accident Convention, Tampere Convention, Inter-American Convention, Caribbean Disaster Agreement, ASEAN Agreement, and so forth.

The Draft Articles on the Protection of Persons in the Event of Disaster

The Draft Articles contain elements of both progressive developments of international law (*lex ferenda*) and codification of existing norms (*lex lata*) related to disaster (Sivakumaran, 2017). The aspects of progressive development are mainly reflected in the provisions relating to the cooperation and assistance among the States and international organization and disaster risk reduction, where codification of the existing norms is reflected in the provisions regarding protection for disaster victims (Valencia-Ospina, 2008). The codified body of norms contains both hard and soft norms, though the distinction is opaque. Similarly, the proportion and distinction between progressive development and codification remain moderately vague. Though the Draft Articles as a whole are still considered to be a soft law instrument, the current form of the Draft Articles is not the final one as it appears from the Convention-like pattern of the text. Until the adoption of the Draft Articles as a Convention, the hard norms located in the Draft Articles will derive their binding forces from other binding sources of international law (Sivakumaran, 2017).

Protection of the Victims of Disasters in the Draft Articles

Despite the scope of the Draft Articles is set out in Draft Article 1 to be the protection of persons in the event of disaster, greater emphasis has been put on the “rights and obligations of the States in relation to one another” (ILC, 2016). Only three draft articles address the protection of the persons affected in the event of disaster (Bartolini, 2017). Among these three, Draft Article 2 states that the purpose of the Draft Articles is to *inter alia*, “meet the essential needs of the persons concerned, with full respect of their rights”; Draft Article 4 enshrines that the inherent dignity of the human persons must be respected and protected in the event of disaster; Draft Article 5 confirms the respect for and protection of the human rights of the disaster affected persons. Finally, Draft Article 6 sets out that the principles of humanity, neutrality, and impartiality must be followed in response to disaster.

The term “protection” is not defined in the Draft Articles. ILC’s commentary on the Draft Articles incorporates both positive and negative obligation of the States into its protection regime. Draft Article 4 and Draft Article 5 both highlight “respect” and “protection” of human dignity and human rights. “Respect” refers to State’s obligations to non-interfere with people’s rights, where “protection” requires adoption of number of measures by the States to prevent human rights violation by any non-actor and ensure satisfaction of individual needs of disaster affected persons (ILC, 2016). ILC’s commentary confirms that being the reiteration of the human rights obligation of the States in the event of disaster, it eventually encompasses the human rights obligation expressed in the international human rights instruments. The obligation of the State extends to the progressive realization of the economic, socio, and cultural rights as enumerated under the International Covenant on Economic, Social, and Cultural Rights (ICESCR). The provision of minimum core obligations under ICESCR (immediate realization of essential foodstuffs, essential healthcare, basic shelter and housing, education for children) also continues in the event of disaster.

Though the Draft Articles based its protection regime on IHRL, it adopted a synthesis of both the right-based and need-based approaches of protection which is reflected in the purpose of the Draft Articles (which is “to meet the essentials needs of the person concerned, with full respect of their rights in responding to and reducing the risk of disaster.” “The person concerned” refers to the persons directly affected by the disaster, including the ones displaced due to disaster (Valencia-Ospina, 2008). The combination of the both approaches is also reflected in Draft Article 10 which equally emphasizes on state’s duty to ensure protection of persons and provisions of disaster relief assistance. Draft Article 6 accentuates the need-based approach by highlighting that the response to disaster shall take place “while taking into account the needs of the particularly vulnerable” and applying the principle of neutrality, impartiality, and non-discrimination. ILC’s commentary assures that the principle of non-discrimination does not exclude positive discrimination, rather the later part of Draft Article 6 provides for affirmative action for the vulnerable ones. The ILC deliberately kept the term “particularly vulnerable” open ended to include any individuals or groups that might find themselves vulnerable in the event of disaster (ILC, 2016). The situation of vulnerability entails protection with taking into account special needs. The IFRC Guidelines also include the displaced persons as a group with special needs.

The temporal scope of protection is set out in the Draft Article 1. Protection under the Draft Articles shall be provided “in the event of disaster.” According to the ILC, the terms “in the event of disaster” imply that the temporal scope of the Draft Articles extends from pre-disaster preparatory phase to post-disaster recovery phase (ILC, 2016). It also applies to protracted displacement situation where humanitarian assistance is necessary for a longer period of time (Kalin, 2019; Kalin & Chapsiat, 2018). The ILC further confirms that the scope of the Draft Articles extends to the disaster risk reduction through reducing “exposure” and “vulnerability” in the pre-disaster stage (Draft Article 9) (ILC, 2016). As per Draft Article 9, the State has an obligation to “reduce the risk of disaster by taking appropriate measures.” The

measures include *inter alia* adopting legislation or regulation to prevent, mitigate, and prepare for disaster. The Sendai Framework encourages the States to take measures to reduce vulnerability through building resilience. A concurrent reading of the Draft Articles and the Sendai Framework shows that State's obligations towards displaced persons in the event of disaster start at the pre-disaster stage with building resilience and reducing vulnerability, and it ends by finding a "durable solution" for them at the post-disaster stage. "Durable solution" for the displaced persons refers to a phase where their need of specific assistance and protection linked to their displacement cease to exist and such person can enjoy human rights without discrimination on the basis of their displacement (IASC, 2010).

Obligation of the States

The Draft Articles recognize separate duty of the "affected State" and "assisting State." Affected State refers to the "State in whose territory, or in territory under whose jurisdiction or control, a disaster takes place," where "assisting State" refers to the State "providing assistance to an affected State with the consent of affected State." As per Draft Article 10, the affected State has the duty to ensure the protection of persons in its territory or territory under its jurisdiction. The affected State also plays the primary role in management of relief assistance. On a similar tone, the Guiding Principles place the primary duty and responsibility to provide protection and humanitarian assistance for IDPs on the national authorities. As reflected in the Preamble to the Draft Articles, the State remains the responsible actor by the virtue of the principle of sovereignty (ILC, 2016), a principle enshrined in the numerous international legal instruments and judicial pronouncement, having the status of customary international law (Besson, 2017). The concept of "sovereignty as responsibility" derives from the doctrine of *parens patriae*. A doctrine of domestic law, *parens patriae*, places the sovereign as the protector of its weaker subject (Dhumal, 2018). The term "sovereignty as responsibility" was coined by Francis Deng, the first Representative for the UN Secretary General for IDP, to emphasize the duty of the State in protecting the IDPs (Phil Orchard). The Draft Articles do not create any legal duty to assist the persons affected by disaster on the part of the assisting States. The assisting States may offer the affected States any assistance with the consent of the latter one which must essentially be voluntary. The only duty an assisting State assumes under the Draft Articles is to provide due consideration to the request of assistance from the affected State (Draft Article 12).

Human Rights and Disaster Displacement

The general reference to the human rights in the Draft Articles is a recognition that the IHRL is applicable in disaster situation. Similarly, the Guiding Principles reiterate the human rights of the IDPs drawn from the IHRL by analogy. The ILC recognizes the Guiding Principles as a non-binding codified text of best practice for

the protection of human rights which serves to contextualize the existing human rights obligations towards the IDPs in the event of disaster (ILC, 2016). Conjointly, the Draft Articles and the Guiding Principles serve as a legally non-binding text that identifies the existing human rights norms for the protection of IDPs in the event of disaster on a need-based approach, without establishing an independent and novel body of norms (Kalin, 2019). These norms derive their legal bindingness from the IHRL instruments. In the commentary, ILC labels the Draft Article 5 as just the reminder of the obligation of States under IHRL. While these norms derive their bindingness from other regime, they simultaneously derive the limitations as well. The ILC confirms that the reference to the rights in the Draft Articles incorporates the limitations as well which is further supported by Draft Article 18 which stressed that the Draft Articles shall operate without prejudice to other applicable rules of international law.

The so-called derogation clause in IHRL enables States to exonerate itself from any obligations to respect and protect human rights by derogating them on the ground of public emergency or by limiting them invoking certain justifications recognized in international law (Sommario, 2012). It is true that the States need to restrict certain human rights in disaster situation to operate effective and successful disaster management (Sommario, 2012). For instance, freedom of movement of the people in the disaster stricken area may be restricted, or freedom of expression may be reasonably restricted in order to stop spreading disaster-related rumors and panic. Article 4 of the International Covenant on Civil and Political Rights (ICCPR) provides for a derogation clause which exonerates the States from treaty violation on the ground of public emergency. It must be underlined that natural or man-made disaster qualifies as public emergency (Questiaux, 1982). The derogation clause cannot be invoked unconditionally. UN Human Rights Committee (HRC) points out in General Comment 29 that two conditions must be met: the emergency must be of such degree that “threatens the life of a nation”; and there is official proclamation and notification of a state of emergency (HRC, 2001). IHRL instruments also permit leeway in restricting human rights to the States in non-emergency situation. Any such restriction must meet the three pronged test: the restriction (i) is prescribed by law, (ii) pursues a legitimate aim, and (iii) is necessary and proportionate to that aim (HRC, 1984; Sommario, 2022). The first criterion requires the restriction to be imposed by any national “law.” The European Court of Human Rights opined that the law must be “formulated with sufficient precision to enable the citizens to regulate their conduct” (Sommario, 2022). To fulfil the second criterion, the States restricting human rights have to make a plausible case that they have a legitimate purpose to impose the restriction. Thirdly, there must be clear demonstration of necessity to impose the restriction in a proportionate manner. Proportionality refers that the restrictive measure taken must be the least intrusive one (HRC, 1984). The States are actually granted the leeway or “margin of appreciation” to determine whether a restriction passes the test (Kratochvil, 2011).

However, often this leeway is used by the States to justify State’s failure in protecting human rights or even worse, in respecting human rights. A report submitted to the UN Human Rights Council stated that the IDPs are subjected to

significantly higher level of human rights violations than any other persons (HRC, 2009). The same report also identified that the human rights violation of IDPs is not always intentional but often happened due to bad policies, lack of capacity, or negligence of the States. In either case, States can make use of the leeway to justify its failure. As to the economic, social, and cultural rights (ESC rights), the States have a general obligation to progressively realize the apparently non-justiciable rights. Yet, States' retrogression from realizing the ESC rights can be justified in case of severe economic difficulties, *force majeure*, distress, or state of necessity (Reidel, 2011). Further, the ESC rights can be limited by the States for the purpose of promoting general welfare. The approach of "progressive realization" is unable to meet the immediacy of the need of shelter, foodstuffs, and healthcare of disaster affected IDPs. The UN Committee on Economic, Social, and Cultural Rights (CESCR) issued "minimum core obligations" approach under which the States must all time guarantee the minimum essential rights, i.e., essential foodstuffs, equal access to primary healthcare, basic shelter and housing, and basic education. The CESCR affirms that these core obligations are non-derogable and States must take necessary actions to ensure the rights even in the time of natural disaster, though the reality of practice of the States shows the contrary (Giustiniani, 2021). Nonetheless, the State can exonerate itself from the core obligations by invoking resource constraints. A State unable to provide the core rights due to economic constraints only has the burden of justifying that every effort was made to fulfil the obligations (Giustiniani, 2021). The rationale behind is that the presence of natural disaster can severely undermine the capacity of the State to realize the obligation under the International Covenant of Economic, Social, and Cultural Rights (ICESCR) (Muller, 2009). Considering the lack in capacity and hardship of the States (especially the developing States) to fully realize their obligation, the CESCR adopted and incorporated the concept of international cooperation and assistance in the ICESCR (CESCR, 2003).

International Cooperation and Assistance

The ILC recognizes the indispensability of international cooperation and assistance for the protection of persons in the event of disaster, especially in the time when the affected State lacks the capacity to tackle disaster situation. Draft Article 7 highlights the States' duty to cooperate among themselves while implementing the Draft Articles. Draft Article 8 provides an inclusive list of forms of assistance. Draft Article 11 connotes that if the disaster manifestly exceeds the national capacity of the affected State, it has a duty to seek assistance from other States and organizations. The UN General Assembly, in the Resolution 46/182, also recognized that the affected States may lack capacity against the magnitude and duration of catastrophe, and it may need urgent assistance from international community. As per Draft Article 12, assisting States may offer external assistance to the affected State upon the request or with the consent of the affected State. Such offers, whether unilaterally

or requested, are essentially voluntary and do not create any legal duty to assist (ILC, 2016). The ILC considers that the principle of international assistance and cooperation derives from the State's obligation under international human rights instrument and customary international law. The major reference human rights instrument for the principle is the ICESCR. The ICESCR imposes some degree of duty upon the States to take steps through international cooperation and assistance in order to realize the economic, social, and cultural rights. The idea behind the principle was that the wealthier States should assist the poorer States. However, in the context of the human rights obligations of the States to render international assistance and cooperation, the principle remains the one of entirely abstract nature (Giustiniani, 2021). It would be difficult to say that this commitment of international assistance and cooperation has any legal bindingness. In General Comment 3, the CESCR circumvents imposing any obligation on the part of the (wealthier) States to provide assistance and cooperation to the (affected) States. Rather, it tied the issue of international assistance with the responsibility of the individual (affected) States. General Comment 3 notes that the States have an obligation to make maximum use of its available resources which are existing within the State and availed through the international assistance and cooperation (CESCR, 1990). In other words, under ICESCR, the States have obligation only to avail but not to provide international assistance and cooperation. In the same way, the Draft Articles adopt the principle with no binding obligation on the part of the assisting States to cooperate. Though the principle of international assistance and cooperation is a well-established principle in international law, contention that there exists any legal obligation of the States to provide assistance would be a hyperbole (Saul et al., 2014).

Conclusion

The main finding of the chapter is that the Draft Articles do not introduce any hard norm into the normative framework under international law for the protection of internally displaced persons in the event of disaster. The Draft Articles effectively structure and blend the existing norms with the new norms within the policy option framework (see section “[The Guiding Principles on Internal Displacement](#)”). The norms related to the duty of the States and international assistance and cooperation are extrapolated from IHRL by analogy. While extrapolating the norms of voluntary and slow-paced international assistance and cooperation, issues like immediate character of disaster situation and technical and financial incapacity of the affected States have not been given justified consideration. However, ILC’s original purpose was to develop treaty norms for IDRL which is lucid from the treaty-like language of the Draft Articles (Sivakumaran, 2017). Blending hard norms with the soft one has its virtue. According to Sivakumaran, the soft norms may eventually be hardened by the effect of the hard norms (Sivakumaran, 2017). Nonetheless, the Draft Articles remain the single holistic international legal instrument on the event of disaster till today.

Abstract

The focus of the chapter will be on disaster management laws in Bangladesh and will shed light on judicial developments. Apart from critically examining disaster management laws, the chapter will analyze the relevant milestone litigations filed before the Supreme Court of Bangladesh in the last 50 years. The chapter will make some conclusive comments on the statutes and domestic judicial remedies in Bangladesh. Through this examination we aim to portray the lengths to which

Introduction

The location of Bangladesh is just on the bank of the Bay of Bengal; its riverine foundation of the territory makes it one of the most vulnerable countries in the world. The condition of Bangladesh is emanated quite adequately through relevant statistics. The emergency events database of Universite Catholique de Louvain reports that the most frequent disasters to affect the citizens of Bangladesh are storms (around 52%), while floods are the second most harmful (31%) (UCLouvain, [n.d.](#)).

Based on these reports and statistics, Bangladesh is regarded as one of the most disaster-prone territories of the world. The Intergovernmental Panel on Climate Change (IPCC) ranks Bangladesh as the seventh most vulnerable country to climate change (Saleemul Huq, [2022](#)). Every year the country faces not only natural calamities like floods, cyclones, droughts, and landslides but also man-made disasters like the Rana Plaza collapse and influx of Rohingya migrants.

The people of Bangladesh have remained victim to disasters, both man-made and natural, for a long time. Only recently has the country learned to live and deal with disasters through their effective management. In order to do that, the parliament of Bangladesh has enacted several legislations which prescribe ways and means for an effective disaster management system. Besides legislation, the government has adopted several policy instruments, issued gazette notifications, and provided guidelines in that direction. Such legislations, directives, and guidelines, at times, were not adequate. In situations like those, if people resorted to the judicial system, the courts gave the government certain directions. The legislations and directives which although most of the times are based on international legal instruments do not always conform to them.

This chapter identifies a number of lacunae in the existing legal framework of Bangladesh in its efforts to manage disasters so that effective measures can be taken to strengthen our legal framework. Part II shall shed light on the constitutional framework for dealing with disasters of different kinds and enquire whether the constitution framers contemplated such disasters and the necessity of extraordinary measures in case of a disaster. In Part III, this chapter deals with the legislative framework of Bangladesh highlighting the loopholes in the domestic legal framework in consonance with its international legal obligations. Finally, Part IV focuses on the judicial decisions time to time issued by the Supreme Court of Bangladesh, often as a stopgap measure. This chapter concludes that although there has been massive development in the framework for managing disasters, there are still some avenues for further development.

Constitutional Framework for Disaster Management in Bangladesh

Scope for Emergency Power

The original constitution of Bangladesh 1972 did not contain any provision for emergency measures, nor did it have specific reference to any extraordinary use of executive or legislative power in case of any unusual event. However, the legislators soon felt the need for emergency provisions in the constitution. In the Constitution (Second Amendment) Act 1974, the legislators added provisions for emergency in the constitution in three different provisions: Articles 141A–C. Now the constitution of Bangladesh contains explicit provisions regarding the grounds of proclamation of emergency. Article 141A, although has not expressly mentioned a disaster, natural or man-made, situation as a ground for proclamation of emergency, has created an indirect scope for the proclamation of emergency if it appears that the economic life of the state is threatened by internal disturbance. Article 141A says:

If the President is satisfied that a grave emergency exists in which the security or economic life of Bangladesh, or any part thereof, is threatened by war or external aggression or internal disturbance, he may issue a Proclamation of Emergency for one hundred twenty days:

Provided that such Proclamation shall require for its validity the prior counter signature of the Prime Minister.

Leading constitutional law jurist of Bangladesh, Mahmudul Islam, noted that the constitution does not provide any explanation of terms and phrases like “war or external aggression” and “internal disturbance” (Islam, 2012). Due to such space for interpretation, there are disagreements among scholars as to when emergency can be declared. Although there are some alternate views, in favor (Hoque, 2020) and against (Ahmed, 2020), such leeway may include the case of disasters which consequently has had a negative impact on the economic life of Bangladesh. Notably, Bhuiyan argued that during the Covid-19 crisis, it was pragmatic of Bangladesh to deal with the allegedly emergency situation by a legislative model rather than by proclamation of emergency since the latter one takes a more restrictive approach to protection of rights (Bhuiyan, 2020). His opinion relied on the empirical research of Tom Ginsburg and Mila Versteeg (Ginsburg & Versteeg, 2020).

The significance of an emergency mechanism is that the restrictions on the power of the state to impose restrictions on certain fundamental rights will no longer be effective. Thus, it will be possible to impose any restriction whatsoever to contain the emergency situation. However, as opposed to popular belief, a proclamation of emergency does not automatically suspend fundamental rights; rather separate law needs to be enacted to impose such restrictions.

The court considered, in *Iqbal Hassan Mahmood alias and Iqbal Hassan Mahmood Tuku vs. Government of Bangladesh and others* (05.12.2007 – BDHC): LEX/BDHC/0034/2007, that natural disaster is a general ground for declaring emergency. In the words of the court:

It would be difficult to find out a nation that never faced a state of emergency in its history. The need to declare a state of emergency may arise from situations as diverse as an armed action against the state by internal or external elements, a natural disaster, civil unrest, an epidemic, a financial or economic crisis or a general strike. The implementation of emergency law invariably leads to restrictions on normal economic, civil or political activity and rights in order to address the extraordinary circumstances that have given rise to the emergency situation.

Although the court considered that natural disasters may be grounds for issuance of proclamation of emergency, the court also was cautious about the overexploitation of the emergency power allocated to the executive. In the words of the court:

Certain restrictions may be fully justified. At the same time, there is a danger that a government will take advantage of a state of emergency to introduce unwarranted restrictions on human rights and civil liberties, to neutralise political opponents, to postpone elections, or for other self-serving purposes that would be more difficult to pursue under normal circumstances. It is also in the experience, in some country there has been tendency to maintain state of emergency for years or even decade long after the original reason for its proclamation has disappeared.

From the above discussion, it is clear that the executive has the discretion to impose restrictions on such fundamental rights under the constitutional framework. However, the government needs to be cautious in using emergency powers.

Impact of International Legal Instruments

The constitution of Bangladesh does not have any provision about the status of international law in the domestic corpus juris. Despite such silence, through various judicial decisions, it is a settled issue that Bangladesh, generally speaking, is a dualist country (Hossain & Bhuiyan, 2019; Haque, 2017, 2021). It means international law does not directly apply in Bangladesh's legal system. Thus, unless an international legal instrument has been ratified by the parliament of Bangladesh, such international laws are not directly implementable in Bangladesh even if the country has signed the international covenant, convention, or treaty.

Such principle will also be equally applied in the case of disaster-related international law. Thus, in order to assess whether our disaster management legal framework is adequate, attention should be given to the corpus juris of Bangladesh and not international instruments where Bangladesh has signed the treaty. However, there are some judicial decisions in which the Supreme Court of Bangladesh has directly applied the provisions of international law instruments which are nonbinding for Bangladesh. For example, in the *Hussain Muhammad Ershad v Bangladesh* (2001) 21 BLD (AD) 69, Justice BB Roy Chowdhury drew contents from the nonbinding *Universal Declaration of Human Rights*. In this case, the court observed that international law can be applied in order to fill in any vacuum in the domestic law, provided that international law is not found to be conflicting with domestic law.

Thus, this judicial approach has created a wider scope for the application of international law in Bangladesh.

Legislative Framework for Disaster Management in Bangladesh

There are a number of laws in Bangladesh that may be invoked to manage disasters in Bangladesh. A number of these laws require upgrades and reform to conform with international standards of disaster management. This part of the chapter shall critically discuss the legislative framework for disaster management in Bangladesh.

Disaster Management Law

The major law dealing with management of disasters is known in its name: the Disaster Management Act 2012. It defines a disaster, constitutes a national disaster management council, and imposes a penalty for relevant offences. This law is backed up by different implementing instruments, for example, the Disaster Management Policy 2015, the Standing Orders on Disaster 2019, and the National Plan for Disaster 2016–2020. Before the Disaster Management Act 2012 was enacted, the method pursued by governments across the spectrum used to be based on relief-centric measures. With the enactment of the Disaster Management Act 2012, the policy has observed a paradigm shift in its approach, from a “relief-centric” approach to a “holistic one.” If we take a comparative approach and look at our neighboring countries, it seems that this was meant to be the way forward for all the nations. For example, when India faced a major “Gujrat earthquake,” India also moved toward a preparedness approach from a post-disaster relief mechanism (Guru, 2019).

The National Disaster Management Committee (NDMC) is chaired by the prime minister. This committee is responsible for coordinating the entirety of the national efforts for disaster management. Section 6(h) of the act empowers the NDMC to take any means necessary to manage disasters properly. Despite the silence of the law, it seems that it is the jurisdiction of the NDMC to decide whether any sort of international assistance would be required. It has been also indicated in the Armed Forces Divisions (AFD)’s 2020 Standard Operating Procedure for Multinational Coordinating Center. The 2019 Standing Orders on Disaster assigns the Ministry of Foreign Affairs to be the bridge between foreign governments and INGOs with help from Bangladeshi missions abroad. The same ministry is responsible for setting up a system for timely receipt of international humanitarian assistance and relief. Thus, it seems that the Ministry of Foreign Affairs only takes steps when the NDMC directs it to do so.

The government has the power to frame policies with regard to “international and regional disaster management.” There is another provision (Sec. 32) in the law that prescribes for establishing a disaster management fund. Any fund received from foreign government, organization, or any international organization with the approval of the government shall be deposited to the fund. The act also gives the

government power to receive and provide cooperation from other foreign countries to conduct relief operations during the disaster period. In that direction, the government is allowed to enter into memorandum of understanding, international agreement, convention, treaty, or any other legal document with foreign states and regional or international organizations. The act also keeps a provision for ensuring accountability backed by a sanction mechanism. Section 39 provides that if anybody misuses the funds of the disaster management fund, then that person may be punished for this offense for not more than 1 (one) year rigorous imprisonment or not more than 1 (one) lakh Taka fine or both punishments. Notably, nobody is given the responsibility to oversee such use or misuse of funds. However, the deputy commissioner may make a written allegation to the court under Sec. 45.

There are a number of ways to improve the current disaster management law of Bangladesh. Firstly, the act is silent about regulation of international disaster assistance. Though the government is given the power to frame rules, even after a decade, such rules remain unframed. Secondly, the 2019 Standing Orders on Disaster does not prescribe the mode of humanitarian coordination. The government should undertake immediate measures to enact a rule where the time frame within which assistance is to be offered and the factors to be taken into consideration while offering or accepting assistance should be provided. The role of the international humanitarian actors should also be detailed in the 2019 SOD. Thirdly, the procedure for coordination between NDMC and the Ministry of Foreign Affairs should be specified in the act itself or may be listed down as a function of the NDMC. Fourthly, there is no special provision for ensuring security to the international actors without going through the respective deputy commissioner. A centralized mechanism may be adopted to ensure the international actors who have come forward to provide assistance are not facing troubles due to red tapes of bureaucracy. Fifthly, the 2019 Standing Orders on Disaster is oblivious of the minimum standard of humanitarian recovery activities. In the absence of minimum standard provisions, the quality of recovery efforts may fail to fulfill its true purpose. Sixthly, although it seems that the provision for imposing penalty for misappropriation of funds equally applies to the foreign funds because the foreign funds will be a part of the disaster management fund, the law can clarify it by further inclusion in the legislation.

A better mechanism for enhancing accountability may be designed by introducing reporting methodology or reforming the existing reporting protocol. Right now, there is a gaping vacancy on a position of check and balance, which is quite pivotal in battling corruption and other dishonest methods related to handling monetary funds. The sole person responsible to reporting any discrepancies in handling the funds is the deputy commissioner, which makes the system vulnerable to a plethora of issues. Where the person in charge will be discouraged to make a report as it, advertently or inadvertently, will inevitably put into scrutiny and question his own actions and capabilities, quite nearly turning it, essentially, into a “self-reporting system.” Given the fact that there are both positive and negative arguments on the utility of self-reporting system (Simmons & Creamer, 2019; Kornblum, 1995; Creamer & Simmons, 2019; Scott & Balthrop, 2021), in the Bangladeshi context, it would be more befitting to either have a fixed body to monitor and evaluate the

reports submitted or employ a third-party external observer to do so outside the jurisdiction of the deputy commissioner.

Moreover, the Disaster Management Act is silent about the details to be included in a request for foreign assistance. Although the standard operating procedure of the Armed Forces Division prescribes a form for request for foreign assistance, a legislative inclusion of the form and prescription of the process can make sure all the stakeholders are duly obliged to follow the instructions.

Meteorology Law

The Meteorology Act 2018 provides for establishment of Bangladesh Meteorological Department. This department is responsible for monitoring and overseeing the exchange of information with foreign states. It is also empowered to do so in case of regional/international organizations in consonance with the international obligations of the state. In this regard, Sec. 6(1)(b) provides due direction for mutual cooperation of the state with other states and non-state entities. It states that the department shall provide expert opinions and data to the interested stakeholders, research institutes, and agencies and exchange weather services data with all concerned domestic and international organizations in view of national needs and international obligations. This seemingly incorporates the obligations under the SAARC Disaster Response Agreement. However, the procedure of exchanging such information has not been specified. A possible revision of the law or a further adoption of a rules can address this concern.

Taxation Laws

The National Board of Revenue published the Standing Order no. 47/98/customs which declares all goods imported by any diplomatic mission, persons enjoying diplomatic privileges, and organizations/persons enjoying “special privileges” are eligible for the “rapid clearance procedure.” The Standing Order also applies to any relief items. Goods qualifying for the rapid clearance procedure shall get immediate out-pass seal without any physical examination or “unstuffing” procedure. Other laws and policies that are relevant in this regard are Customs Act 1969, Income Tax Ordinance 1984, and VAT Act 2012. These laws regulate the exemption or reduction in duties and taxes with regard to relief items.

Again, Sec. 19 of the Customs Act 1969 provides the government a general power to exempt goods from custom duties. The section states that if the government is satisfied, after consultation with the National Board of Revenue, and that it is necessary in the public interest to do so, it may exempt any goods imported into, or exported from, Bangladesh from customs duties partially or wholly.

The National Board of Revenue (NBR) has issued the Statutory Regulatory Order (SRO) no. 61 (SRO no. 61-law/92/1444/customs) exempting listed humanitarian goods from duties and taxes if they are imported by Bangladesh Red Crescent

Societies or any foreign/local NGO registered under the NGO Affairs Bureau or by any other unregistered foreign or local organization. Subsequently, through SRO no. 178 – law/2012/2406/customs, the NBR excluded the listed items from pre-shipment examinations. The NBR has the authority to arrange such facilities from time to time considering the national need.

Aviation Laws

The Civil Aviation Act 2017 is silent about a system for priority landing of airplanes carrying humanitarian assistance supplies. In April 2020, the Civil Aviation Authority of Bangladesh issued a directive keeping provisions for foreign operators to carry cargo in the passenger compartment for the “unhindered supply chain of medical equipment and different essential goods/commodities.” There are instances when the Civil Aviation Authority of Bangladesh issued circulars to arrange special or suspend particular flights. For example, they issued circulars on 14 May 2020 and 28 May 2020 regarding the suspension of flights to and from certain countries. The gazettes stated that international flights of the following type, cargo, emergency landing, technical stop, medical evacuation, special flight operation, relief/humanitarian assistance, and citizen evacuation, shall continue as usual. Therefore, there are exceptions to international travel restrictions facilitating movement of humanitarian relief teams. For citizen evacuation and humanitarian assistance, permission must be obtained from the Ministry of Foreign Affairs. This implies that the CAAB has the authority to allow for special provisions for emergency situations. However, it is recommended that the Civil Aviation Act should be amended to provide the authority with the authority to allow for priority landing of flights carrying international humanitarian assistance.

In addition, the establishment of the National Emergency Operation Center (NEOC) has been a milestone. As a response to the Nepal earthquake in 2015, the Bangladesh government understood the need for a complete disaster preparedness for Bangladeshi citizens. The NEOC is a three-tier system that facilitates an inter-governmental framework for coordination in regulating the responses during national and international disasters.

Judicial Approach in Managing Disasters

The first case that used the term disaster in the sense we are using it now in disaster law is Dr. Mohiuddin Farooque vs. Bangladesh decided in 1996. In this case, the then Chief Justice ATM Afzan noted that ecological disaster has the impact of an economic disaster because environment and ecology have become matters of universal concern. In his words:

... all the environmental deterioration and risks we have experienced to date have occurred at levels of population and human activity that are much less than they will be in the period

ahead. And the underlying conditions that have produced this dilemma remain as dominant, driving forces that are shaping our future and threatening our survival.

Noting such observation, the Supreme Court of Bangladesh granted Bangladesh Environmental Lawyers Association (BELA) locus standi to intervene when public interest and constitutional rights of people are threatened.

In granting locus standi in favor of Bangladesh Environmental Lawyers Association (BELA), the court said that “a national organization . . . , which claims to have studied and made research on the disputed project, can and should be attributed a threshold standing as having sufficient interest in the matter, and thereby regarded as a person aggrieved to maintain the writ petition.” The grant of locus standi to persons not directly aggrieved was a milestone because now people could come forward against the government for their action or inaction.

In another case, *Mohiuddin Farooque and Ors. vs. Bangladesh and Ors.* (28.08.1997 – BDHC): LEX/BDHC/0422/1997, the wheels of justice progressed further when the High Court Division of the supreme court acknowledged the necessity of foreign assistance in “managing” disasters. In a case related to a development project aimed at controlling flood which regularly brings miseries to the people of the flood-prone areas of the district of Tangail specially during the rainy season of the year, namely, FAP 20 project, the court noted:

In the event of any interference into the “FAP-20” activities, the country will be deprived of the benefits expected to be derived from the implementation of the scheme and also from getting foreign assistance in the development work of the country and in future, donor countries will be apprehensive in coming up with foreign assistance in the wake of natural disaster. At the present stage of the implementation of the project, it will be unpractical to stop the work and to undo the same. But in implementing the project, the respondents, cannot with impunity, violate the provisions of laws of the land referred to and discussed above.

When arsenic became a major problem for Bangladesh and was showing disastrous impact, the court noted, in *Rabia Bhuiyan, MP vs. Ministry of LGRD and others* (27.08.2005 – BDAD): LEX/BDAD/0006/2005:

... the extreme gravity of the situation and the serious effect of continuing arsenic contamination through drinking ground water on public health, this Court directs the respondents to fulfil their legal obligations to provide safe water to millions of persons across Bangladesh.

Thus, the supreme court has taken different stopgap measures to prevent disasters, natural or man-made, from time to time. The court has also directed the government to take necessary measures, because in the words of the attorney general, natural disasters affect common interest of many countries at the same time (*Faridul Alam and Ors. vs. Bangladesh and Ors.* (22.07.2010 – BDHC): LEX/BDHC/0348/2010). He substantiated that natural disasters have no borders and one single event can affect many neighboring countries at once. He argued that any disturbance of basic elements of the environment can seriously create

impediment for “life” on the planet within the meaning of “life” under Article 32 of the constitution.

In *Ain-o-Salish Kendra (ASK) and another vs. Bangladesh, represented by the Secretary, Ministry of Labour and Manpower and others* (05.09.2010 – BDHC): LEX/BDHC/0034/2010, the court appreciated the role of the NGOs and INGOs in alleviating the poor and distressed segment of the citizenry. But the court recommended that the works of these organizations can be more meaningful and more fruitful if there is a central independent body coordinating the resources of these platforms altogether in a planned manner. In case of a disaster situation, such an independent body can be a one-stop solution center for the INGOs and foreign countries who will be coming forward with their financial and technical assistance.

The court in another case, namely, *Bangladesh Legal Aid and Services Trust (BLAST) vs. Bangladesh and others* (13.10.2010 – BDHC): LEX/BDHC/0077/2010, pointed out that the building code provides for precautionary measures and protection against natural disaster by earthquake. The court thus directed the government to make sure the building code is being properly followed and such is being regularly monitored.

In a natural or man-made disaster of massive or minor scale, the defense services of the country play a big role in rehabilitating the people of the country. The court emphasized on the role of civil-military relationship in crisis management for the greater interest of people at large. The Appellate Division noted their heroic performance during such crisis times as follows (*Bangladesh Bank vs. East West Property Developments (Pvt.) Limited and Ors.* (16.03.2017 – BDAD): LEX/BDAD/0007/2017):

A defence force is an asset of our country. The primary responsibility for raising a defence force in a country is for national security including its boarder and approaches; to defend the country’s sovereignty; to contribute to and, where necessary, lead peace and security operations; to protect the country’s wider interest by contributing to international peace and security, and the international rule of law; to contribute to whole-of-government efforts at home and abroad in resource protection, disaster relief, and humanitarian assistance; peacekeeping, crisis management and humanitarian relief operations; protection of the internal security; defense scientific research and development; defence procurement and purchasing and so on. It can be said in brief that today the obligation of military is beyond their primary role of battling the external enemy as there is a perceptible shift towards internal security involving deactivating terrorists, winning the hearts and minds of aggrieved people of the country, riot control, saving lives during natural disasters and military diplomacy.

When popular news media in Bangladesh started reporting risks of earthquakes in Bangladesh during 2010–2011, it created much distress among people. The news media then reported that the Bangladesh government does not have sufficient equipment necessary for rescue operation in case an earthquake happens. The High Court Division was moved by one NGO, namely, Human Rights and Peace for Bangladesh. The court agreed with the contention of the petitioner NGO and directed the government to buy necessary equipment required for rescue operation in an earthquake (*Human Rights and Peace For Bangladesh (HRPB) And Others*

Vs. *Government Of Bangladesh And Others* 63 DLR (2011) 71). The court also directed the government to constitute a high-powered committee composed of ministers, experts, NGOs, etc. at the earliest time. The name of the committee is Earthquake Preparedness and Awareness Committee. The court also directed the Ministry of Finance to allocate a budget as soon as the committee has agreed upon the list of necessary equipment to buy. The committee was also instructed to meet frequently and make recommendations to the government from time to time. Thus, the judiciary has time and again taken stopgap measures addressing different ground realities which have not been addressed in the legislation.

Conclusion

This chapter shows that Bangladesh has made a paradigm shift in its approach for “managing” disasters. Before 2012 what was a post-disaster relief distribution-centric initiative, now it has become disaster response and preparedness centric. In the words of one commentator, Bangladesh turned from a reactive approach to a proactive approach (Sultana, 2016). The constitutional discourse as regards whether emergency can be proclaimed during a natural or man-made disaster remains a moot. However, this chapter argues that in such events, emergency can be proclaimed if the president is satisfied in the due manner. The legislature has enacted a number of laws and amended quite a few legislations lately to incorporate the modern problems that was not addressed earlier. However, there are still avenues for further improvement of the legislative framework. The judiciary of Bangladesh has from time to time adopted stopgap measures to address the unnoticed problems. When found lethargic or indifferent to a problem, the Supreme Court of Bangladesh has even given direction to solve the crisis, e.g., *Human Rights and Peace For Bangladesh (HRPB) And Others Vs. Government Of Bangladesh And Others* 63 DLR (2011) 71. The sooner we develop our legal framework toward a better disaster management system, the more we will be benefited in times of crises.

Abstract

Persons with disabilities (PWD) remain vulnerable and susceptible to discrimination in crisis, whereas they are entitled to inclusive protection. During the COVID-19 pandemic, global health and other public services nearly collapsed, putting the disability needs on the backfoot. Hence, the World Health Organization (WHO) and the United Nations (UN) provided comprehensive and disability-inclusive disaster management guidelines for the member states to secure PWD. Even though Bangladesh adopted response plans in compliance, disability integration failed to reach the level of expectation. The cardinal disability rights instrument, the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) 2006, obliges the state parties to target and mainstream disability rights during risks and emergencies. Though Bangladesh has the Rights and Protection of Person with Disability Act (RPPDA) 2013 in compliance, the scope of the legislation during crises remains uncertain. This qualitative

research investigates whether the current safeguard measures are adequate in protecting PWD of Bangladesh amid the COVID-19 pandemic. The chapter first critically examines the existing national disability safeguard measures and then explores the extent of the protection during the pandemic in compliance with international guidance. Relevant primary sources like national and international legislation, guidelines, and policies are analyzed. Secondary sources like authoritative journal articles, books, and newspaper reports are explored to investigate the disability situation. The pandemic management strategies in Bangladesh fall short in disability protection without comprehensive planning and adequate enforcement mechanism. Disability-inclusive disaster regulatory measures and proper monitoring are necessary to yield better protection in future crises.

Keywords

Persons with disabilities · PWD · COVID-19 pandemic · Bangladesh · Disability

Introduction

The COVID-19 pandemic disproportionately affected persons with disabilities (PWD) and unmasked underlying inequalities in accessing their rights. Generally, the PWD suffer and die disproportionately during disasters (UNISDR, 2014). They are also unequally excluded from disaster planning, management, and decision-making processes (UNISDR, 2014). The PWD were more prone to COVID-19 infection and had difficulty accessing health and other support services (UN, 2020a, d; WHO, 2020, 2021). Pandemic prevention measures also posed additional physical barriers (ILO, 2020a; UN, 2020a, d; WHO, 2020). Women and children with disabilities endured significant risks of gender-based violence (GBV) (UNDESA, 2020). The PWD also faced financial hardships and remained least protected with social insurance benefits (Center for Inclusive Policy, 2020; IASC, 2020; ILO, 2020a). Their enjoyment of human rights was disrupted during the pandemic.

Disability considerations are imperative under the Sendai Framework for Disaster Risk Reduction 2015–2030 (Sendai Framework) to build back better after disasters. The preparedness, response, and recovery plans follow the twin-track approach of disability inclusion, which implies mainstreaming and targeting disability rights during crises. The member states are bound to prioritize disability in risk management as per the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) 2006. In compliance, Bangladesh enacted the Rights and Protection of Person with Disability Act (RPPDA) 2013. Unfortunately, the RPPDA fails to clarify the extent of disability rights during emergencies and lacks a monitoring framework. The United Nations (UN) circulated disability-inclusive pandemic response plans for comprehensive, sustainable, and resilient national Disaster Risk Reduction (DRR) and Disaster Risk Management (DRM) frameworks. PWD comprised 6.94% of the population of Bangladesh (Bangladesh Bureau of Statistics, 2016).

Following international guidance, Bangladesh adopted disability-specific pandemic management strategies. The qualitative research investigates whether the current safeguard measures are adequate for disability protection during the COVID-19 pandemic in Bangladesh.

The chapter critically examined the extent of disability protections in the pre-pandemic DRM frameworks and COVID-19 specialized plans by analyzing the existing laws, guidelines, and strategies. Necessary secondary sources like books, journals articles, and newspaper reports were analyzed to assess disability situations amid the pandemic. The chapter is divided into three parts; introduction, main body, and conclusion. The main body first elaborates on the development of disability rights and the evolution in Bangladesh. Then, pre-pandemic national, regional, and global disaster risk management (DRM) strategies are discussed. International and national pandemic response strategies are subsequently analyzed. Accessibility of disability rights during the pandemic in Bangladesh is also critically examined. Finally, the key findings are summarized.

Even though the national disaster strategies mandated disability inclusion, the implementation framework was inadequate in Bangladesh. Hence, targeting and mainstreaming disability rights became challenging during the pandemic. Specialized pandemic strategies failed to protect PWD in the absence of extensive national planning and monitoring. As a result, the humanitarian impact of the COVID-19 pandemic was high among PWD in Bangladesh.

Disability and COVID-19 Pandemic

Development of Human Rights-Based Disability Models

The medical model was the most influential early model. Disability was a personal tragedy that needed social assistance for treatment and rehabilitation (Degener, 2016; Kayess & French, 2008; Schulze, 2010). The model solely relied on the afflictions caused by the impairments and the social help rendered to cure them. It segregated PWD from society and placed them on specialized schemes and welfare programs (Kayess & French, 2008). The other significant model was the social model, which regarded disability as a social construct (Degener, 2016; Kayess & French, 2008). The social prejudice against the PWD resulted in oppression, which needed to be rejected (Degener, 2016; Kayess & French, 2008). This model shifted the focus from impairments to social inclusion of disability (Degener, 2016; Kayess & French, 2008). It aimed at substantive equality by planning specialized and targeted arrangements for the PWD like flexible working hours, communication in accessible formats, compensation, assistance, etc. The disability rights movements have emerged from the social model and influenced the development of the UNCRPD. However, the UNCRPD is the primary outcome of the human rights model, which observes disability from a right-based approach. It views PWD as individuals with inherent human rights and ensures holistic social inclusion. Even

though this model concentrates on transformative equality, it does not negate substantive equality (Degener, 2016).

The UNCRPD made a paradigm shift from the welfare approach to a right-holder approach (Kayess & French, 2008), but it is not the first international document to secure disability rights. The Universal Declaration of Human Rights 1948 (UDHR), the International Covenant on Civil and Political Rights 1966 (ICCPR), and the International Covenant on Economic, Social, and Cultural Rights 1966 (ICESCR) safeguard some disability rights. The Committee on Economic, Social, and Cultural Rights (ESCR) declares that the PWDs are entitled to the human rights affirmed in the UDHR (General Comment No. 5, Para 34). The Convention on the Rights of the Child 1989 (CRC) and the Convention on the Elimination of All Forms of Discrimination Against Women 1979 (CEDAW) also highlight the rights of women and children with disabilities. Still, a comprehensive international document securing disability rights was absent till 2006. Some early efforts were made via the adoption of the World Program of Action Concerning Disabled Persons 1982 (WPA) and the UN Standard Rules on the Equalization of Opportunities for Persons with Disabilities 1993. The non-binding soft laws remain inadequate, and consequently, the UNCRPD was adopted in 2006.

Instead of creating new rights, the UNCRPD aligns the existing human rights with disability needs (Degener, 2016; Kayess & French, 2008). It upholds individual and collective equality (Article 3, 4 and 5) and highlights disability integration in the Sustainable Development Goals (SDGs) (Preamble para (g)). The PWDs often face disability-based discrimination, which nullifies their human rights (CESCR, General Comment No. 5, Para 15; UNCRPD, Article 2). Every state party to the UNCRPD is bound to eliminate disability-based discrimination and uphold disability rights in peace and crisis (Article 4, 5 and 11). Disability-integrated Disaster Risk Reduction (DRR) and Disaster Risk Management (DRM) frameworks are crucial to secure their rights and accessibility (Article 9(1), 10 and 11). Bangladesh, a party to the UNCRPD, is also obligated to uphold disability rights, especially during disasters and crises.

Development and Protection of Disability Rights in Bangladesh

The Constitution of Bangladesh secures the accessibility to fundamental rights by the PWD (Article 26, 44 and 102(2)) and guarantees equality and non-discrimination (Article 19, 27 and 28). It also endorses specialized laws for the vulnerable population to promote transformative equality (Article 28(4)). The Government of Bangladesh (GoB) is also duty-bound to facilitate their access to basic necessities and render adequate social security (Article 10, 11, 15, and 21). The first Disability Welfare Act 2001 was adopted in compliance with the constitutional obligation. However, it became ineffective due to inadequate remedial mechanisms (Mitsuhiko et al., 2014). Bangladesh ratified the UNCRPD in 2007 but took 6 years to enact the RPPDA in 2013. The RPPDA combines social and right-based models (Mitsuhiko et al., 2014). The Neurodevelopmental Disabled Persons Protection and Trust Act

2013 was also adopted for the social integration of persons with mental and intellectual disabilities.

The UNCRPD defines PWD as persons with long-term physical, mental, intellectual, or sensory impairments (Article 1). Disability arises from the interaction between the PWD and their attitudinal and environmental barriers (UNCRPD, Preamble Para (pp) (e)). The open-ended and evolving definition of disability creates scope to include diverse impairments within national legislation (Schulze, 2010). The RPPDA identifies disability as a prolonged and permanent physical, mental, intellectual, developmental, or sensory impairment that debars a person from full and equal participation in society (Section 2(9)). It also defines 12 types of disabilities, including autism, Down syndrome, multiple disabilities, etc. (RPPDA, Section 3–13). However, the RPPDA fails to cover permanent disabilities due to work injury, despite the UNCRPD inclusion (Article 1). Nevertheless, the list is not exhaustive, and the National Cooperation Committee can include new forms of impairments (RPPDA, Section 15).

The GoB established several committees at the national, district, and Upazila/city levels as per the RPPDA that collaborate with the Ministry of Social Welfare (MoSW) in preserving disability rights. Each committee plays a supervisory role over the subordinate committee, but their role in protecting disability rights in crises is ambiguous. Representation from females and the Organization of the Disabled Persons (DPOs) is ensured in these committees. Unfortunately, these committees have no reserved seats, especially for PWD, despite the UNCRPD mandate (Article 29). The RPPDA aims to create a national disability database (Section 31). The PWD, by themselves or via representatives, can apply to the local committees (City or Upazila) for their ID cards (RPPDA, Section 31(1) and Schedule, Rule 1). The Department of Social Services (DSS) under the MoSW has been collecting disability data since 2013. The Disability Information System (DIS) application is launched, and the Usage of PWD Data Policy 2021 is also adopted to aid data collection and usage. Unfortunately, the database is still incomplete.

The RPPDA intends to eliminate disability-based discrimination, which occurs when PWD are biased against and prevented from enjoying their rights due to their disability (Section 2(20)). The Act also provides a list of disability rights (Section 16) and ensures their access to justice (Section 2(17) and 38). The PWD (by themselves or by representation) can file a criminal case for specific offences to the Court of First Class Magistrate or seek compensation (Section 37 and 38). They are also eligible for legal aid (RPPDA, Schedule, Rule 12 read with Legal Aid Services Act 2000, Section 7(a) and Legal Aid Services Regulation 2014, Rule 2). Nevertheless, the framing of the rights is vague, and the Act lacks a functional remedial mechanism. The PWDs are entitled to priority protection during crises (UNCRPD, Article 11). The schedule lays a few disability-inclusive disaster guidelines for the GoB (Rule 13), but their priority protection is not guaranteed as a substantive right in the RPPDA. The guidelines mainly deal with priority protection in health, safe shelter, and recovery during disasters (Schedule, Rule 13) and lack extensive human rights protection in crises. The Act fails to define and clarify the nature and the extent of disability rights during crises.

The RPPDA is supposed to guide the GoB to secure disability rights during emergencies, which unfortunately is vague in the Act itself. The earlier COVID-19 pandemic response and management strategies had no disability-inclusive provisions without precise guidance. Before analyzing the national pandemic strategies, the paper briefly discusses the PWD integrated global and regional DRR and DRM guidelines before and during the pandemic.

Pre-pandemic Global and Regional Disaster Guidance

The DRR strategies aim for disaster resilience and sustainable development by reducing existing disaster risks (UN, 2016). The DRM is the application of DRR strategies to manage current and future disasters (UN, 2016). Effective and sustainable DRR and DRM frameworks consider the adverse effect of risks and humanitarian emergencies on PWD and emphasize their meaningful participation in assessment, planning, implementation, and monitoring (UNCRPD, pp(o), Article 4 and 11). Disability mainstreaming is also necessary for post-disaster management endeavors (UNCRPD, General Comment No. 2). Inclusive disaster planning targets and mainstreams disability at national and local levels. The Sendai Framework, the 2030 Agenda for Sustainable Development Goals (SDGs), and the UNCRPD provide key guidance to aid governmental action for disability-inclusive sustainable disaster planning. The COVID-19 pandemic is a large-scale biological hazard under the Sendai Framework (Para 15), hence the member states are duty-bound to follow Sendai guidance in the pandemic management. The Sendai Framework lays the blueprint to substantially reduce disaster risks by 2030 via people-centric and rights-based disaster management. It emphasizes equal and non-discriminatory disability participation in the DRM strategy (Guiding Principle (d)). The Dhaka Declaration on Disability and Disaster Risk Management 2015 and the Dhaka Declaration 2015 + 1 call for disability mainstreaming at the regional level in coherence with the Sendai guidance and SDGs (Dhaka Declaration, Declaration 2 and 7; Dhaka Declaration 2015 + 1, Declaration 1, 5, 6, and 7).

The Asia Pacific region is a disaster-prone area with 650 million PWD living at high risk during disasters (UNISDR, 2014). The Incheon Strategy to Make the Right Real for Persons with Disabilities in Asia and the Pacific 2012 attempts to implement the Sendai strategy in the region. It sets out ten disability-specific development goals for 2013–2022 and provides strategic guidance to the governments. The Action Plan to Accelerate the Implementation of the Incheon Strategy 2017 is also adopted to speed up regional implementation. The United Nations Office of the Disaster Risk Reduction (UNDRR) coordinates and evaluates Sendai implementation at international, regional, and national levels. The UNDRR recently passed a Strategic Framework 2022–2025 (SF 22–25) (UNDRR, 2021) to accelerate Sendai application in the post-pandemic world. The pandemic necessitates cross-border cooperation in planning, management, and targeted implementation. In this regard, the UN and the WHO circulated necessary guidance. The following part briefly discusses the disability-inclusive international pandemic management strategies.

Disability-Inclusive COVID-19 Preparedness and Response Plans

The WHO declared the COVID-19 pandemic under the International Health Regulations 2005 (IHR) in March 2020. A pandemic is an extraordinary public health-related event with a risk of transmission to other states that requires a coordinated international response (IHR, Article 1). The UN established a Crisis Response Management Team (CMT), and the WHO provided Strategic Preparedness and Response Plan (SPRP) at regular intervals. Based on SPRP, 170 countries have established national response plans and coordination mechanisms till January 2021 (WHO, 2021). However, the DRM capacity significantly varies in the least developed countries (LDCs) due to their systematic underinvestment in disaster management (UN, 2020f). The updated SPRP (operational till 31 January 2022) contains particular guidelines to assist the LDCs (WHO, 2021), and the UNDRR calls for global humanitarian financing (UNDRR, 2019, 2021). The initial required funding to successfully implement the Global Humanitarian Response Plan was \$10.3 billion, which increased exponentially (UN, 2020e). The developed countries financed approximately \$1.9 billion by March 2020 to the LDCs in prevention, control, treatment, and vaccination (UN, 2020f). Also, private individuals and international organizations have contributed more than \$ 95 million (UN, 2020f). Nevertheless, the funding and assistance remain inadequate in managing the crisis.

The primary responsibility for inclusive and resilient DRM lies in the individual state (Sendai Framework, Target (e); SF 22–25, Element 2; UNCRPD, Article 11). Several disability-integrated UN guidance (both international and regional) was issued to assist the member states (ESCAP, 2020; UN, 2020a, d). The UN also established a working group to promote disability integration in crisis response and funding (UN, 2020a). The International Labor Organization (ILO) provided a call for action for all the stakeholders (ILO, 2020c). The Inter-agency Standing Committee (IASC) extended specific guidelines for securing the accessibility to basic necessities, livelihood, and public services of the PWD (IASC, 2020). Besides, 138 countries made a joint statement for disability inclusion in their response and recovery plans (UN, 2020a). The PWD are more vulnerable in the LDCs (Schulze, 2010). These countries require special funding and assistance from international and development donors for their inclusion in disaster plans (UN, 2020f). Bangladesh, an LDC, also pledged for promoting PWD rights during the pandemic. The following part examines the inclusive response strategies in Bangladesh and their implementation during the pandemic.

Disability-Inclusive Pandemic Management Framework in Bangladesh

The national DRR framework includes risk assessment, planning, mitigation, and enhanced preparedness and cooperation (MoDMR, 2019). The DRM strategies aim at risk prevention, reduction, and management for a resilient future (MoDMR, 2019). The DRM framework of Bangladesh primarily consists of the Disaster

Management Act (DM Act) 2012, the National Disaster Management Policy (DM Policy) 2015, Standing Order of Disasters (SOD) 2019 (MoDMR, 2019), National Plan for Disaster Management (NPDM) 2016–2020 (MoDMR, 2017) and 2021–2025 (MoDMR, 2021), and Plan of Action to Implement Sendai Framework for Disaster Risk Reduction 2015–2030 (MoDMR, 2018). The Ministry of Disaster Management and Relief (MoDMR) is the epicenter of national disaster management framework implementation. The DM Act and Policy highlight disability prioritization in DRM plans (DM Act, Section 27 and DM Policy, Principle 2.2). The disaster management national and local committees under the MoDMR have disability representation and consultation in every stage of DRM (MoDMR, 2019). A comprehensive disability database is essential for inclusive DRM (DM Policy, Principle 10.3; SOD, Point 5.2.4), which is yet to develop in Bangladesh. The local committees under MoDMR prepare age, sex, disability, and occupation disaggregated lists for long- and short-term disaster planning (MoDMR, 2019). Unfortunately, the ministerial collaboration between the MoSW and MoDMR in identifying PWD at risk and securing disability rights has not been provided in the national DRM plans. The RPPDA, who guides the national DRM strategies in disability inclusion, also remain silent.

The Ministry of Health and Family Welfare (MoHFW) issued an official gazette declaring COVID-19 a public health emergency under the Infectious Diseases (Prevention, Control, and Elimination) Act 2018 in March 2020 (GoB, 2020b). However, the Act does not contain any disability specialized provision for emergencies. In the 31 points direction on 03 April 2020, the Prime Minister (PM) directed the MoDMR to keep the PWD in special consideration while distributing reliefs (GoB, 2020a). They will receive special humanitarian assistance during disasters under the Disaster Management (Fund Management) Regulation 2021. Unfortunately, their priority access to healthcare and basic necessities has not been highlighted in the direction. The first COVID-19 National Preparedness and Response Plan of March 2020 failed to include disability-specific provisions. Later, a revised and disability-inclusive plan, titled the Bangladesh Preparedness and Response Plan (BPRP) (MoHFW, 2020a), was issued. The BPRP includes targeted risk communication and adaptive service delivery plans for PWD (Plan 10). The MoHFW also circulated a specialized guideline for ensuring priority healthcare of the PWD as a high-risk group in compliance with the WHO guidelines (MoHFW, 2020b). Even though the general vaccination guidelines remain silent about PWD (MoHFW, 2020a), a new guideline for disability prioritization in vaccination was issued in 2021 (MoHFW, 2021).

The earlier national pandemic guidelines failed in disability consideration. The ambiguity in the RPPDA regarding the extent of disability protection during crises contributed to their invisibility in the national pandemic management strategies. The NPDM of 2016–2020 mandated PWD-inclusive disaster recovery and rehabilitation strategies with no clear outline (MoDMR, 2017). Bangladesh has learned from the mistakes, and the NPDM for 2021–2025 plans a disability-inclusive futuristic DRM that aligns with the Sendai Framework and Dhaka Declaration 2015+1 (MoDMR, 2021). A PWD national task force was formed in 2020 to collaborate with the

MoDMR for disability mainstreaming and targeting during the pandemic (MoDMR, 2020a). Several government guidelines stressed cooperation with DPOs/NGOs and disability advocacy groups in implementing and monitoring disability-integrated pandemic plans (MoDMR, 2020a, 2021; MoHFW, 2020b). The following part critically analyzes the implementation of the disability-inclusive COVID-19 government strategies in different sectors in Bangladesh.

Implementation of Disability Targeted COVID-19 Strategies in Bangladesh

Priority access to health and daily necessities, disaster information, social security and aid, safe shelters, strong employment protection etc. are preconditions to the independent living of the PDW during crises (UNCRDP, Article 9 and 11). Bangladesh adopted disability-inclusive pandemic management strategies to secure their access to independent living requirements. The following part analyzes these strategies and examines the implementation.

Healthcare

The PWDs are entitled to access emergency healthcare amid the pandemic, and a denial constitutes disability-based discrimination (UNCRPD, Articles 2, 11 and 25). Due to patient influx, health services have been disrupted worldwide (UN, 2020e; UNICEF, 2020a). Discriminatory triage protocols (which devalued their life), limited access to treatment, physical barriers in accessing hospitals, inaccessible health formation etc. exacerbated the condition of the PWD (IASC, 2020; UN, 2020a; UNDESA, 2020). The states are duty-bound to prioritize and target disability healthcare (physical and mental) via priority treatment and COVID-19 testing, specialized telehealth services, hotlines, etc. (IASC, 2007, 2020; UN, 2020a; WHO, 2020, 2021). Mass vaccination campaigns should also list them as a priority group (International Disability Alliance, 2020).

PWD in Bangladesh are also entitled to emergency medical care during the pandemic (RPPDA, Section 16 (k) and (l) and Schedule, Rule 3, 5 and 13). The National Health Policy 2011 aims to establish a PWD-specialized health service mechanism (Strategy 31), which is yet to be formulated. Disability should be prioritized in emergency healthcare (physical and mental) and COVID-19 testing (MoHFW, 2020b). The specialized health guideline assisted the caregivers and health workers to follow extra precautionary measures to eliminate the risk, as the PWDs are more prone to COVID-19 infection (MoHFW, 2020b). Necessary training should be rendered to the health workers to cater to disability needs (MoHFW, 2020b). The GoB should ensure PWD accessibility to life-saving medication, infection prevention equipment (PPE, hand sanitizer, gloves), and telehealth facilities (MoHFW, 2020b). Even though the general vaccination guideline fails to address disability, later guidance was issued for their prioritization (MoHFW, 2020a, 2021).

The health sector of Bangladesh was overburdened during the pandemic (Needs Assessment Working Group, 2020). PWD have faced more challenges in accessing emergency healthcare as the health system is not disability-inclusive (Begum, 2022; Hasan et al., 2021; Hossain et al., 2020; Needs Assessment Working Group, 2020). The lack of trained healthcare professionals and their unempathetic behaviors increased hardships (Begum, 2022; Hasan et al., 2021). Sadly, the disability disaggregated infection, health service accessibility, and vaccination data are absent. The lack of data made the disability risk and impact assessment even more challenging.

Accessible disaster and disease information is a disability right (UNCRPD, Article 9, 11 and 21; RPPDA, Section 6, 13, 16(d)). The disease information must be circulated in multiple and accessible formats, and community groups should be involved in rapid and targeted outreach (IASC, 2020; UN, 2020d; UNDESA, 2020; UNICEF, 2020b). Bangladesh aimed to circulate disability-inclusive health information via sign language, telecast, pictures, braille, caption, etc. (MoDMR, 2019; MoHFW, 2020b). Rapid circulation of the disease information was done via micing and involving local and religious leaders (MoDMR, 2020a). Cell phone calls introduced a voice warning system about the COVID-19 hygiene protocols. However, the risk-information dissemination remained inadequate for the technologically advanced PWD (Das et al., 2021). Specialized funding was not allocated for disability targeted information circulation. Emergency national hotlines (333 or 16263) provided free telehealth services (MoDMR, 2020a; MoHFW, 2020b), though no disability disaggregated data of the service recipient was found. Moreover, the national health helplines were not accessible to all types of PWD, and no disability-specialized health helpline was launched.

Basic Necessities, Housing, and Education

The PWD are entitled to undisrupted access to food, life-saving medication, wash and hygiene supplies, etc., during disasters (UNCRPD, Article 19 (b); ICESCR, General Comment No. 12; RPPDA, Section 16(f) and 34). Their access to assisted living facilities was disrupted during the lockdown measures (Center for Inclusive Policy, 2020; Women Enabled International, 2020). Argentina, Colombia, Panama, and the UK launched adaptive service delivery systems and community support networks (UN, 2020a). Bangladesh also aimed to establish specialized service delivery points, food aid delivery to households, and help centers for PWD priority access (MoDMR, 2020a; MoHFW, 2020b). Unfortunately, the relief distribution failed to prioritize disability, and many could not access the delivery points due to physical barriers (Diba & Zakaria, 2020). Around 93% of the registered PWD did not get governmental aid and food support due to corruption and mismanagement (Das et al., 2021; Diba & Zakaria, 2020; Hasan et al., 2021). No adaptive delivery service has been developed, and accessing government aid was challenging for them. Maintaining physical distancing in the slum areas remained challenging in Bangladesh, and the slum-dwellers faced increased health risks (Bhattacharya et al., 2021a). Unfortunately, no disaggregated data of infection on the slum-dwelling

PWD were found. Overall, the basic needs of the PWD remain almost neglected during the pandemic.

PWD struggled with uninterrupted Internet connections, accessible learning materials, braille and captioning support, etc., in remote learning (IASC, 2020; UN, 2020a; UNICEF, 2020a). They are entitled to accessible education during disasters (UNCRPD, Article 24; RPPDA, Schedule, Rule 5(5) and 9). The GoB allocated 34.82 crore taka for the schools for disabled children in the 2021–2022 budget (Ministry of Finance, 2021). Still, the number of sign language instructors is inadequate (Mizan, 2021). Their right to education amid the pandemic should be facilitated via accessible remote learning (MoHFW, 2020b). Bangla braille software and text to speech facility were adopted (Mizan, 2021). Class 6–10 courses were telecasted on the national TV channels due to inaccessible and expensive Internet connections (Chowdhury, 2020). Unfortunately, the telecasts were not disability-inclusive (no captioning or sign language). Expensive Internet connections and inaccessible distance-learning measures made many students with disabilities drop out (Bhattacharya et al., 2021a). Hence, the targeted governmental efforts were inadequate for the education of PWD.

Employment

The economic resilience of the PWD drastically declined as many were laid off (ILO, 2020a; UN, 2020c; WHO, 2020). The UNCRPD secures their right to work (Article 27). The Vocational Rehabilitation and Employment (Disabled Persons) Convention 1983 and the Recommendation on Employment and Decent Work for Peace and Resilience (Recommendation no. 205) call for their work opportunities in crisis. Unfortunately, Bangladesh is not a party to any of these ILO Conventions. The UN Guiding Principles on Business and Human Rights highlight employers' responsibility in securing PWD rights (UN, 2011). Some employers adopted special arrangements like telework, paid leave, flexible working, etc., as accessible workplace arrangements (ILO, 2020a). Still, remote working was challenging without braille and sign language-based software and accessible equipment (ESCAP, 2020; ILO, UNICEF, UNPRPD, & IDA, 2020; ILO, 2020b).

The PWDs in Bangladesh are entitled to get employed without discrimination (RPPDA, Section 16(1)(i) and 35(1)). The GoB and employers should be involved to make workplaces accessible for the PWD (leave, telework, special work arrangements, etc.) during the pandemic (MoHFW, 2020b). However, more than 70% were unemployed at the onset of the pandemic, and their economic condition declined (Bhattacharya et al., 2021a, b). The GoB initiated a special subsidy, and the PM declared a special stimulus package for the RMG industries. Still, the RMG owners refused to pay and fired workers due to decreased production and international contract cancellation (Hasan et al., 2021; Hossain, 2021; Kabir et al., 2021; Mizan, 2021). The RMG industries are the largest job market for PWD. Unfortunately, no disability disaggregated data has been found for the RMG workers with disabilities, but it is doubtful that the financial assistance reached them. Moreover, most PWDs are involved in informal work with no job security, and many were

unemployed during the pandemic (Das et al., 2021; Hossain, 2021). As a result, they fell into extreme poverty.

Social Security Measures

Social protection measures are the targeted policies and programs for vulnerable groups (ILO, 2017). Less than 20% of PWD have access to social security measures in LDCs during the pandemic (Durán Valverde et al., 2019), even though they are entitled to priority social protection (UNCRPD, Article 28 and 11; RPPDA, Schedule, Rule 11). Bangladesh has a disability-inclusive social safety net program predating the pandemic. The GoB aims to provide a monthly allowance of 750 taka to 1 million PWD below 59 years and 3000 taka above 60 years under the National Social Security Strategy (GoB, 2015). The budget for 2021–2022 allocated 1820 crore taka to the MoSW to be disbursed among 20.08 million PWD (Ministry of Finance, 2021). The PM declared special humanitarian aid for the vulnerable groups, including PWD (MoDMR, 2020b; MoHFW, 2020b). The MoDMR issued the Disaster Management (Fund Management) Regulations 2021 and convened a committee to supervise the process (MoDMR, 2020b). The local committees under the MoDMR prepared lists of PWD for targeted support (MoDMR, 2020b), as a comprehensive database is absent. Even though the PM directed fair distribution of the aid (GoB, 2020a), many listed PWD were excluded due to corruption (Das et al., 2021; Diba & Zakaria, 2020; Hasan et al., 2021). Many PWD in rural areas remained unaware of the special aid (Das et al., 2021). A detailed and disaggregated database of aid disbursement cannot be found. Without a targeted and practical disbursement mechanism and proper monitoring, the financial support failed to reach them.

Intersectional PWD and Their Vulnerability

The UNCRPD is the pioneering document to protect the diverse range of PWD from compounded discrimination (pp (i), Article 3, 6, 7). Nonetheless, age, gender, poverty, disability, etc. exacerbated the risk during the pandemic (WHO, 2020; Women Enabled International, 2020). Women, children, and older persons with disabilities remained within the high-risk groups (UN Women, 2020; UNFPA, 2020). Besides, the older PWD with comorbidity were deprioritized in triage protocols (IASC, 2020; UN, 2020a, b). Social services for children with disabilities were substantially decreased (UNICEF, 2020a). The GBV against PWD escalated without proper assistance and legal remedy (UN Women, 2020; UNDESA, 2020; UNFPA, 2020).

Sustainable DRM strategies cover all forms of intersectionality and impairments (UN, 2020a, d; UNFPA, 2020). Bangladesh mandates priority protection for women and children with disabilities in disasters and post-disaster rehabilitation (National Children Policy 2011, Policy 6.8, 6.9 and 6.12; National Women Development Policy 2011, Objective 37.3; RPPDA, Schedule, Rule 8, 12, 13). The RPPDA guarantees GBV free environment (Section 16 (k) and Schedule, Rule 12), but the PWD increasingly became victims of GBV during the pandemic (Bhattacharya et al., 2021a; Needs Assessment Working Group, 2020). The special national helplines

(333 and 999) are not disability-integrated. Bangladesh failed to launch a specialized helpline for PWD, despite the mandate of the GoB. The social inequalities suffered by women and children intensified during the pandemic (Bhattacharya et al., 2021a; Das et al., 2021; Diba & Zakaria, 2020; Needs Assessment Working Group, 2020). Females with disabilities were more discriminated against while accessing basic necessities than their male counterparts (Das et al., 2021). The PWD standing at intersectionality became exposed to further discrimination and social exclusion.

A comprehensive disability disaggregated database enables the countries to design better DRM strategies, render tailored support, and assess implementation (IASC, 2020; UN, 2020a; UN Women, 2020; UNDESA, 2020; UNFPA, 2020). The UNCRPD also advocates for a database for better policy application (Article 31). Unfortunately, a detailed disability database is absent, which made extensive COVID-19 impact analysis on the PWD impossible. The following part summarizes the findings of the above discussion.

Findings

Sustainable national DRM frameworks cover all forms of impairments in compliance with the UNCRPD, the Sendai Framework, and other international and regional disaster response standards. However, the fatality of the COVID-19 pandemic went beyond the DRM capacity of Bangladesh. The implementation framework was inadequate in targeting and mainstreaming disability needs. The RPPDA failed to guide the national DRM strategies in disability inclusion, and the ambiguity has resulted in PWD invisibility in the early national pandemic management strategies. Nonetheless, several disability-integrated guidelines were published later. The existing DRR and DRM frameworks lack adequate PWD representation in disaster decision-making and monitoring. The disability targeted funding was insufficient as well. Bangladesh has learned from its mistakes and plans to invest in disability-integrated DRM to build back better. A comprehensive database with age, sex, and disability disaggregated data substantiates tailored governmental support in disasters. Even though the GoB aims to create a national disability database, the registration process is yet to complete. The lack of disability data hampered the pandemic impact analysis in Bangladesh. The GoB should take proactive steps to finalize the national disability database for resilient and inclusive disaster management.

The pandemic prevention measures inadvertently affected the PWD and deprived them of disability rights. Without proper monitoring and implementation, they faced disability-based discrimination despite priority guidelines. The PWD are more prone to COVID-19 infection and are entitled to priority healthcare. Bangladesh failed to create a disability-inclusive health system. During the pandemic, the health workers also lacked adequate training to deal with diverse PWD. The disease information was transmitted in multiple formats and via community engagement at the local levels. Still, the technologically disadvantaged PWD face hurdles in accessing information. The absence of disability disaggregated health and vaccination data highlights their invisibility in the health sector.

The GoB prioritized the PWD in government cash and food aid and aimed to create specialized delivery systems. However, no adaptive delivery system has been launched so far. Many faced physical barriers in accessing service delivery points of governmental aid. Even though the slum-dwellers were at increased risk of COVID-19 infection, no disability disaggregated data on the slum-dwelling PWD were found. The GoB allocated funds to specialized and accessible education for children with disabilities. However, distant learning during the pandemic became extremely difficult due to expensive remote learning mechanisms. The PWDs are entitled to non-discriminatory behaviors at work. Nonetheless, many were fired from work during the pandemic and fell into extreme poverty. Special governmental assistance was declared, of which they remain unaware. No disability disaggregated data regarding the disbursement of the allowances can be found. Many registered PWD were excluded from receiving governmental assistance due to corruption, and proper monitoring for fair disbursement was absent.

The GoB planned for specialized and accessible hotlines for the PWD for fast support. However, no specialized helpline was launched, and the existing national helplines were not disability-inclusive. Women and children with disabilities endured greater risks of GBV. They also faced more discrimination in accessing their rights than their male counterparts. The Covid-19 pandemic revealed the weakness of the existing DRM and the vulnerability of the PWD during crises. Despite disability-integrated pandemic guidance, their social exclusion was pronounced.

Conclusion

The PWD sustained higher risks during the COVID-19 pandemic, and their disability rights were neglected in Bangladesh. While the GoB adopted disability-inclusive response strategies, the lack of implementation frustrated the objective. Unavailable health and support services, unemployment, inadequate government assistance, and corruption in aid disbursement created an unfavorable situation for the PWD. A comprehensive risk assessment based on disaggregated data can substantiate the national DRM, which is still absent in Bangladesh.

Disability-integrated DRM requires additional funding, which Bangladesh is willing to invest. Nonetheless, Bangladesh needs technical and financial assistance from international development donors and business corporations to build back better. The response and recovery plans also require a multi-stakeholder collaboration among GoB, private actors, DPOs, and the local community. Sustainable crisis response plans should be inclusive, informed, transparent, and accountable. PWD representation in crisis decision-making and monitoring ensures their access to rights during risks. Bangladesh needs disability-integrated long-term DRM plans and proper monitoring for future crises. The lesson learnt from the COVID-19 pandemic can help to secure disability rights and guarantee their resilience in future disasters.

Abstract

Disaster risk reduction (DRR) is comparatively a new approach to dealing with disasters that aims at preventing new and reducing existing disaster risk and managing residual risk for strengthening disaster resilience by involving a broad range of stakeholders, both public and private across the full cycle of disasters. The efficiency of a DRR planning depends on the proper functioning of these stakeholders (both actors and beneficiaries). Beneficiaries need to be capable of asking for their entitlements, whereas the actors need to be answerable for their performance. This ultimately requires empowerment of the beneficiaries and accountability of the actors. Although DRR instruments contain provisions for encouraging participation of beneficiaries and guidelines for actors, these lag behind in ensuring empowerment of the beneficiaries and accountability of the actors. On the other hand, disasters whether natural or man-made affect the enjoyment of a range of human rights of the affected population. This matter is evident from a number of International Human Rights Law (IHRL) cases

admitted in numerous instruments of IHRL. However, DRR discipline fails to provide provisions for protecting human rights in disaster situation. In such a backdrop, this chapter recommends the application of IHRL in DRR planning and shows how IHRL can contribute to better DRR planning. The chapter found that the use of IHRL can assist in empowering the beneficiaries and ensuring the accountability of the actors, thereby resulting in an effective DRR planning. In addition, such integration of IHRL in DRR planning would safeguard the enjoyment of human rights of all concerned in a disaster setting.

Disaster risk reduction (DRR) · Human rights · International Human Rights Law (IHRL) · Accountability · Empowerment

Introduction

Men's struggle with disasters is not new though the contemporary concept of "disaster" is relatively new. Disaster is defined as "a serious disruption of the functioning of a community or a society involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources" (UNISDR, 2009, p. 9). While the earlier concept of disaster only meant the occurrence of natural hazards like earthquakes, floods, tsunamis, hurricanes, landslides, and forest fires, the present concept of disaster is described as a result of the intersection of four components (Lazarevski & Gjorgon, 2017): (i) happening of a hazard (hazard means any dangerous phenomenon, substance, human activity, or condition that may cause loss of life, injury, or other health impacts, property damage, loss of livelihoods and services, social and economic disruption, or environmental damage, UNISDR, 2009, p. 17); (ii) exposure of people, property, and other systems to a hazard; (iii) vulnerability (potentials of damage) due to exposure to a hazard; and (iv) coping capacity and resilience of people, organizations, and systems, using available skills and resources, to face the adverse effects of the hazard and recover from the effects of a hazard in a timely and efficient manner.

Globally, losses caused due to disasters (numbers of people died, number of people affected, and losses of economic, social, and environmental assets) are on the increase. For example, during the period 2000–2019, 7348 major disaster events were recorded, causing the deaths of 1.23 million people and affecting 4.2 billion people, which resulted in approximately US\$2.97 trillion in global economic losses (UNDRR, 2020, p. 6). This was a sharp increase over the previous 20 years (1980–1999) when 4212 disasters were recorded, claiming about 1.19 million lives and affecting 3.25 billion people with economic losses of approximately US\$1.63 trillion (UNDRR, 2020, p. 6). With this increase in the number of disasters and consequent havoc, there have been relentless efforts to cope with disasters. Over the years, such efforts become proactive envisioned to reduce the risks and minimize

the impacts in comparison to an earlier reactive approach focused on consequent recovery arrangements. This, in turn, gives rise to the concept of DRR, a proactive approach to disaster management (Rawinji, n.d.). Though DRR plans comprise different targets, priorities for action, and guiding principles, they often fail to bring about material changes in reducing the consequent havoc caused by disasters, including infringement of a range of human rights of the affected population. In such context, it is expected that the incorporation of IHRL that comprises numerous concepts, instruments, standards, and principles designed to protect human rights can contribute to formulating a better DRR plan.

Accordingly, this chapter will focus on the possible implications of integrating IHRL in DRR planning. The chapter is divided into five sections. After the introductory section, the second section will discuss the concept of DRR and the IHRL framework in brief. This will be followed by the third section addressing the interface between disasters and human rights. The next section will highlight the potential benefits of integrating IHRL concepts, principles, and standards in DRR planning. This will follow the conclusion, thereby summarizing the whole chapter.

Brief Overview of DRR and IHRL Framework

DRR: From Reactive to Proactive Approach

DRR stands for the “concept and practice of reducing disaster risks through systematic efforts to analyze and manage the causal factors of disasters, including through reduced exposure to hazards, lessened vulnerability of people and property, wise management of land and the environment, and improved preparedness for adverse events” (UNISDR, 2009, pp. 10–11). It aims at “preventing new and reducing existing disaster risk and managing residual risk, all of which contribute to strengthening resilience and therefore to the achievement of sustainable development” (UNGA, 2016, p. 16). As stated by Lazarevski and Gjorgon (2017), this notion did not come overnight, rather moved from a narrowly perceived technical discipline of the 1990s, to a broad-based global movement of the 2000s focused on sustainable development.

The journey started in 1989 with the United Nations General Assembly (UNGA) proclamation declaring the 1990s as the International Decade for Natural Disaster Reduction (IDNDR) that aimed at improving mutual capacity for (i) mitigating the effects of natural disasters, (ii) assessing potential disaster damage, and (iii) establishing early-warning system and disaster-resistant structures. This clearly demonstrates the reactive nature of early attention being paid to disasters by the international community. The IDNDR was reviewed in 1994 at the First World Conference on Natural Disaster Reduction, thereby adopting the Yokohama Strategy for a Safer World: Guidelines for Natural Disaster Prevention, Preparedness and Mitigation and its Plan of Action (Yokohama Strategy) (Lazarevski & Gjorgon, 2017). This instrument acknowledged that disaster response is not sufficient, rather prevention is vital for lasting improvement in fighting disasters and urged states to

develop and strengthen national capacities in this regard. In furtherance of the Yokohama Strategy, the UNGA established the UN International Strategy for Disaster Reduction (UNISDR) in 1999 for coordinating the disaster reduction activities of the UN system and other regional organizations (Lazarevski & Gjorgon, 2017).

The next breakthrough in the development of DRR notion is the adoption of Hyogo Framework for Action 2005–2015: Building the Resilience for Nations and Communities to Disaster (HFA). Unlike its predecessor, the HFA puts emphasis on a more proactive approach to disasters (HFA, para 8). It favored a strategic and systematic approach to reducing exposures to hazards by developing stronger institutions, mechanisms, and capacities to build resilience (Bartolini & Natoli, 2018). Accordingly, five priorities were identified for action, namely, (i) make DRR a national priority with a strong institutional basis for implementation; (ii) identify, assess, and monitor disaster risks and enhance early warning; (iii) use knowledge, innovation, and education to build a culture of safety and resilience at all levels; (iv) reduce underlying risk factors; and (v) strengthen disaster preparedness for effective response at all levels (Lazarevski & Gjorgon, 2017).

Following the midterm review of 2011, some major gaps were identified in HFA along with progress made in some areas such as passing of national legislations, establishment of early-warning systems, and strengthening disaster preparedness and response (IISD, 2011). The major gaps pointed out were lack of systematic multihazards risk assessments and early-warning systems taking into account social and economic vulnerabilities; poor integration of DRR into sustainable development policies and planning at national and international levels; nonintegration of climate change adaptation and DRR at the national and local levels; and the insufficient level of implementation of the HFA at the local level (IISD, 2011). As such, the UN Conference on Sustainable Development (2012) called for a more integrated approach in DRR in the context of sustainable development (Bartolini & Natoli, 2018).

All these reviews culminated in a fresh start in 2015 with the adoption of a new framework in DRR, the “Framework for Disaster Risk Reduction 2015–2030” during the third World Conference on DRR (Sendai Framework) having 7 targets, 4 priorities for action, and 13 guiding principles. The Sendai Framework has some distinctiveness compared to the earlier instruments on DRR such as emphasis on effective disaster risk management as opposed to earlier disaster management; broadening of scope of DRR to cover all kinds of natural-man-made hazards, as well as related environmental, technological, and biological hazards and risks; recommendation of multihazard management of disaster risk at all levels as well as within and across all sectors; encouragement of participation of all relevant stakeholders, including women, children, and youth, persons with disabilities, poor people, migrants, indigenous peoples, volunteers, the community of practitioners and older persons in the design and implementation of policies, plans, and standards; importance on reducing existing vulnerability to disaster and to prevent the creation of new risks by strengthening disaster resilience; clarification of state responsibility for DRR by calling for all-of-state institutions’ engagement; and emphasis on implementation of integrated and inclusive economic, structural, legal, social,

health, cultural, educational, environmental, technological, political, and institutional measures for preventing and reducing hazard exposure and vulnerability to disaster (Lazarevski & Gjorgon, 2017).

In spite of having the abovementioned innovations in Sendai Framework, concerns are raised by experts that it may fail to achieve its targeted goals due to some factors such as nonbinding nature of the instrument that encourages states to follow the guidelines but cannot bind them; lack of concrete indicators for tracking progress toward its goals; and noninclusion of institutional mechanisms to monitor the implementation (Lazarevski & Gjorgon, 2017).

IHRL Framework

IHRL, as a form of international law, mainly comprises a series of binding treaties, customary international laws, and other nonbinding instruments such as declarations, guidelines, and principles adopted since 1945 conferring legal form on inherent human rights. Emergence and continuous development of IHRL in the international spheres are seen as one of the most significant developments after the end of Second World War (Rehman, 2010). Development in this area of law has different dimensions such as conceptual dimensions (evolution and development of different concepts centering on human rights), legislative dimensions (adoption of different legal instruments at the international, regional, and national levels on human rights issues), and institutional dimensions (emergence of different institutions and forums at the international, regional, and national levels working on human rights). Among all these dimensions, two specific features of conceptual dimensions, i.e., “right-holder and duty-bearer” concept and “right to life as an all-encompassing right” concept will be highlighted in the context of this study.

Right-Holder and Duty-Bearer Concept

In IHRL, every human right entails a claim of entitlement (either individually or collectively) and a corresponding duty toward that right; accordingly, each right reflects a normative relation between a right-holder and a duty-bearer, pertaining to a protected object (Besson, 2015). Claim of entitlement implies that the rights-holders are empowered to claim their rights. Empowerment requires observance of at least three principles: participation, access to information, and nondiscrimination (da Costa & Pospieszna, 2015). Here, participation denotes active, free, and meaningful participation of the rights-holders in the process of realization of the rights; access to information implies easy access to the requisite information for claiming the rights; and nondiscrimination connotes identical treatment in the process of fulfillment of the rights irrespective of gender, economic status, social condition, color, language, race, or other factors (da Costa & Pospieszna, 2015).

Regarding duties toward human rights, duty-bearers’ duties are to respect, protect, and fulfill human rights, i.e., both negative duties and positive duties (General

Comment (GC)3, 1990, which has been subsequently replaced by GC 31, 2004). The obligation to respect implies noninterference with the enjoyment of human rights; the obligation to protect requires preventing human rights abuses; and the obligation to fulfill requires taking positive action to facilitate the enjoyment of human rights.

As a branch of international law, IHRL mainly obliges territorial states, i.e., states are the primary duty-bearers within their territories under IHRL. By becoming parties to IHRL treaties, states bind themselves to carry out the responsibilities under those instruments by putting in place requisite local actions. Accountability of the states as duty-bearers is also ensured under IHRL framework by different mechanisms and procedures such as individual complaints or communications, state reporting procedure followed by issuance of concluding observations, and Universal Periodic Review (UPR) (Carraro, 2019).

Along with this traditional state-centric duty-bearer concept of IHRL, another concept “multi duty-bearer” has evolved in recent times, as stated by Vandenhove & van Genugten (2015, p. 1) that “[h]uman rights law has to move beyond territoriality as the main criterion for assigning human rights obligations.” The concept has emerged in order to bring nonstate actors, like corporations and international organizations, within the purview of IHRL as sometimes they are in a position to greatly affect individuals’ enjoyment of their human rights (Destrooper & Mbambi, 2017; Altwicker, 2018; Lane, 2018). Example of recognition of this concept at the international level is the endorsement of the UN Guiding Principles on Business and Human Rights by the UN Human Rights Council in 2011, which was developed by the Special Representative of the Secretary-General John Ruggie on the issue of human rights and transnational corporations and other business enterprises. This instrument affirms that corporations doing businesses have their own human rights responsibilities distinct from states (Lane & Hesselman, 2017).

Right to Life: An All-Encompassing Right

Right to life, as a form of civil and political (CP) rights, has been protected by all international and regional human rights instruments such as Universal Declaration of Human Rights (UDHR), art. 3; International Covenant on Civil and Political Rights (ICCPR), art. 6(1); European Convention on Human Rights (ECHR), art. 2; American Convention on Human Rights (ACHR), art. 4; and African Charter on Human and Peoples’ Rights (AFCHPR), art. 4. Originally this right was put in place as a right guaranteeing prohibition of arbitrary deprivation of life (Rehman, 2010). However, by way of wider interpretations by international-regional supervisory bodies and national courts, this right has subsequently emerged as a basic right, the enjoyment of which is a prerequisite for the enjoyment of all other human rights (Przetacznik, 1976; GC 36, 2019, which is adopted replacing the earlier two GCs of the 1980s on right to life). Nonderogability of this right in any circumstance is also recognized, as stated in GC 36: “It is the supreme right from which no derogation is permitted even in situations of armed conflict and *other public emergencies*

(emphasis added) which threatens the life of the nation" (GC 36, para. 2). The scope of this right is broadened to include "right to a healthy environment" and "right to peace" (Ramcharan, 1983). In addition, right to life is interpreted as a right to live a quality life, i.e., life with dignity in numerous cases. Examples include *Munn v. Illinois*, 1877; *Maneka Gandhi v. Union of India*, 1978; *Francis Coralie v. Union Territory of Delhi*, 1981. This is also confirmed in GC 36.

Even this right works as a gateway for enforcing a range of economic, social, and cultural (ESC) rights. For example, while dealing with a case regarding workers' protection from occupational health hazards and diseases employed in asbestos industries, the Supreme Court of India applied article 21 of the Indian Constitution comprising right to life. The Supreme Court held that the "right to health, medical aid to protect the health and vigour to a worker while in service or post-retirement is a fundamental right under Article 21, read with Articles 39((e), 41, 43, 48-A and all related articles and fundamental human rights to make the life of the workman meaningful and purposeful with dignity of person" (*Consumer Education & Research Centre and Others v. Union of India and Others*, 1995, para. 27). A similar instance is found in the case, *Chairman, National Board of Revenue (NBR) v. Advocate Zulhas Uddin Ahmed and others* (2010), where the Supreme Court of Bangladesh (Appellate Division) considered right to medical care as part of right to life contained in article 32 of the Bangladesh Constitution and held imposition of Value-Added Tax (VAT) on certain health services as contrary to the provision of the constitution. Thus, it is an established position that right to life is an all-encompassing right, and that the safeguarding of this right is crucial for the enjoyment of the entire range of CP and ESC rights (Ramcharan, 1983).

From the above discussions in this section, it may seem that DRR and IHRL deal with two distinct subject matters; DRR dealing with disasters and IHRL dealing with human rights. In reality, these two subject matters interface in some respects, which will be highlighted in the next section.

Interface Between Disasters and Human Rights

The interface between disasters and human rights lies from two perspectives. Firstly, havoc caused by disasters can result in infringement of a range of human rights. Examples include right to life, privacy, property, housing, and livelihoods (da Costa & Pospieszna, 2015; Sommario & Venier, 2018). Lewis and Maguire (2016) showed this relationship referring to the 2004 Tsunami that struck the coastline around the Indian Ocean on December 26, 2004. Millions of people were affected by this disaster. Disruptions to basic services, food, water, shelter, and health care were caused to those who survived the tsunami. In addition, the disaster left them vulnerable to a variety of other human rights abuses, including human trafficking, sexual and gender-based violence, arbitrary arrests, and discrimination in the distribution of aid (Lewis & Maguire, 2016, pp. 346–47). Secondly, in both cases, state is the primary duty-bearer, i.e., state has the primary responsibility to prevent and

reduce disaster risk (Sendai Framework, para. 19) and to protect, respect, and fulfill human rights (GC 31, 2004, para. 6).

As to addressing the interface between disasters and human rights, disaster discourses stand far behind than the human rights discourses. Human rights issues have expressly been mentioned only in the recent Sendai Framework, which spells that one of the aims of DRR is “to protect persons and their property, health, livelihoods and productive assets, as well as cultural and environmental assets, while promoting and protecting all human rights, including the right to development” (Sendai Framework, para. 19).

Though IHRL does not provide any specific right of protection from disasters, the linkage between disasters and human rights has been addressed adequately in different instruments and judicial decisions. For example, in Res. 22/16 adopted by the Human Rights Council it is acknowledged that “human rights and fundamental freedoms of millions of people around the world are affected in different ways by humanitarian crises, including armed conflict, *natural disasters and man-made disasters* (emphasis added), as well as during the stages of recovery, relief and rehabilitation” (UNGA Res. 22/16, preamble). In GC 36 on right to life, the Human Rights Committee clarifies that states’ duty to protect life implies that “states parties should take appropriate measures to address the general conditions in society that may give rise to direct threats to life or prevent individuals from enjoying their right to life with dignity” (GC 36, para. 26). Such appropriate measures should include, among others, the development of contingency plans and disaster management plans designed to increase preparedness and address natural and man-made disasters, which may adversely affect enjoyment of the right to life, resulting in disruption of essential services (GC 36, para. 26).

In four landmark cases based on right to life (article 2 of the European Convention on Human Rights) – *Öneryildiz v. Turkey* (2005); *Kolyadenko and Others v. Russia* (2013); *Budayeva and Others v. Russia* (2014); and *Ozel and others v. Turkey* (2015) – the European Court of Human Rights found violation of state obligation under article 2 of ECHR in disaster situations.

Among these cases, the case of *Budayeva and Others v. Russia* is the most remarkable one. The case concerned a large-scale mudslide that had happened between July 18–25, 2000, in the town of Tyrnauz causing eight deaths, including the death of relatives of one of the applicants and other casualties. The applicants alleged that the Russian authorities failed to take timely and effective preventive measures, including warning the local population, implementing evacuation and emergency relief policies to halt the havoc and after the disaster, carrying out a judicial inquiry for assessing the responsibilities for the incident. The court found Russia responsible for violation of article 2 of ECHR on both counts, i.e., breach of article 2 in its substantive and procedural aspects. Firstly, the court found violation of substantive aspects of right to life under article 2 due to the failure of the authorities to take timely and effective preventive action. Secondly, the court determined that the lack of state inquiry of the incident also constituted a violation of procedural aspects of article 2. In this case, the court affirmed the duty of states parties to protect life, including in relation to natural disasters, without imposing an impossible or

disproportionate burden on states. Actions expected from states in this regard include, among others, adopting appropriate legislative measures to deal with disaster risk reduction, setting up administrative procedures to monitor potentially dangerous situations, informing people about risks, setting up early-warning systems should a danger be imminent, evacuating the population, conducting investigations to find out about responsibilities of authorities who did not act timely, and compensating survivors from neglect by state authorities (da Costa & Pospieszna, 2014).

Apart from the foregoing general instances under IHRL, reference to disaster issues can be found in some IHRL instruments dealing with rights of special groups of people. For example, while articulating state obligation in situations of risk and humanitarian emergencies, the Convention on the Rights of Persons with Disability (CRPD) explicitly refers to disasters by stating that states must undertake “all necessary measures to ensure the protection and safety of persons with disabilities in situations of risk, including situations of armed conflict, humanitarian emergencies and the occurrence of natural disasters” (CRPD, art. 11). Accordingly, the Committee on the Right of Persons with Disability has urged states to take into account the specific needs of persons with disabilities in their DRR plans in its Concluding Observations on several occasions (Shucksmith, 2017). In 2018, the Committee on the Elimination of Discrimination against Women, the supervisory body under the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) adopted a General Recommendation, specifically dedicated to the gender-related dimension of DRR planning (CEDAW GR 37, 2018).

The connection between disasters and human rights is also highlighted in two other instruments prepared under the auspices of the UN. The Operational Guidelines for Protection of Persons Affected by Natural Disasters, 2006, prepared by the Inter-Agency Standing Committee (IASC) emphasizes that persons affected by natural disasters should enjoy the same rights and freedoms under human rights law without any discrimination (Ferris, 2014, p. 179). Though all human rights are equally important, the guidelines identified four groups of human rights in dire need of protection during disasters: (i) protection of life, security, physical integrity, and family ties; (ii) protection of rights related to the provision of food, health, shelter, and education; (iii) protection of rights related to housing, land and property, livelihoods, secondary and higher education; and (iv) protection of rights related to documentation, movement, re-establishment of family ties, expression and opinion, and elections. Another instrument, the Draft Articles on the Protection of Persons in the Event of Disasters, 2016, prepared by the International Law Commission (ILC) also acknowledges that serious human rights implications arise from disasters and affirms that “persons affected by disasters are entitled to the respect for and protection of their human rights in accordance with international law” (ILC Draft Articles, art. 5).

Due to the aforementioned interface between disasters and human rights, it is believed that application of IHRL can have an immense contribution to DRR planning; this topic will be highlighted in the next section.

Contributions of IHRL in DRR Planning

For an effective DRR planning, empowerment of relevant stakeholders (beneficiaries) and accountability of the actors involved in the process are crucial (da Costa & Pospieszna, 2015). Though the instruments on DRR encourage participation of relevant stakeholders in DRR planning and contain numerous guidelines for states to follow, they lag behind in ensuring empowerment of the beneficiaries and accountability of actors. IHRL can be an indispensable reference point in this context.

As discussed in section two, one of the important concepts under IHRL is the concept of right-holder and duty-bearer against each human right. The concept of right-holding carries with it the element of empowerment of the right-holders that can be ensured by observing three principles: participation, access to information, and nondiscrimination. Application of this standard of empowerment in DRR planning can be of great significance for its efficacy. Participation of the disaster-affected or disaster-prone population and other beneficiaries will warrant their full engagement and consultation in setting up and implementing new projects and plans of DRR. In the context of DRR, securing access to quality and essential information will enable the relevant stakeholders to make critical decisions regarding the preparation for, avoidance of, and protection in response to disaster threats (Forbes-Genadea & van Niekerka, 2017). Observance of principle of nondiscrimination will ensure that no one is discriminated while securing access to relevant support or in setting up relevant recovery programs, evacuation plans, etc. (Lane & Hesselman, 2017). This will also contribute to identifying, categorizing, and prioritizing the needs of individuals and communities affected by disasters (Lewis & Maguire, 2016).

As mentioned before, accountability of actors is vital for effective functioning of DRR plans, which is absent in DRR discourse. For securing accountability on the part of the state authorities, it is important that affected communities have access to grievance mechanisms that may be used to challenge the outcome of decisions affecting them and also when the authorities fail to prevent or reduce the risk of disasters (da Costa & Pospieszna, 2015; Ferris, 2014). Application of duty-bearer concept of IHRL will make the actors of DRR planning answerable for their decisions and conduct, and responsible for (potential) human rights violations (Lane & Hesselman, 2017). For ensuring accountability in DRR setting, Cubie and Hesselman (2015) recommended using IHRL supervisory mechanisms, which, in their opinion, would “open up international mechanisms of human rights accountability and oversight in the context of disasters, including the UPR process, State reporting, and individual and inter-State complaints mechanisms” (Cubie & Hesselman, 2015, p. 22).

Integration of IHRL in DRR planning can be useful in other respects as well. Incorporation of IHRL in DRR planning would ensure that affected people are not deprived of their fundamental human rights as the concept of right to life under IHRL permits no derogation and the states are not absolved of their responsibilities to ensure human rights even in situations of emergencies like disasters. The use of

IHRL standards designed for particular groups of people such as persons with disabilities and women–children in DRR planning would help to provide special attention to the needs of vulnerable and marginalized subgroups within the larger set of beneficiaries (Lane & Hesselman, 2017) and thus empower them. The multi-duty-bearer concept of IHRL can contribute to DRR planning as disasters include man-made disasters and often havoc caused by disasters increase due to inaction or negligence of different actors involved in the pre- and post-disaster events. Multi-duty-bearer concept, if incorporated, would make the nonstate actors involved in the DRR schemes responsible for their acts.

Conclusion

This chapter examines the potentials of using IHRL in DRR planning. DRR is a modern approach to dealing with disasters in a systematic way for reducing exposure to hazards, diminishing vulnerability of people and property, and other systems to hazards and improving preparedness to face adverse effects of disasters. However, the approach is not free from criticism. Major criticisms leveled against this approach are nonbinding nature of DRR instruments; lack of arrangement for empowering the relevant stakeholders in DRR planning; and absence of any accountability mechanisms on the part of the actors, primarily the states. The approach also lags in underscoring the importance of realization of human rights of the affected persons. On the contrary, IHRL develops a set of concepts, instruments, standards, and principles dedicated to the protection of human rights of persons in any situation, including disasters by ensuring empowerment of the right-holders and accountability of the duty-bearers. Accordingly, this study endeavors to point out the potential benefits of incorporating IHRL in DRR planning. It was found in this study that integration of IHRL can be useful to DRR planning in several ways such as IHRL concepts and principles can ensure both empowerment of the beneficiaries and answerability of the actors in a DRR planning. This integration can also guarantee fulfillment of human rights of the concerned stakeholders with special attention being paid to the needs of the vulnerable and marginalized sections among stakeholders.

Abstract

Nuclear disaster is one of the most critical catastrophes to handle. It has massive, long-term, and transboundary impact on both human health and biodiversity. Although new technologies have been invented to minimize the risks of nuclear emergencies, yet there is no guarantee of zero accident. That is why most of the developed countries have reduced dependency on nuclear energy over the past couple of decades. Despite that, Bangladesh being a developing country, geo-climatically vulnerable to natural disasters and one of the most densely populated countries, initiated to launch its first nuclear-based power plant at Rooppur in 2023.

As a rapid growing economy, currently Bangladesh has huge demand of electricity, while the present government is trying to increase the production quickly through nuclear energy and decrease the dependence on gas and other fossils. Consequently, it has to take utmost care of international safety arrangements to produce electricity from nuclear source. A comprehensive emergency preparedness plan, a truly empowered regulatory body, and highest compliance of international nuclear safety laws are key to minimize the risks of nuclear disaster. Otherwise, any nuclear accident will bring unbearable distress not only in

Bangladesh but also to its neighbors. Thus, this brief paper aims to assess and closely look into the compatibility of the existing legislative frameworks of Bangladesh in ensuring safety in nuclear power plants with the globally accepted standards.

Keywords

Nuclear disaster · Safety · International standard · Bangladesh · Compliance

Introduction

Nuclear disaster is most calamitous in nature among all others as it has huge long-term impact on health, environment, and economy. Also, it knows no boundary as radioactive contamination spreads by wind rapidly. As a result, nuclear power plant requires sophisticated technology coupled with implementation of internationally recognized safety measures to operate it safely. There are several other concerns regarding nuclear energy to produce electricity including overall cost-effectiveness of nuclear power project as it requires huge investment to construct safe power plant and needs continuous supervision for its operation. Furthermore, management of radioactive waste and spent fuel is another major headache to operate safe nuke power plant. Apart from these, consequence and impact of nuclear accident on the environment and human life are questioning the sustainability of it.

The International Atomic Energy Agency (IAEA) defines nuclear accident as “an event that has led to significant consequences to people, the environment or the facility. Examples include lethal effects to individuals, large radioactivity release to the environment, or reactor core melt.” Bangladesh is historically one of the most natural disaster-prone countries and nowadays equally vulnerable for man-made disasters. A nuclear disaster may bring intolerable sorrows and sufferings to the life of the mass people, while Bangladesh is not ready to bear the cost of it now. Thus, utmost care of international safety arrangements to produce electricity from nuclear energy is a must for a densely populated country like Bangladesh. A comprehensive emergency preparedness plan, a really empowered regulatory body, and highest compliance of international nuclear safety laws could combinedly reduce the risks of nuclear disaster.

Compliance of International Safety Law in Bangladesh

Nuclear energy industry necessitates comprehensive law and regulation because of its widespread, dangerous, damaging, and transboundary nature. Apart from technological advancement, up-to-date domestic legislation is also essential to ensure enforcement, accountability, and efficient use of nuclear energy. However, Bangladesh has just started constructing its first ever nuclear-based power plant at Rooppur; hence it needs extralegal effort to ensure highest level of safety and

security in accordance with the established international law and practice (Karim, 2018). Bangladesh has obligation under international law (i.e., the Non-Proliferation Treaty (NPT), the Convention on the Physical Protection of Nuclear Materials, the Treaty on the Non-Proliferation of Nuclear Weapons, etc.) to ensure peaceful and safe use of nuclear energy. Under the agreement between Bangladesh and IAEA, it shall establish and maintain a system of accounting for and control of all nuclear material subject to safeguard. Thus, strong domestic legislative framework in this regard can accelerate the burden of creating safe environment surrounding nuclear energy. It will not only protect the people working in the power plant but also protect the local inhabitant, economy, and environment as well.

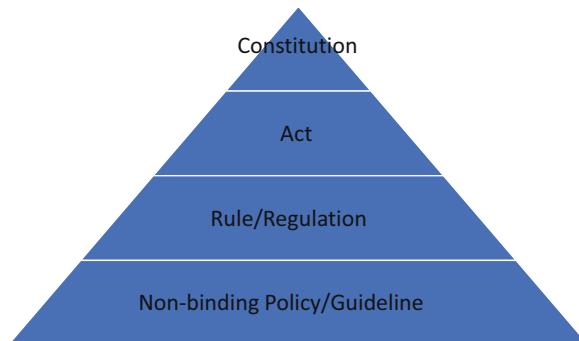

However, the IAEA suggests that every efficient and effective nuclear law must reflect the level and focus of country's nuclear program and it should ensure highest alignment and constancy among national nuclear legal systems notwithstanding the needs of domestic legislative systems and it must be compatible with a general legal and regulatory framework of the country (Stoiber et al., 2010).

According to the IAEA requirement, the nuclear energy laws of Bangladesh have four different levels, i.e., i) constitutional level, ii) statutory level, iii) delegated legislation, and iv) nonbinding policies and guidelines. The Constitution of the People's Republic of Bangladesh has conferred the legislative power to the House of the Nation (the parliament). Therefore, it is the parliament which can enact any law subject to the power conferred by the constitution. Albeit there is no particular mention of nuclear energy in the constitution, but the parliament can pass law relating to nuclear energy unless it goes inconsistent with the constitution. However, at the statutory level, Bangladesh has a good number of laws to deal with this sector, e.g., the Bangladesh Atomic Energy Commission Order 1973, the Bangladesh Atomic Energy Regulatory Act 2012, the Nuclear Power Plant Act 2015, and the Nuclear Safety and Radiation (Control) Act 1993 are mentionable among others.

In the third level, there are some delegated legislations as well (e.g., the Nuclear Safety and Radiation Control Rules 1997). Apart from these, there are also some nonbinding policies and guidelines (e.g., National Policy on Radioactive Waste and Spent Nuclear Fuel Management 2019, the Bangladesh Nuclear Energy Action Plan, the National Nuclear and Radiological Emergency Preparedness and Response Plan, etc.). So, it can be said that the structure of the Bangladeshi nuclear energy laws is apparently consistent with the IAEA given alignment as it fulfills the levels of laws (e.g., statutes, rules, nonbinding policies) suggested by the IAEA (Fig. 1).

The Nuclear Power Plant Act, 2015, is one of the crucial legislations in Bangladesh governing the nuclear power industry. Now, if we examine the compatibility of this law with the IAEA design of comprehensive nuclear law, then we can see that the objective and scope of the Nuclear Power Plant Act is clear from the preamble of this legislation that the act was legislated to constitute a company to establish and manage the Rooppur Nuclear Power Plant (RNPP) and other nuclear-based power plants in the country and to regulate matters concerning this. Therefore, it is evident from this legislation that the main purpose of enacting this law is to establish a company to manage and oversee the nuclear power industry in Bangladesh.

Fig. 1 Hierarchy of nuclear energy law in Bangladesh

Section 4 of the act empowers the Bangladesh Atomic Energy Commission (BAEC) to constitute a company, namely, the Nuclear Power Plant Company Bangladesh Limited, with prior permission from the government to act as an owner and operating organization of the RNPP and other nuclear power plants in the country. Consequently, the whole law emphasized on the formation of the board of directors, qualifications and disqualifications of the directors, duties of the managing director and other directors, meeting, annual report, and account and different company-related matters and disregards human and environmental safety. The company has no obligation to carry out an environmental impact assessment and present justification of building the nuclear power plant considering the economic, social, and other benefits or detriment to the health due to the radiation.

In addition, there is no mention of fixing the criteria for selecting a site to build a nuclear reactor. Also, there is no provision to consult with the local people or public participation before selecting the location of a nuclear power plant. Fullest public consultation and publication are vital before doing any sensible project like nuclear power plant.

Furthermore, there is no obligation on taking informed decision regarding all possible positive and negative impacts of a nuclear power plant under the law.

Although it is one of the statutory duties of the company to ensure radiation safety to protect the workers (U/S. 7(5)(k)), there is no mention about insurance to cover the workers in case of any radiation hazard occurring, while in India the court ordered in the *M K Sharma v Bharat Electronic Ltd* case to arrange proper insurance for the workers who are working in the sensitive area of the factory to protect them and to strengthen the safety measures at the cost of the employer. Regrettably, there is no such direction from the court in Bangladesh although section 99 of the Labour Act, 2006, makes group insurance compulsory for an establishment having more than 100 permanent workers. In fact, this provision pertaining to group insurance for workers remains in the text only; it has yet to become a reality (Mannan, 2013).

Albeit this piece of legislation focused on the emergency situation, it does not have any provision about the consequence of nuclear disaster. Also, it only suggests training for the concerned workers and technical persons, and neither has any

arrangement of basic knowledge circulation among the local inhabitants regarding any nuclear disaster, nor the company has any duty to form public awareness about nuclear disaster.

Moreover, it does not stipulate any liability assessment procedure in case of nuclear disaster. Hence, there is every possibility of escaping liability by any of the stakeholder. So, the law should address all the aspects of safe energy production from nuclear energy and the consequences of nuclear disaster. Additionally, enactment of rule and regulation under the law is necessary to detail the function and procedure of the company.

The Bangladesh Atomic Energy Regulatory (BAER) Act 2012 is another significant law in Bangladesh in terms of establishing an autonomous regulatory authority in pursuant to IAEA safety standards to ensure the health and safety of the plant workers and the public against any harmful effects arising from peaceful uses of nuclear energy in the country.

Pursuant to section 7 of the stated act, the government has established the Bangladesh Atomic Energy Regulatory Authority (BAERA) to fulfill the purposes (i.e., authorization, safety and security of radioactive materials, nuclear safety, radiation protection, physical protection, quality assurance, waste safety, emergency preparedness, nuclear liability, etc.) of this act. Nevertheless, according to the Nuclear Energy Agency of the Organization for Economic Co-operation and Development (OECD), “the fundamental objective of all national nuclear safety regulatory bodies is to ensure that, within their countries, activities related to the peaceful use of nuclear energy are carried out in a safe manner, in accordance with international safety principles and with full respect of the environment.”

Independence of the regulating authority and effective separation from any other body having interest in the nuclear energy sector is a fundamental requirement under the Convention on Nuclear Safety. However, the regulatory authority cannot be entirely separated from the government as the government is principally liable to ensure safety. The reason for independence of the regulatory authority is to confirm full compliance of safety measures without any sort of interference. In order to make it independent in decision-making, the regulatory body should have effective independence from governmental agencies, industries, and interest groups (INSAG-17 2003), which means impartial decision-making and enforcing power coupled with financial independence of the authority. Independence does not mean complete isolation; rather the regulatory body remains accountable for their action and decision, and it must be open and transparent.

In Bangladesh, the BAERA is the sole licensing authority to operate nuclear energy in the country. Hence, it should be properly empowered to grant license and revocation of the same without any sort of influence from any other governmental organ or anywhere else. Additionally, this authority is entrusted to appraise safety standards, protection from radioactive hazards, transportation and handling of spent fuel, waste safety, management, disposal, etc.

The BAERA has the authorization power, and the mentioned law determines the process of getting authorization from the BAERA and imposes certain duties on the authorization holder. However, internationally, public participation is mandatory

during the licensing process especially during the period of site selection (Bredimas and Nuttal 2007). Regrettably, there is no mention of public participation in anywhere during the process under the said act.

Further, there is question about the qualifications of the chairman and other members of the authority determined under the Bangladesh Atomic Energy Regulatory Act 2012. The qualification clause is very ambiguous and not clearly specifies their educational and professional requirements like: “the chairman and the members of the authority shall be appointed from among the persons having adequate qualification and experience in the field of management of atomic energy; provided that one member may be appointed from among the persons having qualification and experience in the matter of production and circulation of electricity” (S. 8).

According to the International Atomic Energy Agency guideline, the required qualifications and experience of the head (in this case the chairman) should have an MS in nuclear engineering with experience of minimum 15 years in progressively responsible positions in power plant engineering and specialized training of 1 to 2 years nuclear safety regulations, orientation in foreign regulations and other international codes of practice, safety guides, etc., whereas the directors of different divisions (in this case the members) should have MS in engineering (mechanical, civil, electrical, or nuclear) with experience of 10–12 years in the specified fields (Matin, 2014).

Hence, Bangladesh clearly not only neglects the basic qualifications of the people who will monitor the sector but also undermines the significance of a competent authority to regulate the whole industry. Hence, the act needs to be amended focusing on sustainability and objective analysis of the risk associated with nuclear disaster and fulfill the regulatory gaps.

The Bangladesh Atomic Energy Commission Act 2017 (which was actually the Bangladesh Atomic Energy Commission Order 1973) is another noteworthy and first legislation in the nuclear sector in Bangladesh. However, a commission was established under the said law just a couple of years after getting the independence for the promotion of the peaceful use of atomic power in the areas of food, agriculture, health, Medicare, environment, electricity and industry, the discharge of international obligations connected thereto, the undertaking of research, the execution of development projects involving nuclear power stations, and the generation of electric power threat. Thus, the Bangladesh Atomic Energy Commission (BAEC) is the principal body in the country to look after the whole uses of nuclear energy. However, the law mainly deals with the formation, functions, fund, etc. of the commission. Nevertheless, earlier the BAEC was acted as the licensing authority before the BAERA came into force. Hence, avoidance of power overlapping in case of license granting and clear demarcation of functions between these two regulatory bodies are necessary.

With the view to develop a legal framework, the parliament has passed the Nuclear Safety and Radiation (Control) Act in 1993, and later in 1997, the corresponding Nuclear Safety and Radiation Control (NSRC) Rule was formulated. Actually, these couple of legal instruments were introduced to manage the nuclear safety and radiation although when the NSRC Act was enacted, the plan to establish

nuclear power station was not on the table. As a result, this piece of law is not focusing matters relating to nuclear power plant; rather it emphasized on the industrial use of atomic energy, medical science, and other research happening at that time. These two laws deal with many provisions in the issue of licensing, enforcement, and strengthening the overall regulatory framework. However, the punishments suggested in this act are very weak which is impractical to apply in prevailing condition. That is why the BAER Act has been enacted subsequently to eliminate the deficiencies outlined in the former one and ensure nuclear and radiation safety in a more effective way (Haider et al., 2014).

Thus, it can be said that Bangladesh needs holistic and exhaustive legal framework to comply with internationally recognized safety standards as the present legal regime fails to fully comply with the IAEA guidelines. It is also important to finalize the IAEA Integrated Nuclear Security Support Plan (INSSP) to establish good governance for nuclear safety in Bangladesh.

Other Potential Areas to Address

The contract between the Bangladesh Atomic Energy Commission (BAEC) and the Russian company ROSATOM is not a settled value contract rather a cost in addition to the contract. Consequently, the Russian company gets the advantage of increasing the cost in addition to their net revenue to be consolidated into the agreed sum. In addition, the contract will not cover all of the fuel costs, operation and upkeep costs, and decommissioning and radioactive waste organization cost to the end of its operational life cycle (Karim, 2018). Moreover, according to the said contract, the risk is very high for Bangladesh as the government of Bangladesh has to reimburse the full loan amount with interests if in any event the RNPP is canceled or accidentally destroyed (Rahman, 2015). Hence, Bangladesh is clearly in weakening position in the contract and failed to negotiate properly with the government of Russia in this regard.

Nevertheless, Bangladesh has already experienced damages in its gas field and did not get compensation due to lack of proper legal framework. Thus, it should be more careful while dealing with nuclear energy as the destructive power of nuclear energy is numerous times greater than the earlier. However, the common law of tort might be helpful to create strict responsibility and get compensation for the accident arising out of negligent work. Nevertheless, Bangladesh doesn't have any tort law framework, and it needs to address this vacuum before the occurrence of any accident.

On the other hand, although Bangladesh is a state party to the Convention on Supplementary Compensation for Nuclear Damage 1997, unfortunately there is no civil liability law for nuclear damage in the country, whereas India has a similar type of law since 2010. However, India has enacted the law with the primary aim to give prompt compensation to the victims of a nuclear incident through a no-fault liability regime channeling liability to the operator and also on the state. Conversely, Bangladesh has currently no separate legal instrument like India to compensate the

victim of nuclear damage although it has some provision regarding liability behind nuclear incident and compensation in the BAER Act 2012 which is not sufficient if we consider the gravity and destructive nature of nuclear incident.

Establishment of a nuclear damage commission is essential under the law to assess the liability and handle issues relating to nuclear damage and compensation. Besides, the creation of a nuclear incident fund is urgent for the country to tackle any nuclear damage initially.

Concerns Relating to Environmental Safety

The topmost benefit of the nuclear-based power plant is that it has no visible CO₂ gas emission and this system is not responsible for global warming. However, still, there is heavy concern about nuclear power plant because of its unimaginable damaging power and longtime effect that can sustain decades after decades (Ramana & Mian, 2021). Also, it has transboundary impacts as air knows no boundary. Consequently, it shakes immensely the whole planet considering the safety issues, especially after the occurrence of the Three Mile Island (1979), Chernobyl (1986), Tokaimura (1999), and Fukushima (2011) incidents. Apart from economic viability, protecting the workers, concerned stakeholders, and public as a whole, preserving the environment from radioactive hazards and using the natural resources sustainably are two of the principal concerns expressed by the pressure group in Bangladesh regarding the nuclear power plant (Ramana & Mian, 2021).

Bangladesh is one of the most highly dense countries in the globe and already becomes a major victim of climate change. The land, air, agriculture, river, fisheries, etc. of the country are already affected by the result of climate change, and it is no longer ready to take another heavy ecological destruction arising out of nuclear pollution.

In addition, Bangladesh is a state party to the Climate Change Conference held in Paris (COP21) and a founding member of the Climate and Clean Air Coalition to Reduce Short-Lived Climate Pollutants (CCAC). Hence, Bangladesh must fulfill its obligations and commitment given in global forum to save the earth from any kind of nuclear disaster. Nevertheless, both the government of Bangladesh and the ROSATOM (the RNPP project-implementing state company of Russia) have assured that the RNPP project will be implemented using the latest state-of-the-art nuclear technology and 3 + –generation Russian VVER-1200 reactors to be set up at the Rooppur which is regarded as safest across the world. Nonetheless, according to specialists, VVER uses U235 nuclear fuel which produces dangerous radioisotopes during operation (Islam, 2014).

Environmental impact assessment (EIA) is a crucial prerequisite before implementing a huge project like RNPP which Bangladesh had already done. Nevertheless, continuous monitoring of the environment is also essential during every stage of the project from the beginning to the end of the plant's life. However, public participation and consultation are significant during the EIA under the Aarhus

Convention. Nonetheless, the detailed EIA report was never made fully accessible to the public.

Aside from nuclear accident and radiation, there are a couple of more major concerns relating to nuclear power in the country – number one is the use of water from the river Padma and harmless disposal of spent fuel. The reason behind choosing this site for the RNPP was that it is situated beside the bank of the river Padma. However, the water flow and condition of the river don't remain the same while the government took the decision to build a nuclear power plant back in 1961. In the meantime, the scenario has been changed, while India had constructed the Farakka Barrage in 1975 in their part (the river named *Ganga* in India), which massively affected the water supply in the river Padma in Bangladesh including the Rooppur area. So, there is uncertainty of supply of water during the whole life period of the power plant. Again, nuclear reactor continuously needs water for cooling the system, and used water contains radiation which can abolish aquatic resources forever. Thus, using cooling water consciously and refining and preserving that used water protectively are mandatory.

The ROSATOM has assured that they will return back the spent fuel to Russia. Nevertheless, as Bangladesh is experiencing nuclear power station in a very high scale for the first time, there is also concern about the safe removal of spent fuel from the reactor and transporting it to Russia. Moreover, it is not clear how long ROSATOM will perform its duty, and if it is necessary for Bangladesh to dispose it off inside the country, then selecting a protective and reliable site for that disposal would be very challenging for Bangladesh because of its high population and scarcity of land. Furthermore, the Rooppur site is located smack dab on top of a potential earthquake fault line (Islam, 2014). Besides, cyclone, tornado, and various kinds of natural disaster are very common in Bangladesh that are also raising tension about the safety of the nuclear reactors.

Local inhabitants are the most vulnerable considering the safety concerns of the nuclear power plant. Although Rooppur is approximately 170 km northwest far from Dhaka, the whole country will not remain safe if any accident happens. It may even bring consequence for the neighboring nations as well. The effects of ionizing radiation are massive, and it can be deadly in a particular situation. However, in some cases, it might have longer consequences and needs time to expose the symptom. Even the slow exposure with radiation every day can cause sick health that causes shortening of life. That is why the making of an emergency shelter center, emergency treatment arrangement, etc. is necessary to protect the public.

Conclusion

Bangladesh suffers from a strong legal regime to operate reliable, safe, and sustainable nuclear energy. However, as Bangladesh has already proceeded progressively toward a nuclear regime in the country, there is no scope of overturn from there now. State should take care of every single money of the taxpayers and invest that money for the highest benefit of the country. Hence, Bangladesh should take the

abovementioned concerns sensibly, whereas prompt action is urgent to address those lacunas from the highest level.

Thus, this chapter argues a legal reform to strengthen and create an effective legal regime to operate safe NPP in Bangladesh. It requires a constructive approach to establish, maintain, and operate NPP. A holistic strategy is also essential for the management and disposal of radioactive waste. The country cannot achieve its goals without participatory development and preservation of the environment.

Abstract

A pandemic constitutes a public health emergency and biological disaster that grossly violates a range of rights including the right to health. This chapter examines the COVID-19 outbreak – the most recent and worst pandemic as a case that has been globally exacerbating existing infringements of this right while critically affecting vulnerable people. It argues that international law imposes a “strict” State obligation to realize and protect the right to health of the marginalized people during pandemics. Hence, States are bound to embrace a rights-based approach, particularly concerning the prevention and treatment of COVID-19. Such an approach entails a comprehensive acknowledgement and understanding of the right to health as an inalienable human right. It further imposes individual and collective State duties to adopt effective measures for facilitating the full realization of the right. Accordingly, after conceptualizing the COVID-19 pandemic as a disaster and its public health impact on the vulnerable people, this

S. M. A. Naznin (✉)
Macquarie Law School, Macquarie University, Sydney, Australia

chapter first explores the right to health as a human right by examining key international law instruments. Second, it evaluates States' responsibilities to harness maximum available resources and to perform minimum core obligations for realizing the right of the disadvantaged people. It also examines States' extraterritorial duty to extend international cooperation in this context. The chapter lastly advocates a rights-based disaster management policy for COVID-19 that is particularly inclusive of the vulnerable people to facilitate their effective enjoyment of the right to health.

Keywords

Natural disaster · Biological disaster · Minimum core obligations · Progressive realization · Rights-based approach

Introduction

The COVID-19 pandemic, one of the worst disasters in history, has been impacting human lives at its core. Apart from the shocking number of lives lost, its overall human, economic, and social costs are staggering. Being "concerned both by the alarming levels of spread and severity and by the alarming level of inactions," therefore, at the beginning of the pandemic, the World Health Organization (WHO) declared a public health emergency of international concern requiring urgent state actions to combat COVID crises (WHO, 2020a). As it affects countries and people around the world, the UN Secretary-General cited COVID-19 as "a pandemic of human rights abuses" (Guterres, 2021).

While the COVID-19 pandemic has grossly affected every aspect of human rights, its impact particularly on the right to health of vulnerable people is deep and unprecedented. These people "face systematic exclusion and discrimination due to their age, disability, race, ethnicity, gender, income level, religion, caste or creed, gender identity, sexual orientation, and migratory status." Aspects of vulnerability also prevail in the lives and experiences of "individuals who are stateless, incarcerated, homeless, victims of environmental harm, or suffer from chronic disease" (Barron et al., 2021). Impacts of this pandemic whether direct or indirect negate the enjoyment of their right to health. The pandemic has exacerbated their existing vulnerability as being at the periphery of the power dynamics they have no means and capacity to realize their right. Further, their continuous invisibility to governments results in their limited or no access to the right to health (Barron et al., 2021).

The current chapter demonstrates that States have largely failed to protect vulnerable people's right to health during the COVID-19 pandemic. However, international law imposes tripartite obligations upon States to *respect*, *protect*, and *fulfil* the right to health like any other right. It argues that these obligations are rather strict being associated with the realization of the core content of the right to health. Accordingly, States' minimum core obligation is not subject to resource allocation and availability of resources. This understanding of States' obligation is particularly

vital in protecting vulnerable people's right to available, accessible, acceptable, and quality healthcare, services, and goods.

Unlike the articulation of the nature of the COVID-19 pandemic as an outbreak of infectious disease, its characterization as a disaster is little known and used. This chapter believes that conceiving COVID as a disaster informs about its severity and creates a possibility to adopt an effective rights-based disaster management approach to combat COVID crises. Hence, it first refers to the existing disaster research to examine the nature of the COVID-19 as a disaster. Next, to contextualize the research, it analyzes the public health impact of COVID on vulnerable people. Drawing on an analysis of the vulnerable people's right to health and the corresponding State obligations, it then evaluates the key concerns regarding States' failure to realize the right. To overcome the current challenges, the chapter contends that the adoption of a rights-based approach based on the principle of non-discrimination has the breadth to realize the vulnerable people's right to health during the pandemic.

COVID-19 Pandemic as a Disaster

Disaster denotes "a calamitous event or series of events resulting in widespread loss of life, great human suffering and distress, mass displacement, or large-scale material or environmental damage thereby seriously disrupting the functioning of society" (International Law Commission, 2016). While international law lacks clear guidance as to the application of this definition to the COVID-19 pandemic, the UN Security Council considers transnational health crises including pandemics and epidemics as explicit or implicit threats to the maintenance of international order (United Nations, 2020a). This characterization narrowly aligns with a key characteristic of disaster that catalyzes international disorder including social disruption. Specifically, pandemics like COVID-19 highlight that beyond the conventional arm conflicts endangering international peace and security, pandemics can threaten global order. It intensifies existing geopolitical tensions, allows actors to exploit vulnerabilities, and deteriorates humanitarian crises in conflict zones. It exacerbates indicators of violence including economic instability; distrust in public institutions; political hostilities; social inequality; hindered domestic, regional, and international peace efforts; etc. (See UN Doc S/RES/2532 (2020). Earlier the Security Council addresses transnational health crises in response to the HIV/AIDS epidemic as well as Ebola Outbreaks in West Africa and in the Democratic Republic of Congo. In the respective resolutions, the Security Council referred to its responsibility to the maintenance of international peace and security considering their implicit threat to the international order. See, respectively, UN Doc S/RES/1983 (2011), UN Doc S/RES/2177 (2014) and Doc S/RES/2439 (2018).)

However, this understanding of COVID-19 as a pandemic is inadequate as rather than referring to individual suffering it focuses on its interference with the maintenance of social order or international peace and security. Conversely, existing disaster research that provides a comprehensive definition of disaster can be

beneficial to understanding the nature of COVID-19. In this context, disaster constitutes a serious disruption of the social and community functioning resulting in immense human, material, economic, and environmental suffering which limits the affected people's ability to cope with its existing resources and mechanisms (Lopez-Ibor, 2006). Being a "severe, relatively sudden and frequently unexpected disruption," disasters remain beyond social control while affecting human lives from two levels (Sjoberg, 2006; The John Hopkins and Red Cross Red Crescent, 2008). At the individual level, they cause acute illness, death, as well as substantial economic and social loss, and at the community level, they result in mass death, damages to the means of livelihood, or displacement affecting the whole society (The John Hopkins and Red Cross Red Crescent, 2008).

Disasters are primarily categorized as natural and man-made, while the latter is sub-divided into six categories, such as (i) geophysical (e.g., earthquake), (ii) meteorological (e.g., storm), (iii) hydrological (e.g., flood), (iv) climatological (e.g., heatwave), (v) biological (e.g., epidemic), and (vi) extraterrestrial (e.g., meteorite or asteroid) (Centre for Research on the Epidemiology of Disasters, 2009). Thus, epidemics constitutes a biological disaster. While the list does not expressly include pandemics, a wide body of disaster research considers both epidemic and pandemic, such as SARS, Ebola, and recent COVID-19 outbreaks as biological disasters (Grigg, 2006). Pandemics are often characterized as biological disasters as they both share numerous characteristics. Like natural disasters, pandemics severely disrupt human lives by causing extraordinary social, psychological, and economic suffering (Sarukai & Chughati, 2020; Maison et al., 2021). Since a comprehensive analysis of damages caused by any disaster is a key to determining its nature, the following discussion particularly focuses on the human cost of COVID-19 as well as its economic and social impacts.

It is estimated that only in 2020, COVID-19 caused more deaths crossing the total number of over 1.2 million deaths caused by natural disasters in the past two decades. This is despite the fact those 20 years witnessed many catastrophic natural disasters, such as heatwaves in 15 European countries (2003); tsunamis in 12 Asian and African countries (2004) and Japan (2004); hurricanes in the USA (2005 and 2017); cyclone in Myanmar (2008); earthquakes in India (2001), Pakistan (2005), China (2008), Haiti (2010), and Nepal (2015); drought in Somalia (2010); and others (CRED and UN Office of Disaster Risk Reduction 2020).

As to the economic cost of COVID-19, the World Bank's Global Economic Report calculated that the world economy was lessened by around 4.3% in 2020, a downturn matched only by the depression and two world wars (World Bank Group, 2021). While COVID-19 has caused profound economic disruption to the world economy, developing countries suffer the most due to extreme income loss, increased inflation, lack of resilience to economic shocks, increased expenditure due to public health and other social measures, etc. By negatively impacting the poverty reduction efforts of these countries, COVID-19 has contributed to accelerating global economic inequality. Further to these direct economic costs, school closures and continued disruption to healthcare services have an indirect economic impact by disrupting the growth of human capital, especially among children and

vulnerable communities (World Bank Group, 2022). Globally, 1.6 billion students were affected due to school closures causing an estimated lifetime loss in earnings of 10\$ trillion (World Bank, 2020).

COVID-19 has profound social impacts by intensifying inequality, exclusion, and discrimination. Its social consequences include among others the exacerbation of domestic violence, disruption of educational facilities, and the rise of food insecurity among poor people. These are associated with psychological challenges such as the growth of global mental health crises including stress disorder, depression, anxiety, as well as other symptoms of distress, such as fear, denial, or anger (Saladino et al., 2020; Torales et al., 2020). While affecting all segments of people, it is particularly detrimental to the vulnerable and marginalized communities including the poor, elderly people, people with disabilities, children, and indigenous persons.

Due to these challenges, COVID-19 is conceived as a biological disaster that overwhelmingly affects every country and sector and touches every individual's life irrespective of their age, race, gender, or nationality, while affecting the vulnerable people as examined in the next section. The costs of the COVID-19 pandemic encompassing the total number of deaths, economic losses, and people affected are unprecedented to term it as an extreme biological disaster. To contextualize the research, the analysis below focuses on the public health impacts of COVID-19 on vulnerable people.

COVID-19, Public Health, and Vulnerable People

While having deep socioeconomic challenges, COVID-19 constitutes the most severe public health threat in a century (OECD and WHO, 2020). It constitutes “an extraordinary event which is determined to constitute a public health risk to other states through the international spread of disease and to potentially require a coordinated international action” (WHO, 2005). The identifiers of public health emergency of international concern are, therefore, “(i) the seriousness of the public health impact of the event, (ii) unusual and unexpected nature of the event, (iii) potential for the event to spread internationally, and/or (iv) the risks that travel and trade restrictions may result because of the event” (WHO, 2005). Thus, a determination of the extent of the impact of an event, particularly, on public health can validly justify the existence of a public health emergency. The categorization of COVID-19 as a public health emergency thus reflects the serious impact of COVID-19 on public health.

COVID-19 is phrased as a global public health emergency due to its high infectivity and mortality rate alongside its long incubation period. It has been posing deep negative impacts that encompass both direct and indirect effects on public health. The key to evaluating direct impacts is mainly an estimation of the total number of affected persons, deaths, and hospitalizations. As of 1 April 2022, WHO recorded 486,761,597 confirmed COVID-19 cases including 6,142,735 deaths globally (<https://covid19.who.int/>). This recorded number, however, understates the actual number. For instance, the recent estimate of 3 million COVID deaths by

WHO exceeds the reported 1.8 million COVID deaths in 2020 (WHO, 2022). Further, a systematic study states that the real number of lives lost to the pandemic from 1 January 2021 to 31 December 2021 is thrice the reported number totaling 18.2 million (Wang, 2022).

The direct health impacts of COVID-19 are compounded by its indirect effects including missed and delayed care for other medical conditions (Dimopoulos-Bick et al., 2021). Since its beginning, the pandemic has been disrupting the prevention and treatment of non-communicable diseases such as cardiovascular disease, cancer diabetes, and chronic respiratory disease as well as non-communicable diseases such as HIV, tuberculosis, malaria, and other tropical diseases. It has led to adding to a substantial number of death and years of lives lost by people with preexisting communicable and non-communicable diseases. While these people are already vulnerable to being extremely ill with the coronavirus, a significant number of them faced restricted or no access to care, surgeries, and other medical services due to increased COVID-19 hospitalizations as well as COVID-induced disruptions such as strict lockdown measures or hospital staff deployments to test and treat COVID cases (Núñez et al., 2021; Dimopoulos-Bick et al., 2021).

Another notable indirect impact of COVID-19 is the development of new mental health conditions and the exacerbation of the existing mental health crises. The WHO recognized the effect of COVID-19 to deepen the mental health crisis (WHO, 2020b). From March 2020 onwards, the global rate of anxiety and depression is heightened and even doubled or more than doubled in some countries. For instance, from March to April 2020, in Belgium, France, Italy, Mexico, New Zealand, the UK, and the USA, the prevalence of growth in anxiety levels was twice or more than twice than ever before (OECD, 2021). This is because COVID has induced a surge of negative factors contributing to poor mental health, such as financial insecurity, job losses, and fear as well as a reduction of the related positive factors including reduction of social connection, employment, and educational engagement and access to mental healthcare services and support networks (Dimopoulos-Bick et al., 2021).

Whatever be the impact of COVID-19, direct or indirect, and while it impacts everyone's life, vulnerable people face the highest health risk during the pandemic. This particularly includes poor people, people from minority and ethnic groups, children and adolescents, women, refugees, disabled people, and migrants. Despite the popular belief that rich countries witnessed more causalities of COVID-19, it is well documented that vulnerable people of both developed and developing countries are the worst victims of the pandemic. In some countries, for instance, the fatality rate of poor people is four times high than the rich. As of 19 April 2020, deaths of Black, Asian, and ethnic communities in England constituted 19 percent of an estimated 12, 593 hospital deaths despite they being only 15 percent of the overall population of the country (Barr et al., 2022). In the USA as well, from March to December 2020, the COVID death rate of Blacks and Natives was three to four times and of Latinx was two times higher than White Americans (Shiels et al., 2021).

Vulnerable People's Right to Health During Pandemic Under International Law

The recognition of the fundamental right to enjoy the highest attainable standard of health dates to the adoption of the 1946 Constitution of the World Health Organization. As the preamble articulates, “the enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic and social conditions” (WHO, 1946). Accordingly, WHO’s Constitution provides a comprehensive definition of health as “a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity” (WHO, 1946). Hence, rather than a traditional biomedical understanding of health that concentrates on the physical expression of illness, WHO’s definition resembles health with wellness considering an individual’s physical, psychological, and social conditions (Farre & Rapley, 2017).

Drawing on the WHO’s Constitution, the Universal Declaration of Human Rights (UDHR) acknowledged the realization of necessary medical care and other determinants of health and well-being as the basis of public health. Specifically, article 25 of the Declaration recognized the right of every individual “to a standard of living adequate for the health and well-being of himself and the family, including food, clothing, housing and medical care, and necessary social services.” Unlike the WHO’s constitution that articulates the right to health as a distinct right, the UDHR drafts it as a component of the right to an adequate standard of living. Further, despite recognizing an interrelation between health and well-being, the UDHR does not consider them synonymous with each other.

Significant development of the right to health occurred due to the International Covenant on Economic, Social, and Cultural Rights (ICESCR). Article 12 of the covenant enshrines it as a separate and legally binding right. Under this provision, the right includes two distinct characteristics: first, it extends beyond the right to be healthy. Secondly, the right to health under the ICESCR refers to physical and mental health rather than only well-being. It constitutes an inclusive right that extends to access, firstly, to the determinants of health, such as safe water and adequate sanitation, an adequate food supply and housing facilities, healthy occupational and environmental conditions, and access to health education and information and, secondly, to timely and effective healthcare (CESCR, 2000). This extensive recognition of the right to health has been subsequently strengthened through several regional instruments (For instance, the European Convention for the Promotion of Human Rights and Fundamental Freedoms 1950, the American Convention on Human Rights 1969 and its Optional Protocol in the Area of Economic, Social and Cultural Rights 1988 (article 10, para 1), African Charter of Human and People’s Right 1981 (article 16), Additional European Social Charter 1961 (revised in 1996, article 11), and African Charter on the Rights and Welfare of the Child 1990 (article 14.1) address diverse aspects of the right to health).

Thus, international law while recognizing the right to health and outlining its content acknowledges vulnerable people’s right to health. The most common recognition of every individual’s right to health entails that vulnerable people,

regardless of their status, are entitled to the highest attainable standard of health. Specifically, articles 2.2 and 12.2 of the ICESCR reinforce the preamble of the WHO's constitution by stating that people's right to health is not affected by their "race, colour, sex, language, religion, political or other opinions, national or social origin, property, birth or other status." That means the recognition of the right is based on the principle of equality where no one including vulnerable people will be deprived of their enjoyment of this right. To illustrate the accessibility component of the right, the CESCR makes an explicit reference to vulnerable people by stating that "health facilities, goods and services must be accessible to all, especially the most vulnerable or marginalized sections of the population" (CESCR, 2020).

However, considering the vulnerability of specific groups of people to enjoy access to health, international law has adopted numerous conventions. For instance, the Convention on the Elimination of All Forms of Discrimination against Women enshrines the non-discriminatory right to access to healthcare, including reproductive health as well as underlying determinants of health such as housing, sanitation, electricity and water supply, transport, and communications that are critical to the enjoyment of the right (CEDAW, 1979). Likewise, article 24 of the Convention of the Rights of the Child recognizes the right of every child to access healthcare services including treatment of illness and rehabilitation of health. Other notable conventions to recognize the right to health of vulnerable people include the International Convention on the Rights of All Migrant Workers and the Members of their Families 1990 and the Convention on the Rights of Persons with Disabilities 2006.

Overall, the right to health of all forms including that of the vulnerable people includes, firstly, a recognition of the individual freedom over one's health as well as a right to protect health from any interference. Secondly, it entails recognition and realization of the underlying determinants of health, such as housing, social security, food, water, and sanitation. While the above discussion sheds light on these two elements, thirdly, by adopting the AAAQ model, CESCR illustrates that the existence of available, accessible, acceptable, and quality healthcare is a vital prerequisite to substantiate the right to health. The enjoyment of the right to healthcare, therefore, depends on the fact that adequate and efficient health services are existent (availability), and people can access and afford medical facilities without discrimination (accessibility). The health facilities and services are ethically and culturally appropriate for and respectful of people from diverse backgrounds (acceptability). Lastly, health services must be scientifically and medically appropriate and of a high standard (Quality) (CESCR, 2000).

However, to what extent the development of international law recognizing the right to health applies to a pandemic situation? The question bears significance due to the absence of, firstly, a convention on the vulnerable people's right to health during a pandemic; secondly, a reference to the right in two specific international documents including the 2005 *International Health Regulations* and the *Pandemic Influenza Preparedness Framework 2011* that provide guidelines prepares for outbreaks of infectious disease. A reference to article 12.2 (c) of the ICESCR is relevant here as it recognizes a right to prevention, treatment, and control of epidemic and

endemic amidst other diseases and corresponding State duties. As the CESCR recommends, State responsibilities entail “the creation of a system of urgent medical care in cases of accidents, epidemics, and similar health hazards, and the provision of disaster relief and humanitarian assistance in emergencies” (CESCR, 2020). The European Committee of Social Rights supports this by stating that the right to health provision (article 11) of the European Social Charter should guide States to prevent, control, and contain pandemic diseases (European Committee of Social Rights, 2020). General provisions on the right to health of international instruments that contain the right in all its forms and at all levels thus also address pandemic situations.

State Obligations Toward the Right to Health During COVID

In international law, States hold the primary responsibility to safeguard the right to health alongside its underlying determinants. The existence and scope of State duties are subject to the recognition of the corresponding rights. The full realization of the right to achieve the highest attainable standard of health amidst others is dependent on the “prevention, treatment and control” of threatening diseases, including epidemic and endemic diseases. This provision helps to locate State obligations in times of COVID, as particularly, the right to treatment requires ‘the creation of a system of urgent medical care in cases of . . . epidemics . . . and the provision of disaster relief and humanitarian assistance in emergency situations’ (CESCR, 2000). Thus, State parties should combat epidemic diseases by providing immediate medical care, relief, and assistance during epidemics.

States are subject to tripartite obligations to *respect*, *protect*, and *fulfil* to realize the right to health like other human rights with particular attention to the vulnerable people who have no or only limited access to enjoy the right. For instance, the duty to *respect* requires States to refrain from committing any direct or indirect infringement of the right to health. The duty to *protect* requires States to adopt necessary legislative, and other measures prevent to ensure equal access to healthcare services from third parties. Finally, the duty to *fulfil* requires States to recognize the right to health in their political and legal system and to adopt a national health policy outlining a detailed and practical plan to realize the right (CESCR, 2020). The duty to *fulfil* further includes the duty to *facilitate* requiring States to take affirmative actions to enable people to enjoy their right to health. States must *provide* certain rights if individuals and groups are unable to realize the right by their own means. The duty to *fulfil* also requires States to *promote* the right to health with appropriate measures to create, maintain, and restore public health (CESCR, 2000).

While the ICESCR focuses on the full realization of the right to health, the Covenant has subjected the above State duties to “progressive realization” considering the positive nature of the right and States’ resource constraints. States have “specific and continuing” duties to take actions “expeditiously and effectively” towards the full realization of the right. Any deliberate retrogressive measure against the right is impermissible unless a State proves that it has taken all reasonable steps

to realize it with the maximum use of its available resources (CESCR, 2000). The determinants of reasonableness relate to certain immediate State obligations that include, first, a commitment to ensure a non-discriminatory realization of the right; second, a duty to take “deliberate, concrete, and targeted” steps toward its full realization; and, third, a consideration of the disadvantaged and marginalized individuals and communities’ vulnerability (CESCR, 2000).

To implement such immediate obligations, States should guarantee the realization of the “meaningful content” of the right to health. They have a core obligation to realize the minimum level or essentials of the right, including essential primary healthcare. Even when core contents are resource-dependent, States should still prioritize their realization. According to the CESCR, such core obligations of States include providing access to (i) health facilities, goods, and services based on non-discrimination and with special attention to the disadvantaged segments of society; (ii) nutritious, adequate, and safe food; (iii) shelter, housing, sanitation, and safe drinking water; (iv) essential drugs; and (v) equitable distribution of health facilities, goods, and services (CESCR, 2000). A reference to these five core obligations is a key to outlining the content of the right to health and understanding the extent of State obligations in the context of COVID-19. For instance, since COVID-19 has intensified the existing inequalities by adversely affecting vulnerable people while guaranteeing non-discriminatory access to healthcare, States must specially consider the needs of these people (Montel et al., 2020).

The CESCR also listed certain obligations of comparable priority, which include the duty to (i) ensure reproductive, maternal, and child healthcare; (ii) provide immunization against major infectious diseases; (iii) take steps for prevention, treatment, and control of epidemic and endemic diseases; (iv) offer education and access to information on health; and (v) deliver effective training for health personnel (CESCR, 2020). Even though the obligations of comparative priority are vague as to whether they constitute core obligations or remain subject to progressive realization and resource scarcity (Forman et al., 2016; Tasioulas, 2017), the list is still beneficial to identify further aspects of State obligations toward the right to health. Following the duty to prevent and control infectious diseases, States should take measures for providing COVID vaccination or adopt the test and trace policy if the vaccine is unavailable. To perform the duty to provide education and access to information on health, States must regularly report on their progress to combat COVID by publishing authentic data on indicators, such as death rate, while ensuring people’s access to such information (Montel et al., 2020).

During pandemics, these State obligations toward the right to health are more critical (Mesquita et al., 2021). To protect public health in exceptional circumstances that pose “a serious threat to the health of the population,” international law allows States to derogate from certain obligations regarding other associated rights (ICCPR, 1966, United Nations Economic and Social Council, 1985). However, restrictive measures to protect the health of the population (such as mask-wearing, social distancing, and travel restrictions during COVID outbreak) that limit individual rights and liberty must be lawful, necessary, and proportionate. As the *Siracusa Principles* direct, any such measure should be (i) prescribed by and enforced under

the law, (ii) responsive to a legitimate objective of public interest (such as prevention of disease or injury), (iii) deemed necessary to reach that aim, (iv) the last resort and least intrusive means available to achieve the objective, (v) based on scientific evidence and non-discriminatory in application, and (vi) of limited duration, deferential to human dignity and subject to scrutiny (United Nations Economic and Social Council, 1985; Human Rights Committee, 2001). Overall, even when States derogate from certain obligations even in a state of emergency, the limitation on rights must not disproportionately impact the marginalized people. Accordingly, “emergency declarations based on the COVID-19 outbreak should not be used as a basis to target particular groups, minorities, or individuals” (OHCHR, 2020).

Beyond the state-centric paradigm of obligations, under the ICESCR, States have bound themselves to international cooperation for realizing the right to health like other socioeconomic rights. As the CESCR comments that during emergencies, States have a separate and collective responsibility to cooperate in disaster relief and humanitarian assistance by paying special consideration to the needs of the disadvantaged people. Further, states bear a joint duty to address the challenges of the highly transmissible diseases that cross borders. Developed countries have a responsibility to help poor and developing States in this regard (CESCR, 2020). The International Health Relations (IHR) 2005 specifies this duty in the context of public health emergencies by imposing obligations to assist other states to prevent diseases. Thus, States should “detect, assess and respond to public health emergencies; develop, strengthen and maintain public health capacity; and mobilize financial resources” (WHO, 2005).

States' Failure to Uphold Vulnerable People's Right to Health During COVID-19

As the human rights impact of COVID is widespread, any analysis of corresponding States' responses is broad. Following the discussion on the vulnerable people's rights and corresponding state duties, for a structured analysis, this section focuses on three determinants to examine States' failure during the COVID outbreak. The first two relate to the States' national obligation to realize the right to available, accessible, adequate, and quality healthcare as well as the right to fulfil the underlying determinants of health. Moreover, the last relates to the States' international obligation to assist.

Availability, Accessibility, Acceptability, and Quality Healthcare

Many countries have been facing challenges in realizing the availability, accessibility, acceptability, and quality of healthcare regarding the right to health during COVID-19. Let alone poor counties, in countries such as the USA, the UK, Italy, and Spain, the unavailability of essential medical care including diagnostic testing, ventilators, oxygen, and personal protective equipment (PPE) is evident. While the

right to health requires non-discriminatory access to healthcare services and goods, discrimination in healthcare settings grossly deprived marginalized people. For instance, a survey found that governments in the USA, the UK, Canada, and Ireland failed to provide access to PPE in residential institutions for disabled children (Disability Rights International et al., 2020). Evidence demonstrates that Indigenous Australians were largely excluded from the planning and implementation of the rollout (The Guardian, 2021).

Fulfilling Underlying Determinants of the Right to Health

COVID has severely impacted people's right to housing, social security, employment, food, water, and sanitation, the fulfilment of which are otherwise integral to realizing the right to health. Governments' frequent failure to fulfil these determinants in the public health emergency measures resulted in negating the right to health during the pandemic while intensifying existing vulnerabilities. Even governments' support measures provided inadequate attention to the vulnerable people's right to the underlying determinants of the right to health. For instance, in Lebanon, the government's failed food assistance plan and delayed financial aid program could not provide sufficient benefits to poor families (Human Rights Watch, 2020b). Stimulus packages in France, Denmark, the UK, and India failed to explicitly refer to the rights of the vulnerable people (United Nations, 2020). Particularly, the Indian government's economic package failed to address the needs of the migrant workers and informal sector employees (Human Rights Watch, 2020c). The Nigerian Stimulus Bill provided support only to the formal sector employers although 80 percent of the country's workforce is in the informal sector (Human Rights Watch, 2020a).

States' International Obligation to Assist

Despite the recognition of States' international legal obligation to assist other states during public health emergencies, devastating public health impacts of COVID-19 question the efficacy mandates of state collaboration (Bump et al., 2021). Countries' political considerations sometimes override their obligations to realize public health by creating favorable conditions through international cooperation resulting in the negation of necessary healthcare services. For instance, international sanctions debarred the Iranian government to secure essential medical supplies and protective equipment like PPE, respirators, test kits, and pharmaceuticals during the COVID-19 crisis (Karimi & Turkamani, 2021). Indicating the perils of the vulnerable people, the Country Director of the Relief International stated "the impact of COVID 19 on Iran was particularly harsh, as the country's economy was already under the pressure of sanctions. . . . This directly impacted the socioeconomic well-being of millions of families living in Iran negatively – both the Afghan refugee population, but also the host community" (Relief International, 2021). Further, against clear guidelines to ensure universal and equitable access to COVID vaccinations, many countries

choose to prioritize their national or regional interests giving rise to vaccine nationalism (Zhou, 2022).

A Rights-Based Approach to Disaster Management During COVID

As disasters grossly threaten the protection of human rights, international law provides normative standards outlining people's rights and States' duties. Hence the *Sendai Framework for Disaster Reduction* stresses the significance of adopting disaster management plans that can protect and promote human rights. As article 19 (c) of the Framework states, "managing the risk of disasters is aimed at protecting persons and their property, health, livelihoods and productive assets, as well as cultural, and environmental assets while promoting and protecting all human rights. . . ." Unlike the traditional "charity" or "needs" framework, a rights-based disaster management plan thus places human rights at its center (Boesen & Martin, 2007). The efficacy of the disaster management plan depends on its inclusion of human rights as the key content (Rice et al., 2017).

Particularly, by addressing the vulnerability of the marginalized people, this approach imposes core obligations upon States to realize their right to health. Overall, this recognition of the right to health is the "beacon" for States' responses to the COVID crisis requiring them to "prevent, treatment, and control" threatening diseases. Further, the AAAQ model indicates the key elements of the right to guide appropriate state actions for ensuring available, accessible, acceptable, and quality healthcare, services, and goods. Given the States' failure to realize these components of the right to health of the vulnerable people, the adoption of this framework in any domestic disaster management plan on COVID would be beneficial. This is because, first, it provides an understanding as to the extent of protection of the right to health, and second, it evaluates States' present response and preparation to realize the right. Particularly, "it helps frame the analysis and debate about how the right to health is guaranteed in the context of COVID-19 and it shows the extent to which countries are prepared to address future crises" (Toebes, 2020).

Further, a rights-based approach to disaster response contains plans and policies that enshrine cross-cutting human rights principles of equality and non-discrimination, participation, accountability, and transparency. Equality and non-discrimination imply that "everyone is equal in dignity and rights." Participation means "active, free, and meaningful engagement" of all individuals including vulnerable communities such as victims of disasters, women, minorities, and rural people. Accountability denotes the presence of a system that protects and promotes human rights through monitoring, review, remedies, and action. Transparency requires information sharing particularly with the affected people to guarantee their active and meaningful participation in the decision-making process. While the recognition of human rights constitutes the core of the rights-based approach to disaster management, the principles supplement its effective operation. Significantly, "the principle of non-discrimination and equality constitutes the key principle of the rights-based approach to health being the basic pillar of international human

rights law as enshrined in every human rights instrument with a commitment that no one is left behind" (Mesquita et al., 2021).

Incorporation of these principles of the rights-based approach to disaster management into the COVID disaster management plan, particularly, the non-discrimination principle, is crucial when the vulnerable people suffer acute discrimination. The principle when applied to the rights-based approach to pro-vulnerable COVID-19 management policy requires States to (i) provide non-discriminatory access to healthcare to all people, (ii) ensure an adequate healthcare system to provide non-discriminatory treatment, (iii) guarantee that public health measures address special needs of specific groups of vulnerable people such as persons with disabilities, (iv) increase the availability of COVID related physical and mental health issues, (v) allow adequate testing and treatment for COVID-19, (vi) ensure that implementation of public health directives does not become counterproductive to exacerbate vulnerability, (vii) address and protect the needs of persons with substance dependence by providing access to healthcare and safe supply of substance, and (viii) ensure that health service providers are accessible (Manitoba Human Rights Commission, 2020). Thus, the incorporation of the non-discrimination principle of the rights-based approach specifies extensive States' obligations toward the vulnerable people's right to health during the pandemic.

Apart from the recognition of the right to health and inclusion of principles, a right-based disaster management policy also requires international assistance to realize the right in question (Rice et al., 2017). Adopting this approach to disaster management requires that plans, policies, and responses concerning international assistance comply with States' duties as outlined in international law. It empowers the community as individuals to develop the capacity to combat future challenges through collaborative engagement and can affirmatively contribute to societal needs (OHCHR, 2013). International law, however, being deeply consent-based faces the challenge of non-cooperation or even inaction due to States' self-centric strategic behavior as informed by the prioritization of national interests over the global good. A holistic approach recognizing the role of the non-consensual mechanisms as well, like non-state actors including NGOs, businesses, and adjudications, therefore, can help in mitigating missing inter-state consent. By creating awareness, setting agendas, providing technical aid, etc., these actors can mitigate coordination problems (Aaken, 2016).

Conclusion

Devastating impacts of COVID-19 pandemic have revealed that the vulnerability of the public health system is not confined to State borders. Rather than being state-centric, the vulnerability is victim-centric as the protection of the marginalized people's right to health remains at the edge in both developed and poor countries due to deep exclusion and discrimination. States' gross and continuing failure contradicts their commitment under international law that outlines the scope of the right, corresponding domestic obligations to *respect, protect, and fulfil* the core of the

right as well as the international obligation to assist. An understanding of COVID-19 as a disaster is beneficial in this context as while reflecting on the severity of the pandemic, it requires States to shift their attention to the protection of the right to health of the vulnerable. An effective and adequate COVID disaster management plan, therefore, should enshrine a rights-based approach. While adopting the approach, particularly an emphasis on the overriding human rights principle of non-discrimination is crucial in this unprecedented time to realize the right to health of all including the vulnerable people.

Abstract

Climate change is expected to increase the severity and frequency of natural catastrophes, increase floods, and significantly influence crop yields, infrastructure, displacement, and development prospects, causing human and economic losses. Adapting to projected changes could help lower the risk of both climate change and catastrophes. Both climate change adaptation (CCA) and disaster risk reduction (DRR) strive to control hydrometeorological risks by reducing community susceptibility, increasing their resilience, as well as minimizing the consequences of climate-related disasters and associated risks following proactive and long-term approaches to disaster management. The promotion of a DRR

management system has the potential to significantly enhance adaption to the changing climate and vice versa. As a developing country, it is extremely important for Bangladesh to consider how to tackle climate change and disasters in the long term for human welfare and sustainable development. Bangladesh has separate climate change and disaster management systems, with minimal synergistic approach between the two. Over the time, the country has moved swiftly with its legislative responses to climate change and disaster, but when it comes to DRR and CCA integration, things are still in the early stages with a slew of obstacles to overcome. This chapter presents Bangladesh's current legal and policy responses to climate change and disaster management, emphasizing existing DRR and CCA strategies and the challenges that remain as well as solutions that can be used to address them.

Keywords

Climate change · Disaster management · Bangladesh · CCA · DRR · Integration · Legislations · Policies

Introduction

Due to high population density and constrain of natural resources, the South Asian countries are highly exposed and susceptible to climatic change and disaster risk (Eckstein et al., 2021; Sammonds et al., 2021). Bangladesh as a coastal state and mega-delta is in the greatest threat of changing climate and disaster risks ranking seventh out of ten in the list of “Long Term Climate Risk Index: The 10 Most Affected Countries from 2000 to 2019” (Eckstein et al., 2021). The country is disaster prone for its geographic location, climate change and disaster hotspot, population density, limited resources, and previous vulnerability (Sikder & Xiaoying, 2014). In recent decades, Bangladesh is facing number of climate-induced disasters and extreme weather occurrences including protracted floods, super cyclone, tsunami, and excessive rainfall (World Meteorological Organization [WMO], 2021) of which flood is common, severe, and of increased vulnerability by causing harm to food stock and livelihoods (Ahmed et al., 2015). Only in 2020, 5.4 million are victim of floods in Bangladesh placing it among the top five countries in terms of flood disaster victims in the world (Statista, 2021).

Bangladesh has tolerated disasters and shown a proclivity to handle them. The early norms to deal with disasters were to control disasters rather to manage. The controlling strategy proved an unsuccessful attempt in two floods in 1987 and 1988 and one super cyclone Gorky in 1991 (Nasreen, 2021). The traditional reactive strategy has long continued with post-disaster aid efforts and substandard infrastructure development. In Bangladesh, the idea of disaster risk reduction (DRR) resulted in a shift from the post-disaster aid to pre-catastrophe management in order to mitigate disaster risks (Nasreen, 2021). Along with the latest global policy, the Sendai Framework for Disaster Risk Reduction (SFDRR) (2015–2030), preparedness, mitigation, response, and recovery

have regarded as successful elements of DRR mechanisms in disaster-prone countries including Bangladesh as well.

Bangladesh adopted legislations, policies, and plans separately for climate change as well as disaster management. The development of climate change policies and disaster management regulatory arrangement has been going under two distinct ministries in Bangladesh with limited collaboration (Haque et al., 2019). Bangladesh's legislative measures to deal with disasters also include climate change-induced disasters. Nevertheless, it has done a little for managing slow-onset climate change events or extreme weather events including global warming, melting of the glaciers in the Himalayas, sea level rising in the Indian Ocean, tropical cyclones and associated storms formed in the Bay of Bengal (Awal, 2015), and salinity intrusion in soil and water until recently (Human Rights Council, 2018).

The secretariat of the United Nations International Strategy for Disaster Reduction (UNISDR) outlined the key perspectives and approaches of DRR that might support adaptation strategies of climate change (Islam & Sumon, 2013). Alternatively, climate adaptation strategies could enhance DRR and in some cases prevent climatic events or extreme weather events. Where possible these two should be coordinated for a better DRR system (Djalante & Thomalla, 2012). Bangladesh has separate ministries for CCA and DRR, but their collaboration needs improvement (Ministry of Disaster Management and Relief [MoDMR], 2020).

This chapter critically examines Bangladesh's legislative framework, policies, and plans for climate change and disaster management, with a particular emphasis on DRR and CCA and their potential integration and governance. It concludes with several suggestions for integrating CCA and DRR. This chapter is structured into four sections: (1) Introduction, (2) Climate Change and Disaster Management Laws and Policies in Bangladesh, (3) Bangladesh's Approach to Disaster Risk Reduction and Climate Change Adaptation, and (4) Conclusion.

Climate Change and Disaster Management Laws and Policies in Bangladesh

Climate Change

Given the severity of climatic change and the threats it presents to Bangladesh, governments have implemented extensive legislative actions to address these long-term issues. The country's supreme law, however tacitly, addressed the subject of climate change. As part of the 15th constitutional amendment, Bangladesh inserted Article 18A which mandates that "the state shall endeavour to protect and improve the environment and to preserve and safeguard the natural resources, bio-diversity, wetlands, forests and wild life for the present and future citizens" (The Constitution (Fifteenth Amendment) Act, 2011). In addition, Bangladesh has already focused on addressing climate change concerns by passing legislation, policies (as shown in Fig. 1), and funding substantially in adaptation measures, setting specific climate change objectives as well as strategies.

2021	Mujib Climate Prosperity Plan up to 2030
2022	National Adaptation Plan of Bangladesh (Zero Draft)

Fig. 1 Year-wise climate change laws and policy initiatives. Note. Prepared by authors after studying climate change laws and policies adopted from 2002 to 2022

National Adaptation Programme of Action (NAPA)

National Adaptation Programme of Action (NAPA) is the country's early legal initiative on climate change at the domestic level. In accordance with the decision of the UNFCCC's COP7, the Ministry of Environment and Forests (MoEF) (currently, the Ministry of Environment, Forests, and Climate Change) formulated the National Adaptation Programme of Action (NAPA) in 2005, which was updated in 2009.

The purpose of Bangladesh's NAPA formulation was to provide a framework that guides the coordination as well as execution of adaptation measures through a participative approach and the promotion of synergies with relevant initiatives. NAPA 2009 depicted both the current effect of climatic variability and extreme occurrences, as well as the possible future susceptibility. In order to prioritize adaptation requirements and efforts, poverty reduction and livelihood security with a gender viewpoint have been selected as the guiding principle (Ministry of Environment and Forests [MoEF], 2009b). Furthermore, NAPA 2009 specified priority projects for development and execution in the near and medium term, including financial needs assessment; mainstreaming climate change into other sectors; improving the resilience of urban infrastructure and industry; investigating insurance

and other emergency preparedness solutions; incorporating climate change into national, sectoral, as well as spatial development plans; and land zoning design for climate change adaptation (MoEF, 2009b).

Bangladesh Climate Change Strategy and Action Plan (BCCSAP)

The Bangladesh Climate Change Strategy and Action Plan (BCCSAP) is currently the main national blueprint for addressing climate change and increasing capacity as well as resilience to its effects. It is a “knowledge strategy” (Ministry of Environment and Forests [MoEF], 2009a) based on NAPA (2005 and 2009), issued by the Ministry of Environment and Forests. Within 6 key areas, it lays out 44 programs that Bangladesh would pursue in the long, medium, and short term (MoEF, 2009a):

- (a) Food security, social protection, and health.
- (b) Comprehensive disaster management.
- (c) Infrastructure.
- (d) Research and knowledge management.
- (e) Mitigation and low carbon development.
- (f) Capacity building and institutional strengthening.

The government of Bangladesh has provided institutional arrangements to respond promptly to the climate change crisis, as well as to coordinate and promote national climate actions (MoEF, 2009a). The organizational structure for the climate change action plan is visualized in Fig. 2.

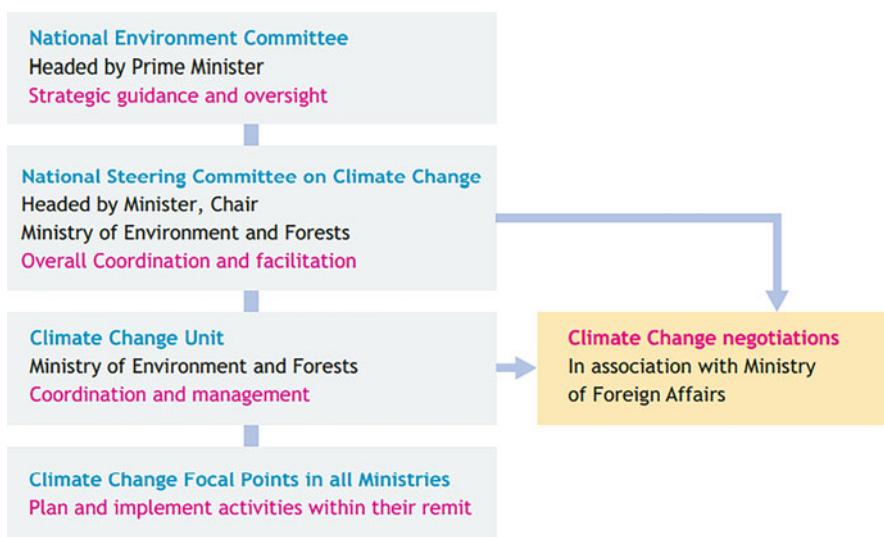

Fig. 2 Organizational plan for the climate change action plan. Note. From “Bangladesh Climate Change Strategy and Action Plan,” by Ministry of Environment and Forests (MoEF), Government of the People’s Republic of Bangladesh, 2009 <http://nda.erd.gov.bd/files/1/Publications/CC%20Policy%20Documents/BCCSAP2009.pdf>

The BCCSAP is being considered as part of the country's overall planning process. It was a 10-year initiative (2009–2018) that aimed to increase the country's ability and resilience to climate change issues. Although it is explicitly mentioned in the BCCSAP that it is a working document and that adjustments would be made from time to time as necessary by the corresponding sectoral agency (MoEF, 2009a), it has not been updated since the 2009 edition.

The Climate Change Trust Fund Act 2010

The government of Bangladesh (GoB) had considerable budgetary challenges in carrying out BCCSAP 2009. Rather than relying on the international community for funding, Bangladesh opted to take action with its own finances. This resulted in the establishment of two independent financial vehicles: the Bangladesh Climate Change Trust Fund (BCCTF) and the Bangladesh Climate Change Resilience Fund (BCCRF) (Rahman & Huang, 2019). The former is wholly funded by the government's own budget, whereas the BCCRF is made up of funding promised and contributed by development partners. The BCCRF had completed all of its projects and ceased operations in 2017 ("Global Climate Change Alliance Plus [GCCA+]," n.d.).

The Climate Change Trust Fund Act 2010 (CCTFA) was enacted to ensure that the benefits of BCCTF-financed projects reach the intended beneficiaries. It planned for establishing an initial budget of USD 100 million each year from 2009 to 2011. As per Sec. 10 (b) of the Act, 66% of its budget would be spent on implementing projects, which were given preference in the BCCSAP (The Climate Change Trust Fund Act [CCTFA], 2010). The remaining budget would be kept as a reserve for emergency. The interest earned on the deposit would be used to fund project implementation. Gradually, it grew into a fund of around USD 450 million, which financed 789 projects through May 2021 (Irfanullah, 2021b). The fund's overall direction and administration is overseen by a board of trustees, which is chaired by the minister of the MoEF, as stipulated in Sec. 9 (CCTFA, 2010). The majority of BCCTF-funded projects concentrated on the construction of physical infrastructure; however, the local residents whose lives were significantly impacted were not given a role in the planning or execution of the projects (Khan, 2022). In addition, this fund is experiencing a number of issues, including a decrease in the amount of money allotted to it, a lack of high-quality submissions, political clout in decision-making, as well as capacity restrictions (Rahman & Huang, 2019).

Bangladesh Climate Change and Gender Action Plan, 2013

Bangladesh Climate Change and Gender Action Plan (ccGAP) is one of the policy papers which has been prepared in accordance with the country's desire to empower, respond to the needs of women, and promote gender equality in the context of climate change (Ministry of Environment and Forests [MoEF], 2013). The transformational aspect of gender interventions is the core idea of the ccGAP. It has incorporated gender concerns into four of the BCCSAP's six core pillars (MoEF, 2013). This plan requires gender-sensitive evaluations and gender-responsive initiatives when addressing climate change since its objective is "to mainstream gender

concerns into climate change-related policies, strategies and interventions ensuring access to, participation in, contributions towards and benefits for the diverse group of stakeholders for the sustainable and equitable development of Bangladesh" (MoEF, 2013).

The Bangladesh Delta Plan 2100, 2018

Adopted in 2018, the Bangladesh Delta Plan (BDP) 2100 outlines three higher-level national targets, including the eradication of extreme poverty by the year 2030, reaching the upper middle-income level by the same year, and turning Bangladesh into a prosperous country beyond 2041 (General Economics Division [GED], 2018). Six specific goals are also included in the BDP 2100 to assist in achieving those higher-level goals. Even though each of the six specific goals can be either directly or indirectly tied to climate change, goal 1 of the BDP clearly refers to climate change, which is to "ensure safety from floods and climate change related disasters" (GED, 2018). The government intends to implement this 100-year plan in three phases: 2030, 2050, and 2100. In order to achieve the objectives, the BDP 2100 has identified six hotspots relying on hydrological conditions: Barind and drought-prone areas, Chattogram Hill Tracts, coastal zones, Haor and flash flood areas, river systems and estuaries, and urban areas (GED, 2018).

Nationally Determined Contribution (NDC)

Bangladesh has so far made three nationally determined contribution (NDC) submissions in order to meet its commitments under international climate agreements. The most recent one was in 2021, where Bangladesh prepared a 10-year implementation plan for the NDC spanning 2016–2025 to reduce growing GHG emissions and adapt to climate change (Ministry of Environment and Forests and Climate Change [MoEFCC], 2021). Acknowledging Bangladesh being a climate-vulnerable country, the present NDC includes adaptation component that summarizes past efforts and future goals. Furthermore, it pledged under the NDC to cut GHG emissions in three main sectors, namely, energy, industry, as well as transport, by 5% below the "business-as-usual" (BAU) emission level by 2030 or by 15% below the BAU emission level by 2030 if developed nations provide sufficient and suitable assistance (MoEFCC, 2021).

Bangladesh Country Investment Plan for Environment, Forestry, and Climate Change (CIP-EFCC) 2016–2021

Bangladesh Country Investment Plan for Environment, Forestry, and Climate Change (CIP-EFCC) 2016–2021, which was initiated in 2017, provided a strategic approach for planning and coordinating national as well as international investments in Bangladesh's environment, forestry, and climate change sectors. There are 14 coherent, coordinated investment programs identified under four pillars: (1) sustainable development and natural resources management; (2) reduction and control of environmental pollution; (3) adaptation, mitigation, and resilience to climate change; and (4) environmental governance, human, gender, and institutional capacity development (Ministry of Environment and Forest [MoEF], 2017).

The Mujib Climate Prosperity Plan 2021

The Mujib Climate Prosperity Plan (MCPP) is a five-themed approach that investigates the prospects and hurdles of socioeconomic growth, climate resiliency, and green opportunities. It alters Bangladesh's trajectory to resilience from vulnerability and eventually prosperity. BDP2100 is a key strategy in the Mujib Climate Prosperity Plan to expedite the process of coping with the effects of climate change (Irfanullah, 2021a). The MCPP acts as a link between different policies that are already in place to facilitate their acceleration and supplementation rather than replacing them. A few examples of policies that are now in effect are as follows: NAPA 2009; BCCSAP 3009; CCTF 2010; BDP 2100; 8th Five-Year Plans; Perspective Plan 2021–2041; Forest Investment Plan 2017–2022; Climate Resilience Program; Climate Fiscal Framework, for climate fiscal policy-making; and Country Investment Plan for Environment, Forestry, and Climate Change 2020–2025. However, compared to other policies, MCPP does not require the establishment of any operational institutions to oversee its execution.

National Adaptation Plan of Bangladesh 2022 (Zero Draft)

The development of a national adaptation plan (NAP) became an imperative necessity for Bangladesh to ensure a clear path forward for implementing BCCSAP. The zero draft of the NAP prepared by the MoEFCC was released for public comment on March 3, 2022. As stated in the zero draft, the vision of NAP is “reducing climate risks through effective adaptation strategies for fostering a resilient society, ecosystem and sustainable economic growth” (Ministry of Environment and Forests and Climate Change [MoEFCC], 2022). The NAP established six goals to achieve its vision:

- (a) Ensuring protection against climate change variability and induced natural disasters.
- (b) Developing climate resilient as well as smart agriculture.
- (c) Developing climate resilient infrastructures and smart cities.
- (d) Promoting nature-based solutions for communities' well-being and biodiversity conservation.
- (e) Integrating CCA into the planning process for good governance.
- (f) Ensuring transformative capacity building for adaptation.

To realize NAP's goals and vision, 22 adaption strategic actions and 52 programs are selected. Those adaptation strategies are based on nine guiding principles: (1) prioritization of crosscutting sectors; (2) country-driven, participatory, and gender inclusiveness; (3) top-down and bottom-up approaches; (4) promotion of horizontal and vertical integration; (5) synergy with international environmental agreements; (6) alignment of goals and objectives with national aspects; (7) inclusion of important proposals in NAP; (8) investment in adaptation from private sectors; and (9) financial integrity through monitoring, evaluation, and reviewing (MoEFCC, 2022).

The National Adaptation Plan principally concentrates on four priority theme areas such as agriculture and livelihood security, water resources, urban area, and drought and coastal zone and their subsectors. Institutional stewardship is critical to the successful execution of the National Adaptation Plan. Acknowledging the remaining inefficiency in BCCSAP, a multilevel institutional arrangement is proposed in the zero draft of the NAP comprising National Environment and Climate Change Council, headed by the prime minister; National Steering and Coordination Committee chaired by the minister, MoEFCC; National Executive Committee, chaired by the secretary, MoEFCC; Local Executive Committee, chaired by the district commissioner; and the technical Advisory Committee and Climate Change Wing of MoEFCC. Recognizing the importance of a legally enforceable instrument, the National Adaptation Plan (NAP) emphasizes several issues such as the drafting of the National Climate Change Act and its guidelines, revision of the Climate Change Trust Fund Act (2010) and rules, establishment of Local Adaptation Program of Action (LAPA), the Youth-Led Adaptation Plan (YLAP), and the Chattogram Hill Tracts Climate Action Plan (CHT-CAP) (MoEFCC, 2022).

Eighth Five-Year Plan (2020–2025)

With the goal of attaining sustainable development, the eighth Five-Year Plan (2020–2025) is organized around six interrelated key themes, the fourth of which is directly related to climate change and is titled “a sustainable development pathway that is resilient to disaster and climate change; entails sustainable use of natural resources; and successfully manages the inevitable urbanization transition” (GED, 2020b). In order to achieve the goal, the government intends to implement a broad range of environmental fiscal reforms, in addition to administrative reforms, to improve environmental performance. Such reforms include the following specific references to the climate change issue: (a) integration of climate change issues in planning and budgeting, (b) improving capacity of and increasing resources for the MoEFCC, (c) cutting fuel subsidies and adopting a green fossil fuel tax, and (d) coordination of the BCCSAP, NAP, CIP, and NDC with BDP 2100 (GED, 2020b).

Perspective Plan (2021–2041)

The recently adopted Perspective Plan (2021–2041) (PP2041) aims to build a robust environment and climate change funding strategy, focusing on different financing opportunities between the private and public sectors. The PP2041 environmental management strategy focuses on integrating environment and climate change into development plans (GED, 2020a). To pursue green growth strategy, the PP2041 intends to implement the following policies, initiatives, and organizational changes: (a) incorporating the environmental cost into the macroeconomic scheme, (b) putting the delta plan into action to boost climate resilience and minimize vulnerability, (c) reducing the pollution of water and air, (d) removing subsidies for fuel,

(e) imposing green tax on the consumption of fossil fuel, (f) levying taxes on the emissions produced by the industries, (g) preventing surface water contamination, and (h) study of geospatial specifics to make evidence-based decision (GED, 2020a).

Disaster Management

Disaster Risk Management Laws and Policies

Bangladesh has designed its comprehensive disaster management strategies based on the differences in catastrophe origin and impacts. Its present focus is on disaster risk reduction and mitigation (Mall et al., 2019). Despite of having a long history of disaster management, Bangladesh waited nearly 41 years since its independence to establish the state's legislative obligation to disaster management (Disaster Management Act [DMA], 2012). Table 1 depicts the country's disaster management legislations and policies along with international commitments in chronological order.

Table 1 Year-wise national and international disaster laws and policies adopted by Bangladesh

Laws and policies on disaster management	
1997	Standing Orders on Disaster
2005	United Nations International Strategy for Disaster Reduction: The Hyogo Framework for Action (2005–2015) (This framework is updated to Sendai Framework)
2006	SAARC Framework for Action (SFA) 2006–2020
2010	Revised Standing Orders on Disaster
2010	National Plan for Disaster Management 2010–2015
2011	Cyclone Shelter Construction, Maintenance, and Management Policy
2012	Disaster Management Act
2015	Sustainable Development Goals (SDGs) (2015–2030)
2015	Sendai Framework for Disaster Risk Reduction (SFDRR) (2015–2030)
2015	Disaster Management Policy
2015	National Debris Management Guideline
2016	National Plan for Disaster Management 2016–2020
2016	Policy Guideline of Management of Dead after Disasters
2019	Revised Standing Orders on Disaster
2019	National Strategy on the Management of Disaster and Climate Induced Internal Displacement
2019	Revised Standing Orders on Disaster
2020	National Plan for Disaster Management 2021–2025
2020	8th Five-Year Plan

Note. Prepared by authors after studying disaster-related laws and policies adopted from 1997 to 2020

The Standing Orders on Disaster (SOD)

The Standing Orders on Disaster (SOD) were the first policy interventions on disaster management, originally released in Bangla in 1997. Following then, the government updated it twice, once in 2010 and again in 2019, to reflect changing conditions. As an all-inclusive disaster management template, SOD is widely utilized as a pivotal document by all levels of government for disaster intervention and management process (Shammin et al., 2022). With each SOD update, the inclusion of new stakeholders expanded, and their duties, responsibilities, and tasks were defined in detail (Quader, 2020). In terms of comprehensively addressing the duties of all those stakeholders in each of the phases, the SOD 2019 was much ahead of the earlier ones. Furthermore, it has considered and adhered with the obligations promised in the international commitments such as Sendai Framework for Disaster Risk Reduction, Sustainable Development Goals (SDGs), and other relevant international agreements. Figure 3 illustrates key aspects of the three SOD adopted in Bangladesh to support disaster management and emergency response.

Cyclone Shelter Construction, Maintenance, and Management Policy 2011

The Ministry of Disaster Management and Relief (MoDMR) developed the Cyclone Shelter Construction, Maintenance, and Management Policy (CSCMMP) in 2011 to ensure effective usage of such cyclone shelters, which have previously been built, are being built, or will be built in coastal regions. The policy specified three types of cyclone shelters: college, higher secondary school/Madrasa cum multipurpose shelter, primary school cum multipurpose shelter, and multipurpose shelter (Ministry of Disaster Management and Relief [MoDMR], 2011). Under the CSCMMP, three management forums were established, each with its own set of duties for managing cyclone shelters, including local beneficiary communities, organizations, and the appropriate management committee (MoDMR, 2011). One of the most significant features of the CSCMMP is that it identified the necessary amenities that must be provided in the cyclone shelter, such as adequate light, air, water, food, and sanitation. However, prior research findings on disaster management demonstrated that such services in the shelter were in poor condition (Jahan, 2020).

Disaster Management Act 2012

The preexisting international laws on disaster risk reduction were a significant driving force for the enactment of a legislation on disaster management in Bangladesh at the national level. The Disaster Management Act (DMA) was enacted in 2012 as a primary legislative instrument to better organize, target, and reinforce disaster management efforts, as well as to provide guidelines for effective disaster management infrastructure (Mannan et al., 2021). This legislation embraced an all-hazard, all-risk, and all-sector course of action to disaster management, emphasizing risk reduction as a major aspect of disaster management alongside emergency response management, while also promoting sustainable development (Quader, 2020). According to Sec. 21, the Act assigned statutory responsibilities on minis-

SOD 1997	<ul style="list-style-type: none"> First disaster management policy intervention focused on conventional relief Assigned tasks and responsibilities for disaster management at every level to relevant bodies Outlined disaster management tasks based on different phases such as Normal Times, Alert and Warning, Disaster and Recovery Phases. Inclusion of limited number of stakeholders Priorities for policymaking centered on prevention, mitigation, preparedness, as well as catastrophe response.
SOD 2010	<ul style="list-style-type: none"> Transition to response to disaster risk reduction (DRR) from traditional relief response Addressed climate change challenges Inclusion of additional relevant stakeholders Outlined disaster management tasks based on two main categories: Risk Reduction and Emergency Response Emergency Response based on different stages such as Normal Times, Alert and Warning, Disaster and Rehabilitation Stage Considered issues concerning children, women, disabled, and the elderly Disaster Incident Management System with Multi-Agency Participation Outlined the Responsibilities of the Local Government Elected Representatives, Field Level Officials, and Humanitarian Organizations
SOD 2019	<ul style="list-style-type: none"> Added more types of catastrophe to the list while defining disaster Defined DRR Provided a set of DRM Guidelines to be prepared/updated Inclusion of a greater number of stakeholders Outlined disaster management tasks based on two main categories: Risk Reduction and Emergency Response Emergency Response based on different stages such as response preparedness stage, Alert/warning Stage, Disaster Stage, Rehabilitation, Reconstruction and Recovery Stage Provided Gender Responsive' Guideline for Disaster Management with a focus on Gender Sensitive Coordination, Gender Equality-Based Participation, Gender Transformational Initiatives, 'Gender Responsiveness' at Various Levels Taken into account contemporary international development on disaster such as SDGs, Sendai Framework

Fig. 3 Features of the SOD of 1997, 2010, and 2019. Note. Authors prepared the figure after studying SOD of 1997, 2010, and 2019. From “Standing Orders on Disaster,” by Ministry of Food and Disaster Management, Disaster Management & Relief Division, 2010 <http://www.nahab.net/wp-content/uploads/2018/03/SOD-.pdf>; “Standing Orders on Disaster,” by Ministry of Disaster Management and Relief, 2019 https://modmr.portal.gov.bd/sites/default/files/files/modmr.portal.gov.bd/policies/7a9f5844_76c0_46f6_9d8a_5e176d2510b9/SOD%202019%20_English_FINAL.pdf

tries, divisions, committees, and other organization for disaster management that were set out in the SOD. Several key provisions of this legislation include the president's authority to declare a distress zone and help and support for seniors, children, women, and people with disabilities, as well as the power for the requisition assets, such as service, houses, transport, or any other facilities identified as

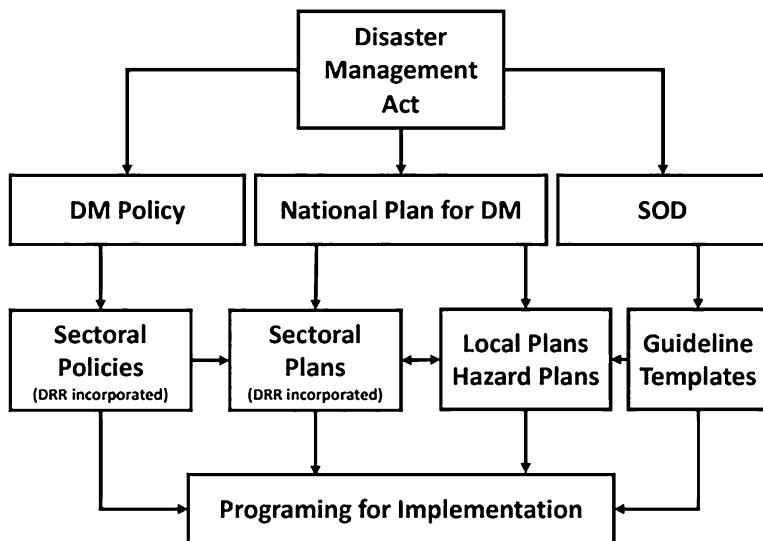

Fig. 4 Regulatory framework for disaster management in Bangladesh. Note. From “Bangladesh Disaster Management Reference Handbook,” by Center for Excellence in Disaster Management and Humanitarian Assistance, 2020 https://reliefweb.int/sites/reliefweb.int/files/resources/disaster-mgmt-ref-hdbk-bangladesh_1.pdf

emergency shelters (Disaster Management Act [DMA], 2012). The regulatory framework for disaster management in Bangladesh is visualized in Fig. 4.

Two distinct funds were created to carry out the Disaster Management Act's objectives: the National Disaster Management Fund and the District Disaster Management Fund (DMA, 2012). The Disaster Management (Fund Management) Rules 2021, adopted in accordance with the provisions of Sec. 32 of the DMA, is a significant recent addition to the instruments of disaster management policy governing the execution of such funds. If effectively implemented, it could alleviate several financial issues, such as contribution from individual people or agencies (Mannan et al., 2021).

To promote efficient planning as well as coordination of DRR and emergency response management, a set of interconnected organizations has been formed both at local and national levels (Quader, 2020). The Ministry of Disaster Management and Relief (MoDMR) was in charge of interministerial planning, coordination, as well as disaster response at the national level. Additionally, the government established a national council under Sec. 4 of the DMA and several disaster preparation committees at the union (local council), upazila (subdistrict), district, and national levels. As per Sec. 6 of the Act, the national council is entrusted with issuing required directives or consulting with relevant authorities and individuals in order to organize workshops and seminars to raise awareness on all pertinent disaster-related topics, operations, instructions, programs, regulations, rules, and policies.

Disaster Management Policy 2015

In 2015, the National Disaster Management Policy was devised in accordance with Sec. 19 of the DMA of 2012 to develop a new perspective on DRR as well as emergency management.

The policy provided a strategic framework for disaster management in Bangladesh and specified the country's national disaster management principles. Four principles guided the policy: comprehensive disaster management, public participation in disaster risk management, an emphasis on adaptation, and finally, the collection, sharing, and promotion of successful catastrophe efforts. The aim of this strategy is to reduce the risk of natural, environmental, and man-made disasters to levels that are humane and acceptable for people, particularly those who are disadvantaged and poor, and to create competent and effective emergency response systems to cope with large-scale disasters (Disaster Management Policy [DMP], 2015). In order to attain that aim, the policy devised hazard-specific strategies based on evaluations of Bangladesh's main catastrophe threats (DMP, 2015). It covers over 16 different kinds of catastrophes and presents tactics for each one in two phases: risk reduction and emergency response.

National Plan for Disaster Management 2021–2025

The National Plan for Disaster Management (NPDM) 2021–2025 is being regarded as the government of Bangladesh's "white paper" on disaster and related occurrence management. The NPDM has been in existence for 3 consecutive years 2010–2015, 2016–2020, and now 2021–2025. The first one, which ran from 2010 to 2015, was a result of the Hyogo Framework for Action (HFA) and the South Asian regional cooperation attempts (Mannan et al., 2021). The second NPDM focused on resilience, whereas the most recent one included a wide range of disaster management concerns. Natural and man-made hazards were included in the plan for the first time. It emphasized the need for national policies and programs to address increasing threats including climate change, drought, and desertification. An "all-hazard" or "multi-hazard" approach is used in this plan, which links hazard-specific actions to higher-level priority action plans (MoDMR, 2020). Furthermore, it is guided by the country's major strategic initiatives, such as Vision 2041, the Delta Plan 2100, and the eighth Five-Year Plan. The plan included four priority measures based on the state's circumstances and contemporaneous global initiatives. The new NPDM has many noteworthy features, including social inclusion as a foundational approach; a priority-level action plan; synergies between DRR and CCA; and a connection between DRR and sustainable development (Shammin et al., 2022).

National Strategy on the Management of Disaster and Climate-Induced Internal Displacement 2019

The government of Bangladesh has adopted National Strategy on the Management of Disaster and Climate-Induced Internal Displacement (NSMDCIID) with a particular emphasis on the people internally displaced as a result of disaster and climate threats. The plan used a rights-based approach, establishing a National Task Force on

Displacement, which would serve as the supreme decision-making authority for internal displacement caused by disasters as well as climatic threats (Refugee and Migratory Movements Research Unit [RMMRU], 2020). NSMDCIID has established a displacement management framework in accordance with the International Organization for Migration's migration management cycle in order to determine suitable interventions at various stages of displacement (RMMRU, 2020). It outlined four strategic responses including putting an end to displacement, relocation or resettlement, humanitarian relief and rights-based shelter and evacuation administration, and viable solution to displacement (RMMRU, 2020).

Institutional Arrangement for Disaster Management

The Ministry of Disaster Management and Relief is tasked with the primary responsibility for disaster risk management. This ministry is in charge of the development of policies, regulations, and legislation as well as the execution of DRM programs, including the monitoring and evaluation of their effectiveness (Ministry of Disaster Management and Relief [MoDMR], 2019). Table 2 lists the responsibilities of local and national DRM committees.

Table 2 Institutional committees and their responsibilities for DRM in Bangladesh

	Responsible bodies	Head	Key responsibility
National-level bodies	National Disaster Management Council (NDMC)	Prime Minister	Providing guidance on developing and reviewing disaster management policies and plans
	Inter-Ministerial Disaster Management Coordination Committee (IMDMCC)	Minister, Ministry of Disaster Management and Relief (MoDMR)	Implementation of NDMC/Government disaster management policies
	National Disaster Management Advisory Committee (NDMAC)	Chairman of Standing Committee, MoDMR	Recommend to the MoDMR on DRR, emergency preparedness, and humanitarian aid initiatives
	Earthquake Preparedness and Awareness Building Committee (EPABC)	Minister, MoDMR	Reviewing earthquake preparedness, awareness initiatives, as well as providing recommendations to appropriate bodies
	Chemical Disaster Management and Awareness Raising Committee	Secretary, Ministry of Industries	Reviewing existing chemical preparedness and awareness programs and providing recommendations for improvement
	National Platform for Disaster Risk Reduction (NPDRR)	Secretary, MoDMR	Coordinate among stakeholders to reduce catastrophe risk

(continued)

Table 2 (continued)

	Responsible bodies	Head	Key responsibility
	National Disaster Response Coordination Group (NDRCG)	Minister, MoDMR	Evaluating earthquakes and other mega-catastrophes to improve emergency response as well as methods and processes of early recovery
	Cyclone Preparedness Programme Policy Committee (CPPPC)	Minister, MoDMR	Developing strategic plan for the Cyclone Preparedness Programme (CPP)
	Cyclone Preparedness Programme Implementation Board (CPPIB)	Secretary, MoDMR	Providing suggestions for the CPP budget, human resource organization, and technical content
	Committee for Speedy Dissemination of Special Weather Bulletin/ Disaster Warning Message and Determining Strategy	Director General (DG), Department of Disaster Management (DDM)	Improving predictions and alerts for floods, landslides, flash floods, thunderstorms, precipitation, cold waves, etc.
	Focal Point Operational Coordination Group (FPOCG) Related Committee	DG, DDM	Recommending adequate coordination of operations of disaster management committees at national and local levels
	NGO Coordination Committee for Disaster Management	Secretary, MoDMR	Coordinating governmental and nongovernmental catastrophe preparedness, response, humanitarian relief, and recovery efforts
	Disaster Management Training and Mass Awareness Taskforce	DG, DDM	Guiding the formulation of disaster risk management training strategies and modules
	Fire Risk Management Committee	DG, DDM	Reviewing fire prevention and disaster awareness programs and providing suggestions to relevant agency
	Committee for Disaster Damage and Needs Assessment	DG, DDM	Coordinating all catastrophe damage and need assessments
	Forecast-Based Financing/ Action (FbF/A) Taskforce	Additional secretary, MoDMR	Assisting preparation of forecasts relying on early action methods by analyzing catastrophe level, trigger, and effect and coordinating with stakeholders

(continued)

Table 2 (continued)

	Responsible bodies	Head	Key responsibility
Local-level bodies	City Corporation Disaster Management Committee	Mayor	Preparation of contingency plans and conduct drills/ simulations for earthquakes, fires, chemical spills, building collapses, urban flooding, and waterlogging
	Divisional Disaster Management Committee	Divisional commissioner	Assisting the DDMC in formulating earthquake, fire, flood, and cyclone plans
	District Disaster Management Committee (DDMC)	Deputy commissioner	Preparation of comprehensive risk reduction plans and their implementation at the district level
	Upazila Disaster Management Committee	Chairperson, Upazila Parishad	Ensuring development and implementation of the union and upazila disaster risk-inclusive development plans
	Municipal Disaster Management Committee	Mayor	Undertaking pre-disaster preparedness, reviewing the status of DRR action plans with all sectors involved
	Union Disaster Management Committee	Chairperson and member of reserved women seat by rotation	Preparing action plans for reducing risk and increasing involvement of at-risk populations

Note. Adapted from “Standing Orders on Disaster,” by Ministry of Disaster Management and relief (MoDMR) Government of the People’s Republic of Bangladesh, 2019 https://modmr.portal.gov.bd/sites/default/files/files/modmr.portal.gov.bd/policies/7a9f5844_76c0_46f6_9d8a_5e176d2510b9/SOD%202019%20_English_FINAL.pdf

In reducing catastrophes and tackling the climate crisis, the government has shown a willingness to link climate change adaptation and disaster risk reduction (Nasreen, 2021). The following portion of the chapter discusses how Bangladesh has approached CCA and DRR, as well as the remaining barriers to integrating the two.

Bangladesh’s Approach to Disaster Risk Reduction and Climate Change Adaptation

Existing scholarships emphasized the need to integrate DRR and CCA to maximize resource efficiency and reduce duplication (Islam et al., 2020; Begum et al., 2014; Tearfund, 2008). Contemporary international agreements such as Kyoto

Protocol, the 2015 adoption of the Sendai Framework for Disaster Risk Reduction, and the Paris Agreement on climate change mandate increased coordination in climate and disaster risk reduction approaches to reduce vulnerability as well as enhance resilience (OECD, 2020; Intergovernmental Panel on Climate Change [IPCC], 2012). In most countries, however, climate change adaptation and disaster risk reduction are handled by different institutions and stakeholders resulting in overlapping and gaps in approaches and mechanisms (OECD, 2020). This is also true in Bangladesh.

Previously, Bangladesh has distinguished itself by being one of the first to design and adopt the National Adaptation Programme of Action (NAPA). Despite its widespread recognition, the NAPA has been criticized for its solitary adaptation approach. Presently, the Bangladesh Climate Change Strategy and Action Plan (BCCSAP), the Bangladesh Climate Change Trust Fund, and the NDC, 2016–2025, are the main initiatives for addressing CCA at the national level. Currently, the government of Bangladesh is on the cusp of adopting the NAP and has already released the zero draft. A formal institutional framework for implementing adaptation measures is recommended in the zero draft, and perhaps the final version will be even more explicit. Meanwhile, the Standing Orders on Disaster, the Disaster Management Act, the Disaster Management Policy, and the NPDM 2021–2025 are among the plans as well as policies in place to promote DRR. Bangladesh's progress on both frontier is promising in and of itself; nevertheless, when it comes to integration between the two, the country is confronted with a number of challenges:

Institutional Linkage

DRR and CCA have direct link with some aspects such as prevention strategies, building resilience, nonstructural measures, organization (both national and international), experts, agencies, and so on (Begum et al., 2014). It is not essential to collaborate on the dissimilar field of DRR and CCA; however collaboration of CCA and DRR might be done on particular disasters like floods and cyclones for effective resilience (Clegg et al., 2019). Coordination among institutions who govern DRR and CCA is essential to get a successful step forward to linking these two (Leitner et al., 2020). Despite this, their link is essential to demark who does what functions; understanding of their functions and taking approaches; improving opportunities; enhancing learning, functional efficiency, and efficacy; better use of resources; and a robust solution of the wicked issue of climate change (Leitner et al., 2020). In Bangladesh, there remains a lack of coherence in operational and technical aspects of CCA and DRR, despite the fact that potential coherence could be ensured in these areas (OECD, 2020). Local and regional institutions as well as the actors of CCA and DRR are working in complete isolation from one other when it comes to implementing their respective strategies (Islam et al., 2019).

Policy Gaps

Although the Sendai Framework for Disaster Risk Reduction (2015–2030) and the Paris Agreement provide a significant chance to strengthen cohesiveness across a broad range of policy sectors that are related to CCA and DRR, Bangladesh did not make enough use of this opportunity (OECD, 2020; Murray et al., 2016). Non-separation of legislation and policies addressing CCA, poor governance, and insufficient expertise and resources are making it hard to execute CCA measures in Bangladesh (Chowdhury et al., 2022). There is still a significant mismatch between CCA and DRR strategies, which are frequently governed by multiple departments with minimal or no coordination between them. To support and facilitate the identification of chances for coherence in CCA and DRR, Bangladesh is in dire need of policy integration (OECD, 2020). “Integration,” on the other hand, does not mean creating a unified policy framework but rather adopting a holistic approach to all policies related to CCA and DRR at the domestic level (Cubie & Natoli, 2022).

Inadequate Knowledge Sharing

Bangladesh lacks a suitable platform for exchanging information on CCA and DRR developments and progress. In order to better monitor the implementation of the SDGs, Bangladesh has built an online data repository system named “SDG Tracker.” However, there is data available on just one of the indicators (Indicator 13.1.1) connected to climate change. There is not one facility that has all of the relevant socioeconomic information, regional risk circumstances, and viable adaptation solutions in the national level. Thus a platform for DRR and CCA knowledge and tools which are more accessible to national climate change adaptation policy-makers and stakeholders are absent and urgently required. Furthermore, a lack of coordination awareness frequently inhibits the integration of DRR and CCA (Islam et al., 2019). The zero draft of NAP recommends developing knowledge management plans and platforms in order to appropriately assess knowledge availability, access, and interaction on CCA (MoEFCC, 2022). If developed, they could serve as useful platforms for exchanging information about existing as well as future CCA initiatives.

Lack of Mass Awareness and Mainstreaming

In Bangladesh, the implementing authorities, particularly those at the local level, are unfamiliar of the CCA and DRR processes, as well as the benefits of incorporating these two. In Bangladesh, there are national hotlines for disaster risk warning, in addition to a number of institutions such as the Water Resources Planning Organization (WARPO), the Center for Environmental and Geographic Information Services (CEGIS), and the Flood Forecasting and Warning Centre (FFWC), which offer research, databases, and guidance. Nevertheless, each of these institutions follows

its own set of governing policies and has a unique mission and vision to achieve. A system for sharing CCA and DRR statistics, data, and knowledge is needed to accelerate understanding and collaboration and assist stakeholders to discover, access, and use important content according to their requirement. The NAP zero draft mentioned websites, apps, national communication workshops, press conference, online training, webinar, talk shows, media coverages, policy briefs, infographics, flyers, and animated short videos as potential NAP communication media and tools (MoEFCC, 2022). In addition, a number of different communication materials are specified depending on the variety of targeted audiences and stakeholders. Some examples of these pieces include technical papers, reports, leaflets, infographics, policy briefs, web portals, workshops, seminars, webinars, public lectures, exhibitions, and social media (MoEFCC, 2022). If effectively implemented, it has the potential to raise widespread public understanding of climate change impacts and adaptation challenges.

Conclusion

Bangladesh is experiencing multidimensional challenges with present climate change impacts and frequent disasters. A peek at Bangladesh's climate change and disaster management strategies reveals that Bangladesh adopted many plans, policies, and laws to reduce disaster losses, be proactive about disaster management, and take long-term measures to protect itself from climate change. In many nations, risk reduction has been accomplished through coordinating CCA and DRR, which has so far been a successful endeavor. Recognizing the risk factors associated with both climate change and disasters, the government of Bangladesh adopted several forthcoming development objectives and policies, with some shortcomings in terms of attention on executing the policies, financing sources, knowledge sharing, as well as integrating disaster risk reduction and climate change adaptation. Although the existing available mechanism might provide some temporary assistance in mainstreaming specific concerns of CCA and DRR, there remains a dire need of a systematic approach to the exchange of knowledge about CCA and DRR endeavors. Furthermore, climate change and disaster management could benefit from holistic policy integration approach that improves the CCA and DRR measures. Regional cooperation, in conjunction with national initiatives for knowledge exchange and other cross-sectoral issues related to climate change and disaster management, might be of tremendous assistance in achieving greater success.

Abstract

The legal protections under international refugee law (IRL) in the context of disaster-driven human displacement (DHD) and climate change migration shifted from a comparatively profound academic bewilderment to a critical challenge of unparalleled proportions of international treatment of refugees and migrants. This shift manifests in developments at the global and regional levels. The 1951 UN Convention relating to the Status of Refugees (UNCSR) and the 1998 UN

Guiding Principles on Internal Displacement (GPID) in 2018 underscored the greater than before legal and policy emphasis on internally displaced persons (IDPs). Further, following the 2016 New York Declaration for Refugees and Migrants, the legally nonbinding Global Compact for Safe, Orderly and Regular Migration (GCM) and the Global Compact on Refugees (GCR) were adopted by the UN General Assembly (UNGA) on December 19, 2018, signifying the most noteworthy international development relating to the DHD and climatically displaced migrants (CDMs) in the context of climate change migration. On the other hand, the emergence of artificial intelligence (AI) and its deployment in determining the DHD status has further queered the pitch for securing legal protection for the DHD people. I argue in this book chapter that the IRL needs to provide a complete response to the rights of the DHD population and CDMs. Still, its fundamental principles are relevant to realizing the legal protections of DHD people, CDMs, CMSs, and IDPs. I also examine the application threshold of GCR to the role of UNCSR with its 1967 Additional Protocol in addressing the legal protections of DHD people and climate refugees and how AI application presents new challenges to protecting the DHD population. Therefore, I will rummage through the hybridized interpretation of international law (HIIL) and postulate the idea of a protection firewall and bias-free and nondiscriminatory AI application under customary international law (CIL) to address the plight of such displaced people. How can AI secure resilience and relief for the DHD people? I advocate the HIIL argument and contextualize the universality of the principle of *non-refoulement* afresh to advance the legal protections for the DHD people worldwide.

Keywords

DHD · IRL · RAMS · *Non-refoulement* · Human rights · Protection gaps · Global Compacts · CDMs · Climate change migration · Customary international law

Introduction

A transnational, transcontinental, and global human mobility caused due to DHD has presented novel challenges under IRL. Today, the DHD population reaches record highs in an age of crowd-pleasing nationalism, impervious borders, and the othering of refugees. Simultaneously, climate change intensifies the frequency and intensity of life-threatening weather conditions, exacerbating factors that cause the DHD. However, the power struggles, military conflicts, and climate change disasters between states, peoples, and individuals have plagued humanity ever since it first appeared on this planet, leaving millions of people homeless and forcing them to look for shelter inside or outside of their country. So, the problem of the refugees, asylum-seekers, migrants, and stateless (RAMS) (Ahmad, Refugee Rights, and Health: The Impact of COVID-19 on Refugee Camps, 2020) is profoundly different today. The new and most repeated DHD recorded in 2021 happened in East Asia, the

Pacific, and South Asia, collectively constituting almost 80% (IDMC, 2022a, b) of the total DHD comprising rains, tropical cyclones, monsoons, and floods. China, the Philippines, and India were the most affected countries, and many displacements occurred due to preventive evacuations. Despite a moderate hurricane season in the Americas and not as much rainfall in sub-Saharan Africa, the Middle East, and North Africa, all three regions were affected by acute droughts and excessive temperatures, causing hundreds of thousands of DHD (Michael Berlemann, 2017). The arid conditions also ignited other death traps like wildfires, forcing DHD people to flee their homes (WOLTERS, 2019). Europe experienced weather extremes that triggered heat waves, wildfires, and heavy flooding, leading to more than 261,000 displacements, an increase equated to 2020.

Consequently, the human rights of the DHD persons have gained enhanced significance, and their human rights (Thielbörger, 2019) are required to be expanded, redefined, and reformulated. IRL's foundation is a humanitarian one; however, it is obvious that this foundation is terribly out of date for our day (Coady, 2002). Therefore, the DHD problem needs global political solutions as the disaster displacement in the context of climate change migration problem is a phenomenon of our age (Alison Heslin, 2018). People have been confronting forced migration due to disaster displacement (Forced migration or displacement, 2022), conflict (IDMC, 2022a, b), violence, human rights violations (IACHR, 2015), and persecution (Scott, 2020). Such a displaced population has reached more than 100 million for the first time in the history of DHD (UNHCR, 2022), and it is further likely to be accelerated (Sven Smit, 2022). The Internal Displacement Monitoring Centre (IDMC) has released its Global Report on Internal Displacement and reported that the aggregate registered number of internally displaced persons (IDPs) worldwide had reached 59.1 million by 2021, up from 55 million in 2020 (IDMC 2022a, b). However, 38 million internal displacements were recorded in 2021, with some people displaced multiple times (Koonthamattam, 2022). Moreover, the total internal displacements are pegged at 5 million in Ethiopia, the highest annual figure ever recorded for a single country (Davies, 2022). Similarly, internal displacements in the Democratic Republic of Congo, Afghanistan, and Myanmar have also been recorded unprecedentedly.

The leading driver of DHD is climate change (UNHCR, Climate change link to the displacement of most vulnerable is clear: UNHCR, 2021), and forced displacement is making the conceptual, normative, and institutional frameworks accountable for providing solutions (Cullen, 2020). Nevertheless, IRL's fundamental principles and purposes are relevant to envision the legal protections for the DHD people, CMSs, and IDPs (Scott, 2020). The DHD individuals confront the most significant protection gap as they do not cross international borders (Schrepfer, 2012) and are not recognized under the UNCSR. Therefore, DHD migrants require well-defined legal protection within the normative and institutional frameworks consisting of holistically formulated domestic policies, fixity of responsibilities of the national governments who deny humanitarian entry to the DHD people consistent with international monitoring, and enhanced accessibility to climate rights and freedoms.

DHD and the Analysis of IDMC Report 2022

Worldwide human mobility has been triggered due to DHD presenting significant challenges to the IRL framework. Simultaneously, climate change increases the pace of dangerous weather circumstances, worsening considerations that pander to the DHD and cladding the sensible execution of international law with more challenges. However, certain UN agencies and numerous concerned states have grappled with CMSs worldwide and sought its international resolution (Ionesco, 2019). This shift is visible in developments at the global and regional levels. Moreover, the UNCSR and the 1998 UN-GIPD in 2018 and beyond also accentuated the greater than before legal and policy stress on the IDPs within their homelands. The GCR and GCM have registered broad and overwhelming support while recognizing the new moral and political undertakings in the context of conventional DHD drivers and climate change migration factors. Climate disasters have been causing more internal displacement than conflict and war (Mahapatra, 2021). By the end of 2021, there were 38 million internal displacements, out of which 14.4 million resulted from conflict and violence, and disasters caused 23.7 million in 141 countries. The total number of IDPs was 59.1 million as of the end of 2021; 53.2 million came from conflict and violence, and disasters produced 5.9 million IDPs (IDMC, 2022a, b). Therefore, the global estimate of conflict and violence was the highest ever documented (14.4 million). However, individual countries, including Ethiopia, the Democratic Republic of the Congo (DRC), and Afghanistan, recorded all-time highs. Many communities repeatedly fled as conflict frontiers shifted. Disasters sparked more than 60% of the internal displacements documented worldwide in 2021 (IDMC, 2022a, b), and more than 94% were the outcome of climate-induced hazards like storms and floods (López, 2015). The hurricane season in the Pax Americana and rainy seasons in Afro-Asia and sub-Saharan Africa were less severe, partly explaining why figures were lower than in 2020 and 2019 (Portal, June 2022). Drought in several regions triggered 240,000 displacements (IDMC, 2022a, b) and fuelled other hazards such as wildfires (Merzdorf, 2019) that forced people to flee. In DRC, in May 2021, the Nyiragongo volcano (OCHA, 2021) erupted, generating more than 599,000 disaster displacements (IDMC, 2022a, b) that turned out to be the highest figure for a geophysical calamity in a single year.

In countries like Myanmar, Somalia, South Sudan, and Syria, disasters and conflict collided (Reliefweb, June 2022), triggering many new and repetitive displacements. Present insecurity in Iraq and Syria forced many IDPs to flee for a second or third time. In reality, frequent displacements recorded in these countries were regular movements meant that the number of IDPs at the end of 2021 (IDMC, 2022a, b) did not establish any significant change. The intercommunal conflict generated 1.3 million internal displacements across 24 countries (IDMC, 2022a, b), mostly in sub-Saharan Africa. However, the assessment of displacement caused due to criminal violence remains challenging.

Nonetheless, 5.9 million people survived internal displacement due to disasters at the end of 2021 across 84 countries and territories (IDMC, 2022a, b). Afghanistan, China, and the Philippines had the highest figures, accounting for over 3 million.

Most of the people were still displaced by Afghanistan's disasters and were forced to flee their homes before 2021, the majority by drought and floods that have affected Afghanistan since 2018. According to the housing destruction data (IDMC, 2022a, b), both China and the Philippines are significantly affected by typhoons that cause widespread devastation of this type. However, such evidence is exceptional as there often needs to be more follow-up on the figures of displaced people after a disaster hits. This makes it problematic to appreciate the magnitude and nature of protracted displacement triggered by disasters and climate change impacts. Hurricanes Eta and Iota left 1.9 million people internally displaced across several countries in Central America in 2020 (IDMC, 2022a, b). Still, no follow-up assessments were carried out last year, which has limited the understanding of the duration of displacement following such storms.

DHD Population: Socioeconomic Impacts and Other Challenges to IRL

The DHD population has presented innumerable novel challenges in the first quarter of the twenty-first century that has brought out the ugliest challenges such as popular nationalism (Bruin, 2022), closed borders (Helene Benveniste, 2020), the othering of refugees (Hiraide, 2022), stymied immigration (McAdam, 2011), socioeconomic impacts (Salgado-Gálvez, 2018) of DHD migration, intensification of life-threatening weather conditions (Jakobsson, 2021) due to climate change, and declined economies. DHD vulnerability is at the core of IRL, and IHRL also offers a regulatory framework, so to talk of AI in the context of IRL may appear disturbing as a minimum. The challenges of potentially integrating algorithmic decision-making (ADM) and machine learning into global migration governance and policy (GMGP) have across-the-board repercussions for the IRL.

The Socioeconomic Impacts of DHD

The DHD generates specific requirements for the IDPs, government agencies, the humanitarian sector, and host communities. The economic impact of internal displacement worldwide was more than \$21 billion (IDMC, 2022a, b) in 2021. The estimate includes the price of providing every IDP with funding for their housing, health (DavidCantor, 2021), education, security, and compensation for their loss of income after 1 year of their displacement, as reported (Ekezie, 2022) in humanitarian response plans. In economic terms, the average impact in every year of DHD per IDP is about \$360, culled from the data from 18 countries, and the amount ranges from \$90 in Colombia to about \$710 in Libya (IDMC, 2022a, b). The disparity arises from divergences in the wants level across DHD populations and the projected expenses meeting them. The global Covid-19 pandemic and ongoing conflicts and disasters (IDMC, 2022a, b) have worsened food insecurity among IDPs (WFP, 2022) and swelled their dependence on humanitarian aid. In Libya, almost 77,000 IDPs were

projected to be food insecure and need food assistance in 2021, up from 17,000 just before the pandemic (OCHA, 2021). Therefore, the DHD crisis changes the demographical settings in a geopolitical entity and emasculates economic stability and human development.

DHD Terminology Challenges

The DHD people fleeing natural calamities caused due to natural disasters and remaining in their home countries must be regarded as the “DHD persons” (for international protection) and “CDMs” (for municipal protection), because terms “evacuees,” “disaster victims,” and “refugees” make the concept of IDPs baffling and limited to people displaced by violence (Agier, 2020) who are treated as per the 1998 UN-GPID. The conflict-driven and disaster-driven displacements are not the same and cannot be included in the definition of the IDPs. There needs to be clarity concerning its definition. Therefore, I propose that such people may be addressed as “disaster refugees,” “climate refugees,” “environmental refugees,” “migrants,” “refugees,” “internal circumstantial migrants (ICMs),” and “divinity-induced migrants” (DIMs) at the international level and “CDMs” in the context of municipal law. The DHD people do not fulfill the refugee definition requirements under the UNCSR and remain outside the mandate of the UNHCR even though the term “climate refugee” has gained visibility and popularity in common academic parlance. However, the UNHCR prefers “persons displaced in the context of disasters and climate change” (Verdier-Jouclas, 2019). Human rights defenders and civil society institutions approach the expression with the intent to initiate a debate. Therefore, I propose the usage of “DHD” for dedicated humanitarian assistance.

Thus, it is time to adopt a comprehensive additional protocol to the UNCSR on the rights of the DHD, and all people in migration must come under the humanitarian mandate of the UNHCR without any distinction as to which individuals qualify for international protection and how the nation-states should respond to the changing climate. Therefore, recent advances such as constructing border walls and fencing with electric currents have also problematized the humanitarian protection landscape worldwide.

Artificial Intelligence *Fait Accompli* and the Protection of the DHD People

AI, especially machine learning (ML), has been mapping disaster risk reduction (DRR) and predicting the impact of extreme weather conditions. AI raises a few questions: What benefits does AI present? What are the AI challenges, and how should these challenges be addressed? And how can AI provide important information to the DHD people, stakeholders, and policy-makers? To realize the potential of

AI for DRR and formulate an AI for DRR strategy, there is a need to respond to these questions and collaborate to apply AI to DRR challenges. The AI industry is growing at an incredible pace. Nation-states around the world are competing to win “AI Supremacy.” Major geopolitical entities advocate that the nations that will come out on top in AI will be “the ruler of the world.” Companies are investing upfront billions of dollars in acquiring the most significant market stake. Simulations demonstrate that by 2030 about 70% of companies will have adopted some AI technology (Bughin, 2018). The ADM technology and AI application must be well equipped to frustrate any bias, prejudice, inequality, and discrimination against the DHD people during their status determination, which is only possible if legitimate and efficient mechanisms are programmed based on public trust and protection for human rights with algorithmic transparency. One of the national governments’ top political priorities is to devise an AI policy framework to respond to global human rights standards transgressions (Kavanagh, 2019). Ethical AI practices for coordination, information, and interpretation of the above human rights of DHD and CDMs are obligatory for the nation-states and all stakeholders. ADM technologies require a human face with a human-centric HIIL approach to visit the existential crises of the DHD people.

However, prognostic analytics, biometric corroboration, automated credibility assessments, and ADM are technologies that could have utility for decision-making administration for the DHD people. Therefore, the implications for accountability, legitimacy, transparency, and human rights (Kaplan, 2019) demand an appropriate and sensible schedule for crucial deliberation regarding the potential impact of present and future AI technologies on RSD. Such challenges have further exacerbated the problems of DHD persons while making the practical implementation of IRL problematic. For example, in the DHD crisis, AI can identify damage and assess the reconstruction cost with its specifically developed algorithm that will reduce the time by conflating data from satellite, geospatial, and weather predictions. However, AI challenges to human rights have to be perceived and holistically responded to, as the consequences it creates might be extraordinarily profound and volatile. The progress of AI technology is very rapid, while the law remains slow, and it cannot manage AI with the same speed. Therefore, nation-states and individual entities need to invest more efforts in AI research and development while formulating policies and laws governing AI technology to protect the human rights of the DHD people.

DHD and Global Human Rights Frameworks (GHRF)

Many countries have been grappling with the DHD people, IDPs, CDMs, and climate refugees outside the IRL protection framework. The contemporary IRL protection framework is confronted with a twofold challenge, i.e., national security narrative and human rights narrative. Thus, today UNCSR is a pillar of the international refugee protection framework that is more balanced but less diversified in the

present circumstances. The human rights of the DHD persons, the CDMs, and the RAMS are legal concepts that demand the resolution of their fundamental human needs and vulnerabilities in CMSs. Therefore, the law of state responsibility must be expanded to incorporate the protection of the DHD persons, the CDMs, and the RAMS following the institutional convergence of the GCR and GCM.

Fundamental Principles of IRL in DHD Scenarios

The fundamental principles of IRL emanate from a range of universal and regional human rights treaties, the rules of CIL, and the ever-developing norms and standards in the practice of states and international organizations like the Office of the United Nations High Commissioner for Refugees (UNHCR). Further, the UNCSR is the core basis of IRL along with 1967 Additional Protocol (UNCSR-AP). Primarily, these two instruments establish the principles of refugee protection and command that forcibly displaced people must not be compelled to return to their homeland or territory where their lives, liberties, and rights are imperiled contrary to their will and volition. The principle of *non-refoulement* sets out the duties of RAMS and the responsibilities of states toward them. In the second part of the twentieth century, an individual was recognized as the subject of international law with dignity, integrity, and liberty under the IHRL framework. The UDHR (Universal Declaration of Human Rights) and IHRL core treaties provide the principles of protection for RAMS, DHD people, and other displaced persons (ODPs) that may be put as:

- *The right to have rights*
- *The equal and across-the-board-treatment and nondiscrimination*
- *The right to leave, return, and access to territory*
- *The right to protection of life in camps, settlements, and collective shelters*
- *The right to livelihood and good health*
- *The right to have states' human rights obligations, the rights against racism, stigma, and xenophobia*
- *The right to information*
- *The right to protection of privacy*
- *The right to belong, the right to border justice, the right to gender equality*
- *The right to have fair enforcement of immigration law*
- *The rights of labor workers*
- *The rights of marginalized groups/minorities*
- *The rights and their limitations*

These protection principles apply to DHD populations across geopolitical jurisdictions as the displacement makes them vulnerable and victims at par with RAMS. The HIIL approach and basic structure of international law (BASIL) premise have to facilitate the fiscal accrual benefits from AI application while upholding the shared values and democratic spaces of liberal societies.

Contextualizing the IRL Response and the Universality of the Principle of *Non-refoulement*

The IRL protection regime established for refugees, RAMS, or IDPs has failed to extend protection to CDMs (Ahmad, 2019). Thus, the potential requirement for fresh expression and protection arrangements for DHD needs consideration. The soul of IRL is the principle of *non-refoulement* that sustains it and determines its efficacy and applicability in conflict, violence, DHD, and beyond. But it begs a challenge to guarantee respect for the principle of *non-refoulement*. Nevertheless, the substantive spirit of the principle remains non-polemical. But, unfortunately, the DHD persons are deprived of their liberty and detained and repatriated to their country of origin. These obligations challenge the state practice of granting an individual the right to access the refugee status determination (RSD) procedures.

In the context of *non-refoulement*, the existence of a DHD crisis matters. Still, the DHD crisis cases are implicitly qualified to invoke the principle of *non-refoulement* under IHRL and IHL, and issues of extra-territoriality may be more relevant for the DHD people as they also find themselves in refugee-like situations. Generally, the DHD-affected states do not appreciate the practical pragmatics of the principle of *non-refoulement* and deny access to RSD procedures before a competent tribunal. Even UNHCR may not be available to aid. Advise DHD persons due to the exclusion clauses of the UNCSC as these clauses do not protect those who committed crimes against humanity and peace (Note on the Exclusion Clauses EC/47/SC/CRP.29, 1997). Still, these exclusion clauses must be extended to the DHD people. However, the principle of *non-refoulement* should not have been confined to IRL or refugees alone, as it is also present in IHRL, IHL, and customary international law (CIL) as a safety valve. In the DHD crisis, human rights IOs are not performing but attend only to specific places and cases. States have been resorting to diplomatic assurances to dodge their obligations under the principle of *non-refoulement*. National courts play a central role in preserving and defending the principle of *non-refoulement*. Further, the courts must also identify its limits, scope, and constitutive elements to determine the interplay between IHRL, IHL, and any criminal responsibility issues and the role and limitations of diplomatic assurances. For instance, Article 3 of the ECHR prohibits torture and inhuman or degrading treatment or punishment and enforces positive obligations on states, including the obligation of *non-refoulement* that has been underscored by the European Court of Human Rights (ECtHR) in *Soering v United Kingdom*, Application no. 14038/88 and *Chahal v United Kingdom* (22414/93) [1996] ECHR 54.

Locating the Legal Protection Threshold of Global Compacts (GCs) in Complementing the Role of 1951 UNCSC with 1967 AP for the DHD People

The Global Compacts on Refugees and Migrants are embedded in the IHRL and reiterate the states' commitment to respect, protect, and fulfill all IHRL envisioned

obligations. The Global Compacts are shifting from vertical legal protection to the DHD, CDMs, and RAMS and their families to horizontal legal protection. Thus, to address the unprecedented increase in forced displacements worldwide, these two Global Compacts (GCs) are primarily designed to provide for but are not limited to:

- Complementing the existing IRL framework with common pathways
- Strengthening the multilateral response architecture
- Reimagining the principles of international cooperation, responsibility-sharing, and international solidarity with the states hosting the DHD, CDMs, and RAMS
- Engrafting the principles of non-regression and nondiscrimination across all stages of the migration circle to get rid of all forms of discrimination, including racism, intolerance, and xenophobia against the DHD, CDMs, and RAMS and their families

UN Global Compact on Refugees

GCR was designed to provide a mechanism for humanizing international responses to displacement based on the principle of *non-refoulement*. But unfortunately, almost 4 years later, refugee rights defenders opine that progress and commitments need to be faster on the part of the international community (Osborn, 2021). The objective of the UN-sponsored GCR is fourfold: to lessen pressure on host countries, increase refugee self-reliance, enhance access to third-country resettlement, and support conditions in refugees' countries to return in safety. Therefore, I perceive the GCR as consistent with the HIIL approach as the "Re-engagement with Multilateralism," expanding the trajectory of solutions and supplementing the present trends of cooperation and in tune with BASIL doctrine as "Multi-alignment with Constitutionalism" to protect the rights of DHD, CDMs, and RAMS and their families and free the nation-states from their orbit of international relations imperatives, diplomacy choices, and foreign policy priorities. GCR is a protection equalizer and functions as a safety valve without a legally binding treaty obligation on the states. Re-engagement with Multilateralism bolsters the GCR principles of international cooperation, responsibility-sharing, and international solidarity with the DHD, CDMs, and RAMS hosting states.

It is advocated that the GCR's paragraphs 61 and 63 should be read in combination for bridging the protection hiatuses to extend the legal protection to the DHD people in the context of climate change migration. Paragraphs 61 and 63 contemplate the inherent powers of the RSD officials of the states to emplace the mechanisms to identify the international protection requirements of individual protection claims, RSD processing for large refugee movements, and group-based protection (UNHCR, ExCom Conclusions No. 103 (LVI) (2005) (s) and 96 (LIV) (2003), 2018). The GCR envisaged a quadrennial review framework Global Refugee Forum (GRF), under which states and stakeholders meet to deliberate about the best practices to achieve the aims of the GCR. The GCR has a subdivision called "Comprehensive Refugee Response Framework" (CRRF), which implements the wide-ranging humanitarian protection measures applicable to specific situations

involving large movements of RAMS. The same must also be available to the DHD persons and CDMs.

UN Global Compact on Migrants

GCM is regarded as a discovery and initiative to respond to the people's disaster-driven displacements and climate change migration. In the moral sense (Kälin, 2018), it addresses the plight of the people confronting droughts, earthquakes, floods, rising sea levels, and the negative impacts of climate change and other disasters. It promises to function on the vision of guiding principles such as common understanding, shared responsibilities, and unity of purpose within the cooperative framework envisaged in the 2016 New York Declaration for Refugees and Migrants. GCM is the first intergovernmental LNB agreement with an HRBA approach, expressed as a whole-of-government approach and a whole-of-society approach. With these principles, GCM tends to accomplish 23 objectives and associated commitments and explicitly makes a moral statement about the DHD migrants. For example, Objective 2 addresses the factors of migration in its sub-headline relevant to disaster-driven displacement, environmental degradation, and climate change migration. It demands measures to "develop adaptation, mitigation, and resilience strategies" to DHD and the negative impacts of climate change-induced erosion of habitable conditions. Further, Objective 21 entails a commitment to respect the prohibition of the return of migrants to conditions of irreversible harm and invokes the principle of *non-refoulement* relevant for the DHD people. However, the provisions relating to the implementation and follow-up are a vital part of the GCM that remains in oblivion. I perceive this impugned part inadequate without the HIIL approach allowing GCM to have "Re-engagement with Multilateralism" for capacity-building mechanism based on the "International Migration Review Forum" (IMRF) under paragraph 49.

HIIL and the Postulation of Protection Firewall Under CIL

The DHD people and CDMs constitute an essential category among all the variations of human displacement in the context of climate change that remains beyond human control. To address and respond to the concerns of the DHD community, I employ the HIIL approach based on the postulation of a protection firewall embedded in the rubrics of CIL. I encapsulate the HIIL approach with BASIL (basic structure of international law), the doctrine that (Ahmad, Refugees, and Algorithmic Humanitarianism: 2021) I theorize as:

- A compendium of dynamic principles governing judicial relations among human beings, nation-states, international institutions, and organizations based on the HRBA drawing upon non-derogable dignity, inalienable diversity, and immutable distinction of global human life by ensuring the absolute human existence consistent with *jus cogens*, *non-refoulement*, and CIL.

- HIIL approach straddles the ontological arguments culled from the therapeutic hermeneutics of the ambit of IRL, IHRL, IHL, CIL, ICL, IML, and CCL entrenched in the HDC (Hybridized Dynamic Constitutionalism). The HDC argument is based on the values such as the international rule of law, multiculturalism, democracy, judicial institutionalism, etc.

Thus, the HIIL approach, in tandem with the BASIL proposition, can accomplish the human dignity of the DHD people in the context of climate change migration. The amplitude of the dignity of the DHD persons constitutes and defines the province of human rights known as “All human rights for all” and “the world is one family,” which have relied on the liberal and expanded lingual construction of human rights securing full human dignity to the DHD global humanity.

Conceptualization of the Normative and Non-derogable Human Rights of DHD People

Conceptualizing the normative and non-derogable human rights (NDHR) of the DHD people and non-derogable obligations of states to protect those NDHR of the DHD persons is a difficult task. For a long time, protecting the NDHR of DHD persons has received extremely scant normative, legal, and institutional attention (Hoffman, 2009). The conceptual framework of the IRL has to respond to the normativity of the protection gaps violating the rights of the DHD refugees not covered by the UNCSR. The concerns of the DHD population across the world and their human rights trepidations regarding displacement victims who have not received sufficient legal protections relating to the following rights and CMDs that include but are not limited to:

- The right to life with human dignity
- The right to *non-refoulement*
- The right to protection of refugeehood
- The right to food security and healthcare
- The right to dignified livelihood opportunities
- The right to equality of treatment on the grounds of humanitarian assistance, caste juxtaposition, ethnic mistreatment, racial integration, and religious identity
- The right to nondiscrimination in matters of poverty and vulnerability
- The right to safety of personhood and personal integrity in refugee camps
- The right to gender parity in matters of sexual abuse and gender-based violence
- The rights of elderly, differently abled, and physically and mentally challenged people
- The rights of forced relocated people to hostile territories
- The rights against human trafficking and conscription of children in armed forces
- The rights to durable solutions under IRL in locations of displacement
- The rights under GCR and GCM undertakings and understandings
- The rights of complementary legal protections under IRL, IHRL, IHL, CIL, IML (international maritime law), ICL, CCL, etc.

Living with climate change is bound to transform human existence in inimical ways that are likely to be insurmountable (O'Brien, 2022). The upsurge in DHD will likely generate massive displacements that will change the global perception of DHD people. The DHD people are regarded as refugees and IDPs uprooted due to conflict and persecution. By 2050, the climate change vortex of drought, heat waves, wildfires, hurricanes, and floods will produce a 250 million DHD population. However, the UN and IDMC are on the same page in expressing their inability to prognosticate the nature of the DHD, whether permanent or temporary.

Ethical Dimensions of the IRL and the Future of the NDHR of the DHD People, CDMs, IDPs, and Climate Refugees Not Covered Under UNCSR

The DHD people, CDMs, IDPs, and climate refugee flows are the corollary of dangerous and deleterious socioeconomic and geopolitical permutations among many nation-states. Irrespective of the causes of displacement, the most significant pain in one's life is to have been displaced from their ancestries, heritages, and pedigrees that are fallible, fallacious, and fatal. To uproot people from their land of origin amounts to deprivation of fundamental rights and freedoms that include but are not limited to:

- The right to usual life
- The right to housing memory
- The right to historical culture
- The freedom to feel belongingness
- The right to the immemorial neighborhood
- The right to cross-cultural and multicultural bonds
- The right to perennial socialization
- The right to human interdependence
- The right to classic climate
- The right to geopolitical predilections
- The right to diversity and identity
- The right to be consulted in economic modules
- The right to participate in community development
- The right to good governance
- The right to the rule of law
- The right to socioeconomic development
- The right not to be displaced

These are not merely rights but go beyond the rubrics of rights as inalienable entitlements, basic bonds, and natural claims. Thus, a holistic understanding of the NDHR of the DHD people under contemporary IRL must be rejigged to ensure its pragmatic future.

Legal Protections in the Context of Climate Change Migration

A context of mounting evidence of the negative impacts of climate change on the human rights of the DHD persons and CDMs has necessitated the potential legal protection framework because the concerns of the UNHCR are presently rooted in the UNCSR refugee definition (UNHCR, Collection of International Instruments and Legal Texts) which states that a refugee is an individual who:

[...] owing to a well-founded fear of persecution for reasons of race, religion, nationality, membership of a particular social group or political opinions, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country, or who, not having a nationality and being outside of the country of his former habitual residence as a result of such events, is unable or, owing to such fear, is unwilling to return to it.

The reasons for climate change force people and trigger their involuntary migration by crossing international borders that are not the relevant reasons for seeking refugee status as per UNCSR definition. The refugee definitions in regional instruments like the 1969 OAU Convention Governing the Specific Aspects of Refugee Problems in Africa and the 1984 Cartagena Declaration on Refugees (CDR) are possibly more receptive to including the DHD persons. The OAU Convention considers individualized persecution and people who flee “owing to external aggression, occupation, foreign domination or events seriously disturbing public order,” according to Article 1(2). Thus, the victims of climate change repercussions caused due to human-induced intervention can qualify as refugees under the CDR. Further, the CDR protects victims of natural disasters if they cross international borders due to massive human rights violations.

Presently, there are no benchmarks or models for determining migration’s voluntariness or forcedness to protect them under the GPID. In 2009, the Parliamentary Assembly of the Council of Europe (CoE) made Recommendation 1862 (Europe, 2012) for applying GPID to DHD people. In 2004, the US Agency for International Development (USAID) supported the GPID for DHD persons and CDMs. USAID recognized the usefulness of the GPID framework for the IDPs but encouraged their application to the victims of natural disasters. In 2009, African Union adopted the legally binding Convention for the Protection and Assistance of Internally Displaced Persons in Africa aka Kampala Convention founded on GPID and requires states to assist and protect the IDPs due to natural calamities, climate change, or human-made disasters (Beyani, 2011) despite its inherently weak enforcement. Therefore, the lack of legally binding international instruments for DHD persons who have crossed international borders ultimately impelled several European countries to amend their asylum laws. However, a legally binding second additional protocol to the UNCSR for addressing the plight of the DHD people and CDMs must be adopted with the HIIL approach within the BASIL province. Thus, the DHD persons, CDMs, and other displaced persons (ODPs) constitute a specific class of people in the context of

their sufferings and deprivation, and their following human rights have been neglected by their governments, and the same must also be attended to:

- *The right to have human rights*
- *The right to legal identity*
- *The right to have the law*
- *The right to ethical livelihood*
- *The right to social security entitlements*
- *The right to migrant status determination (MSD)*
- *The right to inclusion*
- *The right to consular access and protection*
- *The right to the application of R2P*
- *The right to recognition*
- *The right to have legal protection*
- *The right to have the response*
- *The right to consultation*
- *The right to information*
- *The right to institutional help*
- *The right to special needs*
- *The right to reintegration*
- *The right to resettlement*
- *The right to rehabilitation*
- *The right to the family reunion*
- *The right to preventive measures*
- *The right to humanitarian pro bono aid*
- *The right to safe pathways*
- *The right to training in disaster management*
- *The right to monitor rights implementation*
- *The right to choice of the host community*

The UNSCR and its 1967 Additional Protocol constitute the core subject matter of the IRL regime. But IRL suffers the worst fate of human rights rhetoric: it is trivialized by the hypocrisy of governments. The legal mandate of the UNHCR is that neither the country expelling refugees nor potential states of refugees are under any obligation even to permit the UNHCR to operate in their territories.

Conclusion

The legal protections under the IRL framework for the DHD populations have presented an unprecedented critical challenge to the robustness of international law. Legal protections for the DHD people lack the fundamental principles relevant to realizing the NDHR of the DHD people stranded in the CMSs. The GCs should

have been adopted as a second additional protocol to the UNCSR or a legally binding international treaty. These GCs would have genuinely worked as a firewall under the CIL and strengthened the universality of the principle of *non-refoulement* afresh to advance the legal protections for DHD people worldwide. In addition, converting and adopting the 1998 GPID and 2009 Kampala Convention as a legally binding international treaty could be a viable solution with the HIIL approach to cover the NDHR of the DHD people. The UNHCR is, unfortunately, a creation of governments, and the contributions of these donor governments ultimately determine the budget of the UNHCR that influences their protection agenda. Thus, the UNHCR should get autonomous status within the present jurisdiction of the UN General Assembly. The DHD is a global phenomenon and requires global governance to palliate it with global tools. The GCR must institutionalize the responsibility for protecting refugees and the DHD worldwide and prioritize its execution based on the HIIL, equity, and responsibility-sharing toward the RAMS before the GRF meeting in 2023.

On the technology front, the democratic supervision of the AI structures regarding the development, design, and deployment of AI must be implemented. The AI application must frustrate any bias, prejudice, inequality, and discrimination that is only possible if legitimate and efficient mechanisms are programmed with high sensitivity for the DHD people. Thus, the mechanisms and universal legal protections for the DHD people, the CDMs, the RAMSs, and the ODPs under IRL need fundamental reform to ensure a comprehensive approach.

Abstract

Resorting to armed conflicts is a human-made disaster. Sovereign states are under an obligation to apply relevant principles governing armed conflicts to minimize the ravages of such disasters, to provide effective remedies, and to rebuild their societies. International humanitarian law (IHL) provides rules to protect civilians and civilian objectives in armed conflicts. This research aims at examining the international obligations of states as established by IHL to protect civilians from the ravages of armed conflicts with special reference to Sri Lanka. Sri Lanka

experienced a protracted non-international armed conflict, which spanned over three decades. Since the cessation of hostilities, the international community, particularly the UN Human Rights Council (UNHRC), is scrutinizing whether the government of Sri Lanka has effectively discharged its international obligations during the war, specifically based on the alleged human rights and humanitarian law violations committed against civilians. UN Human Rights Council has adopted several resolutions, which require the government to address the accusations and to foster transitional justice. This research analyzes relevant legal principles, practical situations, and responses of the international community, in particular the resolutions adopted by the UN Human Rights Council on Sri Lanka to assess international and domestic legal responses regarding the protection of civilians during Sri Lanka's armed conflict. Key findings reveal that the frequent changes of governments, their policies, and strategies have impeded addressing the disaster effectively. Failure to adopt necessary enabling legislations and the disinclination to allow international mechanisms to probe into the alleged incidents weaken the defenses of Sri Lanka. This research recommends that diligent discharge of international obligations and upholding rule of law would provide a sustainable solution to Sri Lanka's human-made disaster.

Introduction

Armed conflicts, being a grave humanitarian catastrophe, inflict serious impact on human lives, such as deaths and grievous hurt to the body and properties including other physical, psychological, and emotional harm. Among those affected categories of persons, civilians are more vulnerable than others due to the conduct of hostilities in armed conflicts because they do not get directly involved in the conduct of hostilities. Due to the devastating impact of wars on civilians, their properties, and other civilian objectives, it is important to analyze the consequences of armed conflicts on them and the adequacy of the existing legal framework in such scenarios from a legal perspective in order to address gaps and to propose effective laws and policies to provide appropriate preventive and mitigatory strategies and remedies and also to punish the perpetrators of such crimes with required severity.

In the above backdrop, the main objective of this book chapter is to examine the impact of the ravages of armed conflicts on civilians and the obligations of sovereign states with particular reference to Sri Lanka, from an international law perspective. Any armed struggle has inevitably produced tragic consequences in general as well as on the protection of civilians in particular, from the beginning to post-war situations. Sovereign states are under an obligation to apply relevant rules, principles, laws, and customs governing armed conflicts to address the consequences of such disasters

diligently, to provide effective remedies, and to rebuild their societies. International humanitarian law provides rules to protect civilians and civilian objectives in armed conflicts. This book chapter is limited to discussing relevant norms and principles of public international law, humanitarian law, and human rights law and to producing an appraisal of the applicable legal principles with special reference to the international obligations of Sri Lanka to protect civilians in situations of armed conflicts.

Sri Lanka suffered from a protracted non-international armed conflict, which spanned over three decades. Since the cessation of hostilities, the international community has been scrutinizing whether the government of Sri Lanka has effectively discharged its international obligations, during and after the war, particularly to probe into the alleged human rights and humanitarian law violations committed against civilians. The UN Human Rights Council has adopted several resolutions, (UN Human Rights Council resolutions 19/2 of 22 March 2012, 22/1 of 21 March 2013, 25/1 of 27 March 2014, 30/1 of 1 October 2015, 34/1 of 23 March 2017, 40/1 of 21 March 2019 and 46/1 of March 2021 on promoting reconciliation, accountability and human rights in Sri Lanka) requiring the government to address the accusations, to provide effective remedies, and to foster transitional justice. To appraise the legal responses of Sri Lanka under its international obligations, this research analyzes relevant international legal principles and the ground-level situation of Sri Lanka.

Legal Framework Governing Armed Conflicts

International humanitarian law (IHL) is the specialized legal regime that regulates conflict resorting to warfare. It attempts to come to a compromise between military necessity and humanity in times of armed conflict with a view of lessening the harmful effects of armed conflict. It restricts the use of force in war in two ways: with the use of measures to protect civilians as they do not participate directly in the armed struggle and the combatants who are not able to fight anymore and by limiting certain methods and means of combat to the amount required to accomplish the military objectives of resorting to war. Thus, the objective of armed conflicts is constrained to the purpose of weakening the fighting capacity of the adversary (Marco Sassoli, 2011). IHL is mainly comprised of the rules stipulated in treaty law, customary international humanitarian law (CIHL), and case law jurisprudence developed through international, regional, and domestic courts and other tribunals. Geneva Conventions (GCs) of 1949 and their first and second Additional Protocols (APs) of 1977 are the main international legal instruments which regulate the armed conflicts, whereas the customary international humanitarian law (CIHL) rules codified by the International Committee of the Red Cross (ICRC) provide further protection. IHL rules seek to “establish minimum standards of humanity that must be respected in any situation of armed conflict” (Melser, 2016). Hence, this body of law provides universally accepted principles to mitigate the adverse impact of armed conflicts, which is one of the worse forms of human disasters.

An Appraisal of Core Legal Principles Regulating Armed Conflicts

Core principles of international humanitarian law (IHL) include “principle of distinction” and “principle of proportionality” among others and are crucial in mitigating the unnecessary sufferings produced by the ravages of armed conflicts (Melser, 2016). The underlying legal doctrines in these two principles are well embedded in both the treaty law and CIHL. The protection of the “persons who are either not at all directly participating in the hostilities and the ones who do not do so any longer are guaranteed in the principle of distinction. It always necessitates the involved parties to an armed conflict to distinguish between the civilian population and combatants and between civilian objects and military objectives and accordingly shall direct their operations only against military objectives” (Marco Sassoli, 2011). The St. Petersburg Declaration, Preamble, has recognized that “the only legitimate object, which States should endeavour to accomplish during war is to weaken the military forces of the enemy.” Additional Protocol I Article 51(1) and CIHL Rule 1 stipulate that “[t]he civilian population and individual civilians shall enjoy general protection against dangers arising from military operations.” According to these principles, civilians and civilian objectives cannot be the direct target of military operations under any circumstances and, if do so, is a serious violation of IHL. Article 8 of the Rome Statute of International Criminal Court defines such violations as war crimes.

The other most important principle of IHL is the principle of proportionality. According to this principle, “the use of force and the resulting destruction must not be disproportionate to the objective and to the military advantage sought” (Marco Sassoli, 2011). As Melser explains, “where the infliction of incidental harm on civilians or civilian objects cannot be avoided, it is subject to the principle of proportionality” (Melser, 2016). Thus, as Melser emphasized “those who plan or decide on an attack must refrain from launching, or must suspend, any attack which may be expected to cause incidental loss of civilian life, injury to civilians, damage to civilian objects, or a combination thereof, which would be excessive in relation to the concrete and direct military advantage anticipated” (Melser, 2016). This principle is included both in the treaty law and CIHL. For example, Additional Protocol (AP) I Articles 51(5)(b) and 57(2)(a)(iii) and (b) and CIHL, Rules 14, 18, and 19, give effect to the principle of proportionality.

Both these principles strive to protect civilians from direct attacks as well as from being subject to collateral damages. Therefore, it is important to pay utmost concern to safeguard innocent civilians, their properties, and other civilian objectives such as schools, markets, hospitals, places of worship, etc. However, the contemporary armed conflicts provide ample evidence that these principles are least respected, and as a result, more than ever the civilians are severely affected.

Difference of Regulation Based on Classification of Armed Conflicts

International humanitarian law does not articulate uniform rules for all types of armed conflicts. It classifies armed conflicts in accordance with the definitions

stipulated in the treaty law and customary law and applies different rules accordingly. IHL categorizes armed conflicts as falling into two types: international armed conflicts (IACs) and non-international armed conflicts (NIACs). Treaty law, in particular, the Geneva Conventions of 1949 and Additional Protocol I of 1977 to the Conventions provide extensive protection to the victims in IACs. Alternatively, less protection is provided for the victims of NIACs (Stewart, 2003) as stipulated in Article 3 common to all four Geneva Conventions of 1949 and Additional Protocol II of 1977. This discriminatory application of rules is criticized by scholars stating that this characterization is “arbitrary, undesirable, difficult to justify, and that it frustrates the humanitarian purpose of the law of war in most of the instances in which war now occurs” (Stewart, 2003). As a result, the civilians who are affected by the ill consequences of NIACs are having less protection under IHL treaty law, but the customary laws have not maintained the same distinctions as of the treaty law thereby providing similar protection under its rules in the two types of armed conflicts. It is noteworthy because the pains, sufferings, losses, and many such adverse impacts of armed conflicts cannot be treated differently just because they have happened in a different context.

Common Article 2 of the Geneva Conventions defines “international armed conflicts as conflicts between two or more sovereign States.” The applicable laws to such types of armed conflicts are the 1899 and 1907 Hague Conventions, the four Geneva Conventions of 1949 (except for Article 3 common to the conventions), first Additional Protocol to the Geneva Conventions of 1977, customary principles of international laws, and the case law jurisprudence developed through international courts and tribunals. Although the Geneva Conventions do not offer a similar definition to non-international armed conflicts, Common Article 3 of the GCs imposes a strong obligation “to protect civilians and other categories of people who should take no active part in the hostilities, including members of armed forces who have laid down their arms and those placed hors de combat by sickness, wounds, detention, or any other cause.” According to Common Article 3, “they should be treated humanely in all circumstances, without any adverse distinction founded on race, color, religion or faith, sex, birth or wealth, or any other similar criteria.” However, Common Article 3 does not provide a definition of armed conflicts not of an international character and thus leaves it for interpretation. This lacuna is filled through case law jurisprudence and the Article 1 of Additional Protocol II of 1977. As cited in paragraph 70 of the decision in the Prosecutor v. Dusko Tadic, it was decided that “On the basis of the foregoing, we find that an armed conflict exists whenever there is a resort to armed force between States or protracted armed violence between governmental authorities and organized armed groups or between such groups within a State” (Prosecutor v. Dusko Tadic, 1999). Moving beyond this definition, Article 1 of Protocol II requires “This Protocol, which develops and supplements Article 3 common to the Geneva Conventions of 12 August 1949 without modifying its existing conditions of applications, shall apply to all armed conflicts which are not covered by Article 1 of the Protocol Additional to the Geneva Conventions of 12 August 1949, ..and which take place in the territory of a High Contracting Party between its armed forces and dissident

armed forces or other organized armed groups which, under responsible command, exercise such control over a part of its territory as to enable them to carry out sustained and concerted military operations and to implement this Protocol.” The protracted armed conflict that occurred in Sri Lanka could be defined both under Article 1 of Additional Protocol II and the judicial interpretation given in the Tadic judgment, as an armed conflict not of international character because it happened within the territory of Sri Lanka between the government armed forces and an organized armed group, named, the Liberation Tigers of Tamil Eelam LTTE.

International Obligations of States for Protecting Civilians

States undertake international obligations under treaties as well as by contributing to create customary laws through their state practices and *opinio juris* (accepting those practices as law) (Evans, 2010). Obligations are respected in good faith, which is spelled out through an important maxim of international law, namely, *pacta sunt servanda*. This maxim requires the states, which expressed their consent and accepted that international rule/s are bound, to discharge their obligations without fail.

Legal principles governing situations of war are found in treaties, customary laws, case law jurisprudence, and in scholarly works. Historically, involvement of civilians was less in the conduct of hostilities. Combatants who were directly involved in warfare were considered legitimate targets of their rivalries unless the combatant happened to lay down their arms and placed in the status called *hors de combat*. As outlined above, “the principles of distinction and proportionality” strongly require the protection of civilians because “they do not directly participate in warfare” (Melser, 2016). Therefore, civilian should not be the target of any war and their lives should be spared. However, if the civilians are determined to participate directly in armed conflicts, they will lose their protection provided under the applicable rules of IHL. “The concept of direct participation in hostilities (DPH) refers to conduct which, if carried out by civilians, suspends their protection against the dangers arising from military operations, for the duration of their direct participation in hostilities, civilians may be directly attacked as if they were combatants” (Melzer, 2009).

The Fourth Geneva Convention relative to the protection of civilian persons of 1949 dedicates its provisions to the protection of civilians in the context of international armed conflicts. “For the purposes of the principle of distinction in IAC, all persons who are neither members of the armed forces of a party to the conflict nor participants in a levée en masse are civilians and, therefore, entitled to protection against direct attack unless and for such time as they take a direct part in hostilities” (Melzer, 2009). This convention lucidly provides protection for civilians under three situations: civilians who are trapped in IACs as aliens, citizens in occupied territories, and detained as interns by the enemy powers. In NIACs civilians are protected under Common Article 3 and Additional Protocol II of 1977. In addition to this

extensive coverage of protection afforded under the treaties, they are further protected by customary rules of IHL.

Civilian Protection in International Armed Conflict Situations

Fourth Geneva Convention as well as the customary IHL rules prohibit the “use of civilians as a human shield to protect certain areas or installations, usually of military importance, from enemy attack” (Rule 97, Customary International Humanitarian Law Rules, Henckaerts, 2005). The “collective punishment of civilian’s measures aimed at intimidating or terrorizing the civilian population, pillage, hostage-taking, and reprisals against civilians are also forbidden” (Fourth Geneva Convention, Article 33). Articles 14 and 15 of the Fourth GC and Articles 59 and 60 of Protocol I include very important provisions to set up safety zones such as demilitarized zones, no-fire zones, etc. during the armed conflicts in order to protect civilians with the consent of both sides. The primary objective of said provisions is to protect the civilian population as a whole or groups of especially vulnerable people. During armed conflicts, it is important to provide particular attention and protection to the wounded and sick soldiers, children, disabled persons, elderly persons, etc. These provisions are particularly important for their protection to be guaranteed.

Additional Protocol I of 1977 devoted a lengthy section on the protection of civilians in IACs. Article 48 imposes a basic rule that require “the Parties to the conflict to make a distinction between the civilian population and combatants and between civilian objects at all the times” as a mandatory requirement “in order to ensure respect for and protection of the civilian population and civilian objects.” Accordingly, belligerent groups should unleash their attacks only against military targets, not against the civilians or their properties and other civilian objects. Unfortunately, this is a frequently violated rule in times of war, and as a result, the disastrous situation of such conflicts is aggravated. Article 50(3) helps to resolve matters of doubts by stipulating that “in case of doubt whether a person is a civilian, that person shall be considered to be a civilian.” These are noteworthy provisions to guarantee the protection of civilians in conflicts and to mitigate the disaster they undergo.

Article 51 guarantees the protection of the civilian population by stipulating strong provisions. This article claims that “the civilian population and individual civilians shall enjoy general protection against dangers arising from military operations” (Article 51). Also, “civilians should not at any event be the object of attack. Acts or threats of violence with the purpose of spreading terror among the civilian population are prohibited.” To achieve the desired purposes, any indiscriminate attacks are prohibited. For example, as explained in Article 51(5)(a), it is prohibited to treat “separated and distinct military objectives” as a “single military objective in an area where civilians are concentrated, or civilian objectives are present.” In such a situation, the disaster to be happened will be countless as well as a serious violation of humanitarian law principles. Also, Article 51(5)(b) prohibits attacks which may not be directed against the civilians but is expected to “cause incidental loss of

civilian life, injury to civilians, damage to civilian objects, or a combination thereof, which would be excessive in relation to the concrete and direct military advantage anticipated” (Article 51(5)(b)). Article 51(6) prohibits “reprisals against the civilians or civilian population.” Important provisions are laid down to protect cultural property and other important objects and religious places. Accordingly, it is outlawed to “commit any acts of hostility directed against the historic monuments, works of art or places of worship which constitute the cultural or spiritual heritage of peoples” (Article 53). Salutary provisions are incorporated in Protocol II to protect the things which are vital to the existence of the civilians. Article 54 protects civilians from starvation by prohibiting to make them starve to achieve military targets. Accordingly, attacks cannot be unleashed to destroy objects, essential for civilians for their survival, such as their harvest, farming lands, livestock, reservoirs used for irrigation and consumption purposes, etc.

The above provisions in the treaty law and customary law aim at protecting civilians from the adverse impacts of armed conflicts. War being one of the gravest forms of disasters, it is crucial to protect not only civilians and their properties but also the environment that they live in. For example, Article 35(3) prohibits “to employ methods or means of warfare which are intended, or may be expected, to cause widespread, long-term and severe damage to the natural environment.” This provision required the protection of environment for safe living of civilians, among other benefits.

Civilian Protection in Non-international Armed Conflicts

In the context of NIACs, Article 3 common to all the Geneva Conventions requires the state actors as well as the non-state actors to provide protection to “persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed *hors de combat*.” This is salutary because in an NIAC situation the responsibility of protecting the civilians, among other responsibilities, has extended to dissident armed groups who has taken up arms to fight against state armed forces and other military groups. Additional Protocol II of 1977 also provides protection to civilians through its provisions although they are few in number.

Article 13 of Protocol II provides important provisions to mitigate the sufferings of civilians due to armed conflicts escalating within the territorial boundaries. In this regard, “the civilian population as well as individual civilians shall not be the object of attack or should not be subjected to acts or threats of violence to spread terror among the civilian population” (Article 13(2)). Article 14 of this protocol provides protection to the civilian objects which are essential to their existence. The protocol also prohibits making the civilians starved as a method of warfare. It includes the protection of their harvest, husbandry, and other resources necessary for their survival. These cannot be destroyed to achieve the military objectives of the warring parties. In Sri Lanka, the last debacle was designated as “humanitarian operation” as the aim of which was to rescue a water reservoir called *Mavilaru*, which has been

used by civilians mainly for their consumption and agricultural purposes, from the insurgents, who captured it to achieve their military objectives. Article 15 protects “the works and installations containing dangerous forces such as dams, dykes and nuclear electrical generating stations.” These objects would be turned/used to be military objectives due to the very nature of the armed conflicts. However, if such objects are attacked, the resultant damage could lead to “severe losses” to the civilians and their properties, as the attack may lead to the release of “dangerous forces” such as heavy water flows, electricity, and other energy sources in their full power with no control to stop.

It could be concluded that although the principles relating to the civilian protection are less detailed in Protocol II than in Protocol I, the fundamental aspects of civilian protection are guaranteed by Common Article 3 of four Geneva Conventions and the above discussed provisions in Protocol II.

Armed Conflict of Sri Lanka

Sri Lanka underwent a disastrous period with an escalation of violent activities in the northern province of the country since the late 1970s. It eventually transformed into a civil war situation. The armed rivalry was between “the armed forces of the government of Sri Lanka and the Liberation Tigers of Tamil Eelam (LTTE)” led by its leader Velupillai Prabhakaran, protracted for about 26 years. A war of three decades caused all types of damages to the society. The war claimed the lives of several thousands of people. In 2010, the UN Secretary General, Ban Ki Moon, appointed a panel of experts to investigate the alleged violations committed during the conflict. The committee is known as “*Darusman Committee*” and the report produced by the committee was designated as the *Darusman* report. The report was published in 2011, which included serious allegations against the armed forces of the government of Sri Lanka claiming that they committed those in the last phase of the war. The report claimed that the alleged violations are against the civilians who got trapped in the war-torn area (*Darusman, 2011*). The government of Sri Lanka denied the statistics included in this report as incorrect at several domestic and international forms. According to the *Darusman* report, more than 40,000 civilian were killed because of the war, which Sri Lanka has refused to accept.

The armed conflict in Sri Lanka was non-international, although India got involved in it through the adoption of a bilateral treaty named Indo-Lanka Peace Accord of 1987 between India and Sri Lanka during the regimes of Mr. Rajiv Gandhi, the then prime minister of India, and Mr. J.R. Jayewardene, the then executive president of Sri Lanka, to end the violent hostilities (Samarasinghe, 1988). However, this was not a successful endeavor. It facilitated India to intervene into internal crisis and to send a peace-keeping force to Sri Lanka and to encourage the government of Sri Lanka to introduce a power sharing mechanism by adopting the 13th amendment to the Constitution of 1978. The 13th amendment introduced two salient features to the constitution: it established the system of provincial councils (Chap. XVIIA, Articles 154a to 154t) to share power between the central

government and the nine provincial councils and made Tamil language also an official language along with Sinhala language (Article 18(2)).

Sri Lanka being a state party to the four Geneva Conventions of 1949, it is bound by Common Article 3 of the conventions, as it is the one and only article which regulates the non-international armed conflicts. Therefore, the state is obliged to protect the civilians as stipulated in Common Article 3. However, Sri Lanka is not a member state to Additional Protocol II of 1977. Nevertheless, as several of the provisions of this protocol is considered as embodying customary laws, it is argued that Sri Lanka is obliged to respect those customary laws (Seneviratne, 2019).

International Scrutiny of Sri Lanka's State Obligations

After the cessation of hostilities in May 2009, Sri Lanka has been subject to several international queries regarding the armed conflict, particularly about the tragic plight of civilians who were severely affected by the war.

Resolutions Adopted by the UN Human Rights Council on Sri Lanka

In 2009, the 30-year long internal armed conflict ended. Since then, the Human Rights Council has been urging the government of Sri Lanka to commence a wider discourse with all the stakeholders to restore peace, harmony, and stability in the country and to build up trust among different ethnic groups who believe that they are discriminated on the grounds of their ethnicity, religion, and language. More than a military solution, what is required is to find a lasting political solution to create a conducive environment for all the people in Sri Lanka to live in harmony. The need to protect and promote human rights and human dignity has been reiterated in the resolutions adopted by the Human Rights Council since 2009 to the present. The resolutions adopted by the UN Human Rights Council (UNHRC) are varied in nature. They are on/against/shared by Sri Lanka requiring the authorities to promote “reconciliation, accountability, and human rights” in Sri Lanka (UN Human Rights Council, 20012–2017). Most notable resolutions are the UNHCR 19/2 of 22 March 2012, UNHCR22/1 of 21 March 2013, UNHCR 25/1 of 27 March 2014, UNHCR 30/1 of 1 October 2015, UNHCR 34/1 of 23 March 2017, and the UNHCR 40/1 of 21 March 2019 on promoting reconciliation, accountability, and human rights in Sri Lanka. (All of these Resolutions are titled as on promoting reconciliation, accountability and human rights in Sri Lanka)

The UNHCR Resolution 25/1 of 27 March 2014 (UNHRC Resolution A/HRC/25/1) required the government “to monitor the human rights situation in Sri Lanka and to continue to assess progress on relevant national processes, to undertake a comprehensive investigation into alleged serious violations and abuses of human rights and related crimes by both parties in Sri Lanka during the war.” This resolution further required the UN High Commissioner for Human Rights “to undertake a comprehensive investigation into the alleged serious violations and abuses of human

rights and related crimes by both warring parties in Sri Lanka during the war period covered by the LLRC Report.” Based on the mandate received, in 2015, the Office of the United Nations High Commissioner for Human Rights issued a comprehensive report on Sri Lanka (UNHRC, 2015). It included an assortment of key findings of the probe undertaken by the Office of the United Nations High Commissioner for Human Rights into the “alleged serious violations and abuses of human rights and related crimes during the armed conflict in Sri Lanka.”

In 2014, then president, Mahinda Rajapaksha, who officially declared the end of the armed conflict of Sri Lanka, called a presidential election, 2 years ahead of the scheduled time. However, he was defeated by Maithripala Sirisena, the common candidate formed by the opposition political parties. President Sirisena formed a new government with the help of opposition political parties in 2015. The international community developed hopes that this new government that came into power would take tangible steps to mitigate the damage caused to Sri Lanka and to the civilians and their properties due to the war. The report of the high commissioner contained several recommendations to the new government to set up a hybrid court comprised of domestic and international adjudicators to probe into the “alleged violations of human rights and humanitarian law committed by the parties during the armed conflict.” Accountability was highlighted as the key to fostering reconciliation and in rebuilding the devastated society (UNHRC, 2015). President Sirisena too was not successful in fulfilling the requirements of the UNHRC resolutions. Maintaining political stability of the country continues to be a daunting challenge in the country. In the presidential election, held in 2019, the Secretary of the Defense Ministry during the war period, Gotabhaya Rajapaksha, was elected as the executive president of Sri Lanka. Despite furthering the pledges made by the previous president and the government to the international community and to the UNHRC, the new president and his government maintained a negative approach toward the accountability issues. The stance of the new government was to deny any kind of international monitoring or investigation. Instead, they promised to solve the pending issues using domestic legal and institutional frameworks. The Minister of Foreign Affairs declared the position of the government in 2021 at the annual sessions of the UNHRC (Press Release, President's Media Unit, 2021). President Gotabhaya Rajapaksha and the prime minister of his government, Mahinda Rajapaksha, had to resign from their positions in 2022 due to the severe public pressure that outbroke in the forms of nonviolent protest marches, etc. for several months from March to June 2022, which came to know as “public struggle-Aragalaya” (Ranaraja, 2022).

The above discussion revealed that in spite of certain steps taken by the government of Sri Lanka in the aftermath of the armed conflict, several requests made by the UN HRC remain unfulfilled. Every year, the UNHRC and the UN High Commissioner for Human Rights consider the situation of the country and make requests to fulfil Sri Lanka’s obligations. The inability to do so has created a severe havoc in Sri Lanka. The resignation of powerful executive president and the prime minister, both are from the same family and credited for war victory due to the intolerable public outcry, is the best example for the impact of this failure. Sri Lanka is facing a severe economic crisis due to bad governance and inability to probe and address past

violations, specifically the allegations based on wartime human rights and humanitarian law violations. The above discussion reveals that the changes of governments, their policies, and strategies have adversely impeded addressing this human disaster effectively. Failure to adopt necessary enabling legislations and the disinclination to allow international mechanisms to probe into the alleged incidents have weakened the credibility of Sri Lanka before the international community. Continuous reminders coming through the UNHRC resolutions evince it. Therefore, it is essential for the government of Sri Lanka to discharge of its international obligations diligently and to take all the necessary actions and measures to uphold rule of law in the country to guarantee its people including the war-affected communities and civilians that it works to foster transitional justice and to provide a sustainable solution to Sri Lanka's human-made disaster. Also, the state, which too face or have faced similar situation, should use the case of Sri Lanka as a precedent to be obliged to fulfil their sovereign obligations without fail and to uphold rule of law, good governance, and democracy for their people.

Sri Lankan Endeavors for Compliance with UNHRC Resolutions and the Challenges

The protection of civilians is an undeniable obligation of the government in power in any context including situations of armed conflicts. Therefore, the government of Sri Lanka should not be able to refrain from duly discharging its responsibilities undertaken under international law. The reports submitted by the United Nations High Commissioner for Human Rights in 2021 and 2022 on Sri Lanka to the UNHRC reveal the salutary steps by the government of Sri Lanka taken so far. The Office on Missing Persons (OMP) endeavored to find out the fate of the missing persons and is in the process of preparing a list of missing persons with the support of several stakeholders in the country. Another crucial step was the establishment of the Office for Reparations (OR), which also is attending to its mandate and has handled a number of claims thus far. The Office for National Unity and Reconciliation (ONUR) too is in progress in its mandated work. The National Human Rights Commission is working to protect and promote human rights situation in the country (A/HRC/51/5: Situation of human rights in Sri Lanka - Comprehensive report of the United Nations High Commissioner for Human Rights, 2022).

In the 2022 report, the High Commissioner for Human Rights is deeply concerned about the unprecedented economic crisis that Sri Lanka is facing currently and noted the broad-based public protest movement that demanded a change of government and the call for accountability and deeper reforms. The commissioner urged “the new Government to embark on a national dialogue that would advance human rights and reconciliation and to carry out the deeper institutional and security sector reforms needed to prevent the recurrence of violations of the past” as “victims of past human rights violations continue to wait for truth, justice” (A/HRC/51/5: Situation of human rights in Sri Lanka - Comprehensive report of the United Nations High Commissioner for Human Rights, 2022).

Despite the pledges made by the present government to the UNHRC and to the international community, the country is seriously affected with several other disasters in the aftermath of the war, allegedly due to the mismanagement of public property, corruption and lack of good governance, victimization, nepotism, and favoritism. Currently it is designated as an underdeveloped country although it had been ranked as a middle-income country. Sri Lanka is undergoing a serious economic crisis at present induced by a political crisis, due to the bad governance by the different political regimes in power during and after the armed conflict of Sri Lanka. Therefore, it is stated that the unfulfilled obligations of Sri Lanka have to be addressed sooner than later. The government should meet its international obligations specifically based on the requirements made by the international community to protect the rights of people in the country, who are the aggrieved parties of the past occurrences.

Conclusion

This book chapter dealt with the issue of state obligations in light of applicable international legal principles and provisions with regard to the protection of civilians affected by the ravages of armed conflicts, who live in the jurisdictions of those sovereign states, and to provide effective remedies for their salvage and to rebuild the societies ravaged by armed conflicts. It mainly examined the relevant international humanitarian law principles under treaty law and customary law, which provide crucial provisions to protect civilians, their properties, and other civilian objectives in times of armed conflicts. The main objective of the work was to evaluate the international obligations of states established by IHL to protect civilians from the ravages of armed conflicts, with special reference to Sri Lanka. This chapter also attempted to explore whether the government of Sri Lanka has effectively discharged its international obligations during and after the war, specifically based on the alleged human rights and humanitarian law violations committed against civilians. It discussed UN Human Rights Council resolutions on Sri Lanka, which required the government to address the accusations and to foster transitional justice. In that light, relevant legal principles and the UNHRC resolutions were assessed above. In this backdrop, the author wishes to suggest the following recommendations.

It is of utmost importance for sovereign states to duly discharge the international obligations undertaken by them. The government of Sri Lanka should work cooperatively with the international community rather than taking arbitrary decisions with regard to fulfilling its international obligations. Probing into the allegations against the parties to Sri Lanka's armed conflict, based on the accusations made by several parties about wartime violations, is crucial. This can be done within the premises of the domestic criminal justice system as Sri Lanka has proved its capacity within the present structures in the past with independent actions, decisions, and outcomes. However, political intervention should be completely avoided to prevent undue influences on the administration of justice. Access to justice should be guaranteed adhering to the established principles of natural justice. Right to a fair trial of all the parties should be met.

The community of states should help the country to come out of the challenging situation faced by the country by extending their friendly hands without marginalizing Sri Lanka, which was heavily affected by the three decades of prolonged armed conflict, tsunami disaster, and the Covid-19 pandemic situation. Now the country is facing a serious economic crisis. People are suffering immensely from the issues of shortages of fuel, gas, food, etc. This situation produces continuous disaster to the country. Therefore, further sanctions or embargoes will lead to the weakening of the country in many respects.

The government also should commit to protect the rights of its citizens, guaranteed in the constitution and other laws of the country, without any discrimination. The right to equality of all should be guaranteed as required in Article 12 of the Constitution. Sri Lanka is a multicultural country, in which diverse communities with different ethnic, religious, and linguistic identities are living. Minority communities are generally of the view that they are discriminated against by the government allegedly influenced by the ethnic and religious majority. They demand equal treatment of all the citizens of the country without being marginalized. Therefore, it is important to establish appropriate mechanisms to redress their justifiable grievances. The civilians who are affected as victims, directly or indirectly, by the ravages of war, should be given a fair hearing, and their grievances should be attended immediately. Their right to know the truth should be effectively satisfied through proper means.

Fostering transitional justice to the war-affected society is very crucial. Remaining issues of transitional justice should be addressed according to a proper plan without any political motives. Appropriate homegrown mechanisms should be established to offer appropriate reparations to the needy people whose lives and properties are affected due to the armed conflict. A pledge of non-recurrence of past disasters is particularly important for Sri Lanka. All citizens should be able to live freely and happily in this multicultural society.

The constitution of the country is currently subject to revision. A draft constitution was prepared by a nine-member special expert panel (SEC) appointed by the previous president, who resigned from his position due to severe public pressure and agitation. The 21st amendment to the current constitution is adopted and is better than the 20th amendment in terms of reducing the arbitrary powers of the post of executive presidency. The new constitution is expected to provide a strong basis to guarantee the protection and promotion of human rights and dignity of all, along with robust and accessible redress mechanisms. With due diligence and action, Sri Lanka will be able to address the most devastating disaster effectively that it faced in the past three decades.

Abstract

The present legal framework of International Disaster Law derives authority largely from traditional international law instruments such as treaties or customs. Cross-cutting areas of international law are also of interest in this respect, particularly the nexus of International Human Rights Law and International Environmental Law wherein the focus remains squarely placed on state actors and their respective obligations. However, in Bangladesh, notable incidents of fires and building crashes in factories and work establishments resulting in massive deaths and injuries have brought to forefront the question of corporate human rights responsibility in relation to disaster. Furthermore, the COVID-19 pandemic has caused and continues to cause concerns regarding workplace

conditions, safety, and a range of worker rights, particularly in the RMG sector. In light of these circumstances, this chapter measures the national legal framework against the UN Guiding Principles on Business and Human Rights and other contemporary shifts in the international perspective on corporate human rights responsibility. Lastly, drawing from the analyses as well as regional and international best practices, this chapter tries to provide recommendations to further ensure corporate human rights responsibility in disaster management.

Corporate responsibility · Business and human rights · Disaster Law · Bangladesh

Introduction

The past decade in the economy of Bangladesh has been marked by remarkable growth, increase in inflow of Foreign Direct Investment (FDI), and rise in Gross Domestic Product (GDP) (UNCTAD, 2018). A significant portion of the country's economic growth is attributed to the RMG Sector (UNCTAD, 2018). However, as a backdrop to these tremendous success stories, concerns regarding working conditions of workers, particularly with regard to wage, working hours, and workplace safety, have persisted. Most notably, the Rana Plaza tragedy of 2013, where a factory collapse led to 1134 reported deaths and several thousand non-fatal injuries, set off rippling effects within and outside Bangladesh and is considered a significant point in time when it comes to issues of workplace safety, worker rights, and corporate responsibility. The global response to the Rana Plaza Tragedy and its ensuing effects clearly indicate the need for increased vigilance towards ensuring compliance of businesses, both local and international, to the local legal standards that touch upon human rights. It has also catalyzed the growing attention to the need for adhering to international standards on labor and human rights, among others, in the sphere of business.

More recently, the COVID-19 pandemic has led to massive loss of employment; disruption in global supply chains has resulted in reduction or denial of wages. The exacerbated conditions have sparked protests, and allegations of anti-trade union activities by employers in dealing with these upsurges were reported. Particularly, there have been incidents of fires at factories, hospitals, etc., resulting in deaths and injuries. While the work to unearth the exact impacts of the pandemic is ongoing, it is undeniable that it has had widespread, and at the same time, differentiated impacts on the lives of the people, bringing to fore the role that the state has played in its interaction with businesses at times of natural and human-induced crises. Therefore, the responsibilities of businesses during disasters and situations of crises and the state's functions in regulating compliance with these responsibilities need to be evaluated in light of international standards and regional practices.

The UN Guiding Principles on Business and Human Rights

History

Traditionally, international human rights framework has always been state-centric – although the rights and entitlement under the Universal Declaration of Human Rights (UDHR) have been set as a common standard that every “individual and organ of society” shall strive to achieve, the subsequent promulgation of the International Covenant on Civil and Political Rights (ICCPR) and International Covenant on Economic, Social and Cultural Rights (ICESCR) centers on the state as the primary duty-bearers when it comes to upholding human rights (Nolan & Baumann-Pauly, 2016). However, despite the focus on state responsibility to “respect, protect and fulfill” human rights, it is uncontested that business enterprises significantly impact the lives and rights of the people. Bangladesh’s colonial past and the role that the British East India Company has had in shaping its history remains a strong example in that regard. The concern and need to regulate corporate conduct is therefore reflected in international legislative history as early as 1974 in the efforts to promulgate the UN Draft Code of Conduct on Transnational Corporations. The efforts continued, and in 2000, the UN Global Compact encouraged business enterprises to voluntarily incorporate its 10 principles under four broad categories – human rights, labor standards, environment, and anti-corruption. In parallel, efforts to formulate the UN Draft Norms on the Responsibilities of Transnational Corporations and other Business Enterprises with regard to Human Rights continued, but were met with criticisms on grounds that they placed far more extensive responsibilities on corporations than they did on states (Nolan & Baumann-Pauly, 2016). The debates surrounding the draft Norms led to the appointment of a Special Representative of the Secretary-General on human rights and transnational corporation and other business enterprises (SSRG). In 2005, John Ruggie was appointed as the SSRG, and it was his efforts that resulted in the 2011 Guiding Principles on Business and Human Rights (UNGPs). The UNGPs expand upon three main pillars or principles. These are (i) state’s duty to protect against human rights abuses by third parties, including businesses, (ii) corporate responsibility to respect human rights, and (iii) need for more effective access to remedies.

Basic Principles

The first pillar focuses squarely on state responsibilities and reiterates its obligations which are already established under the “respect, protect and fulfill” framework of international human rights law. The second pillar reiterates the business enterprises’ role in respecting human rights – it encompasses the business enterprises’ obligations under national laws, and ensuring respect for international standards, particularly those set out in the International Labor Organization (ILO) core conventions and the standards of international human rights as laid out under the Bill of Rights. It also refers to prevention and mitigation of human rights abuses, and to avoid

causing, or contributing to human rights violations. The third pillar emphasizes on effective access to remedies, and refer not only to judicial remedies, but also to non-judicial remedies, some of which may be provided and regulated by non-state actors, including the business enterprises themselves.

UNGPs in the Context of Disasters

The UNGPs lay down, in general terms, obligations of corporations in preventing and mitigating adverse human rights impacts which may occur through their activities. These would generally be extended to situations of disasters. Logically, corporations would be required to abstain from acts that result in deterioration of environment or which would lead to natural disasters. Most notably, adherence to international labor standards of workplace safety would be directly connected to disasters which fall under occupational hazards.

Furthermore, when due to its activities, disasters and hazards occur, corporations would be required to mitigate and address human rights impact of such disasters. Furthermore, although the UNGPs do not expressly mention situations of disasters, they broadly envision contextually differing needs and corresponding requirements of compliance. For instance, the Commentary to Principle 23 of the UNGPs states the following:

Some operating environments, such as conflict-affected areas, may increase the risks of enterprises being complicit in gross human rights abuses committed by other actors (security forces, for example). Business enterprises should treat this risk as a legal compliance issue, given the expanding web of potential corporate legal liability arising from extraterritorial civil claims, and from the incorporation of the provisions of the Rome Statute of the International Criminal Court in jurisdictions that provide for corporate criminal responsibility.

In addition, corporate directors, officers and employees may be subject to individual liability for acts that amount to gross human rights abuses. In complex contexts such as these, business enterprises should ensure that they do not exacerbate the situation. In assessing how best to respond, they will often be well advised to draw on not only expertise and cross-functional consultation within the enterprise, but also to consult externally with credible, independent experts, including from Governments, civil society, national human rights institutions and relevant multi-stakeholder initiatives.

Although the first paragraph draws from Rome Statute and relies on situations of conflict as an example, it may be argued that this is for illustrative purpose as the Principle itself deals with “Issues of Context,” and addresses, in broader context, the need for business enterprises to ensure highest commitment to international recognized standards of human rights even when there is a possibility that some operating environments, or contexts may make it more complex to do so. Moreover, there is also emphasis on differentiated needs of specific groups which is of relevance. For example, paragraph 3 of the commentary to Principle 12 of the UNGPs states:

Depending on circumstances, business enterprises may need to consider additional standards. For instance, enterprises should respect the human rights of individuals belonging to specific groups or populations that require particular attention, where they may have adverse human rights impacts on them.

This would directly apply to situations where any specific population or group is affected by a disaster in which a contribution of the business enterprise can be made out. More broadly, the UNGPs acknowledge differentiated needs of vulnerable groups such as women, children, and indigenous communities, which is also a theme pertinent for situations of disasters as disasters result in evidently disproportionate impacts on vulnerable groups.

Bangladesh's Commitments Under International Law

Bangladesh is a signatory to most of the international human rights instruments, such as the International Covenant on Civil and Political Rights (ICCPR); the International Covenant on Economic, Social and Cultural Rights (ICESCR); United Nations Convention on the Rights of Child (UNCRC); Convention on the Elimination of all forms of Discrimination Against Women (CEDAW); and United Nations Convention Against Torture (UNCAT). It has also ratified most of the ILO core Conventions. As of March 2022, it is signatory to all the fundamental ILO Conventions, i.e., the Forced Labor Convention, 1930 (ILO Convention no. 029); Freedom of Association and Protection of the Right to Organize Convention, 1948 (ILO Convention No. 87); Right to Organize and Collective Bargaining Convention, 1949 (ILO Convention No. 98); Equal Remuneration Convention, 1951 (ILO Convention No. 100); Abolition of Forced Labor Convention, 1957 (ILO Convention No. 105); Discrimination (Employment and Occupation) Convention, 1958 (ILO Convention No. 111); Worst Forms of Child Labor Convention, 1999 (ILO Convention No. 182); and the Minimum Age Convention, 1973 (ILO Convention No. 138). Among these, only the Minimum Age Convention, 1973, has not yet come into force and will be in force from 22 March, 2023. More relevant for occupational hazards and safety, Bangladesh is party to the Workmen's Compensation (Occupational Diseases) Convention, 1925 (ILO Convention No. 18); Equality of Treatment (Accident Compensation) Convention, 1925 (ILO Convention No. 19); and Protection against Accidents (Dockers) Convention, 1932 (ILO Convention No. 32), among others. As such, Bangladesh is under international obligations to translate international human rights standards and labor standards into its domestic laws and regulations. Needless to say, the rights encompassed in these instruments, for example, right to life, right to health, right to property, and right to work, are all severely impacted in situations of disasters and, as such, are intricately related to the business and human rights principles (De Guttry et al., 2012).

Therefore, it stands that in formulating its national laws, regulations, and policies which regulate corporate activities, Bangladesh has obligations to ensure consistency with international standards. This would have multifaceted implications for the present topic: for example, Article 11 of the CEDAW requires state parties to take all appropriate measures to eliminate discrimination against women in the field of employment, and more specifically requires states to ensure “The right to protection of health and to safety in working conditions, including the safeguarding of the function of reproduction.” The obligations under the ILO Conventions such as ILO Convention no. 87 and ILO Convention no. 98 require the state to enact laws that ensure the right to collective bargaining and to prevent anti-trade union practices and discrimination at workplaces.

The 2013 Rana Plaza Disaster

In 2013, the collapse of the Rana Plaza, resulting in 1134 reported deaths of workers, made it one of the largest industrial disasters in history. The commercial building had been operating without heed to building and safety standards, and its collapse and the massive number of deaths and injuries sent shockwaves across the world, triggering a series of legislative and policy actions, not only within the legal landscape of Bangladesh, but also on the wider global supply chain. The Alliance for Bangladesh Worker Safety was initiated by stakeholders from Northern American apparel industries, and the Accord for Fire and Building Safety in Bangladesh was led by stakeholders from the European Union. Both the Alliance and Accord undertook a range of measures to improve the working conditions in the apparel sector. These measures included safety inspections in factories, monitoring the progress or remedial/corrective measures by factories, providing safety trainings, resolving safety complaints by workers, etc. Both agreements have resulted in measurable improvement to workplace safety standards in the apparel sector. Aside from the involvement of the apparel industries, international organizations and NGOs played a significant role in bringing about reforms. The Bangladesh Labour Act, 2006, was amended in response to the advocacy led by these groups, in 2013, 2015, and 2018, respectively. The 2013 and 2015 amendments were largely focused on formulating a more comprehensive framework for workplace safety. Amendments also brought about changes to the provisions on trade unions aimed at ensuring a conducive environment for collective bargaining, to the provisions on labor disputes in order to facilitate timely disposal of cases, etc. Besides, litigations were initiated against the factory owners on charges of corruption and murder, and a writ petition was filed against four concerned ministries for the failure to comply with an earlier court decision directing the establishment of a building code enforcement agency. These proceedings have not resulted in tangible outcomes, with the criminal proceedings against the building owner still unresolved. Compensation has been provided to victims through private arrangements supervised by the ILO.

Making a Case for Corporate Responsibility Under the Legal Framework of Bangladesh in the Context of Disasters

Fundamental Rights Under the Constitution

The Constitution of Bangladesh provides for fundamental rights under Part II of the Constitution. These rights include right to equality and non-discrimination (Article 28); right to protection of law (Article 31); right to life and personal liberty (Article 32); right to freedom of movement (Article 36); and right to property (Article 42) – these rights can and are often impacted by situations of disasters. Economic and social rights such as right to food, right to health, and right to environment, which are most clearly and directly affected by disasters, are not incorporated in the Constitution as fundamental rights; rather, an obligation is placed upon the State to ensure, or endeavor to ensure these as fundamental principles of state policy (FPSPs). The FPSPs are not judicially enforceable. However, the interpretations of courts have brought some of these rights within the overarching right to life. For example, courts have concluded that the right to livelihood forms part of the right to life in a case arising out of eviction of slum dwellers. In similar vein, courts have decided that right to health could be a part of right to life and may be violated in situations where health services are offered at exorbitant fees. Right to healthy environment was interpreted to be an integral part of right to life in a case arising out of flood action plans which was anticipated to have adverse environmental impacts.

The Constitution also allows aggrieved individuals, or any person representing an aggrieved group which itself may be unable to seek remedy, to come before the Supreme Court to seek remedy for violation of fundamental rights. Although the traditional view has been that fundamental rights may be enforced as against states only, growth of judicial activism in the area has resulted in successfully upholding fundamental rights as against third parties who function in the “public domain.” This creates a pathway to bring businesses before the courts for human rights violations.

Labor Laws

Bangladesh Labor Act, 2006, and the Bangladesh Labor Rules, 2015, regulate labor laws. Export Processing Zones (EPZ) Labor Act, 2019, regulates labor laws within the EPZs. The Bangladesh Labor Act was originally enacted in 2006 with a view to consolidating all existing laws and regulations on labor laws. It was subsequently amended in 2013 in the aftermath of the Rana Plaza disaster. The 2013 Amendment aimed to increase the standards of workplace safety, provisions on fire safety, minimum wages, etc. The Act was again amended in 2018, which introduced provisions on anti-trade union activities and discrimination and introduced penalty for the same.

Under the labor laws, companies are required to ensure workplace safety and prevent occupational hazards. Labor inspectors are required to inspect factories and industries to ensure compliance with the safety standards. Workers are entitled to compensation in case of accidental injuries, and their families are entitled to compensation in case of accidental death at workplace. Dispute resolution mechanisms

arising out of accidental injuries, or deaths, are to be heard by the Labor courts, and appeals are heard by the Labor Appellate Tribunals. As of 2020, there are 10 labor courts in Bangladesh, which has been noted as being inadequate to handle the volume of cases. Furthermore, the inspection mechanism is not robust and instead of being risk-based is motivated by economic factors (ILO, 2020). As a result, while the law touches upon business's obligations in preventing and compensating for disasters such as occupational hazards and disasters such as building collapse, fire, etc., the implementation of the laws remains a challenge.

Environmental Laws

Bangladesh has enacted several environmental legislations which have a bearing on corporate responsibility in natural or man-made disasters. The primary legislation is the Bangladesh Environment Conservation Act, 1995, under which the Bangladesh Environment Rules, 1997, have been enacted. These two laws set out the category of industrial establishments and the requirements for the industries to obtain an "Environment Clearance Certificate." Industries may also be required to undertake Environment Impact Assessment, or EIA. These responsibilities are relevant in risk reduction stages of disaster management. The laws also lay down prohibitive provisions against activities that pollute environment. Section 17 allows aggrieved communities to file a case for compensation before the Environment Courts for harm resulting out of non-compliance with the Act and Rules. Arguably, when disasters occur due to corporate violation of the environmental rules, communities may seek remedy from the Environment Courts. However, the remedy has to be sought through the Director General of Department of Environment and communities do not have direct access to courts.

Disaster Management Laws

(i) The Disaster Management Act

The primary disaster-management legislation is the Disaster Management Act, 2012, which defines a disaster as:

"Disaster" means any of the following events caused by nature or man-made or climate change, the extent and severity of which affect the life, livelihood, normal life, resources, property and environment of the people including cattle, birds and fish in the affected area, causing such damage or suffering to such an extent that the population's own resources, capabilities and capabilities are not sufficient to deal with it and which requires relief and any kind of outside help, such as: -

- (i) *Cyclones, hurricanes, tornadoes, tidal waves, abnormal tides, earthquakes, tsunamis, excess rainfall, droughts, floods, river erosion, coastal erosion, drought, excessive salinity, excessive arsenic pollution, landslides, landslides, landslides, landslides, Heatstroke, cold sores, chronic waterlogging, etc.;*
- (ii) *Explosions, fires, shipwrecks, major train and road accidents, chemical and nuclear radioactivity, fuel oil or gas leaks or any other genocidal event;*
- (iii) *epidemic-causing disorders, such as pandemic influenza, bird flu, anthrax, diarrhea, cholera, etc.;*

-
- (iv) *Infections by bio-derived or bio-infectious, including infections of harmful microorganisms, toxins and inanimate objects;*
 - (v) *inefficiency or damage to essential services or disaster prevention infrastructure; and*
 - (vi) *any unusual event or accidental mishap that causes extensive loss of life and property;*
- (Section 2(11), Disaster Management Act, 2012)

The definition is broad and non-exhaustive, but its illustrative examples capture the kinds of disasters that have had significant impacts on the lives of people, such as fires, explosions, accidents causing extensive loss of lives, public health crises like epidemics and pandemic, etc. As mentioned in the introduction, these disasters have significant involvement of business enterprises. Although the Disaster Management Act, 2012 primarily focuses on the formation and functions of the National Disaster Management Council and the District Disaster Management Committees (government organs tasked with disaster management activities and reduction, prevention, awareness, response, relief and rehabilitation stages), Section 49 of the Disaster Management Act, 2012, states:

(1) If a person intentionally or negligently, without taking appropriate preventive measures, causes an environmental catastrophe which causes a disaster and results in loss of life, property, establishment or business of any other person or organization, the aggrieved person or organization may file a suit in the appropriate court for recovery of compensation from that person or organization.

(3) If a suit for compensation is filed under sub-section (1), the court may, considering the evidence, order the payment of compensation equal to the actual loss or any other amount as the court considers appropriate.

This Section indirectly creates a negative responsibility upon corporations (Section 2(19) of the Disaster Management Act, 2012, defines “person” to include “where applicable, any company, or association of persons”) to refrain from “intentional or negligent” acts which cause environmental catastrophe or disasters and results in loss of lives, property, etc. It also allows a judicial mechanism for individuals to seek remedy in the form of compensation for loss.

(ii) National Disaster Management Policy, 2015

The National Disaster Management Policy, 2015 has been enacted pursuant to Section 19 of the Disaster Management Act, 2012, with a view to ensuring good governance in disaster management, and to ensure transparency and accountability of concerned stakeholders. Paragraph 4.2 of the National Disaster Management Policy, 2015 specifically addresses the role of businesses. It states that the government shall ensure coordination with business associations such as Federation of Bangladesh Chambers of Commerce and Industries (FBCCI), Bangladesh Garment Manufacturers and Exporters Association (BGMEA), Bangladesh Textile Manufacturers and Exporters Association (BTMEA), and Bangladesh Knitwear Manufacturers and Exporters Association (BKMEA) in order to encourage businesses to take independent measures of disaster risk reduction within their businesses. It also states

the government shall encourage businesses to participate in disaster response as part of its Corporate Social Responsibility (CSR) activities. Although this points to government acknowledgment of the importance of businesses as stakeholders in disaster risk reduction and response, the Policy only creates a responsibility on the part of the state and does not translate to any binding obligations on the part of corporations.

(iii) Standing Orders on Disaster (SOD), 2019

The SOD are enacted under the Disaster Management Act, 2012, with a view to delineating the roles and responsibilities of all concerned stakeholders at every stage of a disaster. The SOD lay down the organization of disaster management committees at local government levels and include the requirement of having one representative of local business groups in the committees. This can be a way to incorporate business interests and responsibilities within implementation of disaster management policies. Furthermore, particular businesses, such as businesses in the telecommunication, businesses in the petroleum sector, etc., have specific roles within the SOD. For example, under clause 5.2.16.1, mobile phone companies are required to coordinate with Bangladesh Telecommunication Regulatory Commission (BTRC) in sending early warning messages speedily to local people. Under clause 5.2.20.2, construction companies are required to coordinate with Urban Development Directorate (UDD) to receive required training for appropriate mechanisms in developing resilience. Under 5.2.50.1, companies and suppliers of petroleum products are required to coordinate with Bangladesh Petroleum Corporation (BPC) to ensure availability and distribution among the affected communities.

Conclusion

Bangladesh's labor laws, environmental laws, and disaster management laws touch upon the responsibilities of corporations to prevent and mitigate disasters. However, there are several gaps in its laws and policies which prevent the effective implementation of the principles of corporate responsibility. Firstly, the law and policy framework on disaster management barely explores the role to be played by private corporations in incidents of disaster; in particular, the aspect of industrial disasters in which responsibility may be attributed to the corporations themselves has not been properly addressed. Furthermore, the laws are fragmented, and do not provide a comprehensive guidance on the growing issue of the multifaceted impacts of industrial disasters. Moreover, existing laws have poorly structured framework on providing compensation; some, such as the Bangladesh Labour Act, 2006, provide a scheme of compensation which is largely inadequate and does not provide scope for judiciary discretion, and environmental laws such as the Bangladesh Environment Conservation Act, 1995, require for complaints to be brought to court by first applying to the Director General of the Department of Environment. Poor implementation of relevant laws resulting out of inadequate inspection, case backlogs in

courts, etc. is further exacerbated by the socioeconomic conditions of the affected communities. Furthermore, different stakeholders across ministries and divisions are entrusted with specific responsibilities, and there is a need for greater coordination. The SOD are a starting point from which the stakeholders can come together and create a holistic policy framework on ensuring corporate responsibility to reduce, prevent, and respond to disasters. In short, the following recommendations may be made:

- Amending the Disaster Management Act, 2012, to provide a comprehensive framework for seeking compensation by victims of disaster and formulating procedural rules and guidelines for the proper implementation of the same.
- Updating existing environmental laws to improve public access to judicial redress and strengthening the scope of local communities' access to the Department of Environment.
- Providing proper training to Labor Inspectors on safety standards and revamping the existing criteria of safety inspection to properly evaluate workplace safety standards.
- Establishing the requisite number of Labor Courts which are adequately staffed for timely disposal of labor disputes.
- Tackling corruption at all stages of inspection, governance, and judicial proceedings to ensure transparency.
- Providing safety and skills trainings to workers and communities in order to improve awareness at all levels, and coordinating with international organizations and NGOs if necessary.
- Formulating corporate governance policies on Environment and Safety (E&S) standards.
- Incentivizing the adoption of environmentally sustainable technology by providing advantages to compliant companies.

Abstract

Historically, the focus of humanitarian efforts has been on providing food, clean water, and healthcare support in areas locked in armed conflicts – as such essential ingredients of life are often rendered inaccessible for the people in such regions. However, recently, the Covid-19 pandemic has ravaged the world, bringing new dimensions and challenges to international humanitarian efforts. The added difficulty of the pandemic in regions that are already suffering from armed conflicts feeds off into a vicious cycle. On the one hand, the hostile activities and accompanying displacement of the people fuel the spread of Covid as social distancing and isolation continue to be distant dreams. On the other hand, the conflicts and international-level Covid restrictions severely hamper humanitarian access to the affected regions. In this way, without appropriate medical help via relief efforts, the situation continues to get worse.

Against this backdrop, this chapter analyzes what, if any, solutions international humanitarian law can provide to this peculiar problem. It begins with an understanding of how Covid-19 has impacted selected regions that were already facing a humanitarian crisis when the pandemic started. The next section explores the issue of humanitarian access in these regions in the aftermath of the pandemic,

including the extent to which relief efforts have been undertaken there and the challenges regarding the same. Then, the chapter delves into the various aspects of international humanitarian law that are applicable in this scenario, which may provide a way out of these challenges. The final section suggests ways forward from the issue based on its legal and practical contexts.

Keywords

Humanitarian workers · Humanitarian relief · International humanitarian law · Covid relief

Introduction

The phrase “humanitarian crisis” describes a particular scenario where, due to a particular event or a number of succeeding events, the health, safety, and well-being of a large group of people are being affected. There is no single cause from which a humanitarian crisis must originate – it may rise from natural disasters, wars and armed conflicts, health emergencies, or even other man-made issues (*What Is a Humanitarian Emergency?*, n.d.). But overall, to be dubbed as a “crisis” or “emergency,” the scope of the problem must be so vast that it overwhelms the available arrangements and resources of the community (*What Is a Humanitarian Disaster?*, n.d.). Combining all of these different facets, the UNICEF has adopted a definition of humanitarian crisis that provides that it is “any circumstance where humanitarian needs are sufficiently large and complex to require significant external assistance and resources, and where a multi-sectoral response is needed, with the engagement of a wide range of international humanitarian actors” (*Scope of CCC's*, n.d.). Moreover, this definition also highlights that there is no set threshold of at what point a problem would be considered a crisis – as the resources and capacities of every country to deal with the issue would vary greatly. However, overall, such an event “threatens the lives and well-being of large numbers of a population and requires extraordinary action to ensure their survival, care and protection” (*Scope of CCC's*, n.d.).

In this context, the Covid-19 pandemic has certainly highlighted and exacerbated the existing deficiencies in public health and governance structures throughout the world. In several nations, the public health emergency, that is, the pandemic, has resulted in a humanitarian crisis in itself (United Nations, 2021). However, the situation turns out to be infinitely more complex when it impacts a nation or community that is already ravaged by a humanitarian emergency. Due to the existing vulnerabilities in such populations and difficulties related to access, the pandemic and the ongoing crises have fed into each other in a cycle, gradually causing the situation to worsen (Dahab et al., 2020; Essar et al., 2021). Currently, throughout the world, there are multiple situations unfolding that may be deemed as humanitarian crises – each with its own distinct emergency situations and problems. This chapter takes into account two of the worst humanitarian emergencies before the human race

right now, Afghanistan and Syria, along with an event closer to home, the crisis faced by the migrant laborers of India in 2020.

The humanitarian crisis in Afghanistan finds its origins several years ago, and it has been dubbed as a “complex emergency,” as well as the “largest humanitarian crisis” due to the various origins and increase in severity of the crisis through the years (*Complex Emergencies: FAO in Emergencies*, n.d.; Subcommittee on Near East Asia, South Asia, Central Asia and Counterterrorism, 2022). Against a backdrop of war, internal conflicts, and climate change emergency, the country has been trapped in a cycle of severe poverty that has been worsening through the generations. For the past several years, US and NATO troops had been stationed in the area with the purpose of maintenance of peace. However, once they were withdrawn in 2021, the country officially fell under the governance of the extremist Taliban group (Essar et al., 2021). On top of these severe human rights violations, food crisis is a major problem in the Afghan context as the majority of the nation is suffering from malnutrition and starvation (UN News, 2021). Additionally, since 2020, the country has been going through multiple waves of the pandemic, with the current number of total confirmed cases standing at 170 thousand and 7.5 thousand deaths (World Health Organization, n.d.). While these numbers may seem low, they are likely to be highly inaccurate due to the low testing capacity and unreliable infrastructure and tracking mechanism of the nation (United Nations Office for the Coordination of Humanitarian Affairs, 2021).

The crisis in Syria has a similar backdrop as the Afghan crisis and has been going on for more than a decade. The root of the event can be found in the Syrian civil war that started in 2011. While the nature of crisis in Afghanistan was one of hunger, in Syria, it is a refugee crisis. It is estimated that more than 6.6 million Syrian citizens had to flee the country since 2011, and an additional 6.7 million were displaced within the country (UN Refugees, 2021). While the global community has been proactive in granting asylum to these refugees, due to an overburdening of the system in the neighboring nations, for the displaced citizens, life has not improved drastically. Most of them live in poverty, without prospects of education, employment, or returning home (UNICEF, n.d.). It is estimated that currently more than 13 million Syrian refugees are in need of humanitarian assistance, which includes 3 million disabled people. For this population, the primary areas where humanitarian aid might be needed are related to poverty and unemployment. The pandemic has sharply exacerbated the existing crisis as the number of people requiring humanitarian assistance rose from 11 million in 2020 to 13 million in 2022 (UN Refugees, 2021). Moreover, the refugee population who are living in camps or other such temporary housing also remain vulnerable to frequent outbreaks of Covid.

Usually, humanitarian crises are characterized by a breakdown of law and order in the concerned nation as in the presence of a healthy governance mechanism the government would step in to mitigate any possible crisis to the fullest extent. However, the scenario was strangely different in India, when the 2020 migrant laborers’ crisis occurred. Unlike the Afghan or Syrian crisis, it was initiated not by a war or other aggressive event, but the policy enacted by the government itself. In March 2020, with a strict nationwide lockdown being implemented throughout

India, the brunt of the situation was borne by the migrant laborers, the daily wage workers employed in a state other than their home state. With factories, construction work, and almost every other avenue of employment effectively stopped, the migrant laborers did not have any source of income, thus, were unable to sustain themselves in the alien cities (Sharma, 2020b). This led to an event that is aptly described as “The Exodus,” where the migrant laborers began a journey back to their home states, thousands of kilometers away, on foot (Barhate et al., 2021). While there is no official data available on how many migrant workers took this journey and how many perished on the way, the fact that they had to walk cross-country without stable access to food, water, and shelter indicates that the number was in hundreds or, possibly, thousands (Elsa, 2020; Warsi, 2020). This population also comprised of several vulnerable sections – pregnant women, children, and the elderly (Sharma, 2020b). Given the lack of access to even the basics of life, it is more than likely that Covid safety and social distancing were far from their minds, which further exacerbated the spread of the disease in the migrant worker community, as well as in their hometowns (Sharma, 2020a).

While these are only three instances of crises, there are several other humanitarian emergencies happening throughout the world, where millions of people have been doubly devastated by the pandemic as well. However, an exploration of these three crises, which are highly different in their nature and context, will underline the primary and common barriers to providing humanitarian relief to such populations. Under this backdrop, the subsequent section in this chapter describes the context of the three crises in Afghanistan, Syria, and India, and analyzes the barriers preventing access to humanitarian relief in these regions. The penultimate section explores the problem from an IHL perspective and discusses how the various international law customs and instruments can be applicable in this context. The conclusive section sums up the findings of the chapter, while highlighting how the effective operation of these instruments to mitigate the issue is thwarted by various ground-level barriers.

Secluded and Waiting: Issues of Access

Humanitarian crises or emergencies are characterized by an existing scenario, where the concerned national government is unable or unwilling to provide the required assistance to its citizens. While the International Bill of Human Rights does not explicitly identify the right to receive humanitarian aid, considering that the basics of life such as food, shelter, and health, education are guaranteed to all people throughout the world (Universal Declaration of Human Rights, 1948), it can be argued that it is the responsibility of the global community to uphold these rights for the relevant populations when the concerned national governments have failed (Jakovljević, 1987). This spirit of help is extended by the international community with due respect to the sovereignty of the concerned nation as the OECD defines the humanitarian assistance as aid extended to “save lives, alleviate suffering and maintain human dignity during and in the aftermath of crises” (Organisation for Economic

Co-operation and Development, 2012), which is provided in natural disasters and other emergencies, “in accordance with the basic humanitarian principles of humanity, impartiality, or neutrality” (United Nations General Assembly, 1991). Thus, in instances of severe violation of the human rights of large groups of people, it is considered as an established custom of international law that humanitarian assistance must be provided by the global community (Dinstein, 2018). This custom was further solidified through the Geneva Conventions and Protocols as well, though its scope is limited to situations of armed conflict. However, historically, humanitarian aid has been provided by the international community in other scenarios such as natural or man-made disasters as well (Macalister-Smith, 1985).

While Afghanistan has been the site of a decades-long humanitarian emergency, the situation has perhaps never been more dire than it currently is. Data from the latter half of 2021 shows that 19 million people in Afghanistan are suffering from acute food insecurity, which is expected to reach 22.8 million by March 2022 (Food and Agriculture Organization & World Food Programme, 2021). While, on the one hand, severe food shortage continues to be a problem in the nation, on the other hand, it is ravaged by the pandemic. On top of this crisis scenario, since 2021, with the withdrawal of the US and NATO troops, the Taliban governance has made the situation exponentially worse. It has been identified by the Food and Agricultural Organization that providing humanitarian aid in Afghanistan is essentially “a matter of life and death” for millions of people – and without intervention from the international community, it will turn into a humanitarian catastrophe (UN News, 2021).

It is not that the international community is unwilling to lend a helping hand to the millions of starving Afghans. Currently, the United States and EU are the largest contributors toward humanitarian relief in Afghanistan, with the United States providing 30% and EU providing almost 25% of the total funding (Financial Tracking Service, n.d.). In the aftermath of the pandemic and the Taliban crisis, additional support has been pledged by the international community as well. Regarding the pandemic-related medical supplies as well, a number of nations, including India, have provided Afghanistan with millions of vaccine doses to ensure that the rampage of Covid in the nation can be curbed to some extent (Laskar, 2022; *Statement by NSC Spokesperson Emily Horne on the United States Providing Additional Humanitarian Assistance to the People of Afghanistan, 2022*). However, several practical and specific barriers make it extremely difficult to ensure that the aid will reach its destination and be efficiently utilized. The primary problem in this context is to ensure that the humanitarian relief will reach the intended victims of the problem and not the currently ruling Taliban group, who would misuse the same to further their extremist agenda. The problem is exacerbated by the fact that the primary mode of access in Afghanistan is through roadways. Commercial flights are extremely rare, and it is difficult for international aid to reach them through air routes (Menon, 2022). Moreover, with the change in government and the collapse in the banking system of the nation, providing financial support to the economy is challenging as well. To counter these problems to some extent, the humanitarian

workers at the international level have been requested to work “independently and securely,” so that the aid efforts may be kept out of the hands of the Taliban group. Pleas have also been made to the Taliban to ensure unfettered humanitarian access to the nation, so that the vulnerable people of the nation may be saved from a terrible fate (Madhani, 2022; *Statement by NSC Spokesperson Emily Horne on the United States Providing Additional Humanitarian Assistance to the People of Afghanistan, 2022*). Still, access and efficiency-related problems continue to hinder potential humanitarian efforts in the nation.

The situation is highly similar for the Syrians as well as for the internally and externally dispersed refugees. On the one hand, the community is ravaged by an extreme scarcity of food and basic social services, and, on the other hand, the pandemic has highlighted the lack of medicines, oxygen, emergency treatment, and other healthcare facilities. With the healthcare infrastructure in the nation almost broken down by the hundreds of attacks, the existing infrastructure was already not enough to meet the basic needs of the population – and it is almost useless in the face of a pandemic (“Coronavirus in Syria,” n.d.; “Health System Overwhelmed in Northern Syria in Most Severe COVID-19 Outbreak Yet,” n.d.). More than 70% of the existing healthcare workers have also fled the country, ensuring that the internally and externally displaced populations are helpless in the face of this crisis (*Syria Anniversary Press Release, 2020*).

While the international community is willing to undertake humanitarian efforts, the primary difficulty related to providing relief in Syria remains the problem of access. Initially, there were multiple border crossing points to Syria that were sanctioned by the UN to ensure that aid could reach all the parts of the country – even the citizens living in active conflict zones. However, due to opposition from several states before the United Nations Security Council, most of these crossing points were closed, and currently, only one point of access remains to the nation (Lederer, 2020). The Bab al-Hawa crossing point from Turkey was initially kept open for only a year, starting from July 2020, which has now been extended for a further 1 year (*Security Council Resolution 2585: The Situation in the Middle East, 2021*). However, considering that currently more than 11 million people including nearly 5 million children in Syria require humanitarian assistance – one access point is highly inadequate to mitigate their healthcare and otherwise basic needs (“Security Council Extends Use of Border Crossing for Humanitarian Aid into Syria, Unanimously Adopting Resolution 2585 (2021),” n.d.; *Syria Anniversary Press Release, 2020*).

In the context of India’s migrant laborer crisis, the scenario was highly different than the other two. On the one hand, the crisis was characterized by not a breakdown of law and order, but by a calculated move from the government itself. This pretext, combined with the fact that there were no official facts and figures regarding the “exodus,” led to a relative ambience of ignorance and apathy in the international community about the issue (Barhate et al., 2021). For that reason, the thousands of workers and their families who were not supported by the nation regarding food, shelter, transport, or medical assistance in their long and arduous journey, resulting

in countless deaths, remain largely unreported in the international community. While the UN took note of the issue and urged the Indian government to “treat [the] migrants with respect” and to show “domestic solidarity and unity . . . to ensure no one is left behind in this time of crisis” (UN News, 2020), without the migrant laborer issue being recognized as a crisis in the international context, there was no humanitarian relief provided by the other nations. Moreover, it is also debatable that in the presence of an active and robust Indian government, whether any effort toward humanitarian relief would have been appreciated, or whether it would be seen as an encroachment toward the sovereignty of the nation. Thus, it is unsure what specific access-related problems could have arisen for any potential humanitarian relief efforts in this context.

On top of the existing access-related issues that already existed in these crisis regions, the pandemic also introduced a number of new and unprecedented challenges in terms of the same. To begin with, most humanitarian organizations faced a massive deficit in funds as a great percentage of the funds and supports that were earmarked for humanitarian relief by the international community had to be redirected to contain the crisis at home. This resulted in several such organizations being compelled to pause various key operations, being able to provide only “life-saving assistance” in most cases (Iyer, 2020). This meant that any kind of humanitarian relief that was not directly and immediately connected to a life and death scenario would be put on the backburner.

However, on a more ground-level scale, the primary problem related to humanitarian relief during the pandemic has been that of access. Considering that for many months since 2020 most of the world was under significant travel and transport restrictions, measures that are still continuing in several countries to this day, ensuring that humanitarian workers and aid can reach the affected regions has been difficult. With lockdowns, mandatory social distancing, and lack of transport, many international organizations were unable to reach the regions where people depend upon international aid for the basic necessities of life. Regarding humanitarian access, Syria was categorized as the highest level of constraints, at “extreme constraints,” while Afghanistan was at the next possible level of “very high access constraints,” and India at the following level of “high access constraints” (Brubaker et al., 2021). Even dedicated flights from the UN or other international organizations were denied access or were highly restricted. While the aspect of limiting humanitarian assistance to life-saving situations could be justified, taking into account the pandemic perspective and to curb further spread of the virus, there was no agreement among the different nations and organizations as to the scope of the phrase “life-saving” (Brubaker et al., 2021). Such a difference in opinions resulted in most of the humanitarian relief to be dependent on the national and local branches or organizations, who could undertake domestic interventions without the same level of practical barriers as international bodies. However, the national and local-level bodies were not capable of bearing the brunt of the full force of the problems as in ordinary situations they are highly reliant on international cooperation.

International Humanitarian Law: A Way Out?

With regard to humanitarian relief and humanitarian access, as the name itself suggests, the most relevant legal sector would be International Humanitarian Law. This branch of legal system originated from rules and codes that would regularly be followed during war, and to this day, modern IHL includes various age-old customary provisions. However, the origin of modern IHL that is applicable in a multilateral context can be traced to the Geneva Conventions of 1949 and its three Additional Protocols.

While prior to the Geneva Conventions efforts had been made to consolidate the already existing international customs related to warfare, the need for a comprehensive international legal instrument was felt most crucially in the aftermath of the two world wars, which brought unimaginable horrors for people all around the world (Dörmann, 2003). The four Geneva Conventions that were enacted in 1949 were Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field, the Convention for the Amelioration of the Condition of Wounded, Sick and Shipwrecked Members of Armed Forces at Sea, the Convention relative to the Treatment of Prisoners of War, and Convention relative to the Protection of Civilian Persons in Time of War (Convention (I) for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field, 1949; Convention (II) for the Amelioration of the Condition of Wounded, Sick and Shipwrecked Members of Armed Forces, 1949; Convention (III) Relative to the Treatment of Prisoners of War, 1949; Convention (IV) Relative to the Protection of Civilian Persons in Time of War, 1949). Two Additional Protocols to the Conventions were adopted in 1977 – the Protocol relating to the Protection of Victims of International Armed Conflicts and the Protocol relating to the Protection of Victims of Non-International Armed Conflicts (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977; Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of Non-International Armed Conflicts (Protocol II), 1977). The final Additional Protocol, enacted in 2005, relates to the Adoption of an Additional Distinctive Emblem (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Adoption of an Additional Distinctive Emblem (Protocol III), 2005).

The primary principles of IHL are focused on the fact that even during warfare unnecessarily cruel or inhumane acts may not be done toward any nation. The standards that are applicable toward enemy civilians, in this context, are much higher than the enemy forces (Dörmann, 2003). Essentially, the Geneva Conventions and their Additional Protocols are Treaties among the different nations, which means that for the state parties of each of the documents it is binding as international law. Among the countries in question, all three countries – Afghanistan, Syria, and India – are parties to all the four Geneva Conventions (Convention (I) for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field, 1949; Convention (II) for the Amelioration of the Condition of Wounded, Sick and Shipwrecked Members of Armed Forces, 1949; Convention (III) Relative to the

Treatment of Prisoners of War, 1949; Convention (IV) Relative to the Protection of Civilian Persons in Time of War, 1949). Among the Additional Protocols, Afghanistan is a party to the first two, Syria is a party to the first one, and India is not a party to any of them (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Adoption of an Additional Distinctive Emblem (Protocol III), 2005; Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977; Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of Non-International Armed Conflicts (Protocol II), 1977). However, even beyond these treaty laws, there are a number of customary rules of International Humanitarian Law that hold great importance in the global community. While IHL is largely concerned about warfare and the ethicalities of the same, humanitarian relief and access find an important place therein (Henckaerts & Doswald-Beck, 2005).

The principle of safety and protection that must be accorded to humanitarian relief and personnel is an established one in the context of international humanitarian law. While formulating the rules of customary international humanitarian law, the International Committee of Red Cross has identified under Rule 31 that “Humanitarian relief personnel must be respected and protected” and under Rule 32 that “Objects used for humanitarian relief operations must be respected and protected” (Henckaerts & Doswald-Beck, 2005). These principles lie on the core belief that no attack or destruction may be launched over the selfless humanitarian relief force, which can provide a country ravaged by war or other such disasters with a helping hand. The ICRC recognizes that these rules are established as a “norm of customary international law,” which has been developed via state practice. The question of humanitarian access, in this context, is more directly dealt with by Rule 55, which states that “the parties to the conflict must allow and facilitate rapid and unimpeded passage of humanitarian relief for civilians in need, which is impartial in character and conducted without any adverse distinction, subject to their right of control,” and Rule 56, which provides that “the parties to the conflict must ensure the freedom of movement of authorized humanitarian relief personnel essential to the exercise of their functions” (Henckaerts & Doswald-Beck, 2005).

These principles of customary IHL are also highlighted in the four Geneva Conventions and their Additional Protocols. Article 23 of the Fourth Geneva Convention provides that the concerned state must provide free passage to all consignments related to healthcare, essential food, and clothing (Convention (IV) Relative to the Protection of Civilian Persons in Time of War, 1949). Similar sentiments are echoed through the 1977 Additional Protocol I as well. In the Additional Protocol I, under Article 17, it has been provided that the aid societies must be permitted “to collect and care for the wounded, sick and shipwrecked, even in invaded or occupied areas,” and the state parties shall “grant both protection and the necessary facilities” to them – even if the concerned region or area comes under the control of an adverse party (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977). Related to humanitarian relief objects, Article

70 provides that in areas without adequate resources “relief actions which are humanitarian and impartial in character and conducted without any adverse distinction shall be undertaken” (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977). Moreover, the state parties must take “relief actions which are humanitarian and impartial in character and conducted without any adverse distinction shall be undertaken” (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977). These relief consignments must also be protected and distributed in a rapid and efficient manner. Under Article 71 as well, it has been provided that “relief personnel may form part of the assistance provided in any relief action, in particular for the transportation and distribution of relief consignments,” and that “such personnel shall be respected and protected.” Moreover, the state parties must, “to the fullest extent possible, assist the relief personnel . . . carrying out their relief mission” (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977).

Another international law instrument that has a significant indirect impact on humanitarian relief efforts is the 1998 Rome Statute of the International Criminal Court. As the name itself suggests, this statute governs the jurisdiction and working of the International Criminal Court. The statute, under Article 7, denounces extermination as a crime against humanity, and this crime is defined as “the intentional infliction of conditions of life, *inter alia*, the deprivation of access to food and medicine, calculated to bring about the destruction of part of a population” (Rome Statute of the International Criminal Court, 1998). This means that cutting off access to life-saving humanitarian efforts may be classified as extermination under this context. Moreover, hampering humanitarian relief missions is also prescribed as a war crime under Article 8, which provides that “intentionally directing attacks against personnel, installations, material, units or vehicles involved in a humanitarian assistance or peacekeeping mission” is a serious violation of international laws and customs (Rome Statute of the International Criminal Court, 1998). While among the three countries, only Afghanistan is a party to the statute, the nature of the Rome Statute is such that it is binding even on nonparty states, if they undertake such serious international crimes.

Thus, there are several international humanitarian law principles that provide for the humanitarian missions, and their personnel and objects must be respected, protected, and facilitated. The Articles related to the same, as enshrined in the Fourth Geneva Convention, would be applicable against all three countries of Afghanistan, Syria, and India (Convention (IV) Relative to the Protection of Civilian Persons in Time of War, 1949). The relevant provisions from Additional Protocol I will be applicable against Afghanistan and Syria (Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977). However, as a part of customary

international law, the principle of impeded humanitarian access holds great value over all the nations (Henckaerts & Doswald-Beck, 2005). The provisions of the Rome Statute in this context would surely be binding on Afghanistan as a party under the same; however, nonparties such as Syria and India may also be brought under its purview in case of violations (Rome Statute of the International Criminal Court, 1998). Notably, while several legal provisions already exist in the context of humanitarian relief and access, the problem essentially relates to effective implementation.

A better implementation process might solve the critical problems of hunger, poverty, and unemployment of the population of Afghanistan, Syrian refugees, and Indian migrant workers – by curing or reducing the difficulties related to humanitarian efforts. For example, the protection-, safety-, and access-related issues in Afghanistan can be mitigated with effective implementation as the principles apply toward adversary groups also, including the Taliban (Convention (IV) Relative to the Protection of Civilian Persons in Time of War, 1949; Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977; Food and Agriculture Organization & World Food Programme, 2021). Similarly, in Syria, as the lack of access points is impeding humanitarian relief efforts (Lederer, 2020), the relevant principles can be implemented to ensure effective and unrestrained access. In the Indian context, it was a dual problem of lack of humanitarian efforts, as well as an indirect restriction of access due to underreporting lack of transparency in data. However, not only can this scenario be covered under the access-related provisions of IHL, but it may also be seen as a crime of “extermination” under the ICC statute (Convention (IV) Relative to the Protection of Civilian Persons in Time of War, 1949; Protocol Additional to the Geneva Conventions of 12 August 1949, and Relating to the Protection of Victims of International Armed Conflicts (Protocol I), 1977; Rome Statute of the International Criminal Court, 1998). Overall, on a global scale, the Covid-related restrictions that are unnecessarily constraining essential humanitarian relief efforts may be reduced via the applications of these provisions.

Conclusion

It is an undisputed fact that the access-related problems can be removed or, at the very least, reduced, through the application of the relevant International Humanitarian Law principles. Even considering the fact that not all the states are parties to all the Additional Protocols, the four Geneva Conventions that most states around the world are parties to, combined with the Rome Statute, are enough to facilitate significantly better humanitarian support in the crisis-addled regions. This support would ensure that not only the current starving and/or displaced populations of countries like Afghanistan, Syria, and India, but also the future generations of these nations, would be able to live and grow up in a secure and stable world. With the

essentials of life, such as food, clothing, shelter, and healthcare provided for, there would be a significantly better scope for appropriate mental and intellectual development (Madhani, 2022; Barhate et al., 2021; Lederer, 2020).

However, the current primary problem in this context is indisputably connected to the pandemic. While both Afghanistan and Syria had access-related problems beforehand, they could still be circumvented to some extent by applying the relevant legal principles. But they were exacerbated manifold by the Covid-19-related restrictions (Lederer, 2020; Menon, 2022). On the other hand, India's migrant laborer crisis was a direct result of the same. The restrictions that were applied in both the domestic and international contexts in these nations were mostly in line with various international law principles, along with instruments of public health law, such as the 2005 International Health Regulations (International Health Regulations, 2005). However, in such cases, when the humanitarian relief efforts began to be subsided under the pressure of these restrictions, the focus moved elsewhere and any related concerns were swept under the carpet. While in some cases the informal principle that only life-saving humanitarian efforts would be allowed were applied, this is not an international established principle. There was also no consensus as to which efforts would be deemed as "life-saving," and how that categorization may be made (Brubaker et al., 2021; Iyer, 2020). Moreover, considering that the pandemic is now proving to be a continuing public health crisis, it is getting considerably dangerous to delay or pause humanitarian relief efforts for indefinite periods of time.

Essentially, the problem of humanitarian relief or access in the context of Covid is that of balancing of interests. Considering that international law is formulated from treaties or customs with a decided voluntary aspect to it, in such contexts of double crisis, the question remains as to which of these instruments would have precedence over the other. However, the fact remains that an answer to such dilemmas must be formulated, and soon. In the absence of the same, a continuation of the current Covid-19 crisis or the emerging of a new one would hamper the already battered humanitarian efforts across the world to an irrecoverable extent.

What may be helpful in this context is perhaps a clarification of the scope of international humanitarian law and humanitarian relief efforts. As of yet, the IHL instruments do not provide any categorization or hierarchy of different kinds of humanitarian relief efforts that may be undertaken for various disasters. While an exhaustive list of all kinds of crises would be a difficult task, a tier-based categorization of the different kinds of disasters may be done, perhaps based on their range of impact – on territory, population, or time. This categorization would lay the groundwork for the balancing of conflicting interests and would provide a starting point regarding which relief efforts may be classified as life-saving and would have precedence over other interests – health or otherwise. Considering the ease of spread of global-level crises in the current climate, be it a health disaster or a nonhealth one, it cannot be expected that for each of them, other essential relief efforts would take a back seat. Thus, the states' cooperation in clarifying the existing gray area, perhaps in the form of another Additional Protocol, would go a long way toward ensuring the basics of life for millions of vulnerable people.

Abstract

Civilian casualties or crises are a very usual and common aftereffect of an armed conflict either international or non-international. The amount of such war-driven casualty often becomes far higher than any other damage. The effect of such damage continues for a long time even after the conflict comes to an end and creates manifold and long-term negative impacts on the lives of the human population as well as environment in post-war situations. The responsibility of the conflicting state for creating civilian casualty by its armed forces under international humanitarian law only remains limited to or considers situations of the conflict to determine the amount of compensation. The post-war management responsibility is still not attached to a conflicting state complained against under the existing international humanitarian law (IHL) framework or any general principle of international law. Evidently, the victim states indeed are often financially unable to restore their situations. It therefore seems to be very crucial

e-mail: nakib@du.ac.bd

to attach individual responsibility to the conflicting states for post-war management of civilian casualties. Moreover in case of non-international armed conflict, a cooperative state responsibility is warranted. This chapter is an attempt to test the probability of how this responsibility issue could be addressed under the existing legal framework of IHL or under existing state responsibility regime established by general principle of international law. In the accomplishment of such a study, an in-depth analysis of state responsibility regime articulated by IHL for the protection of civilian properties and natural environment is relied upon in association with factual references to the post-war management of humanitarian crises in all previous era to the extent they are deemed to be fit.

Keywords

Civilian casualties · International humanitarian law · State responsibility · Reparation · Compensation

Introduction

Civilian casualties are the very usual and common aftereffects of a war which is a man-made disaster (Somasundaram, 2006; Irwin, 2014). The amount of civilian casualties caused in war out of the destruction of civilians' properties and natural environment in particular becomes far higher than any other damage. It continues for a long time even after the conflict comes to an end and generates manifold and widespread negative impacts on the lives of the human population, for their restoration and rehabilitation. It puts the war-ravaged states to shoulder the burden of huge amount of financial costs for the purpose of reconstruction activities, stumbling further more development and welfare activities for their citizens. The incidents of the Second World War and Iraq war of recent past evidence the extent of states "sufferings" in afterwar situations. The Second World War created long-lasting bad consequences to the states engaged in conflict affecting humans and their properties, the real cost of which could not be exactly statistically estimated, but said to be immense and uncountable. The worth-mentioning incident is atomic bombardment on two cities of Japan creating horrific destruction of everything with long-lasting effects borne by Japan alone years after years. As a consequence of war, both in Western and Eastern Europe, the devastation rate was vast. For example, France suffered a total amount of money equivalent to three times of its annual national income; in Great Britain about 30 percent of the homes were destroyed or damaged; and in Poland 30 percent of its buildings and 60 percent of its academic and scientific research institutions and government and public administration infrastructures and facilities were destroyed (Britannica, n.d.). The war in Iraq destroyed about \$230 billion of infrastructure (Committee on International Security Studies, 2002). It is often seen, considering the destruction of civilian properties and natural environment as a war crime for the breach of laws and customs of war established by the international humanitarian law (IHL), only the individuals are prosecuted in

the courts or tribunals and tried for their offences. The conflicting states are not held responsible for compensation for the damage caused and usually this is not invoked by the prosecuting states. The criminal tribunals indeed do not have jurisdiction determining the civil liability of the states for such damages caused by their armed forces. The claim could be litigated with the ICJ or any arbitral forum for violation of state responsibility under the IHL treaty principles. The IHL treaty principles dealing with state responsibility for taking all cares and precautionary measures so that civilian casualties involving civilian lives, abodes, properties, and natural environment do not happen are well articulated. Holding responsibility for a conflicting state out of the acts of the armed forces done in excess of military necessity is limited to war situations only and that is all for the determination of amount of responsibility. The IHL frameworks do not address the state's responsibility for post-war management or minimizing civilian casualties in a victim state. Nor so far the issue is concerned, the jurisprudential development occurred through the verdicts of the courts. The evident reality is often the victim states are found financially unable to restore their situations, for reconstructing their damaged infrastructure requiring huge amount of ultimate costs. An individual burden sharing or cooperative responsibility requirement may be attached to the offending states, thus making the restoration or rehabilitative programs of victim states easier. This chapter decides to examine how this responsibility proposal could be addressed logically under the existing legal framework of IHL or existing responsibility regimes established by general principles of international law. Doing such a work requires considering the interpretive approach of responsibility regime of IHL for the protection of civilian population and their properties during war with factual references to the post-war crises management in all previous times. Hence, for the accomplishment of this work, the author intends to address a few damage scenarios borne by the war-ravaged countries along with an in-depth critical analysis of the state responsibility for the wrongful acts of its armed forces leading to civilian casualties in respect of their properties, abodes, and all means of survival.

Civilian Casualties as a Result of War

Despite the strong prohibition by the laws and customs of war, the modern world has witnessed the disastrous impacts of attacks on civilian population and properties since the beginning of the last century. Attacks on civilian population and properties in different wars have resulted in the loss of many human lives unnecessarily, massive displacement of people, destruction of uncountable amount of civilian amenities, and widespread damage to social services and infrastructure. In an armed conflict-induced disaster summary sheet, it has been attempted to show that both international and internal armed conflicts create direct and indirect impacts on livelihood and food security (such as loss of food stock, crop yields, and livestock, loss of farms and fisheries tools, damage to irrigation channels, loss of labor forces), healthcare services (such as damage and destruction of hospitals and healthcare centers, poor water and sanitation and hygiene conditions, and disruption of health

assistance systems), shelter (such as damage and destruction of houses and buildings, destruction of natural resources used to rebuild shelter), water and sanitation services, education systems and facilities, electric generation systems, etc. (ACAPS, 2012).

The account of horrific disastrous incidents of the Second World War is not statistically accurately discernable. A study on only money loss of the countries in Europe shows an estimation of more than \$1,000,000,000,000, although this figure is not considered to be representing the human casualties and miseries, deprivation, and sufferings, damaged economic life, or sheer physical destruction of property (Britannica, n.d.). However, on a particular note, it has been shown that the destruction level of physical structure has gone far beyond the First World War. France found its total cost at an amount equivalent to three times more than France's national income (Ibid). Belgium and the Netherland's damage rates were almost same as their resources (Ibid). The destruction of homes and abodes in Great Britain was estimated to be about 30 percent, while in France, Belgium, and the Netherlands about 20 per cent (Ibid). A very vulnerable situation occurred to agriculture in these occupied countries. The huge amount of loss and damage of agricultural facilities and livestock used for farming, the shortage and crisis of machinery and fertilizers, and the drain on manpower created economic fragility in a wider scale (Ibid). Internal transport systems suffered immensely due to the destruction or confiscation of rail cars, locomotives, and barges, and the bombing of bridges and key rail centers (Ibid). The total economic conditions of the continental European countries came to a verge of collapse by the end of 1945 (Ibid). In a specific statistic, it has been shown that 70 percent of industrial infrastructure in Europe was destroyed (Pilisuk & Rountree, 2008). The estimated damage to property in the then Soviet Union either full or partial covered the destruction of 1710 cities and towns, 70,000 villages/hamlets, and 31,850 industrial establishments (The New York Times, 9 February 1946, Volume 95, Number 32158). It is noted that some countries such as Germany and Soviet Union came out of economic fragility sooner, but the UK, by contrast, was in economic ruin and experienced economic decline after war for decades to follow (Emadi-Coffin, 2008).

The devastation scenario was also worse in Eastern Europe. In Poland, 30 percent of its building structures as well as 60 percent schools, scientific institutions, and public administration facilities were damaged (Britannica, n.d.). The destruction also covered 30–35 percent of its agricultural property and 32 percent of its mining resources and electrical powers and industries (Ibid). According to a report, in Yugoslavia, 20.7 percent of its dwellings were destroyed (Ibid). In the Far East Asia, the devastation in Japan through atomic bombardment on its two cities, Hiroshima and Nagasaki, is the most unforgettable horrific incident in the world history. The wide range of human and property and environmental damage covers almost 70 percent of all, and particular statistics on every damaged entity appears to be impossible to be presented here in this chapter (Ibid). It is noteworthy that even the land became unable to grow plants for several consecutive years. The construction or restoration of these two cities in Japan took a long time after the end of war, burdening huge economic expenditure on it.

In recent times, the direct and collateral damage out of the 5-month-long US-led Iraq invasion in different cities of Iraq was immense, and the reconstruction process is still ongoing after the end of war. The damage rate could be assumed with few instances. The petroleum industry accounted for the 95 percent of Iraq's export earnings (Human Rights Watch, 1991). Iraq's oil industries and infrastructure suffered major loss and became the worse victims of the US and its allied forces' air strikes. It was reported that by the end of the war, all power-generating plants went out of function except two; the generating amount was reduced to less than 4 percent of the pre-war output of 9000 megawatts (*Ibid*). The destruction of electric-generating plants led to the wide-scale disruption of agricultural production and food distribution, thereby gravely affecting the healthcare system, water supply, and sewage treatment (*Ibid*). The air attacks also damaged civilian food warehouses, dairy product plants, water treatment facilities, agricultural sector facilities, and a veterinary-vaccine manufacturing facility. The repair cost for damage from air strikes to roads, bridges, electrical-generating plants, oil refineries, and other facilities amounted to \$200 billion (*Ibid*). Iraq spent not less than \$160 billion for its reconstruction and rehabilitation activities in the 1980s (*Ibid*).

In Yugoslavian war, NATO-led air strikes for about 4 months in 1999 destroyed 78 industrial sites and 42 energy installations and infrastructure (20 chemical and petrochemical installations that had the capacity of around 70 percent of oil processing) in the Federal Republic of Yugoslavia during the Kosovo crisis causing dangerous substance that pulled all component of air such as air, water, and soil (Committee on the Environment, Regional Planning and Local Authorities, 2001). These pollutant elements created a long-term negative impact on people's physical conditions and quality of lives in the said region. The serious environmental damage extended to several other countries of Southeast Europe such as Greece, Hungary, Albania, Bulgaria, Romania, Ukraine, and the former Yugoslav Republic of Macedonia (*Ibid*). The amount of forestry destroyed by fires was almost 250 hectares including several thousands of agro-lands that turned unfit and unusable on account of contamination or physical destruction (*Ibid*).

One of the most devastating wars that ended in the 1970s of the last century was the Vietnam War which caused immense human, environment, and economic costs. This war was characterized by the fact that it was fought for civilians, by civilians, and among civilians where the US fighter planes dropped seven millions of tons of ordnance, three times bigger than their acts in including napalm and chemical defoliants. The effects resulting from wide-scale bombardment by American forces not only involved deaths of humans from both sides but also caused devastation of cities, buildings, infrastructure, farmland, and vegetation (Alpha History, n.d.). This also led to human loss and material devastation in neighboring countries such as Laos and Cambodia. The physical devastation was so grave that it caused years of famine and sufferings in Southeast Asia. Huge arable land was poisoned with defoliant or drenched with napalm or diesel leaving some areas unfit for farming (*Ibid*).

State's Responsibility for the Protection of Civilian Property Under IHL

The protection of civilian lives and properties during an armed conflict has always been emphasized in IHL. Since the beginning of the twentieth century, the development of principle of “military necessity” as a legitimate ground for conducting hostilities by the conflicting states or entities established a restrictive approach for them in order to protect civilian lives and objects. (See The ST Petersburg Declaration, 1868, Paragraph 5 and Preamble. It is stated that “the only legitimate object which States should endeavour to accomplish during war is to weaken the military forces of the enemy.” See also Convention Respecting the Laws and Customs of War on Land (1899).) In the similar manner, the principle of distinction between combatants and noncombatants as well as military and civilian objects was developed to serve the said purpose. The IHL treaties throughout the last centuries underscored the need for the protection of civilian lives and properties and more or less addressed through establishing principles in treaty laws. They culminated into a comprehensive regime-building for that purpose, first through the adoption of the Geneva Convention IV of 1949 (The Geneva Convention IV of 1949 is titled as “Geneva Convention Relative to the Protection of Civilian Persons in Time of War of 12 August, 1949”) and then Additional Protocol 1 to the four Geneva Conventions of 1977. The Additional Protocol 1 focuses specifically on the protection of the civilian population and properties with the delineation of state responsibility during the armed conflicts. As regards the protection of civilian population and their objects, this Protocol recognizes the principle of distinction along with addressing the grounds of protection and thus establishing principles exclusively intended for the protection of civilian objects such as protection of objects indispensable to the survival of civilian population (See Additional Protocol 1 to the Geneva Conventions of August 12, 1949, Articles 48, 51, and 54), protection of natural environment (*Ibid*, Article 55), protection of cultural properties (*Ibid*, Article 53), and protection of work installations containing dangerous forces (*Ibid*, Article 57). This Protocol also prescribes an obligation for the parties to the conflict to undertake precautionary measures constantly “to save the civilian population, civilians and civilian objects” (*Ibid*, Article 57).

As regards state responsibility under this Protocol, it has been stated that the High Contracting Parties should ensure respect for this Protocol in all circumstances’ (*Ibid*, Article 1). The phrase “ensure respect” implies a conflicting state’s obligation to undertake necessary measures to prevent the breaches of obligations under this Protocol by its armed forces (Crawford & Pert, 2015). The Protocol reaffirms the basic rule of distinction creating obligation for the parties. The parameters of such obligation have been established by Article 80 of the same. Article 80 (1) provides that “... the Parties to the conflict shall without delay take all necessary measures for the execution of their obligations under ...this Protocol.” (See Additional Protocol 1 to the Geneva Conventions of August 12, 1949, Article 80 (1).) Paragraph 2 of the article states that “...the Parties to the conflict shall give orders and instructions to ensure observance of... this Protocol, and shall supervise their execution” (*Ibid*, 80 (2)). Article 86 (1) of the Protocol also deals with state’s responsibility as it states

that “...the Parties to the conflict shall repress grave breaches, and take measures necessary to suppress all other breaches” of this Protocol which result from a failure to act when under a duty to do so (*Ibid*, Article 86 (1)). All these principles in a similar manner have established state responsibility that may apply to the issues relating to the protection of civilian properties. The treaty-based principles indeed impose the responsibility upon a conflicting state to prevent the occurrence of such violations by its individual armed forces during the situations of armed conflict. So it is inferred from the text of the principles that the omission or negligence in this respect makes a state party engaged in conflict responsible for the violation.

The customary principle of IHL establishes the attribution of responsibility to a conflicting state out of an act done by an individual member of the armed forces or in other ways. Rule 149 determines a state’s responsibility for the breach of IHL attributable to it, and the breach may be committed by its organs, including its armed forces; by persons or entities it empowered to exercise elements of governmental authority; by persons or groups acting in fact on its instructions, or under its direction or control; and by private persons or groups which it acknowledges and adopts as its own conduct (The International Committee of Red Cross, [n.d.](#)). This customary principle determining state’s responsibility may apply to the protection of civilian lives and properties both in international and non-international armed conflict. Under this customary rule, responsibility for violations of IHL may be attributed under four different situations, each and every of which is also supported by the national and international case laws. If looked for particular reference such as for liability of a state for the acts of its armed forces, in the judgment of Eichmann in 1961, the Israeli District Court of Jerusalem attributed the wrongful acts committed by the accused person to Germany as its own “acts of state” (*Attorney General v. Adolf Eichmann*, [1961](#), p. 20). In the *Distomo Case* in 2003, the German Federal Supreme Court observed that the states become internationally responsible for the acts committed by their armed forces during hostilities (*Prefecture of Voita v Federal Republic of Germany*, [2004](#)). In the judgment of the Furundzija case in 1998, the International Criminal Court for the former Yugoslavia (ICTY) held that a state is responsible for the behavior of its armed force (*Prosecutor v Anto Furundzija*, [1998](#)). The ICTY also held a similar view in its judgment on Appeal in the *Prosecutor v. Tadic Case* (*Prosecutor v Dusko Tadic*, [1995](#)). The act of the armed forces during the conflict is deemed to be the act of the states on the premise that they are the de jure organ of the state. The basis for the attribution of the responsibility toward state is the actor’s direct or indirect agency of the state. The state’s responsibility for the all acts of its armed forces has inference from the ILC’s Articles of State Responsibility for Internationally Wrongful Acts, 2001, as Article 7 reads: “[t]he conduct of an organ of a State [...] shall be considered an act of the State under international law if the organ, person [...] acts in that capacity, even if it exceeds its authority or contravenes instructions.” The ILC comments that the international humanitarian law exemplifies the draft article. (The International Law Commission, *Commentary on the Draft Articles on the State Responsibility for Internationally Wrongful Acts 2001*; see for more explanation Marco Sassoli ([2002](#)).)

It is drawn from all above with regard to the state's responsibility that state becomes liable for civilian casualties and damages of their properties as well as natural environment. However, the responsibility of the state by nature differs from the individual responsibility of the members of the armed forces for their own acts.

Nature of State Responsibility v Armed Forces' Responsibility Under IHL

The responsibility a state incurs because of its breach of any kind of international law principles derived either from treaties or international customs is civil by nature which is remedied by reparation. In a report on the *Spanish Zone of Morocco Claims*, Judge Huber said: "If the obligation in question is not met, responsibility entails the duty to make reparation" (*Great Britain v. Spain, 1924*). Here the phrase "obligation in question" means obligation under international law. In the judgment of *Chorzow Factory* (1927), the PCIJ said: it is a principle of international law, and even a general conception of law, that any breach of an engagement involves an obligation to make reparation. Article 91 of the Additional Protocol recognizes the responsibility of a party to the conflict in the form of compensation for its own violation or any violation that may attributable to it for the acts of its armed forces (*Germany v. Poland, 1927*) (this will be discussed in the following section in detail).

The violations of IHL principles by the members of the armed forces give rise to international criminal responsibility. The members of the armed forces become responsible either individually or on the basis of command responsibility requiring trial by either domestic or international criminal tribunals. All the Geneva Conventions of 1949 including Protocols, 1977, have listed respectively the acts of grave breaches which are defined in international criminal law as international crimes such as genocide, crimes against humanity, war crimes, etc. (See the Geneva Convention I, Article 50; the Geneva Convention II, Article 51; the Geneva Convention III, Article 130; the Geneva Convention IV, Article 148; Additional Protocol 1, Article 85 (3).) According to Article 85 (3) of the Additional Protocol 1 to the Conventions, attack on civilian populations and their property including cultural properties and natural environment is an international crime (Article 85 (3) of the Additional Protocol 1 has designated certain grave breaches which constitute "war crime" according to Article 8 of the Rome Statute of International Criminal Court as war crime). The members of the armed forces of conflicting countries may be prosecuted for their acts causing the destruction of the civilian properties on the ground of international criminality.

In view of the difference of the character of responsibility, the same jurisdiction cannot be invoked or applied for determining their degree of responsibility and awarding punishment or declaring the amount of reparation. It is obvious since the time when the trial of international crimes formally started, no criminal tribunal yet held a state responsible for the crimes done by their armed forces or nationals during the armed conflict, rather the criminal tribunals dealt with the trial and declaring punishment of perpetrators of grave breaches of IHL (i.e., whether genocide or

crimes against humanity). The claim for compensation to the opposition state party to conflict can only be made by an injured or victim state through the process of litigation in an international civil court such as ICJ. The litigation cannot be proceeded with by a national of an opposition conflicting state. As per the general principle respecting state responsibility, a state becomes responsible for violations of international law in a manner to other states who suffer. In *Phosphates in Morocco* case, the PCIJ affirmed that with the commission of an internationally wrongful act by a state against another state, international responsibility is established “immediately as between the two states” (*Italy v. France*, 1938). The historical harsh reality is the international criminal cases have been lodged with internationally designated tribunals since the Nuremberg Trial and are still lodged with International Criminal Court (ICC) against the individual perpetrators for their violations of IHL principles constituting different international crimes, but in parallel no case remained to be seen lodged with ICJ or any other tribunal or forum claiming reparation for its violations attributable to it.

State Responsibility for Reparation Under IHL

There are different forms of reparation established by ILC’s Articles on State Responsibility, namely, restitution, compensation, or satisfaction. Article 34 of the Articles provides that “full reparation for the injury caused by the internationally wrongful act shall take the form of restitution, compensation or satisfaction, either singly or in combination” (See ILC’s Articles on State Responsibility for Wrongful Acts (2001), Article 34).

As regards restitution, it is stated that provision for restitution is to establish the situation that existed before the wrongful act was committed (*Ibid*). The article provides for restitution with a condition that this “is not materially impossible” and “does not involve a burden out of all proportion to the benefit deriving from restitution instead of compensation.” The explanation given in the Commentary on the Articles is that the restitution simply may mean to involve the conducts of the release of persons wrongly detained or the return of property wrongly seized, but can also be more complex act, and that restitution comes first on priority basis among the forms of reparation (International Law Commission, 2001). In case of the protection of the cultural property, the restitution as a means of reparation has been recognized as an obligation for parties to conflict. The First Protocol to the Hague Convention for the Protection of Cultural Property provides that State must prevent the exportation of cultural property from occupied territory (The First Protocol to the Hague Convention for the Protection of Cultural Property (1954), Paragraph 3). This also obliges the occupying State to return cultural property if exported (*Ibid*, Paragraph 3).

There are many instances that the form of restitution has been applied through the process of bilateral agreements among the countries. A number of agreements concluded after the end of the Second World War for the restitution of the property that had been stolen, seized, or confiscated. (For example, Paris Agreement on

Reparation from Germany (1946), The Convention on the Settlement of the Matters Arising out of the War and Occupation (1952).) In the afterwar situations, many countries adopted different measures for the restitution. Hungary's Military Manual provides that after the end of a conflict, the cultural and requisitioned objects belonging to civilians must be returned (The Hungary Military Manual, 1982) Germany in 1991 accepted the same rule about the requirement of the return of cultural property. This happened at the end of Iraq's occupation over Kuwait (The International Committee of Red Cross, Rule 150 Reparation <<https://ihl-database.icrc.org>> accessed 14 April 2022).

The current IHL treaty texts do not incorporate "restitution" as a mode of reparation for the damage caused out of violations or breaches of IHL principles in any manner whatsoever. Instead, only compensation has been recognized as only means under IHL for the violations of IHL principles. Article 91 of the Additional Protocol 1 states that "[a] Party to the conflict which violates the provisions . . . of this Protocol shall, if the case demands, be liable to pay compensation" (See the Additional Protocol 1 to the Geneva Conventions of August 12, 1949, Article 91). The obligation for compensation is a long-standing customary rule that has been spelled out in numerous postconflict bilateral arrangements. According to the ILC Articles, compensation is preferred where restitution does not work. The Commentary explains that "restitution, despite its primacy as legal principle, is frequently unavailable or inadequate. . . The role of compensation is to fill gaps so as to ensure full reparation for damage suffered" (International Law Commission, *Great Britain v. Spain*, 1924).

Another form of reparation is satisfaction. According to Article 37 of the ILC Articles, satisfaction is applied where the purpose of reparation cannot be made by other two forms such as restitution and compensation (ILC's Articles on State Responsibility on State Responsibility (2001), Article 37). Satisfaction considers the principle of "proportionality" to the injury caused (Ibid). Satisfaction is generally understood as a means for removing the loss or damage caused to the victim state.

It is indicated earlier that only "compensation" has been recognized as a form of reparation for loss or damage caused by the breach of state obligation or by an act done by any state agent. The restitution and satisfaction are not introduced in the framework of IHL, although recognized by the general principle of international law. However, apart from bilateral agreements during armed conflict, in consideration of damage or loss, the competent courts may exercise their discretion to give any rule for reparation either through restitution or satisfaction on the basis of the demand.

Is Compensation Enough for Post-War Casualty Management as a Form of Reparation?

The obligation to compensate on the basis of demand refers to the monetary compensation that seems to be an appropriate means to remedy all losses and damages caused to the opposition without any distinction between vanquished and victor. But the problem is the calculation or computation of the total damage or

destruction caused to the civilian property or natural environment as their consequences continue years after years posing burden upon the victim states. The once most recognized “Hall principle” of compensation is based upon the market price of the lost or damaged properties. This formula has been criticized immensely because the market price-based damage calculation often becomes unable to consider all potential consequences a victim may suffer. Particularly in case of war situation, the amount of compensation for environmental damage affecting human, animal, or plant health and lives cannot be duly calculable because there arise many types of unforeseen expenditure for restoration. In Yugoslavian war, a report reveals that the scale and long-term environmental damage necessitate special measures, with monitoring and rehabilitation programs both in Yugoslavia and neighboring countries, and this involves a huge amount of unforeseen expenditure. (The Regional Environmental Centre for Central and Eastern Europe, ‘Assessment of the Environmental Impact of Military Activities during Yugoslavia Conflict’ (Preliminary Findings, June 1999).) Sometimes, it is seen that the victim state or states do not have the equipment or institutional capacity to carry out long-term monitoring and implementing measures needed to localize the consequences of the conflict. In case of infrastructure damage the restoration of which takes a long time, the market-based damage calculation suffers the same problem. Additional funding is needed to resolve the problem, because the disposal of debris from building or bridges, accumulation of rubbish and household waste, and the arrangement of equipment and organization for the rehabilitation of healthcare activities are usually borne by the victim states and the calculation of compensation if demanded cannot address or include these additional charges. So the compensation obligation under IHL framework does not suffice to carry out the afterwar civilian disaster management.

In addition, other two forms of reparation may not be deemed to be instrumental in a successful post-war disaster management resulting from the damage and destruction caused to civilian properties as well as natural environment. However, these two methods suffer some kinds of restriction in terms of application and also definitional lacuna. The concept of “restitution is a gain-based remedy” that is very much used to the things of small amount and private ownership. The legal and customary development so far with regard to restitution has been confined to return of cultural property, even owned by the private individuals. Clause 3 of Article 37 of the ILC Articles on State puts limits on the application of “satisfaction” as it states that “satisfaction shall not be out of proportion to the injury and may not take a form of humiliating to the responsible state” (ILC’s Article on the State Responsibility for Wrongful Acts (2001), Article 37 (3)). Accordingly, through the use of satisfaction method alone, post-war disaster management seems to be unlikely, even impossible.

Against the said backdrop, the author recommends two things for a successful management of civilian casualties in post-war situation. Firstly, alongside the compensation as under Article 91 of the Additional Protocol 1, inclusion of a “burden sharing” responsibility may be an effective solution (The Additional Protocol 1 to the Geneva Conventions of 1949 (1977) article 91). Secondly, through an authoritative explanation in the text itself, the meaning of “compensation can be extended to

rehabilitative scheme or program taken by claiming war-ravaged country.” To say clearly, the process of calculation of compensation not only is limited to the cost of losses and damage but also includes the potential and unseen expenditure for rehabilitation or restoration.

Burden Sharing Responsibility as a Logical Solution

Burden sharing responsibility may seem to be significant as a solution for post-war management of civilian casualties. The proposed “burden sharing responsibility” is a modified expression of “burden and responsibility sharing” taken under “Global Compact on Refugee” by the United Nations. The program is mainly intended to ease pressure on host state of refugees and enhance refugees’ self-reliance. The rationale for this is often the host state of refugees finds itself unable to provide duly economic and other international support to the refugee as an obligation due its economic constraint and lack of availability of required logistics. A similar situation is often seen for a war-ravaged country for its reconstruction and post-war disaster management as indicated in the above sections. Against such a backdrop, with the state’s obligation for compensation, an addition of “burden sharing responsibility” may be just and logical.

A Change in Calculation of Compensation as a Solution

The calculation process based on market price cannot be useful to remedy the injury of continued and widespread character as discussed in the section above. It indeed considers the existing losses and damages to the victim country. Therefore, compensation obligation might have coverage of post-war rehabilitative program and thus be a logical solution for war-induced uncountable civilian disaster management.

Conclusion

The chapter was an attempt to examine the probability of establishing a responsibility regime under IHL for states for the management of war-driven civilian casualties in the post-war time. A threadbare discussion and analysis reveal that under the current IHL, a state is only obliged to compensate the victim state for all losses or damages to it caused by its armed forces. The market-based compensation that is often used is thought to be insufficient for the successful post-war disaster management due to its inner lacuna relating to process of calculation of the amount of compensation. In view of this, the author has recommended two proposals that introduction of a burden sharing responsibility principle and bringing a change into the process of calculation of compensation may pave the way for successful post-war management of civilian casualties.

Abstract

The theme of Disaster Management: Administrative Initiatives and Best Practices of the book titled “International Handbook on Disaster Research” consists of ten research articles related to various stages of the disaster cycle reflecting pre- and post-disaster phases in relation to the South Asian context. All papers in this section are based on qualitative research methods using both primary and secondary data sources. The first part of this chapter presents an overview of these studies, and the latter part of the chapter discusses administrative initiatives and best practices in disaster management providing guidance for a better way to prepare for possible disasters and respond to them as quickly and effectively in all stages of the disaster management cycle.

Introduction

Disaster research could be undertaken similarly to social science research. As disaster research are involved in multidisciplinary field, qualitative, quantitative, and mixed methods could be undertaken in the same way as in the social science research. Disaster research are being extensively undertaken descriptively with qualitative research methods. But quantitative studies with advanced statistics and rigorous analysis of disaster research could also be undertaken to test the hypotheses. The aftermath of disasters could also be conducted but may have several challenges as this involves human subjects; however, these kinds of research need to be reviewed systematically and qualitatively under the existing ethical guidelines for disaster research by using the constant comparative method (Mezinska et al., 2016). Thus, disaster research could be conducted using multi-method research approaches.

Among the chapters of this section, a study titled “Paradigm Shift in Disaster Management: Bangladesh Experience” (Chap. 118) authored by Haque argues that disaster management is a paradigm shift, because disaster management involves several activities including disaster risk reduction, smart early warning systems, emergency response, fast evacuation, transfer to the safety of a cyclone shelter, and adoption of pre-disaster and post-disaster plans. With the use of secondary data sources and qualitative research methods, this chapter recommends various policy guidelines adopted by the government, interagency collaboration, community participation in disaster management, and disaster governance to reduce the disaster impact of Bangladesh.

Another titled “The Use of Earth Jurisprudence Against Anthropogenic Marine Environmental Disasters in Sri Lanka” (Chap. 116) written by Edirisinghe emphasizes the necessity of deviating from the legal frameworks which keep the protection of human interests as its core objective. By taking a case of the worst maritime environmental disaster called “MV X-Press Pearl,” a Singaporean containership, the chapter analyzes how earth jurisprudence can be used to protect the oceans and ocean species in Sri Lanka from anthropogenic maritime disasters and to reduce the damage. Using the black letter approach and international and comparative research methodology referencing to several countries in drawing lessons for law reforms, the chapter provided guidance to protect the Sri Lankan oceans for more than the instrumental values that they hold.

The next chapter titled “Making Those Accountable for Man-Made Natural Disasters: A Critical Appraisal of the Law with Special Reference to Sri Lanka” (Chap. 115) authored by Konasinghe and Thilakarathna attempts to design a liability regime for those who either directly or indirectly contribute to the creation of natural disasters. The authors argued that the existing legal system fails to impose pecuniary liability upon those who either directly or indirectly contribute to the creation of natural disasters and that the use of the “polluter pays” principle is inadequate at times since all harm that is caused to the environment cannot be rectified with compensation. Hence, this study suggested awarding exemplary damages, shifting the burden of proof upon the exploiters of natural resources to prove such exploitation does not cause or aid in the creation of natural disasters, and environmental

taxation should be better utilized in making this novel concept a reality for environmental protection and governance.

Another chapter titled “Capacity Building at the Level of Community to Reduce the Risk of Natural Disasters: A Study on the Indian Scenario” authored by Akanksha Shukla and Subrat Kumar Mishra examines the strengths and weaknesses of the Disaster Management Act of India enacted in 2005. Using qualitative research methods of data collection of both primary and secondary information on disaster scenarios in two blocks of Bhadrak district of Odisha state, the study highlights the necessity of building the capacity of rural local bodies to implement schemes for economic development and social justice to minimize the effects of natural disasters on a sustainable basis. The latter part of this chapter proposes recommendations for building the capacities of these institutions to integrate disaster risk reduction planning to improve coping strategies of local communities to manage climate-related hazards as capacity building measures of the local community to improve the disaster risk resilience index of the respective area.

The next chapter titled “Drought, Food Insecurity, and Gender Relations in Selected Districts in India” (Chap. 139) authored by Basanta Kumar Sahu analyzes multiple impact of drought focusing on household food insecurity, drought coping, food insecurity, occupational changes, intra-household risk sharing, and gender relations in some drought-affected districts in India. Using the primary data from 179 sample households with a questionnaire, direct interviews, and focus group discussions in four villages and using Coping Strategy Index (CSI), the chapter revealed that poor households have to follow varied food arrangements and occupational changes in response to drought impact and follow both “labor smoothing” and “consumption smoothing” strategies to manage food scarcity which are neither effective nor gender neutral and also offers some region-specific policy actions to improve drought risk governance and management to improve gender equity.

Another chapter titled “Good Governance Strategies for Disaster Management and Risk Reduction” (Chap. 140) chapter authored by Pallavi Sinha Das also uses qualitative research methods with secondary data to examine the Disaster Management Act 2005 in India and highlighted the governance structure that aids the enactment and administration of public policies along with sustainable livelihoods which are conducive to a country’s economic and social development and condenses the vulnerability to disasters. The study emphasized that disaster mitigation machinery needs to be equipped and organized in advance to minimize the post-disaster effects.

The next chapter titled “Climate Change Disasters and Impact on Women in South Asia” (Chap. 141) written by Garima Sangwan and Debahuti Brahmachari examines the complex interplay of gender and climate change disasters. With the use of qualitative research methods with descriptive analysis based on secondary data, the chapter discusses various dimensions of gender inequality and climate change disasters to understand the impacts of climate change disasters on women and emphasizes gendered disaster management and a comprehensive disaster management approach that needed to highlight the gendered impact of such crises. The

research tries to sum up proactive strategies as recommendations that the state should embark upon both as long-term and short-term goals.

The next chapter titled, “Women and Domestic Violence During the Covid-19 Pandemic in India” (Chap. 140) authored by Rahila Sikandar, emphasizes domestic violence and its impact on women during the Covid-19 pandemic. The study presented five cases using primary data in the form of interviews and content analysis. The author argued that crimes against women and children have increased during the pandemic; the executive, the legislature, and the judiciary should pay immediate consideration to domestic violence during the pandemic by providing counselling and other services.

Another chapter titled “Cities and Climate Change: Responding to the Impacts of Water-Related Disasters in Sri Lanka” (Chap. 154) authored by Deepthi Wickramasinghe and others examines the impacts of water-related disasters in Sri Lankan cities. Using qualitative research methods with secondary data and related literature review, the study revealed that many coastal cities have faced the impacts of floods and droughts, while inland urban areas have exhibited more impacts from landslides and discussed challenges in managing water-related disasters. This study sheds light on how cities could prepare for rising impacts of climate change and disasters and urged to adopt “environmentally smart” solutions to make cities disaster-safe and disaster-resilient places.

The final chapter titled “Unsung Climate Heroes: Women Protecting Land, Environment, and Livelihood in Odisha” (Chap. 144) by Annapurna Devi Pandey explores how women correct man-made climate change and protect the environment in India. Based on the longitudinal ethnographic fieldwork based on three villages in India with the use of case studies during 2016–2022, the study revealed that rural and indigenous women in Odisha led a struggle to preserve endangered forests, mountains, rivers, and other vital natural resources. This study presented several life experiences of grassroots organizers and activists intimately connected with their land and described how their lives and livelihood have been crippled by development projects contributing to global warming. These women in rural and tribal regions provide lessons to create new insights for a stable and sustainable future, and their initiatives proved necessary grounds for self-empowerment essential to the democratic process for the inclusion of women in policy-making.

All these chapters are related to various stages of disaster management, and the most of the studies have analyzed the impact of disasters in which policies and laws required in the areas of disaster management are highlighted. Disaster risk management helps to reduce the risk of potential disasters that mainly consist of the pre-disaster stage and post-disaster stage.

Best practices of disaster management provide guidance to prepare for possible disasters and respond to them as quickly and effectively in all stages of the disaster management cycle including prevention, mitigation, preparedness, response, and recovery. Mitigation and preparedness are involved in the pre-disaster stage, and response and recovery with rebuilding are involved in the post-disaster stage.

Disaster prevention refers to measures taken to eliminate the root causes that make people vulnerable to disaster (Transitional Government of Ethiopia (TGE),

1993, as cited in Sena & W/Michael, 2006). Multiple strategies including raising awareness about potential hazards and how to address them, educating the public about how to properly prepare for different types of disaster, and installing and strengthening prediction and warning systems are required to reduce the impact of disasters and increase the resilience of the community (Tulane University School of Public Health and Tropical Medicine, 2021). Better communication and coordination are also important in all phases of disaster management.

Disaster mitigation is a continuing effort of emergency management aiming to reduce the impact disasters may have on people, property, and the environment. The Hyogo Framework for Action (HFA) is the first global strategy to provide a detailed work plan for different sectors and actors to work on disaster risk reduction, and the Priority Action 3 of the HFA demands a global call to governments and others to use knowledge, innovation, and education to build a culture of safety and resilience at all levels (Zhoud et al., 2014). Prevention and mitigation strategies should be based on risk assessment and can be considered in relation to land use planning and building codes, providing essential infrastructure, structural works, and appropriate management and protection of landscapes and the environment (Queensland Government, 2021). Providing disaster insurance to protect people's belongings and relocating or evacuating people from disasters could also be recommended.

Disaster preparedness needs a well-prepared plan and implementation of these plans with better communication and coordination to face potential disasters that will help to ensure fast and effective response efforts. Disaster preparedness plans should identify organizational resources, designate roles and responsibilities, create procedures and policies, and organize activities that improve disaster preparedness (Tulane University School of Public Health and Tropical Medicine, 2021). To enhance the effectiveness of the disaster plans, the needs of the communities that may be exposed to possible disasters have to be identified in advance, and also the capacity building of disaster management teams including volunteers and other stakeholders is needed. As observed, improving disaster preparedness and at the same time enabling better disaster prevention and climate adaptation remain key challenges for sustainable development (World Bank, 2022).

Disaster response and recovery strategies and actions are involved in the post-disaster period. Disaster relief is immediate support that is required to provide basic human needs such as food, water, and shelter, and disaster recovery is focused on restoring survival for improving the quality of life. Before implementing disaster response and recovery strategies, disaster response plans should be informed and communicated to all stakeholders using relevant organizational structures (UNDRR, 2021) that help to reduce the damage of the disasters leading to the resilience of the victims and post-recovery. Implementing the post-disaster strategies needs strong government intervention in collaboration with volunteer groups, the private sector, and NGOs. During and immediately after an emergency, disaster management focuses on delivering help and interventions that can save lives, safeguard health, and protect buildings, animals, and community property. Following an initial response, efforts are required to support communities to rebuild emotionally, economically, and physically, and these rebuilding efforts are needed in the areas of

housing, survival methods, infrastructure, education, and health (Tulane University School of Public Health and Tropical Medicine, 2021).

Summary

Disaster management is a continuous, integrated, and holistic process in which any initiation should be done by the government that needs to implement strategies in disaster risk management in collaboration with the private sector, NGOs, and volunteers in the process. The ten articles in this section presented theoretical and practical scenarios in relation to the pre- and post-disaster phases of disaster management in relation to the South Asian context. The latter part of the chapter presented best practices and initiatives in disaster management. All these articles in this section are based on the qualitative research methods, but disaster research also could be taken with the quantitative research methods with the hypotheses testing that is lacking in this section. More comprehensive studies are required, using multi-methods of research in the disaster management field, in future research that could be considered in developing better strategies for disaster management.

Abstract

The enactment of the Disaster Management Act of India in the year 2005 has been a paradigm shift in the approach to disaster management in India. The act envisages reducing the risk of natural disasters by equipping the local communities and their institutions with the necessary skills and capacities to manage these kinds of situations. Gram Panchayat is the institution of local self-government at the village level; Article-243-G of India's Constitution endows them with the necessary powers and responsibilities to prepare plans for economic development and social justice. The chapter based on the study in one of the most disaster-prone states of India highlights the need of building the capacity of rural local bodies to implement the schemes for economic development and social justice to

minimize the effects of natural disasters on a sustainable basis. On the basis of collection of secondary information on disaster scenario in two blocks of Bhadrak district of Odisha state, individual interview and focus group discussions with 500 members of disaster-affected villages as a part of Participatory Learning and Action exercises conducted in the Gram Panchayats covered under the study, the chapter suggests that building capacities of these institutions to integrate disaster risk reduction planning with the Gram Panchayat Development Plan is critical in improving the coping strategies of local communities to manage climate-related hazards. It was also observed that capacity-building measures at the community level improve the disaster risk resilience index of the respective area.

Keywords

Hazard · Vulnerability · Disaster resilience

Introduction

Disaster in common parlance is known as series of events, which gives rise to casualties, damage, and loss of properties, infrastructures, environment, essential services, or means of livelihood on such a scale that is beyond the normal capacity of the affected community to cope with. Disaster Management Act, 2005, of India defines disaster as “a catastrophe, mishap, calamity or grave occurrence in any area, arising from natural or man-made causes, or by accident or negligence which results in substantial loss of life or human suffering or damage to, and destruction of, property, or damage to, or degradation of, environment, and is of such a nature or magnitude as to be beyond the coping capacity of the community of the affected area” (MoHA, GoI, 2011).

The United Nations Office for Disaster Risk Reduction defines a disaster as a hazardous event, phenomenon, substance, human activity, or condition that may cause loss of life, injury or other health impacts, damage to property, loss of livelihoods and services, social and economic disruption, or environmental damage. Disaster is often associated with the risk of negative consequences of a hazard that is natural or man-made. Hence to minimize the risk of hazards, enhancing the capacity of the local community is critical to address the vulnerabilities associated with natural disasters (UNDRR, 2015).

The National Policy on Disaster Management 2009 (NPDM) of India also lays utmost emphasis on disaster preparedness at the level of the local community and their institutions like Gram Panchayats, self-help groups, youth clubs, etc. The policy further recognizes the role of these institutions in the process of preparedness and response to natural disasters as they are quick to respond to any hazards due to their proximity to the local community. During the pre-impact phase, their role is crucial in early warning, hazard mapping, vulnerability assessment, and evacuation process. The involvement of these institutions is also highly essential in the rescue, relief, and response processes including care for domestic animals and managing the

distribution of relief to affected communities. During post-disaster phases like rehabilitation and reconstruction, the policy outlines the need for planning at the level of Gram Panchayat for the construction of hazard-proof houses, roads, bridges, canals, water reservoirs, power transmission lines, etc. with the participation of affected communities. Community-based disaster management (CBDM) by its very nature also demands a decentralized bottom-up approach with the involvement of local bodies considering the diversities and vulnerabilities at different levels. Gram Panchayats and other local bodies need to actively engage with “at-risk communities” for identification, analysis, treatment, monitoring, and evaluation of disaster risks in order to reduce their vulnerabilities (NDMA, MoHA, GoI, [2009a, 2009](#)).

Review of Existing Frameworks on Community-Level Disaster Risk Resilience

The Sendai Framework for Disaster Risk Reduction, 2015–2030, has been recognized globally as the first major agreement that provides member states with concrete actions to safeguard the gains of development by reducing the risk of disasters. The Sendai Framework succeeded the Hyogo Framework of Action (HFA), 2005–1015, for building resilience on nations and communities against potential risks associated with natural as well as human-induced disasters. The Sendai Framework outlines seven targets, out of which four of them emphasize understanding the disaster risks and building the capacities of multiple stakeholders to be resilient to all kinds of hazards. According to the framework, disaster risk management must be based on understanding the disaster risk from all dimensions of its vulnerability such as exposure to risks, capacity, and characteristics of hazards. This know-how can be effectively applied to assessing the disaster risk, its prevention, preparedness, and response mechanism. It further prioritizes strengthening the disaster risk governance at every level, viz., global, regional, national, and microlevels for minimizing the adverse effects of hazards. Disaster risk governance calls for collaboration and partnership at every level by empowering community-level institutions. The framework also agrees upon public and private investments in disaster risk prevention and reduction through structural as well as nonstructural measures which are essential to enhance the economic, social, health, and cultural resilience of persons and communities. The framework recognizes the need to strengthen disaster preparedness and response measures in anticipation of a growing number of hazards. The recovery, rehabilitation, and reconstruction phases were considered critical by each of the participating countries to “build back better” by integrating disaster risk reduction into development planning. In a nutshell, the Sendai Framework focuses on the adoption of measures to address multiple dimensions of disaster risk like exposure to hazards, vulnerability, and capacity in order to prevent the creation of new risks, reduce existing risks, and increase resilience ([United Nations, 2015](#)).

Experiences across the globe have also shown that disaster risk reduction measures are successful when the participation of people is ensured at each stage of

managing hazards. Since the community is the first responder to disasters, failure to understand the risk behavior and culture of the local community leads to poorly designed preparedness measures. Disaster recovery and relief responses which do not directly involve the affected communities have greater risks of providing inappropriate and unsustainable forms of assistance, whereas the involvement of community-level institutions promotes self-reliance. Hence it has been widely recognized to involve the local community that promotes self-reliance and emergency management plans that meet local needs, circumstances, and challenges involved therein. Organized communities are also better equipped with respect to the mitigation of hazards based on their earlier experiences, available indigenous knowledge, wisdom, and innovation. A community-level focus facilitates better-prepared institutions on the ground so that there would be a much lesser impact of disasters in terms of loss and casualties (ADPC, 2006).

Section 22 (2)(i) of the Disaster Management Act, 2005, of India stipulates enhancing awareness, education, and training at the ground level with the participation of the local community to manage various natural disasters. It also emphasizes contemplating suitable measures to prevent, respond, and mitigate disasters in the long run. Section 30 (2)(xii) of the act facilitates training and awareness at the community level for the prevention of natural disasters with the support of elected representatives of local self-governments (LSGs), officials of departments working at the cutting edge, and functionaries of nongovernment organizations (Ministry of Law and Justice, GoI, 2005).

India's National Policy on Disaster Management, 2009, lays special emphasis on disaster preparedness at the community level since they are placed at the center of disaster response and preparedness. The policy mandates capacity-building initiatives like training and mock drills of vulnerable sections with the participation of primary stakeholders leading to their empowerment. The policy also gives due recognition to community-level institutions in the matters like animal care and managing relief operations as part of the disaster response mechanism. In the reconstruction phase, the policy clearly outlines the need for owner-driven repair, retrofitting, and construction of houses. It has also prioritized training for developing community-based disaster management systems for the specific needs at the local level in view of regional diversities and multi-hazard vulnerabilities in Indian scenario (NDMA, MoHA, GoI, 2009a, 2009).

Study Area, Objective, and Methodology

A study was undertaken in ten disaster-prone Gram Panchayats of Bhadrak district of Odisha to explore the effectiveness of capacity-building initiatives at the level of rural local bodies in improving the disaster risk resilience of communities at the local level.

Bhadrak is a coastal district of Odisha located in the east coast of India and prone to climate-related hazards like flood at regular intervals. The district is also

NB-Blocks covered under the study have been marked with arrows

Fig. 1 Study areas. (Source: www.bhadrak.nic.in)

vulnerable to cyclones due to its proximity to the Bay of Bengal and comes under damage risk zone-B (vb-50 m/sec) due to high-speed wind (Fig. 1).

The district also witnessed severe damage during the 1999 super-cyclone. The district experienced three major droughts during 2010–2019 which led to 45364.31 hectares of crop loss and damage to food grains. There are reports of other hazards like heat waves, thunder storm, lightening, fire accidents, snake bite, etc. that are also experienced in the district at regular intervals (DDMP, Bhadrak, 2019).

Bhadrak being the district prone to multiple natural hazards in the state of Odisha as part of the east coast of India was selected for the study. The study was undertaken in two blocks of the district prone to natural hazards like floods and cyclone at regular intervals. Basudevpur and Chandabali were the blocks where the study was carried out. As these two blocks, i.e., Basudevpur and Chandabali of Bhadrak district, are situated on the coast of the Bay of Bengal, the villages lying within 1.5 kilometers of the coast are also highly vulnerable to tsunami, one of the deadliest natural disasters. The Indian Meteorological Department (IMD) of the government of India has identified 17 and 24 villages in the Basudevpur and Chandabali blocks, respectively, which are vulnerable to tsunami (DDMP, Bhadrak, 2019) (Fig. 2).

Since all the Gram Panchayats of these two blocks are prone to both floods and cyclones, five Gram Panchayats from each block were selected at random for the purpose of the study with the following objectives:

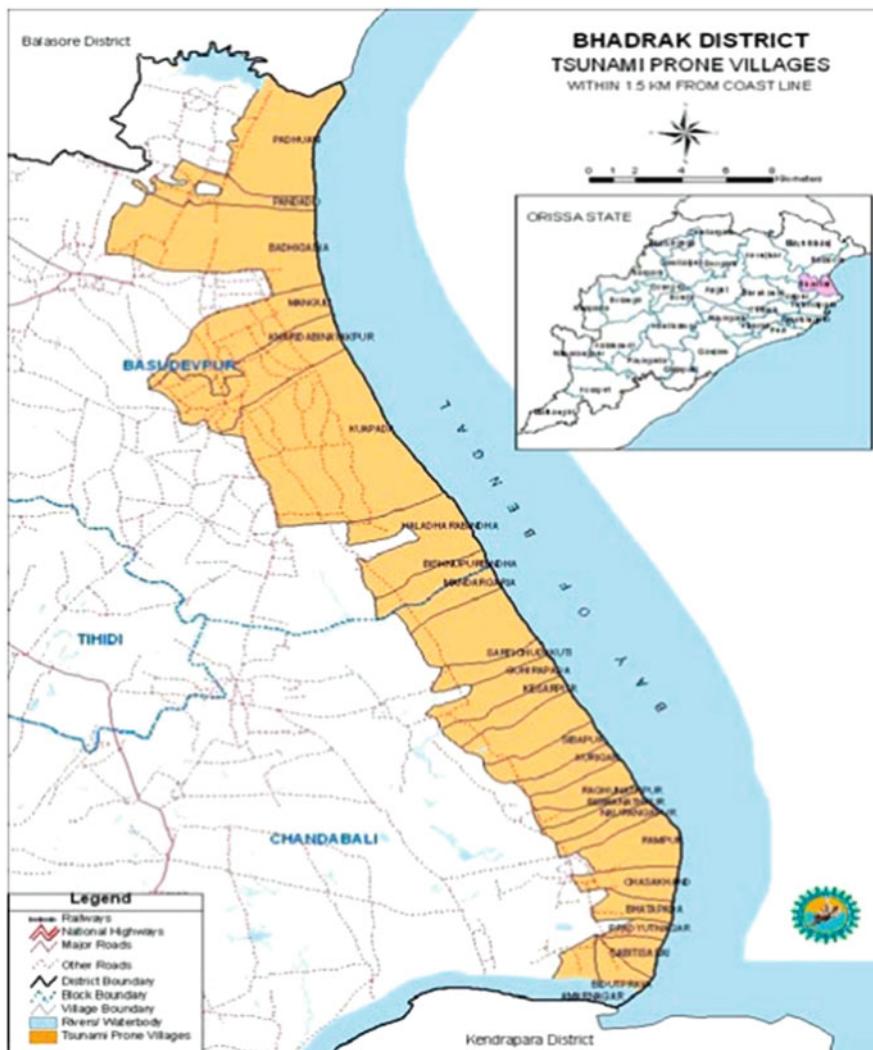

Fig. 2 Tsunami-prone villages in the study area. (Source: www.bhadrak.nic.in)

- (i) To study the institutional setup in the disaster-prone Gram Panchayats of the regions vulnerable to multiple hazards.
- (ii) To know the constraints experienced by the rural local bodies in managing natural disasters at the village level.
- (iii) To explore the effectiveness of capacity-building initiatives being undertaken at the level of Gram Panchayats for improving their disaster risk resilience.

In addition to the collection of secondary data pertaining to managing natural disasters at the level of the community by the Gram Panchayats, Participatory

Learning and Action (PLA) as a qualitative research tool was used to have an in-depth understanding of the situation on the ground by involving community-level institutions and other stakeholders from local community.

A wide range of participatory tools like transact diagrams, mobility maps, livelihood analysis, preference ranking, and focus group discussions were organized in all the ten Gram Panchayats during the course of the study. The participation of current and past elected representatives of Panchayati Raj Institutions, members of self-help groups, and villagers was ensured during the process by the research team as facilitators. The data collected from the two blocks were analyzed statistically by applying the maxima-minima method, and a composite Disaster Resilience Index (DRI) was developed taking into consideration three parameters related to managing disasters like creation of disaster-resilient infrastructure under different flagship programs like Mahatma Gandhi National Rural Employment Guarantee Scheme (MGNREGS), person-days of employment provided under the flagship programs meant for the rural areas, and the number of people rehabilitated with disaster-proof houses and land development activities to withstand natural disasters.

Analysis and Discussion

Analysis of the study comprised of the following three parts in tune with the study objectives:

- (i) Institutional setup to manage disasters at the local level.
- (ii) Constraints at the community level in managing hazards.
- (iii) Effectiveness of capacity-building measures in managing disasters.

The findings under each part are presented in the following.

Institutional Setup to Manage Disasters at Local Level

As per the provisions of Sect. 3 of the Disaster Management Act, 2005, the National Disaster Management Authority (NDMA) has been constituted at a national level to prepare policies, plans, and guidelines to manage disasters in India. NDMA also coordinates at the national level to implement the plans and guidelines as well as timely response to various disasters.

In line of NDMA, State Disaster Management Authorities (SDMAs) have been constituted in each state as per the provisions of Sect. 14 of Disaster Management Act, 2005, of India which is mandated to discharge the responsibilities of laying down policies, plans, and guidelines and reviewing the measures for preparedness, mitigation, relief, and capacity building, etc. pertaining to managing disasters. Odisha State Disaster Management Authority (OSDMA) coordinates with all the line departments and district administration to prepare, manage, and mitigate different kinds of disasters.

As per Subsect. (1) under Sect. 14 of the DM Act 2005 of India, District Disaster Management Authority (DDMA) has been constituted in Bhadrak district of Odisha state which is chaired by the Collector-cum-District Magistrate of the district. The president of zilla parishad, i.e., district panchayat, acts as the ex officio co-chairperson of DDMA. The additional district magistrate functions as ex officio chief executive officer of DDMA, whereas other district-level officers like the superintendent of police, project director of District Rural Development Agency (DRDA), chief district medical and public health officer, executive engineers of irrigation and rural development, and deputy director of agriculture department act as members of the DDMA. DDMA functions in accordance with the guidelines issued by the Odisha State Disaster Management Authority and NDMA as a coordinating body at the district level to implement all measures in managing disasters. The DDMA is responsible for the following responsibilities relating to disaster management:

- (i) Prepare disaster management and response plan and ensuring the implementation as well as monitoring of disaster-related activities at the district level.
- (ii) Identify vulnerable areas for different kinds of disasters at the district level and ensure prevention and mitigation measures through different line departments at the district level.
- (iii) Review the preparedness and capability at different levels required for responding to disaster situations.
- (iv) Organize, coordinate, and facilitate specialized training programs leading to the capacity building of officers and employees of different departments, nongovernment organizations, local authorities, elected representatives of local self-governments, and workers as well members of the community engaged in preparedness, rescue, and disaster mitigation measures.
- (v) Ensure early warning and dissemination of disaster-related information to the public.
- (vi) Review development plans of different departments and facilitate necessary provisions in their plan for the prevention and mitigation of disasters.
- (vii) Ensure disaster-resilient standards in the construction of buildings as well as the infrastructure of different departments in the district.
- (viii) Identify places and buildings that can be utilized for the purpose of relief camps and centers for shelter in the event of natural calamities or pandemic situations with arrangements for water supply and sanitation.
- (ix) Establish stockpiles of rescue and relief materials and ensure their availability at short notice.
- (x) Ensure involvement of nongovernment and welfare organizations working in the district for managing disasters.
- (xi) Ensure proper systems of communication and carry out mock drills at regular intervals.
- (xii) Perform other functions as deemed necessary to manage disaster situations as per the instruction of the state government.

There are also local crisis management groups at the block and Gram Panchayat level like block-level emergency operation centers headed by the block development officer and village disaster management committees to look after preparedness, rescue, relief, and long-term mitigation of disasters. National Disaster Response Force (NDRF) and Odisha Disaster Rapid Action Force (ODRAF) at the national and state level, respectively, facilitate the community in minimizing causalities, restoration of communication systems, quick deployment of personnel and equipment, etc. The Revenue and Disaster Management Department of the government of Odisha is also responsible for providing immediate relief to the people affected by various calamities like floods, droughts, cyclones, hailstorms, earthquakes, fire accidents, etc. The department also ensures early warning, preparedness, rescue, relief, rehabilitation, and restoration aspects in collaboration with DDMAs and different departments.

At the village and Gram Panchayat level, there is provision for the constitution of the team from the community for early warning, evacuation, shelter management, rescue, and relief operations.

Constraints at the Community Level in Managing Hazards

During the process of conducting Participatory Learning and Action exercises in the Gram Panchayats covered under the study in Bhadrak district in Odisha, responses of local community and their institutions like elected representatives of Panchayati Raj Institutions, members of self-help groups, and others were captured through focus group discussions and preference ranking as major tools.

Although it has been globally recognized that minimizing the risks of disasters would yield results when community-based disaster management is effectively rolled out, the following are the constraints to involving local community and their institutions in managing disaster situations.

Mobilizing the Community for Disaster Preparedness

Though the Disaster Management Act of 2005 and National Policy on Disaster Management of 2009 lay special emphasis on community-based disaster preparedness, the cutting-edge functionaries of field-level government departments and elected representatives of Panchayati Raj Institutions have not succeeded to the desired extent to convince the local community on understanding risks associated with natural and human-induced disasters. As part of the PLA exercises, focus group discussions were organized with 500 members of the local community to ascertain their level of understanding on various aspects of community-based disaster management after a series of discussions and awareness programs organized under the banner of District Disaster Management Authority.

Table 1 and Fig. 3 depict the responses of 500 primary stakeholders of the areas covered under study on their understanding of various aspects of community-based disaster management.

It can be seen from the table and figure that the local community has some degree of awareness on warning about various natural hazards, especially floods and

Table 1 Community-level understanding of disaster management

Aspects of disaster management	Level of understanding			
	Fully	Partially	Nil	Total
Hazard and vulnerability assessment	122 (24.4)	231 (46.2)	147 (29.4)	500 (100)
Warning system	211 (42.2)	88 (33.4)	122 (24.4)	500 (100)
Time and resource planning	67 (13.4)	101 (20.2)	332 (66.4)	500 (100)
Gender-sensitive approach	123 (24.6)	88 (17.6)	289 (57.8)	500 (100)
Inclusion of disadvantage groups	86 (17)	122 (24.4)	293 (58.6)	500 (100)

NB-Figures in the parenthesis indicate the percentage of the total

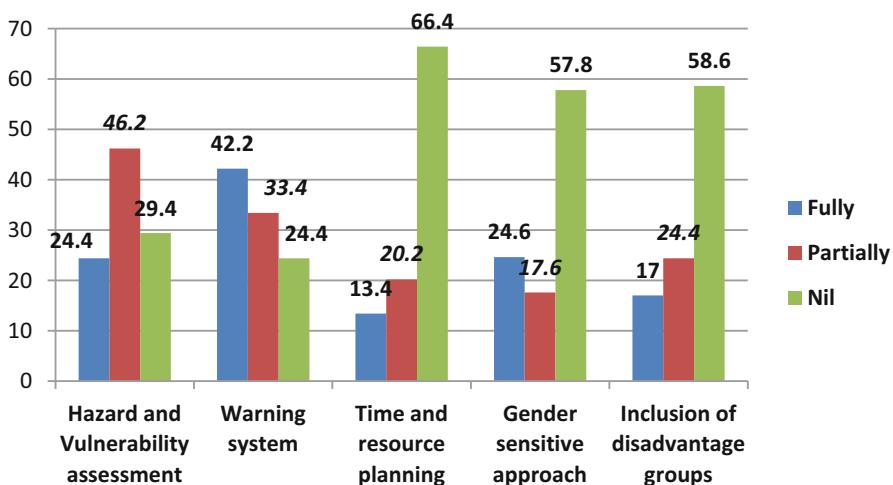

Fig. 3 Responses on understanding level of local community (*in percentage*). (Source: *Field study*)

cyclone. Forty-two (42) percent of the respondents have opined that they could know the forecasting, prediction, and preparedness measures with respect to the nature, intensity, and timing of disasters from electronic and social media, whereas 33 percent of them have these kinds of awareness to some extent. Similarly on the front of vulnerability and hazard assessment, identifying the vulnerable areas, community, and infrastructure susceptible to higher, moderate, and minimum risk is fully understood by 24 percent of the respondents, whereas 46 percent of them opined to have a partial understanding. Even 29.4 percent, i.e., around one-third of the members of the local community, do not have any idea about assessing the hazards and vulnerabilities associated with their localities in the case of any disaster event. Though

planning for timing, resources, and addressing the need of women, elderly people, physically as well as mentally challenged persons, children, and other marginalized groups, 57–66 percent of the respondents do not have any idea about these aspects. Lack of proper understanding on disaster risks, preparedness, and mitigation measures contributed to less mobilization of the local community in the process of managing disasters.

Disaster Risk Governance

Disaster risk governance plays a key role in the process of managing disasters at the community level. It was ascertained during the course of the study that disaster risk governance at the level of departments like revenue, disaster management authorities, and other bodies of the government involves the communities at the time of evacuation to safer places, whereas community-level planning seldom takes place during rescue, rehabilitation, and long-term mitigation measures. Community-level involvement on technical and legal aspects have been very low leading to local communities and their institutions, by and large, depending upon government departments to respond to disasters. It was also observed during the course of interaction with cutting-edge government functionaries and elected representatives of Gram Panchayats that since there are no operational modalities for convergence among different departments to address the pressing issues like poverty eradication, nutrition, drinking water, sanitation, school education, maternal and child health, the welfare of senior citizens, and investing in structural measures such as road, bridges, cyclone centers, culverts, public buildings, etc., there is hardly any scope for community-based institutions like Gram Panchayats, self-help groups, youth clubs, etc. to be involved in long-term mitigation measures, projects, and programs. The institutional mechanism available at the level of the community like Gram Panchayats is not also empowered enough to negotiate with different departments to implement their flagship programs for disaster-resilient structural and nonstructural measures.

Capacity Building as a Tool for Disaster Risk Reduction

After the enactment of the Disaster Management Act of 2005, institutions have been created and strengthened to equip the departments, local bodies, and community-based intuitions to build their capacity to reduce the potential risks associated with natural as well as human-induced disasters.

At the national level, National Institute of Disaster Management (NIDM), New Delhi, is the apex institute under the aegis of the Ministry of Home Affairs, government of India, which acts as the nodal center for the capacity building, training, research, documentation, and policy advocacy in the areas of disaster management. The institute provides support for capacity building to all the national- and state-level agencies responsible for managing the risks of disasters. National Disaster Response Force (NDRF) builds the capacities of disaster management personnel and first responders at the level of the community by way of organizing mock drills for rescue and evacuation during disaster situations. The National

Table 2 Institutions mandated for training and capacity building in India

Institute of Rural Development and Panchayati Raj (NIRDPR) caters to the capacity-building needs of rural areas with a focus on community-based disaster management, livelihood security during disaster situations, and integrating disaster management plan with Gram Panchayat Development Plan (GPDP).

After the enactment of the Disaster Management Act in the year 2005, all states of India have State Disaster Management Authorities, and these bodies cater to the capacity building of multiple stakeholders dealing with disaster management by collaborating with other training institutes and nongovernment organizations. Many of the states have their own Disaster Response Forces (SDRFs) that organize mock drills at the level of the community for rescue and evacuation during disaster situations. Administrative Training Institutes (ATIs) and State Institutes of Rural Developments (SIRDs) also organize training programs leading to the capacity building of government departments and community-based organizations on various aspects of disaster management.

The district-level agencies like District Disaster Management Authorities (DDMAs) and other line departments are responsible for capacity building at the Gram Panchayat level through awareness generation and organizing training programs on disaster preparedness, planning, rescue, evacuation, relief measures, and long-term mitigation of disasters by integrating disaster management into the development planning.

Table 2 depicts the institutional architecture at different levels in the Indian scenario to deal with disaster management.

In order to know the effectiveness of capacity-building measures, interaction was made with the elected representatives of Panchayati Raj Institutions and community-based organizations as well as members to local communities in two blocks of Bhadrak district in Odisha state. Chandabali and Basudevpur were the blocks where the study was conducted.

Table 3 indicates the number of training programs and awareness campaigns on various aspects of disaster preparedness, management, and mitigation measures to village disaster management committees, elected representatives of Panchayati Raj Institutions, and members of community-based organizations like youth club and self-help groups in two blocks covered under the study during the two time periods,

Table 3 Capacity-building measures in two blocks of Bhadrak district in Odisha

Block	Chandabali		Basudevpur	
Year	Training and awareness programs	Participants covered	Training and awareness programs	Participants covered
2015–2016	18	1765	22	2322
2020–2021	65	6456	49	5022

Source: Field study

i.e., 2015–2016 and 2020–2021. It is clear from the table that in the year 2015–2016, Basudevpur of Bhadrak district in Odisha had organized more training programs and awareness campaigns on various aspects of managing disasters to local communities and their institutions than Chandabali block of the district. Basudevpur was also well ahead of Chandabali block in building the capacities of more participants who belong to the locality and are considered to be the primary respondents in managing disasters.

The impact of these two measures over two different time periods was analyzed based on three parameters to improve the resilience of local community to natural disasters experienced in their areas. The parameters are creation of disaster-resilient infrastructure under different flagship programs like Mahatma Gandhi National Rural Employment Guarantee Scheme (MGNREGS), person-days of employment provided under the flagship programs meant for the rural areas, and number of people rehabilitated with disaster-proof houses and land development activities to withstand natural disasters like flood and cyclone that regularly hit these two blocks.

Based on the data collected on the above three areas, Disaster Resilience Index (DRI) for the rural areas was computed by applying the following formula widely known as a maxima-minima method in statistical terms.

$$\text{DRI} = (\text{Best Value} - \text{Observed Value}) / (\text{Best Value} - \text{Worst Value}).$$

DRI is the composite index by factoring all the above parameters. It can be seen from Fig. 4 and corresponding table that Chandabali block's Disaster Resilience Index has almost improved to 80 percent when compared to two different time periods, i.e., during 2015–2016 and 2020–2021, whereas Basudevpur block has shown marginal improvement to the extent of 28 percent. Though Basudevpur's Disaster Resilience Index was more than Chandabali block of Bhadrak district in Odisha in the year 2015–2016, the former has outperformed the latter in the year 2020–2021 which may be attributed to the more frequent capacity-building measures to community and their institutions at ground level.

Figure 5 plots normalized values on other indicators such as the livelihood index, land use, and productivity index of Chandabali block which has shown substantial improvement in disaster resilience from 2015–2016 to 2020–2021. It is clear from the figure that the block has performed well in all indicators like person-days of wage employment provided per household, percentage of women self-help groups linked with credit with income-generating activities, number of user groups formed for integrated management of natural resources, drought-proofing measures,

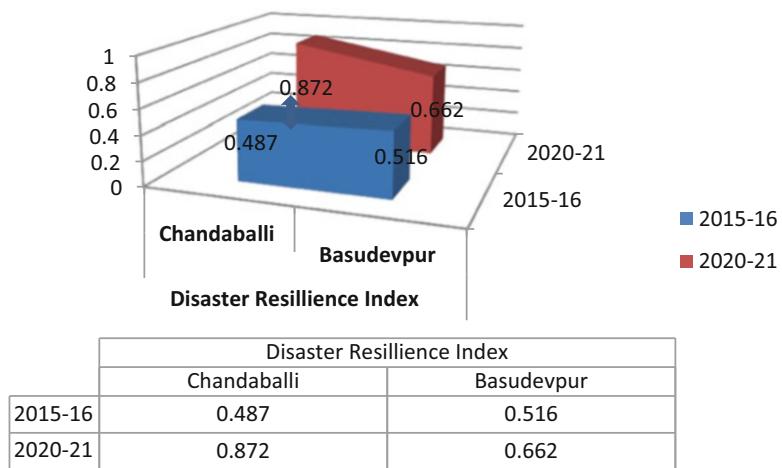

Fig. 4 Disaster Resilience Index of two study blocks. (*Source: Calculated on the basis of field-level data*)

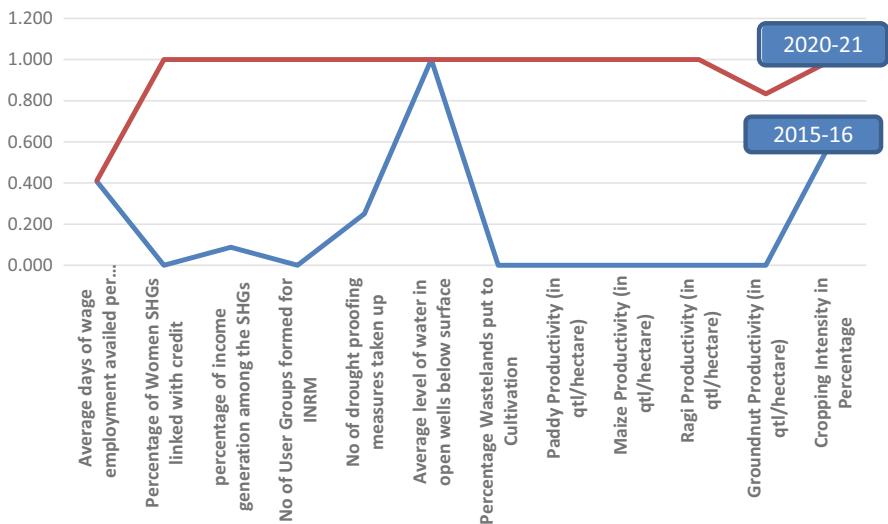

Fig. 5 Normalized values of livelihood, land use, and productive index in Chandabali block of Bhadrak district (2015–2016 and 2020–2021). (*Source: Plotted based on field study*)

productivity per hectare of land, water availability, and other parameters over the period during 2015–2016 to 2020–2021. These improvements attribute to the increased number of programs on training and awareness with relatively higher intensity.

Hence, analysis of information on capacity activities which includes training programs and awareness campaigns at the level of community infers that these

measures contribute to enhance the abilities of individuals, communities, and their institutions to adapt to and recover from hazards and shocks without compromising the long-term prospects of development. The improvement in Disaster Resilience Index of local community in two disaster-prone blocks of Odisha on the parameters like access to wage employment, credit linkage of women self-help groups (SHGs), drought-proofing measures, increase in crop productive, water level and cropping intensity, etc. justifies the need for capacity-building measures at the level of local community to cope with natural hazards effectively.

Conclusion and Way Forward

The enactment of the Disaster Management Act in the year 2005 has been a paradigm shift toward the approach to disaster management in India with the focus on risk reduction through developing skills and capacity of the local community and their institutions. The initiative of the National Disaster Management Authority with the nomenclature “Community-Based Disaster Risk Management (CBDRM)” is a path-breaking step in reducing the risks of various natural and human-induced disasters in which preparing a village disaster management plan is one of the indispensable components. The CBDRM approach provides a platform for the local community to evaluate their own risks in managing disaster situations based on their own capacity and experience. The rationale for building the capacities of community-based institutions is based on the assumption that since the community is the real sufferer and first responder to any kind of disaster, they need to be equipped with the skills for developing coping mechanisms and strategy to reduce the impact of the disaster. It is therefore imperative to appreciate the local knowledge and resources available at the community level, and investment may be made in community-based institutions to withstand the hazards. Leadership development at the community level can be possible through a chain of trained cadres for them to harness the resilience of the community to deal with exigencies. Greater involvement of community-level institutions like Gram Panchayat, village disaster management committees, self-help groups, youth clubs, etc. will ensure collective responsibilities during emergency situations. Hence the activities for disaster risk reduction need to go along the capacity building of local communities in the areas of hazard mapping, vulnerability assessment, and risk reduction measures considering them as proactive stakeholders for the same. Furthermore, it is not only the major disasters like earthquakes, cyclones, and flood that destroyed lives and livelihoods, accumulated losses from drought, landslides, and heavy rainfall also contribute to a large extent to enhance vulnerabilities at the local level for which investment in community-based disaster management assumes significance. Article 243-G of the 73rd amendment of the Indian Constitution also mandates Panchayati Raj Institutions (PRIs) to prepare plans for economic development and social justice. Therefore, it is imperative to equip these institutions to mainstream disaster risk reduction activities into the Gram Panchayat Development Plan (GPDP) and the plans of urban local bodies (ULBs). The risk reduction measures planned at the local level need to be supported with

resources from existing flagship programs and area development grants. The capacity building of elected representatives of PRIs, ULBs, members of village disaster management committees, and other community-based institutions will play a lead role in making plans on the ground for risk mitigation.

The findings of the study conducted in two blocks of a disaster-prone district in Odisha state also infer that capacity building of community-based institutions in the form of training programs and awareness campaigns contributes to improving the disaster resilience of primary stakeholders. Though the sample size of the study area is too small to arrive at the conclusion that capacity building is the driving factor to cope with disaster situations, further study needs to be carried out on enforcing regulatory measures and effective management of various phases of disaster management like preparedness, planning, evacuation, rescue, and rehabilitation which are also the other contributing factors to improve the disaster resilience in the ground. The capacity-building aspects need to be studied in more disaster-prone states with a larger number of respondents. Nevertheless, of these limitations of the study with small sample size and non-consideration of other important parameters, capacity building of community and their institutions contributes to coping with the adverse effects of disasters and minimizing the risk. In order to identify other factors contributing to reduce disaster risk, there is a need for further research on institutional preparedness at different levels such as availability of infrastructure, access to technology, resources, and skilled personnel.

Abstract

It is not easy to achieve the development agenda 2030 (SDGs) without addressing the issues relating to weather-induced human hardships such as droughts that pose multiple threats and risks to sustainable development. The recurrence of drought is evident with increasing frequency, severity, and duration, which can further expand food insecurity, poverty, inequality, and other adversities among the poor, women, and weaker sections in semiarid and backward dry areas. The present chapter is a modest attempt to understand and analyze the impact of drought in general and rising stress on gender relation in particular due to the recurrence of droughts. Droughts not only augment socioeconomic costs but challenge the risk coping capability of the weaker sections.

Using primary data collected from a total of 179 sample households using the questionnaires, direct interviews, and focus group discussions in four sample villages two each from Odisha and Gujarat, the study areas, the chapter analyses the multiple impacts of drought with focus on household food insecurity, drought coping, food insecurity, occupational changes, intra-household risk sharing, and gender relations in some drought affected districts of India. Details about methods

followed for data collection and analysis are presented in the chapter. Using the coping strategy index (CSI) based on four broad groups such as dietary change; augmenting short-term food availability; decreased numbers of family members; and rationing food consumption, the chapter highlights household food consumption strategy in regional contexts.

The findings of the chapter show that poor households have to follow diverse food arrangements and occupational changes in response to drought impact and follow both “labour smoothing” and “consumption smoothing” strategies to manage food scarcity which are neither effective nor gender neutral. The chapter offers some region-specific policy actions to improve drought risk governance and management which would reduce gender inequality.

Introduction

It seems difficult to meet the new development agenda 2030 (SDGs) without addressing the issues relating to weather-induced human hardships, such as droughts, which pose various threats and risks to sustainable development. Though droughts are recurrent events in the recent past with widespread and lasting impacts at the individual, household, community, sub-national, and national levels, they are often underestimated. Multiple costs of droughts especially in dry and backward areas are disproportionately borne by the poor, weaker sections, women, and other vulnerable groups (UNDRR, 2021). While recurrence of droughts with increasing frequency, severity, and duration is evident, it has potentials to augment food insecurity, poverty, inequality, and vulnerability across groups and regions. While major factors of drought are often rooted in the complex interactions of economic, political, social, environmental, and technological systems, drought-induced adversities and scarcities can have diverse impact that can vary with social groups and in different development scenarios.

Droughts can generate complex and multiple costs that affect lives, livelihood, and ecosystem but it was mostly underreported. The impact of drought on household food security, resources use, gender relations, and human development may vary across regions and social groups. Global estimates of the costs of droughts offer only partial accounts due to complexity and multiplicity of drought impacts with its widespread and cascading nature. The GAR Special Report on Drought 2021 (UNDRR, 2021) explored the major drought-induced risks that include exposure to hazard, vulnerability, and growing risks posed by climate change. About 1.5 billion people have been affected with economic losses of at least \$124 billion across the world during last two decades. Similarly, the effect of droughts on India's gross domestic product is estimated to be about 2–5% of GDP per annum, even though contribution of agriculture to India's GDP substantially declined in the recent years.

(Gadgil & Gadgil, 2006). One of the major impacts of drought is the growing water scarcity¹ that affects a sizeable portion of the population as about one fifth of the world's population live in areas of physical scarcity, and many people are approaching this situation. About one quarter of the world's population face economic water shortage (FAO, 2012).

Abnormally dry and long weather conditions in arid and non-arid regions are common in recent years. But drought is beyond aridity or water scarcity and all droughts are not disasters. Drought can have a range of direct and indirect impacts across regions and groups, which are not easy to measure and understand. Adequate clarity and understanding about drought impacts and drought coping at the household and community levels are important from regional development policy perspective to prevent and mitigate the risk of droughts.

It is therefore imperative to understand and address complex nature, pattern, costs, and other impact of droughts in different regions and how different groups respond to drought or manage drought-induced risks. According to FAO, about 84% of the economic losses was due to climate-related disasters and about 86% of loss and damage reported was due to droughts (FAO, 2015). Mostly land-based activities, including crop production, was the most affected subsector, accounting for 42% of total agricultural losses, followed by livestock production of 36%. Under this condition, nature and the pattern of water supply and management and water uses may considerably influence the livelihood and food security of the rural poor and farming households. Unfortunately, growing irregular and uneven rainfall, poor irrigation network, overuse and overdependence on groundwater resources, and lack of water-retaining structures in many parts of India aggravate the situation in agriculture and rural areas, which remain critical during drought (UNDP, 2013). It may lead to regional perpetuation and rising drought vulnerabilities, agrarian crisis, and other problems. Since farming, crop selection, land and water management, and input arrangements are traditionally undertaken by male members and role of women was not given much importance, gender inequality in drought affected areas is expected. Interestingly, rising participation of women in agriculture in recent years with recurrence of drought is also evident.

The main objective of this chapter is to make a comparative analysis of drought in different contexts, focusing on scarcity, during drought, of food, water, crop production, employment, income, etc., at the household level. Effort has been made to highlight household drought coping strategy and gender relations in different contexts in India where both recurrence of drought and implementation of drought policy measures have drawn considerable attention in recent years. With almost similar drought policy regimes in India, it would be interesting to study at the household and community levels food consumption, occupational changes, land holding, resource uses, migration, borrowing, etc., and to understand regional and group specific differences in drought coping mechanism, risk sharing, and gender

¹ Water scarcity is defined as the point when annual water supplies drop below 1000 m³ per person, and below 500 cubic meters is called as "absolute scarcity."

equity. It is presumed that a drought situation becomes intense and hazardous in dry and backward areas than developed irrigated areas when basic entitlements like food and water demands are no longer met and the local people become vulnerable with their diminishing capacity to cope with drought-induced scarcities.

Under drought situation poor households often confront multiple shortfalls (production, income and consumption expenditure) and make different adjustments in consumption, resource use, livelihood practices, and risks coping strategies. Given the different household and local situations, these adjustments, may or not always be effective and gender neutral. The present chapter discusses drought situations and household drought coping responses in different drought affected regions of India. Two districts from Odisha and two districts from Gujarat were selected to capture regional and group-specific variations in household drought coping. It may be noted that variations in quantum and distribution of rainfall and incidence of droughts in India have been reported both in low rainfall states like Gujarat (annual average rainfall 350–750 mm) and high rainfall states like Odisha (annual average rainfall 700–1500 mm). But the nature and impact of drought may vary across states in India subject to natural factors, local development condition, and public policy interventions.

The present chapter aims at to analyze drought-induced risks and household risk coping practices in different regional and group contexts using both high and low rainfall regions and in both tribal and non-tribal areas with focus on food security and gender relations. Given the diverse local condition, it is also discussed and argued whether household drought risk coping measures are effective and gender neutral. Some specific objectives of the chapter are given below.

- To discuss different aspects of drought situations and household risk coping and risk sharing in different regions.
 - To analyze whether household responses to drought-induced shortfalls (food, water, employment, fodder, etc.) vary across region and groups and remain gender neutral.
 - To discuss local policy interventions, drought risk governance, and management in the study areas.
-

Methodology

Gender is one of the important dimensions of the intra-household allocation of resources, and the factors that affect the distribution of resources within the household particularly during any distress period like drought or other weather-based calamities (Agarwal, 1997). However, the links between household risk coping with drought, food insecurity, and gender relations though crucial is not discussed at the regional level, which is important from policy perspective (Quisumbing, 2003; Quisumbing & Smith, 2007).

Resource-based area approach has been followed to understand and compare diverse drought risks across social groups and region on the scale of development

parameters. Primary field surveys at household and community level were conducted in the sample study areas to collect relevant information. Survey areas were selected primarily based on (a) drought occurrence (moderate to severe droughts), and (b) nature of food crop production and other land-based activities, (c) major source of water supply, (d) incidence of labor migration and other factors crucial for food and livelihood security. To capture the diverse impact of drought household response, local drought adaptation practices in two different states (Gujarat and Odisha) and four districts (two each from both of states) were selected based secondary data and information gathered from the local key informants like teachers, community leaders, government officers, etc. Both tribal (dry, backward, and remote) and non-tribal areas (irrigated and developed) areas were considered to compare region and group-specific drought conditions, food security, water management, risk coping behavior, and gender relations at the community and household level. Total of 197 households from four sample villages (one each from dry and tribal area and irrigated non-tribal areas in both states) were identified on the basis of district profile, first-hand information from local informants. The major source of water, cropping intensity, and remote location; local common resources (forest, community land and water bodies, etc.), and public assets (road, community centers, canal/well etc.); structure of occupation; villages size; nature of irrigation and cropping pattern, drought proofing and other public development program were the criterion for selecting sample villages.

A stratified random sampling method was followed to select sample households for detail survey. Land holding size, non-land resource holding, cropping pattern, nature of occupation, female workers, borrowings, labor migration, participation in local public programs, and other socioeconomic factors were considered while shortlisting sample households (around 40–60 households per villages). Data on total 179 household were finalized for analysis. Household-level information on food consumption, employment, asset holding, out-migration, women workers, public food provision, and participation in public welfare programs, etc., collected by direct individual interviews and focus group discussion (FGD) methods. Household consumption smoothing, labor use, and household risk coping was given importance to discuss whether shortfalls of food, water, and other basic entitlements during drought are different and gender neutral across regions and social groups. Household data were collected through direct interviews with head or a senior member of the sample households using suitable questionnaires. Focus group discussion (FGD) with villagers were conducted with priority on participation of females.

In the study areas, some features of drought, water scarcities, adaptations, and other local practices were found worth noting and it helped in better comparison between both tribal and non-tribal areas. Some important features like type of drought areas, sources of irrigation, local drought adaptation practices, and water uses in the study areas are given in the Table 1. Size, castes, and other details of the surveyed households are also specified in the Table 1. It may be noted that caste-wise distribution of sample households shows relatively higher share of weaker sections in both of the states. However, higher proportion of ST in Gujarat (45%) and other

backward castes (OBC) in Odisha (40%) who are more likely to be land poor and food insecure during droughts is evident from the data presented in the table given below.

Drought Impacts and Household Risk Coping

Drought has been progressively costly and climate-related disasters in many parts of India, irrespective of nature and the quantity of average rainfalls. Broadly, drought is associated with scarcity of water, food, fodder, employment, and other basic entitlements but at different intensities. On the other hand, preexisting vulnerabilities within a community or in any areas can be exacerbated in the event of drought that could further push a sizeable portion of total households into poverty, food insecurity, and abiotic stress in dry and backward areas. Since both direct and indirect drought impacts were evident in the study areas, it would be interesting to study the variation in drought risk and household risk coping on the scale of local development, resource use, and public policy intervention. Some important features and household response to drought reported in the study areas are discussed here based on primary field data collected and compiled from field surveys.

It may be noted that Odisha and Gujarat both continue to experience frequent drought situations in recent years with varying intensity and severity. Odisha experienced more frequent drought and water scarcity with very high level of water resources endowment such as high average annual rainfall about 1400 mm and crisscrossed by numerous rivers and rivulets unlike other states. Gujarat is usually a water scarce state having much lesser average rainfall (about half of the average annual rainfall of Odisha) and in recent years the state has been experiencing a rising incidence of drought situations. However, many public policy initiatives including active local water management and watershed programs are found in operation in Gujarat. While there are some similarities between the two states in terms of occurrence and impact of droughts, proportion of tribal population, dominance of peasant farming, migration of rural labor, new water institutions, rising participation of female in agriculture, etc., overall, people's perception and response to drought were found to be different in both states.

Policy interventions to counter drought adversities and to provide alternate water supply like individual pond renovation, watershed development programs, small irrigation projects, deepening tube well, and encouraging people's participation in drought proofing measures are found at present in both the states. Implementation of group water management initiatives like *Panipanchayatin* Odisha (Sahu, 2008) and community water management and development programs in Gujarat are well known among policy makers and analysts. However, some fundamental issues of management, distribution, and water uses remain unaddressed and they continue to be biased against land poor, women, and other weaker sections who are worst affected in case of drought. Abysmally low participation and representation of women in water management and distribution are found in both of the states, yet

Table 2 Drought impact in study areas (responses of sample households in %)

Source: Field Survey (2019)

their perceptions and drought coping priority are found to be different across the study areas.

Data provided in the Table 2 show some key aspects of household level perception and priority in a drought situation, which can have various impacts on household decision making and risk coping. Regional and group-specific variations are also evident in our data that are often missed out in usual drought policy interventions and analysis. Shortage of food and failure of food crops production are considered as major consequences of drought on households, especially in Odisha where better resources endowment and multiple sources of water exist unlike a water-scarce and food-deficit state like Gujarat. It shows that there are some inter-state differences in drought perception, priority, and policy interventions, which could influence drought risk governance and management.

It may be noted that both food crops yield and area are important for household food security in a drought-prone area where the provision of controlled water supply, nature, and type of irrigation are crucial to reduce crop loss at least during critical period such as crop plantation, flowering, and grain-formation stages. From our data it was reported that more than half of the total respondents experienced shortfall in food crop output during drought in both the states but worse in the tribal areas of Odisha. A rising female work participation and out-migration of labor during drought was common in the study areas but more pronounced among the land poor households and in dry, backward, and tribal areas. It shows high level of drought-induced vulnerability among land-poor tribal households and supports the argument of rising feminization of agriculture often debated in the literature. Under this condition, an inadequate and unequal access to land and water resources may accentuate gender relations in drought-prone regions. This is also supported by the trend of shift in household farming and other activities to the female members as their male working members migrate out during drought in search of avenues elsewhere. Hence, dry and backward areas are more likely vulnerable to drought situation in the absence of adequate and effective drought intervention and preparedness.

Shortages of food emerged as the single most household hardship during drought, which is further explained by crop failure, reduction in household expenditure on

food, out-migration of major working members, etc. It may be noted that loss in crop production due to drought is found in all study areas but more pronounced in Odisha and in the tribal area largely due to sharp fall in crop yield in the absence of critical water supply to crop at flowering and grain formation stages. On the other hand loss of household employment during drought seems partly compensated by participation in public employment provision like MGNREGA and seasonal non-farm activities. Rural workers seem resilient to local low-wage employment as farm and non-farm interlinks are crucial for productive local avenues. Inadequate productive farm employment and income during drought and the growing non-farm activities in the study areas may be a case of distress-driven non-farm sector, which is mostly residual in nature (Vaidyanathan 1986) as many poor cannot afford to remain unemployed. In this context, households in Odisha were found to be more stressed than their counterparts in Gujarat, which can have adverse impact on household risk coping and gender relations. Similarly, deteriorating health issues during drought were reported across study areas. About one fifth of households in Gujarat, mostly among women and in non-tribal areas, reported major health problems during drought.

Drought risk is a function of three major factors such as hazard, exposure, and vulnerability and drought impact is a function of its frequency, duration, and severity that depends, to a large degree, on the rate of exposure of the affected groups (UNDRR, 2021). Household vulnerability refers to the capacity to anticipate, cope with, and prevent shortfalls in household and individual well-being, and recover from the adversities. Hence, the nature and strength of household coping capacity and the ability to adapt to the changing conditions in the long term are important yet it may vary across groups and regions. The primary household level data presented in the Table 3 indicates some important aspects of drought-related risks and

Table 3 Drought-induced major issues in study areas

vulnerability explained in terms of range and intensity of drought impact and household responses in regional and group contexts.

Regarding range and intensity of drought impact an average estimate of loss in major crop yield during drought was found in the range of 63–97% in Odisha, which is double of that in Gujarat but the range of crop failure was found to be almost similar in both the states. As expected, decline in farm income was sharper during drought mainly due to the reduced labor demand. Since they could not afford to remain unemployed, many poor pushed themselves into undertaking any possible avenues without considering the level of earning and work conditions. A sharp rise in non-farm activities and large out-migration of labor in the study areas during drought implies poor household coping strategies just to compensate the total drought loss in crop output, income rather improvement in household capability and welfare. This may affect household gender relations. Similarly, household shortfalls in food production and consumption and managing this during drought were found to often outpace other critical issues like postponement or reduction in spending on health, education, and social events. Many tribal households (about 45%) in Odisha reported major health problems during drought, mostly among the women, which is often not given much importance even during normal period. Hence, it is possible that household priority for expenditure on food might outpace their health expenses, particularly for women.

On an average, the decline in food expenditure is lesser in Odisha than Gujarat, which does not necessarily imply that households in Odisha were better off than their counterparts in Gujarat (see data presented in Table 3). This is because many poor households do not have any specific food expenditure plan, rather they have to manage food consumption shortfalls with variety of local food arrangements such as food collection from forest, community food supply, and other sources depending on availability and access. While household food consumption smoothing issues are evident in the study areas, rising food price and liquidation and forced sale of household assets during drought were also reported in the study areas. It not only implies the vulnerability of the poor and weaker sections during drought but it also reaffirms the perception and understanding of drought beyond water scarcity and loss of crop output and farm income.

Drought and Change in Household Occupations in Study Areas

Household resource allocation and occupational changes often indicate household risk coping behavior. Households under any stress condition may reallocate its labor and resources such as family labor, land, non-farm assets, livestock, savings, etc., to manage income flows, expenditures, consumption smoothing, crop output, and returns to assets. In this regard, household may change its labor use and occupations as common household strategy in terms of changing major occupation, undertaking multiple new occupation, increasing average working hours and numbers of works, more women and children entering into labor market, participating in seasonal off-farm activity, out-migration, etc. There can be demand-driven or distress-driven

occupational change subject to the nature of local condition and household risk capability, resource endowment, and other factors. To better understand the effects of household resource allocation and occupation diversification during drought, here focus is on analyzing changes in household income-earning activities. For better understanding and analysis of the changes in household occupation on gender, we focused on some local area-specific activities undertaken by sample households. Some notable drought-induced occupational distribution and changes in both tribal and non-tribal areas, which are more or less concentrated on scarcity of water, food, and employment, are presented in the Table 4. Since farming household largely depend upon land and water-based activities, many younger male workers found migrated out of village during drought period due to limited scope for local avenues. In this regard change in household occupations in the rural economy is rational but it could push female members into such land-based activities. This trend was found in Odisha where decline in agricultural wage labor and cultivators was also reported. As expected, it was more pronounced in tribal areas where forest-based activities were reported to be restricted and declining in recent years.

Household's distress occupational diversification also found in the study areas varies across occupations and regions. It shows decline in animal husbandry and livestock activities where participation of females were higher than males. Major household drought coping strategies found in the study areas are occupational diversification, labor migration, and feminization of low productive land-based activities. Household as a decision-making unit needs to change its occupations and allocation of resource as a part of household risk coping strategies particularly during distress period, but it may not always ensure betterment of all family members. It may not be gender neutral as women share more work burden, bad working conditions, low income, and their personal well-being might compromise during stress period like drought. In this context, difficulties in accessing and basic resources like land, water, seeds, credit, and markets by women, lack of preparedness, and poor capability could further aggravate gender relations at the household and community level.

Household Drought Coping and Consumption Strategy

Data presented in the Tables 5 and 6 show another critical aspect about household drought coping in the study area that is mobility of household major occupation or activity over period. Broadly, the data indicates that farming as the sole source of livelihood for rural households is declining, much faster in Odisha, where issues of employment and income are more challenging compared to the areas in Gujarat where avenues in both farm and non-farm sector is better. It may be noted that about 30% of sample households in Odisha reported change in their primary/major occupation from farming to other activities as compared to 20% households in Gujarat. The data in the Tables 5 and 6 also show the distribution of household who changed their principal occupations into other occupations during the given period to capture the occupational mobility due to drought, water scarcity, and food security. For

example, out of total 30% households, Odisha which moved out of farming as a major occupation, 18% household reported migrated out and 5% joined other non-farm activities, 3% engaged in livestock, and 2% joined as farm wage labor, which are usually low productive and low return land-based activities. It appears that HH occupational mobility as a drought coping tool may be opted for but it may not ensure reduction of drought risks unless there is a better income and employment from new occupation like labor migration, which seems not remunerative for unskilled labor and after adjusting the cost of migration. On the other hand, in Gujarat, out of 20 households who moved out of farming reported engaged in diverse occupations and only 4% of them migrated out. Similarly, about 65% household in Odisha and 45% in Gujarat were found to have moved out of rural manufacturing as these activities are no more remunerative or viable as a major source of living. Interestingly, a sizeable portion of the households who moved out of manufacturing as their major occupation preferred to migrate out in both of the states.

It appears that a substantial portion of rural households who changed their major occupation over a period reported migrated out of their village followed by other non-farm activities. On the other hand, as high as 75–90% of household who already involved in labor migration continued with migration as their major source of earning and employment. Some households preferred to shift to other non-farm activities as major occupations, which are mostly seasonal and less remunerative such as traditional caste-based activities, petty trading, and rural artisans, which shows demand for these activities exist in rural areas. In contrast to Odisha, about two thirds of households in Gujarat continue with their respective occupations except for rural manufacturing and artisans. It indicates that, with better farming activities, local condition, and a prospect of labor migration, a progressive diversification of household occupation can be better drought risk coping measure, which seems missing in Odisha. This is important from a policy perspective that drought policy interventions need to be in enhancing capability and improving local condition for better risk reduction and management than few reactive short-term drought relief measures.

It is worth noting that, except for regular services, most of the households in farming and migration in Odisha were found to not have changed their primary occupation mainly due to limited income and employment options and opportunity. Two more important activities such as livestock and trading and business in Gujarat had not changed by the household because these activities are highly remunerative, employment-intensive. On occupational mobility, a general trend that emerges from the data is that occupational shifts are from farming to labor migration and from labor migration to other non-farm activities.

Looking at the nature and pattern of household occupational changes discussed above, local agriculture and the level of development could play the role of key growth motors that can support in drought risk reduction. Poor farming households with subsistence farming, poor irrigation, recurrence of drought, and poor drought management in Odisha may face more food insecurity and other drought-induced

miseries unlike their counterparts in Gujarat with relatively better local conditions, farming options, and income and employment options.

Coping with Drought: Household Consumption Strategies

We have explored the household coping strategy in terms of changing consumption coping strategies presuming subsistence farming of food crops is predominant among sample households. Any production loss may result in major adjustments in the household food balance including fall in quantity and quality of consumption. Our field data presented in the Table 7 provide evidence that support shortfall in household food consumption has direct fallout of decline in food crop failure, loss of farm income, and hence increasing dependence on market for food purchase unless local public food provisioning is not adequate, affordable, and timely. Another important aspect of household food consumption strategy during stress period is to manage both quantity and quality of food items. Many households reduce their normal food intake during drought situation and more in case they buy food from markets. Household food consumption smoothing (Morduch, 1995) seems constrained by their food consumption coping strategy during drought. Both the number of meals per day and the quantity consumed per meal found reduced in case of some sample households. The nature and extent of decline in household food consumption in study areas are presented in the Table 7, which also explains some important aspects of household food consumption behavior and risk coping mechanism. Other aspects of household adjustments in food consumption highlighted in the Table 7 are the nature and extent of the quality and quantity of food intake variations, regional and group-specific changes and incidence of alternate food arrangements. Though these household food consumption adjustments are very much evident across study areas and related to income, employment, and consumption shortfalls, they may not be gender neutral. With noticeable level of food and water scarcity, decline in land- and livestock-based activities, limited mobility, and

Source: Field Survey (2019)

inadequate access to and use of assets, many poor women in drought affected areas were found suffering from malnutrition, underemployment, and growing unpaid work burden during drought that deteriorated women's health.

Relative measures of decline in quality and quantity of food consumption during drought in the study areas are present in Table 7. As expected, marginal to average decline in quantity of food consumption was very high among tribal households in Odisha whereas sharp decline in quality of food consumption is visible in Gujarat. Less and irregular food intake can lead to diet imbalance and health issues; the impact of adjusting in quality of food consumption is not very clear from our data. Reduction in consumption of higher value food such as milk and milk products, oil, fish, egg, meat, etc., reported among non-poor, can have adverse consequences on health especially for women and children. However, it does not make much difference among the low income and the poor who occasionally consume these high-value food items even during the normal period. Interestingly, there was a shift in regular food grain consumption, mainly from maize, millet, and bajra to wheat and rice in tribal areas because these grains were available under drought reliefs, public distribution system, and food for work programs in which wage payment was in terms of kind (wheat/rice). On the supply front, food production loss leads to reductions in the quantity sold, the quantity of seed kept for the subsequent year, and the quantity stored for future use. Similarly, because of rampant labor out-migration, the conventional practices of food grain storage, food exchange, and regular food crop production reduced in recent years.

The data presented the Table 8 show the intra-household food consumption adjustment reported in the study areas with visible gender inequality. Regarding the question "who faced bigger drop in food consumption in the household," almost all people responded positively but the trend was more in tribal pockets and among women. Most of the female members of family are the first who opined about food consumption shortfalls followed by the male members and others. Within households, a sizeable portion of the total members viewed a high degree of decline in food consumption in tribal area unlike in non-tribal areas where the level of reduction in food consumption was low.

Regarding household food consumption strategy and its impact on gender, the data present in Table 8 show that there is a disproportionate amount of consumption shortfall was adjusted by female members who usually sacrifice food, as social practice, in favor of the working male members and children. About one third of women found reduced their regular food intake substantially during drought. However, this trend was true for the males and tribal regions that imply the nature and extent of local food shortage. Gender inequality in allocation of food within household is partly explained by increased reduction in consumption among the poor and partly by the social and traditional customs and practices as mentioned earlier. Decline in household food consumption in terms of both quantity and quality supports the presence of distress-driven household drought coping behavior. This also supports the finding of earlier studies on gender inequality in food access and intake, better share of boys over girls in food and education, and female disadvantage in food and health care (DeRose et al., 2000; Gittelsohn, 1991). Unlike the findings

Table 8 Trends in intra-household food consumption (%)

Source: Field Survey (2019)

of other studies that analyze food consumption at aggregate household level, the present study finds intra-household food inequality at the individual level to highlight gender differences in food consumption.

Conclusion and Policy Suggestions

In conclusion, recurrence of drought and its adversities very much exist in regions irrespective of the level and nature of rainfall, water resources, and poor farming households; women, tribals, and other weaker sections are the worst affected across regions in India. The nature and extent of drought varies across regions and groups in terms of loss of crop output, farm employment, livestock, and return to land-based activities. As a result, household's drought coping strategy varies from occupational changes, reallocation of family labor and assets, labor migration, distress sale, food consumption adjustment, etc., which do ensure gender inequality. Though impacts of drought are complex and multiple in nature it goes beyond water scarcity, crop failure, and income loss. To cope with drought households, several strategies can be followed, such as, change in occupation, consumption adjustments, expenditure adjustment, multiple borrowings, distress sale, overdependence on forest and forest products, out-migration, reliance on public relief support, etc. Resource-poor households in dry backward and tribal areas use conservative risk coping practices that could have long and lasting effects, which further affect household resource use, risk coping ability, and intra-household gender relations. Women share a disproportionate burden of workload and hardships, arranging food and adjusting food consumption during drought, and face adverse intra-household gender relations, which are often missed out in general policy debate, discussion, and analyses.

Our findings support the view that many poor household in semiarid and dry areas continue to share higher work burden with poor occupational mobility and low or no access to resources and avenues such land, water, credit, technology, and market. At the household level, distress occupational changes, labor migration, food consumption adjustment, informal borrowings, distress sales, etc., were found mostly used as household ex-ante drought coping strategies with regional and group-specific variations, which are not gender neutral. Local food production, agriculture, controlled water supply, better access and use of resource, access to inputs and market, particularly by the women, are crucial to strengthen household risk coping ability in in drought-prone areas.

From policy perspective, it is critically important to understand the local conditions and incorporate drought-proofing measures as an integral part of rural and agricultural development plans. Since households under distress situation often rely more on their female members for "labour smoothing" and "consumption smoothing" that may result in wider intra-household gender inequality, suitable gender-sensitive public policy should be designed to address regional and group-specific issues, which may be different at the national and subnational level. Better policy coordination and integration of drought policy with local development initiatives

and gender development policies may be effective to counter drought-induced adversities and gender inequality.

Abstract

Disasters are sudden, catastrophic, and unfortunate events that cause human and financial damage, destruction, and devastation. Disasters also impede ongoing and impending development projects, and the impacts – outputs and outcomes – vary from geography to geography. Major reasons, as the literature suggests, are due to diversities and differences in the climatic and geospatial conditionalities which lead to the difference in the degrees of vulnerabilities caused to the physical environment and to the human resources. Given the capriciousness and unpredictability of the disasters, the states and the disaster mitigation machinery or communities to manage disasters need to be equipped and organized in advance, to minimize the postdisaster effects. To overcome these stages in process of disaster management to minimize the economic, social, or geographical loss, governance should play a vital role with the 3Es, i.e., efficiency, effectiveness, and economic mitigation process, which in the process helps to synchronize political, economic, and administrative activity in the management of disaster.

P. S. Das (✉)
Political Science, Adamas University, Kolkata, India

This chapter tries to focus on the country's Disaster Management ACT 2005 and laterally three international conferences on Disaster Management which have highlighted the fact that governance structure aids the enactment and administration of public policies along with sustainable livelihoods which are conducive to a country's economic and social development and also, on the other hand, condenses the vulnerability to disasters. This chapter used secondary data that deliberate for sustainable governance structure, and development accountability, participation, predictability, and transparency are the key features.

Keywords

Good governance · Risk minimization and mitigation · Disaster preparedness

Governance, as defined by UNDP (1997) is “the exercise of political, economic, and administrative authority in the management of a country’s affairs at all levels. It comprises mechanisms, processes, and institutions through which citizens and groups articulate their interests, exercise their legal rights, meet their obligations, and mediate their differences. It encompasses all relevant groups, including the private sector and civil society organizations.”

Introduction

Disaster governance has traditionally been understood as a risk reduction strategy that has a split responsibility between local, state, and national institutions and was alienated in bureaucratic hierarchies. However, because of little or no interaction among civil society, governmental organizations, NGOs, or corporate entities, it can just be seen as risk governance which talks about disaster or emergency management of the people. Disaster governance framework should reflect the broader guidelines of the legal and institutional framework of the society of which they are part, which helps to create a receptive atmosphere for vigorous disaster risk reduction by mobilizing the political drive and simplifying the inclusive participation and involvement of the various stakeholders to ensure that political, social, and economic priorities are on the basis of agreement in society; also the point of view of the marginalized and most vulnerable section of the society are perceived in the decision-making process. Although the research in the field of disaster management overtly emphasizing governance is very little, the present chapter focuses on the efforts taken up at the national and international level for indoctrinating governance as part of a “Disaster Risk Reduction.”

The key questions addressed are as follows: At national and local levels, what are the key driving forces which have changed the disaster risk governance characteristics over the period of time?

How the International Framework Has Influenced Disaster Risk Reduction in India and What Are the Outcomes of Its Confluence with Governance?

The objective of the chapter is to understand the positioning of disaster governance on the broader framework of the environment, disaster management, resilience, and preparedness in relation to the present system of disaster governance which revolves around the social, economic, and political factors that impact government measures. It also talks about the importance of governance in disaster management and its gradual development in India and in an international setting with reference to major international strategies such as IDNDR and the three major conferences which include Yokohama Strategy (1994), Hyogo Framework (2005), and Sendai Framework (2015); also few of the case studies will help to answer the key research question that how this framework has set a uniform standard for the disaster risk reduction across the globe with the help of integrated and inter-woven efforts at all levels and of all the stakeholders.

Disasters and human civilization have always coexisted, but as technology advanced and developed, various permanent infrastructures had been built over time. This materialist development has caused a rift between people and nature, which has increased the risk of disasters. Averting these and foreseeing their occurrence at some of the geographical locations are beyond scientific explanation too. As per the definition given by the National Disaster Management Institute of India (NDMI), “disaster is an event or series of events, which gives rise to casualties and damage or loss of properties, infrastructure, environment, essential services or means of livelihood on such a scale which is beyond the normal capacity of the affected community to cope with. Disaster is also sometimes described as a catastrophic situation in which the normal pattern of life or ecosystem has been disrupted and extra-ordinary emergency interventions are required to save and preserve lives and or the environment.”

The United Nations (1987) defined disasters as “A serious disruption of the functioning of a community or a society causing widespread human, material, economic and environmental losses which exceed the ability of the affected community/society to cope using its own resources.” Disasters have constantly been there, and human beings have coexisted with them at the same point of time though they have tried to overcome the situation frequently, but these extreme events either natural or man-induced have exceeded the endurable scale causing massive damage to human life, property, and natural environment within or beyond certain time limits, paralyzing daily life (Waldman, 2019). Avalanches, forest fires, and landslides are very frequent in the Himalayan region of the country; almost 90% of the land mass of the country is prone to disaster. The disasters directly affect economies, agriculture, food security, water, sanitation, the environment, and health conditions every year all around the world. And therefore, disasters have become one of the solitary major concerns for most of the developing and underdeveloped nations (World Bank, 2010). Different hazards because of the varying levels of physical damage caused to infrastructure and agriculture with their direct and sometimes indirect implications have led to the development of disaster management because disasters not only result in loss of shelter but also create adversities, lack of food availability, temporary loss of a source of income, and interruption with socioeconomic activities; such instabilities have their psychological and social magnitudes

which are difficult to replace; nevertheless, some of the losses may be redeemable and compensated by developing systematic disaster management.

In 2005, the “Disaster Management Act (DMA)” was passed by the Government of India for the “efficient management of disasters and other matters connected to it.” This Act proposed the formation of the National Disaster Management Authority (NDMA) which will be headed by the Prime Minister of the country, the NDMA is authorized to formulate disaster management strategies and coordinate and implement these policies and plans for ensuring judicious and effective recourse for the catastrophe. These plans will act as the guiding principle for policies and programs of the central and state to form their respective policies with the prior approval of the same. The National Executive Committee (NEC) is the policymaking committee of the NDMA, which is deputed to guide the NDMA in the execution of responsibilities and guarantee compliance with the guidelines issued by the Central Government. District Disaster Management Authorities (DDMAs) are deputed at the District level and have the primary responsibility of developing, coordinating, and approving plans in accordance with the strategies laid out by the NDMA. SDMAs (State Disaster Management Authorities), headed by the Chief Ministers of the states, will frame policies for DM in the state in accordance with the framework suggested and at the same time will approve the plans in accordance with the strategies laid out by the NDMA.

The ACT is framed on the idea that losses related to the calamity need to be minimized, and are more important than an arrangement of relief and rehabilitation; subsequently, the structure of DM also assures training and development of officers and employees for effective management of disasters in the country and correspondingly will give measures for carrying out respite, restoration, and rebuilding activities in the disaster-hit areas and will prepare DM Plans in harmony with the guidelines of the NDMA, SDMAs, and DDMAs. Specific institutional development in the form of the National Institute of Disaster Management has assisted in the front line and sustenance of an all-inclusive and unified approach toward DM. A shift can be seen from the “relief-centric” response to a “proactive prevention,” “mitigation,” and “preparedness-driven” approach for the conservation of development and to minimization of loss of life and property.

Disaster management and risk reduction in India have their own gaps, including the lack of a declaration of disaster-prone areas, despite the Disaster Management Act performing the principal role of addressing the gap. The officials need to take the initiative as this categorization can benefit policymakers to shape policy in such a way that it helps in mitigating the damages that will be caused because of the catastrophe. The Act indicates that disasters are a sudden incidence, but the matter of fact is that they can be progressive in nature as well. For instance, epidemics like dengue and tuberculosis and the recent pandemic of Covid-19 are disasters despite conventional definitions as thousands of lives are lost to it, but we are still not able to develop an effective mechanism for the same. Disaster management guidelines are under review after the recent pandemic; hopefully it improvises the changes to overcome the drawbacks of the present arrangement and not oversee the

much-valued role that civil society, private enterprises, and NGOs can play together in making a better and safer India.

Literature Review

De Silva et al. (2021) discusses the community-based knowledge which has protected communities over the period of time on the basis of the generations-based knowledge and experience suitable for their community, by the observations based on the hazard's occurrence and the local resources available to them. Does the chapter talk about how community-based knowledge addresses international policies on DRR? And what is the contribution of community-based knowledge to current DRR practices? The chapter also discusses how community-based knowledge and DRR are important contributing factors for sustainable development and in spite of that, there is a gap in integrating these procedures into practice. The chapter highlights that supplementary research is required to expand and develop the system for the incorporation of community-based knowledge and DRR for sustainable development.

Nowell et al. (2018) discussed the suitable mechanism for governance structure in disaster response and at the same time how to structure disaster risk reduction so that it resolves the need for quick response at ground zero with coordination among the various stakeholders. A centralized coordination is required suitable for quickly changing conditions. The authors identified four key factors for effective governance response to disaster reduction and preparedness: (a) quick response to shifting circumstances, (b) managing dispersed data, (c) two-way synchronization, and (d) developing cooperative plans. Lastly, the authors propose that the structure should be neither extremely cohesive nor strictly central. Relatively, it is best categorized as a balance between the center and state just as the federal structure of the country.

Mayer (2019) discusses the importance of disaster resilience as a guiding archetype for the advancement of disaster risk reduction and sanctioning disaster recovery through investment in local communities, developing local capacities to the changing environment and developing it sustainably by paying attention to generation-old knowledge in effect and eminence to national and international programs. Nevertheless, there are a lot of gaps between the theoretical and operational mechanism for enhancement of community capacity for resilience; the chapter elucidates how disaster researchers and experts are theorizing and perceiving the thought of community disaster resilience.

Smith et al. (2009), the authors, discuss about the mitigation of the probable disasters that challenge human civilization in the new epoch and suggest an evidence-based approach to disaster management which again highlights the community involvement. The authors have tried to identify the series of adversities and measures over the period of three decades and have theorized the outcome for highlighting the governance act in the same.

Significance of Governance in Disaster Management

The subsequent step after disaster management, to make it more effective, is good governance; its implementation at every stage can lead to desirable results for DM. Disaster governance is considered a synchronized system in which collaborative efforts of several organizations are brought under one umbrella to resolve the issue that outspread beyond the horizon of any single organization (Ansell & Gash, 2007). Emerson et al. (2012) define the concept of collaborative governance as “the processes and structures of public policy decision-making and management that engage people constructively across the boundaries of public agencies, levels of government, and/or the public, private and civic spheres in order to carry out a public purpose that would be challenging to be accomplished” as it should spread across the predisaster, transdisaster, and postdisaster periods that are intended to diminish the impact and fatalities related with the catastrophes arising from natural or man-made causes for the disasters. Governance plays a very important role in various disaster phases; disaster susceptibilities can be reduced through predisaster arrangements, e.g., risks and susceptibility valuations; infrastructure guidelines; construction code development, implementation, and execution; cautioning arrangements; and academic and mock-drill plans. Post-disaster actions comprise of short- and long-term retrieval plans, and at the same time preparation and execution throughout catastrophe retrieval of involving designs to diminish forthcoming calamity fatalities and endorsing sustainability ideas. Governance measures and significant players’ contribution naturally vary throughout these disaster stages, adding to the difficulty of governance. Risk-recovering initiatives, such as insurance and reinsurance, are a few of the important components of disaster governance.

Disaster governance can be added advantage to comprehend institutional measures concentrating at the supervision of natural or man-made hazards or probable hazards, which pursue to decrease susceptibilities and contacts during predisaster times, and provisions related to mitigation and rehabilitation after the disaster has taken place and managing the consequences of disastrous events. According to Burton and others, safer constructions can be carried out by combining a variety of changes the first can be to avoid construction in disaster-prone areas and design the architecture in such a way that it becomes disaster safe. In order to reduce the impact of the calamity, preplanned construction and training of the community members for disaster response, and developing early warning systems for the protection of the population should be the priority (Burton et al., 1993).

International Strategies for Disaster Governance and Risk Reduction

The very first global breakthrough for making disaster management part of development procedure and policymaking appeared in the form of the International Decade for Natural Disaster Reduction (IDNDR); a decade in the 1990s was designated for the same. IDNDR aims at the capacity development of every nation

in order to mitigate the effects of disaster in an effective and efficient manner; for this, they aim to have adoptive technical and scientific progress along with suitable guidelines for existing plans and technologies in order to bridge the gap between knowledge and its implementation for decreased loss of life and assets (UN, 1987).

However, in spite of the passion and understanding of the importance of the IDNDR, most of the nation faced economic and logistic challenges to implementing the plan in the ground reality; therefore, the IDNDR was not of great success, but still it managed to make people understand that the disasters are not just acts of God but they can be managed in more efficient and effective manner with development of science and technology and national and international cooperation and efforts. IDNDR played an important role in letting countries erecting daunting systems for disaster management. For instance, in India, by the end of IDNDR, a High-Powered Committee (HPC) was set up in (1999) to review the issues related to disaster. In fact, the present Disaster Management Act 2005 of the country owes its origin to the HPC report. The Yokohama Strategy and Plan of Action for a Safer World was the forerunner in this area which was adopted in the year 1994 succeeding the UN World Conference on Natural Disaster Reduction (NDR), held in Yokohama, Japan. It is the preliminary document deliberating the policies at the transcontinental level for research, training, and preparation for disaster prevention, and mitigation of disaster impact.

Yokohama Strategy offers a set of ideologies based on which disaster risk reduction strategies should be planned, rendering to the international world of the mid-1990s. It advocates the development of a global culture for the involvement of local actors in risk management practice and developing a community-embracing capacity building, and self-sufficiency by allocating adequate resources, valuing community experience for disaster risk reduction, and ensuring that the plans are in safe hands. It especially emphasized improving survival techniques so that the community has a mechanism that not only helps them to cope with the disaster but also helps in recovering from disaster impacts. It has also highlighted the importance of identifying and connecting the centers for the research in a particular area in order to enhance the prevention, reduction, and mitigation activities in a more scientific manner; media has to play a more constructive role by updating vulnerable communities for disaster reduction. The strategy emphasized that in the second half of the decade community-based approach needs to be adopted so that the vulnerable or marginalized sections can be benefitted from improved risk monitoring and better communication of forecasts and warnings. It has also highlighted how it can be achieved by encouraging the mobilization of community resources, political commitment by legislation and policy-making on and for risk reduction and prevention programs, deliberation and authority to the local-level government officials for safety measurements, strengthening institutional capacity, considering support of the NGOs for people's involvement developing disaster resistance infrastructure, and last but not the least international communities should provide assistance for developing nations to establish measure and techniques for disaster prevention and reduction within the prevailing resources and in alignment to the subregional, regional, and national policies. The knowledge and experience of the local people

were taken into consideration to allow an easy and fast recovery process. The succeeding decade of the 2000s completely changed the outlook of the way disaster risk reduction was specified, by increasing its competence in hazard preparedness and inhibition by better governance rather than emphasizing coping and relief interventions; likewise, improved governance methods also included people's involvement which was given major consideration (Baudoin & Wolde-Georgis, 2015).

Apart from, this Yokohama Strategy has also emphasized activities at regional, subregional, and international levels, particularly through bilateral and multilateral cooperations for the development of training programs and exchange of technical knowledge and understanding for human resource development, mutual assistance, and joint agreement programs. It has also suggested the extrabudgetary resources be provided for the implementation of the strategy; they have encouraged voluntary contributions from national and international organizations and private organizations, and government should be encouraged to prioritize the importance of disaster management. Last but not least, a review conference on natural disaster reduction should be held at the end of the decade to map out the activities that need to be undertaken in the twenty-first century for the disaster reduction programme. Establishing and developing the early warning system as a priority for the subregional, regional, and national levels will enable more effective warning dissemination. Dissemination of information, transparency, and taking feedback for the assessment of the work at the various levels are a few of the indicators which reflect a good governance approach in the Yokoyama strategy.

Later, the world Conference for Disaster Risk Reduction was held in Kobe, Hyogo, Japan, in January 2005; it was unconsciously held in the aftermath of the Indian Ocean tsunami in 2004, which created mayhem to the lives and livelihood of millions of people; at the same time, it has created consciousness regarding natural disasters, their hazards, and their grave impact not only on humans but also on the environment. The result of the Hyogo Framework for Action 2005–2015 (HFA) is perhaps the utmost important international declaration promulgating the concept of disaster risk reduction. The first decade of the twentieth century was shifting its concentration from disaster to increased focus on risk preparedness in which governance had a major role to play. The Hyogo framework for action was adopted as part of the International Strategy for Disaster Reduction; it was the first plan of its type which has not only talked about disaster reduction but has also deliberated exhaustive progressions needed for the reduction in disaster risks in various sectors and of different scales across the globe.

The Hyogo frame for Action (HFA) has a robust prominence on disaster preparedness and prevention, rather than on response and recovery which was emphasized during the earlier decades of disaster planning. HFA signifies five priorities for action and suggests the importance of community involvement. These are:

- a) Risk reduction should be a national and local priority along with the support of the institutional framework: For this purpose, it proposed the conception and establishment of nationwide unified disaster risk reduction mechanisms, so that

responsibilities can be designated from the national levels to the local levels to enable smooth functioning and coordination across sectors. Categorizing the details and uniqueness of local risk patterns and predispositions, decentralization of authority, responsibilities, and resources should be done in such a manner that maximum risk reduction is possible.

- b) Recognition, assessment, and monitoring of calamity for enhancing early warning system: Government at all levels must develop, update, and disseminate information which must include risk maps, records on disaster occurrence, and statistical evidence related to impacts and losses; on a regular interval, this will empower policy-makers to evaluate the influence of calamities on social, economic, and environmental settings and plan accordingly. Developing early warning systems which contemplate the demographic setting, gender, cultural background, and livelihood structures of the target population along with the training on how to understand and act upon early warning will be superlative for effective operations by disaster managers and other decision-makers.
- c) Culture of safety and resilience needs to be built with integrated knowledge, innovation, and education: For this, easy and accessible information related to relevant traditional practices, Indigenous statistics, and cultural inheritance should be tailor-made for different target populations keeping into consideration their social and cultural factors which should be disseminated specifically to high-risk areas, so that they are encouraged and empowered to take actions which result in decreased destruction and also develop resilience. Enclosure of disaster risk reduction information in the academic program at all levels and use of supplementary methods for disseminating information and educating youth and children for disaster preparedness and resilience.
- d) Reduction of primary risk factors: This includes calamity hazards because of changing socioeconomic and environmental settings, the effect of threats related to ecological events, and climate change, which are discussed in the development of policies and strategies which should include post- and predisaster situations. Food security needs to be promoted particularly in drought-, flood-, and cyclone-prone areas as an important factor for ensuring the resilience of communities. Sustainable construction is needed of basic infrastructures like schools, health centers, hospitals, drinking water, communication, power supply, and transportation so that they are resilient to disasters.
- e) Reinforcing catastrophe readiness for operational response: The effects and loss of life and assets because of adversity can be abridged if authorities and individuals in the communities are up-to-date and equipped with early warnings and disaster management capacities (UNISDR, 2005).

“Hyogo framework has emphasized native knowledge and considered cultural tradition as one of the key indicators to develop information appropriate for ‘target’ audiences” (UNISDR, 2005, p. 9). It has also highlighted the importance of “inclusion of gender and marginalized section perspective” which was further reviewed in the midterm review report of HFA. HFA as one of the initiatives for promoting a higher participating method in DRR and increased collaboration among local

governments and communities would help support DRR planning at a larger scale (Mercer et al., 2008).

The third world conference on Disaster Risk Reduction was the Sendai Framework which emerged out of inferences from the prior two conferences. In contrast to the previous frameworks, it was presented with 15 years of the time line for DRR across the globe. Sendai has specifically conferred the accountability of DRR on the national government with active and enthusiastic participation from regional and local government and has emphasized the significant role of communities. The Sendai Framework is the foundational document in the present setup providing the inclusive and integrated framework for DRR with the fine strategy for carrying necessary changes in the setting of disaster management practices across the world. Sendai Framework prioritizes the implementation of the DRR Program.

Understanding disaster risk: It must be ensured that technical information in disaster risk calculation, development, and application of plans and strategies should have a cross-sectoral approach which must be custom-made to suit the local area and should have an integrated approach of local tradition, Indigenous knowledge, and practices (UNISDR: Activity I, p. 11).

Strengthening disaster risk governance to manage disaster risk: community representatives with training in disaster risk management and familiarity with the relevant legal frameworks should be given the proper duties and responsibilities. Likewise, community participation should be taken into consideration for the development of such laws so that their support can be easily established during its implementation (UNISDR: Activity f, p. 13). Providing appropriate financial and governing support to local authorities to enable them to take the initiative to collaborate and coordinate with civil societies, communities for native peoples, and communities for migrants in disaster risk reduction at the local level (UNISDR: Activity H, p. 14).

Investing in disaster risk reduction for resilience: To enhance the economic, social, cultural, and health resilience of citizens, communities, and the environment as well as their assets, public-private partnership for investment in disaster risk prevention and reduction through structural and nonstructural measures are critical (UNISDR: Activity J, p. 17).

“Build Back Better” must be the motto of recovery, rehabilitation, and reconstruction: The sturdy rise in disaster risk and the teachings from the previous hazards specify the necessity to additionally support calamity readiness for response, taking actions in advance for catastrophes, along with disaster risk reduction and preparedness by guaranteeing effective response and recovery forces at all levels and in suitable numbers. Gender equitability and universal accessibility for response, recovery, rehabilitation, and reconstruction are key approaches, and this can be done only by empowering women and persons with disabilities (UNISDR: Activity K, p. 18).

The Sendai Framework (SF) has set tangible and quantifiable targets on a uniform basis to be accepted by countries across the globe. It aims to fulfill certain targets by 2030: significantly reducing financial loss because of the calamity which affects the global gross domestic product, substantial reduction in mortality rate and number of

people affected by disaster by 2020–2030, and lowering the rates by an average of per 100,000 in comparison to the years 2005–2015. By 2030, there will be a considerable decrease in the destruction of essential health and educational infrastructure (UNISDR, 2015). Sendai framework has tried to bring all the countries under one umbrella so that considerable changes can be seen in the life of the people across the globe and no country is left behind when disaster management is talked about.

Case Study of Disaster Governance

In continuation to the above conferences for disaster risk reduction, let us study how far India has adopted them and tried to implement them as per the Disaster Management Act 2005. Orissa, situated on the coast of Bay of Bengal in the eastern-most part of India, is a natural disaster-prone state; because of its demographic setting, it has very often witnessed hurricanes, and torrential rainfall which causes floods, and hence it is nick-named as “disaster capital” of the country. Hitherto, its two coastal villages Venkatrapur in Ganjam district and Noliasahi in Jagatsingpur district have been acknowledged as “Tsunami Ready” in August 2020, by the UNESCO-Intergovernmental Oceanographic Commission. Subsequently, India has become the first nation in the Indian Ocean Region to achieve recognition for such a high level of preparedness and resilience at the local level for disaster risk reduction (The Hindu, 2020).

Odisha has recently been in news flash for setting an example of the way it has managed to cope with the natural disaster that has struck its coastline. Community-based disaster management is the very core of its disaster management and risk reduction approach, and they have highlighted this aspect as also one of the central themes in the State disaster management plan (OSDMA, 2017). This is because of the fact that any type of disaster community is the first to face the heat and to respond to the situation at the same point of time. Also, the government can easily employ the Indigenous knowledge of the local community for disaster risk reduction as highlighted in the Hyogo and Sendai Framework of Action as one of the aspects of good governance where people’s participation is given the highest importance for the citizen-oriented government.

People’s participation in the disaster management activity is not the only part of community awareness, but empowering them with efficient training from governmental and nongovernmental agencies and dynamic teamwork, which not only includes members from NDMA but also community workers and people’s participation, plays a very important role. Past experiences are given special references while framing policies and programs for disaster management; in the Super Cyclone witnessed by Odisha in the year 1999, more than 10,000 people lost their lives, and therefore as a lesson from this ill-fated experience the state has felt the need to build an adaptable cyclone shelter in the coastline of 480 km; the shelter had been equipped with all the basic services which are required during the emergencies such as community kitchens, life-saving equipment, and announcement vehicles;

subsequently, it helps the affected people to be at one safe place and along with their community members which is emphasized in the Sandia framework activity I (Manorama, 2019).

As per previous research and past records of the tsunami, authorities have recognized 328 villages where seawater has flowed up to 1.5 km inside the village; these records have helped them to develop preparedness plans accordingly. The villages Venkatraipur in Ganjam district and Noliasahi in Jagatsingpur district have been vowed “Tsunami Ready” under the Indian Ocean Tsunami Ready Programme of IOC-UNESCO based on people’s participation (The Indian Express, 2019).

In the recent disaster of Amphan in West Bengal, the state has proven its efficiency in implementing evacuation operations through the community outreach program. It was one of the strongest cyclones recorded in the Bay of Bengal in which around 200,000 people were evacuated immediately after warnings were dispensed by the Indian Meteorological Department and refurbishment works were also commenced on a priority basis so that by the time the hurricane approached the West Bengal coastline most of the electrical repair work had been done (India Today, 2020). Also, Odisha post-Amphan survey report by the steering committee states that community involvement is one of the best practices adopted by the Odisha government in disaster management.

Odisha government has already set a preceding example in super cyclone Fani in 2019, where they have targeted “zero causality” and carried out history’s biggest evacuation operation in which evacuees were accommodated in over 4000 shelters in which 800 are specially designed to survive cyclones (Business Standard News, 2019). Another such success story of Odisha is Cyclone Phailin which struck in 2013 when approximately one million people were evacuated. After the calamity Phailin, the UN acknowledged Odisha’s preparation for disaster as a “global success story” and announced that Odisha will be used as a model for other states (TOI, 2013). As the World Bank puts it, “Odisha has a good community outreach system through which people can be contacted on time. There is a network of 450 cyclone shelters and each shelter has a maintenance committee trained in rescue and relief activities. Through a network of these shelters and committees, the state has involved the entire community making it easy to disseminate warnings and evacuate people” (World Bank Report, 2019). Odisha has already set an example to the rest of the world for no loss of life and the least materialistic and social loss; community participation is most significant which has been set as a standard in international strategies.

The Current Mechanism for Disaster Management in India

In the last two decades, disaster management policy of India has shifted its focus from respite and restoration efforts to all-inclusive management of catastrophe. This new strategy combines predisaster issues of preparedness, prevention, and mitigation, as well as postdisaster issues of response, recovery, and reconstruction. New initiatives, such as making people aware of disaster risk reduction in the development process, making people’s participation relevant through education and

awareness programs at all levels, and employing innovative technologies for disaster forecast and severity, have improved India's alertness for each phase of disaster management. The above-discussed case studies clearly answer the research questions asked at the very being of the chapter. Involving various stakeholders and community participation with their age-old methods and experience assorted with the latest technology delivered results that are set up at various national and international standards for the benign survival of humans and nature. Correspondingly, governance plays a vital role to join forces at all levels of the government and various stakeholders for preparedness and resilient disaster risk reduction which was impossible to find in India before NDM Act 2005.

Though substantial accomplishments have been made in postdisaster response, recovery, and rebuilding, there are still arduous encounters in diminishing the danger because of forthcoming disasters and unsustainable development going around, especially in suburban areas. Unsafe building construction practices in hastily growing urban and suburban areas are India's greatest challenge for disaster management. A major earthquake in any of these India's compactly populated cities in seismic zones would be disastrous in terms of mortalities. Bhuj earthquake of 2001 is one such example. Climate change has extensive consequences for the management of disaster risk in India, as the occurrence and intensity of landslides, flash floods, cyclones, storms, droughts, and cyclones have increased; they are expected to rise further in coming decades.

In addition to this, one area of India's disaster management that is obviously lacking in knowledge is the management of man-made or non-natural disasters, which the current global situation necessitates. Integration and planning at the international level, mainly after 9/11 and 26/11, query unnatural disasters as a priority. The other unnatural disasters that have been discussed universally are the hazardous outcomes of the Nuclear-powered, and Biochemical (NBC) Combat. Henceforward, unnatural disasters become of grave importance for India to be addressed in the upcoming time. The requirement of the present time is to frame out a collective method for inclusive disaster management encircling prevention, preparedness, response, and recovery.

Suggestions

Some of the initiatives which should be part of the disaster management program for sustainable growth are the following: disaster management policy should include plans to shield the utmost susceptible segment of the community such as people below poverty line, females, kids, aged-people, and physically challenged people. The mechanism should be such that lessons learned must be transferred from preparedness and mitigation to management amid societies. In the circumstance when we all are well aware of the fact that catastrophes do not come within lines, these should be managed through enhanced regional cooperations for mutual benefit. Public investment must be encouraged for risk reduction. Determining local vulnerabilities, estimating the likelihood of damage as a result of the adversity, and

incorporating those vulnerabilities into preparations for unforeseen events, insurance, self-insurance, and taxation also expenditure plans should be flexible for speedy allocation of funds. Lastly, extremism is a serious challenge to Indian security which government needs to address to maintain governance and accountability.

Conclusion

Afore stated discussions lead us to conclude that the three international frameworks indicate toward major development for disaster risk reduction in which priority is given to partnerships and involvement of relevant local stakeholders, and communities are widely recognized as an important constituent for the successful development and DRR plans and approaches. The three frameworks treated local communities as esteemed partners with Indigenous expertise who can provide custom-made solutions for the disaster risk; the case study of Odisha can be the best example to prove the fact that how important it is for the community to participate along with other stakeholders. Alignment of national disaster management policy with the three international frameworks is important as these serve as guidelines to direct the flow of funding and the implementation of projects in a specific field, and it would help to develop international policies and agendas for disaster risk reduction.

The author has highlighted the fact that aspects of good governance can only be implemented if the various guidelines given by the international framework are taken into consideration, for example, scientific development, dissemination of disaster data, analysis report for disaster-related risk and damage, early warning signs, and many more. The social and economic loss and lives of people can only be saved when they are well informed about the upcoming unfortunate event. An increase in finance flows at the local scale and, overall, improvement in the bottom-up participatory process within international DRR frameworks are a few of the important aspects which need to be considered by all the nations. With the change in the climatic conditions, it becomes more pivotal that the disaster risk reduction policies are aligned with the sustainable development goals of the UN so that a safer place for the next generation can be passed on.

Abstract

Climate change is a defining threat and an intricate challenge to peace and security in the twenty-first century. The impacts of climate change differ for various regions, communities, classes, etc. The people who belong to the marginalized communities and vulnerable regions are the ones who are the worst affected. The chapter highlights the impacts of climate change disasters on one of the most vulnerable regions, South Asia. Given its geography, low-lying coastal areas in the region are at an immense risk of submergence. Cyclones, drought, and irregular weather patterns have been taking a toll in this region. The impact of climate change is more severe on women, because of poverty, their dependence on threatened natural resources, different roles, etc. Gender norms and limited adaptive capacities aggravate the experiences of such disasters on women sharply.

With 70% of the world's poor being women, the disproportionate impact of climate change exacerbates gender inequality.

The purpose of the chapter is to examine the complex interplay of gender and climate change disasters. The chapter attempts to analyze what are the reasons that make women's position susceptible to climate change disasters in general and in the South Asian region in particular, what makes South Asia one of the most vulnerable regions exposed to climate change disasters, and why there is a need for a gendered approach toward disaster management laws and conventions. The chapter aims to reiterate the need to invest in representative, participatory, proactive, and holistic approaches with a gender-sensitive outlook. In this regard, qualitative research methods with descriptive analysis have been used. The literature and narratives available related to various dimensions of gender inequality and climate change disasters have been reviewed to understand the differential impacts on climate change disasters on women. The need to have gendered disaster management has been highlighted. No comprehensive disaster management approach should neglect the gendered impact of such crises. The research tries to sum up with proactive strategy recommendations that the state should embark upon both as long-term and short-term goals.

Keywords

Climate change · Disaster · South Asia · Gender · Laws

Introduction

Climate change is a defining threat and an intricate challenge to peace and security in the twenty-first century. "Climate change is a 'crisis multiplier' that has intense implications for international peace and stability" (UNSC, 2021). The impacts of climate change are horrendous for us all. However, given the socioeconomic and geographic factors, these impacts are worse for certain regions and groups of people. In the given context, South Asia as a region is the most vulnerable to such climatic challenges and shocks. "About 14% of the region's urban population, totalling about 400 million, live in coastal and major river delta areas that are 10 metres or less above sea level" (Asian Development Bank, 2021a, b).

Given its geography, along with its socioeconomic and political conditions, the situation is worse for people in the South Asian region. Deep-rooted inequalities arising from caste, class, religion, and ethnicity persist in the region and are further complicated by severe gender-based discrimination.

Prevalent gender gaps, social norms, and patriarchal values hinder the mitigating and adaptive capacities of women while facing the impacts of climate change disasters. Notwithstanding the challenges, women have played an extremely crucial role in fighting climate change disasters. It is in the region's interest to tap on this resource in battling climate change. And against this backdrop, the chapter intends to explore and discuss the international conventions on disaster management, laws, and

mitigation policies of South Asian nations through the gender prism. The chapter is divided into three segments: the following section will discuss the vulnerability of the South Asian region to climate change disasters and its interplay with gender. The next section aims to theorize gender considering the climate change crisis. The international laws and policies to mitigate climate change disasters through a gender-sensitive approach will be discussed next and lastly concluding with some recommendations and way forward.

South Asia, Climate Change Disasters, and Gender: The Interplay

The South Asian region is a point of convergence owing to its “vulnerabilities to climate-sensitive diseases, dependence on climate-sensitive livelihoods, projected levels of crop decline in the region, and high rates of poverty and malnutrition” (Patel et al., 2019). “The region is living through a ‘new climate normal’ in which intensifying heat waves, cyclones, droughts, and floods are testing the limits of government businesses, and citizens to adapt and these challenges are only likely to get worse” (Schafer & Roome, 2021). As a region, it is home to some of the world’s countries that are most vulnerable to climate change. According to an estimate by the World Bank, climate change could push “62 million South Asians below the extreme poverty line by 2030” (World Bank, 2020). “More than half of all South Asians, or 750 million people in the 8 countries – Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, and Sri Lanka – were affected by one or more climate-related disasters in the last two decades” (World Bank, 2022).

The intensity of adverse impacts of climate change disasters are graver on certain sections of society who are already marginalized in terms of the resources they have, social oppression they face, and the minimal role they play, while participating in policy- and decision-making, i.e., their bleak political representation. Climate change is rightly understood as the crisis multiplier in reinforcing already existing socioeconomic and political cleavages. Such sections of society have their own delicate position in the process of disaster management.

“Among all forms of marginalization, gender inequalities between men and women, and boys and girls demand special attention” (Banu, 2016). Women are particularly at risk when it comes to climate change. This impacts women disproportionately during different extreme events. “In South Asia, women find themselves in subordinate positions to men, dependent socially, culturally and economically” (*ibid*). They are by and large kept out of the decision-making processes, their mobility is restricted, and more importantly they are under the threat of constant abuse from their own family members, especially males. “Son preference has economic, social and religious utility, while daughters are seen as an economic liability because of the dowry system” (Fikree & Pasha, 2004). The role that cultures, prevailing norms and values, and attitudes play in the abysmal condition of women across the South Asian region leads to shaping up attitudes in “intra-household health and education outcomes” toward women (Banu, 2016).

There are significant disparities across the South Asian region which makes it behind every other region across the globe, only slightly better than the Middle East and North Africa according to the Global Gender Gap Report 2021 released by the World Economic Forum (WEF, 2021). “The limited adaptive capacities arise from prevailing social inequalities and ascribed social and economic roles that manifest themselves in differences in property rights, access to information, lack of employment and unequal access to resources” (Parikh, 2006). “For instance, in the 1991 Bangladesh cyclone, among the victims who died were mostly women and the reasons which came out in further reports were their restrictive mobility, the majority among them lacked the ability to swim in flood emergencies” (Rahman, 2013). There are certain skills which are taught to men only advertently.

Women beneath subjugation of the patriarchal mindset of people and lack of say in family affairs tend to lose autonomy over decision-making even in matters of direct concern for them. And in the aftermath of such disasters, their say fades into what is important for the family. For instance, “after the 2004 Tsunami, women who had lost all of their children, or male children in some cases, were subject to severe trauma and harassment” (Bhadra, 2017). A lot of instances were reported where “women who had previously undergone tubectomies were surgically recanalized to re-enable conception and childbirth” (*ibid*). This discrimination and gender gap impedes the disaster management process at every stage. The needs of the women are often debased in comparison to their male counterparts during times of disaster. These disparities limit the access to resources and agency for women who suffer due to climatic disasters. The intensity of the impacts of climate change on women is noteworthy due to its wide array, the “domains of agriculture, livelihood, food security, both physical and mental health, water and sanitation in the South Asian region” (Patel et al., 2019).

Theorizing Gender and Climate Change Disasters

In the previous section, an attempt has been made to highlight the intricate relationship and implications of climate change disasters on women. Along with this, it tries to highlight the resilient role played by women during situations of climate change disasters. “Pre-disaster vulnerabilities among women play a major role in determining the impacts of disasters” (Bhadra, 2017). Preexisting, structural gender inequalities denote that women and girls are affected in a different manner in comparison to men and boys. These vulnerability and defenselessness of women increase, often due to their lower socioeconomic group and status and more so in the South Asian region given the huge gap in literacy, job opportunities, etc. Therefore, to this, their preparedness, evacuation, response, recovery, and death get impacted. The reason for this vulnerability and susceptibility can often be tracked down to the roles that females hold in society and existing gender and cultural norms where they are born and live their lives, the duties they carry out, the clothing they wear, the way they are expected to behave, and so on and so forth. There exists a compounded discrimination which finds its basis in the fact that women’s susceptible positions prior to the

disaster have indeed led to their exclusion from relief activities, leaving them poorer and more vulnerable, while pushing them to the dangers related to climate change and resource scarcity.

These impacts of disasters increase the magnitude of preexisting development issues and are not merely dependent on the “natural hazard” as part of environmental calamity per se. In fact, “gender inequalities are informal institutional responses to climate; women are underrepresented in governing agencies, and climate policy can negatively affect groups of women” (Pearse, 2017).

- *Lack of equality:* Unequal treatment of men and women with respect to the opportunities given to women in social, economic, and political spheres results in the differentiated impacts of climate change disasters on women. “A meta-analysis of reports on disasters in 141 countries found that higher death rates for women were directly linked to their level of economic and social rights as compared to men” (Neumayer & Plumper, 2007). In contrast to this, in the societies where both have equal rights, the differences in a number of deaths on the basis of sex are less. Also, according to the report of the Asian Development Bank on “Gender-Inclusive Legislative Framework and Laws to Strengthen Women’s Resilience to Climate Change and Disasters,” improving women’s economic standing both directly and indirectly reduced the human cost of disasters (ADB, 2021a, b).
- *Gender, the social construction:* “The social construction of women’s ‘vulnerability’ and ‘virtuousness’ reinforces static ideas about fixed gender roles, or worse, reinforces the perception that women are intrinsically defenceless and closer to nature” (Sondhi, 2020). For instance, women usually have the responsibility to take care of their family members before themselves, especially the children and senior citizens. These forced expected caregiving responsibilities to women often impede their own ability to evacuate during times of such disasters. The same notion is also reflected in the disaster law regimes which are made with a view to mitigate disaster and inculcate resilient attitudes in people experiencing such situations. The spectacle through which these laws and conventions have been formulated and implemented thus requires enquiry. And this begins with an inquiry into the existing variances due to the “biological differences” between men and women and the way in which it differs from the social ones. “Biological reproductive functions remain undeviating, e.g., childbirth. In contrast, socially reproductive functions can witness deviations” (ibid). Looking after children, taking care of the elder ones at home, washing utensils, cleaning, cooking, and other domestic chores can be taken care of by both men and women equally. “Do we have any substantial biological basis for the creation of this distinction in socially reproductive work” (Chaman, 2008)? This influences the relationship between men and women in society in general and more importantly has been deeply entrenched in society as an integral part of the culture of the society which further defines their roles accordingly and their consequent responsibilities and status in the society. These cultural patterns result in emplacing inequalities in control over means of production and further access to resources and adaptability,

succession to property, etc. This would further lead to determining other hierarchies in the social setup such as a role in decision-making, access to other education, economic roles, etc. “A synthesis of these differences and inequalities means that male and female counterparts of the same society face different kinds and levels of exposure and ensuing vulnerability to natural disasters and disaster impacts” (Sondhi, 2020). Against this backdrop, the subsequent paragraphs will discuss how these cultural patterns transform into cultural rigidities which further work as a crisis multiplier during times of climate change disasters. Women do not get any exemption from their routine responsibilities of taking care of their families. They are equally distressed but carry the baggage of the conventional roles assigned to them, and this option for leaving their homes to get relief is not available to many women.

- *Transforming cultural patterns into cultural rigidities:* The differential responsibilities between men and women generally lead to unequal consequences even when there are equal opportunities given to them. In rural areas or small towns, men generally migrate to the cities to find a livelihood for them, and women remain with their families and children to take care of them and also to work in the fields in order to add to their family income. The frequent changes in climate patterns result in subsequent droughts and floods, making the tasks difficult for them. Cultural patterns do limit female mobility and hinder the self-rescue abilities of women. For instance, women in South Asian societies often need the permission of male members of their families in order to leave their homes. Many restrictions are put on women on the level of interaction women can have with other male members of the family. Consequently, “they may be willing to seek shelter in shared communal facilities in case of immediate rescue also, only because they need separate, private spaces and damage to their clothing adds to hesitation in front of stranger males in a shared space” (*ibid*). A lot of instances have been reported where women end up facing sexual favors, the threat of violence, physical abuse, and rapes in the disaster refugee camps. To quote another instance, “in Bangladesh, male heads of household are typically responsible for evacuation decisions and the Purdah system restricts women’s independence movement” (Alam & Collins, 2010). Women are put to greater risks when male members are not there during disaster warnings leading to the delay in their evacuation. Similarly, in the 2005 Kashmir earthquake, “the highly patriarchal social structure and purdah made it extremely difficult for women to evacuate from mountain villages and to access aid materials, healthcare, and compensation for their losses” (Parker & Halvorson, 2007).
- *Accessibility to resources:* “Women’s limited access and control over resources and the gender division of labour in families create barriers to women’s coping with and recovering from disasters” (ADB, 2021a, b). Due to sociocultural inequalities, women very often end up having unequal or no rights over land and family property. Moreover, disasters due to climate change led to severe loss of income, and as a result many times, men are not able to fulfil the needs of their families. Given the amount climate change has severe impacts on the state of

agriculture. Severe conditions of droughts, flash floods, and disturbed patterns of rainfall all result in adverse conditions for agriculture. Men going out to earn livelihoods result in women staying back in rural areas, working on the farms leading to the feminization of agriculture. Women directly bear the stress of adverse conditions in the agriculture sector due to severe impacts of climate change. For instance, “in India, around 65% of female workers depend on agriculture, and they contribute to 55–66% of the total agricultural production” (Census, 2011). “Women are primarily responsible for collecting water to satisfy household and irrigation needs” (Chatterjee, 2021). Impacts of climate change have resulted in long dry periods which add the pressure on women specially to cover huge distances to collect water. They could have invested their time in generating incomes. Food shortage has also led to malnourishment among women and children which further adds to their vulnerability during times of price hikes, unavailability, and unaffordability of food. “A study conducted by the International Food Policy Research Institute (IFPRI) in 2015 found that women were more likely to notice impacts of climate change than men on reduced water availability (18% versus 9%), agricultural productivity (87% versus 72%), and livestock problems (17% versus 8%)” (Kristjanson et al., 2015). Indeed, climate change poses a threat to all livelihoods. However, people associated with the agricultural sector, especially women, are far more burdened by the vagaries of climate change disasters. Even after a disaster has taken place, it is a lot more difficult for women to prove the ownership of their land and property, which in turn amplifies the existing inequalities that they face in relation to men. For example, “following the 2015 earthquake in Nepal, women heads of households experienced direct discrimination when local government officials insisted that distribution would be through male heads of households only” (UN Women; UNFPA; UNDRR, 2021).

- *Violence against women:* Gender-based violence is another important form of gender discrimination that has an impact on women in disasters. Various pieces of evidence show that disasters are associated with high rates of violence against women. Domestic violence is highly prevalent in the South Asian communities. “It increased following sudden-onset disasters and during prolonged disasters such as droughts” (IFRC, 2015). Rapes and sexual assaults have become common in the refugee camps and shelter homes. “Impoverishment due to disaster increased the risk of gender-based violence, including through economic coping strategies such as child or early marriage, transactional sex, and trafficking” (*ibid*). Bizarrely, women face discrimination and violence even during disaster relief work as relief workers. For instance, “In 2015 Chennai floods the women volunteers have reported facing indecent behaviour” (Abraham, 2017). In various disaster management laws and mitigation strategies, women are considered as the beneficiary of the government programs. They receive the relief package and supply distributed at their homes, since they remain at home in accordance with their roles as caregivers. It is important to note that these relief packages are shared by the whole family and the specific needs of women are not often taken

into consideration in the disaster management laws. Due to lack of educational opportunities given to women, there exists unavailability of female doctors after these disasters. “Many women choose not to ‘shame themselves’ in front of a male doctor in general medical camps” (Sondhi, 2020).

Disaster Management Laws and Conventions: Need for a Gendered Approach

There is a second wave of every disaster, which is caused by inadequate response strategies that can be identified as “humanitarian aid induced social problems” (IASC, 2010). The mitigation process in case of disasters demands strong constitutional and legislative actions that are not gender blind in nature. Climatic disasters lead to severe shocks for women as compared to men due to the inherently embedded structural determinants outlined earlier which hinder their resilience and capacities. History of climatic calamities having long-term repercussions has outlined the urgency for a gender lens within the disaster management jurisprudence. The vulnerability parameter differs from country to country, yet women stand at the apex of such inequalities. Governments thus need to mainstream gender into laws and policy guidelines related to disaster risk reduction (DRR) aiming toward sustainable development of all at both national and international levels. UNISDR had set up guidelines in order to strengthen disaster resilience across states through a gender lens in 2006. The underlying objectives focused primarily on highlighting the essential gender concerns in DRR and, secondly, to promote and develop government capacities to integrate gender perspectives within policy-making and DRR legislations (UNISDR et al., 2009).

Decades of marginalization of gender obligations into policy processes globally have delayed the acknowledgment of gender mainstreaming in disaster management and reduction. After the Hyogo Framework for Action 2005–2015: Building the Resilience of Nations and Communities to Disasters (HFA), the gendered approach was implicitly applied into disaster resilience strategies. “Unfortunately, commitment to gender issues is rarely stated explicitly; rather, it can only be assumed to be an implicit part of larger commitments to the HFA” (*ibid*, pg 3). Despite advocacy of gender equality in development goals by the United Nations, government legislation and efforts have resulted in inadequate and fickle progress. “51 of 62 national reports to UNISDR acknowledged gender as important to DRR, but there was still very little concrete mainstreaming in policies and programmes” (UNIFEM, 2009). Laws play a foundational role, and hence the need for strong legislation is the essential constituent to empower women. The legislative framework all across the globe needs to protect women’s human rights in order to strengthen women’s resilience to climate and disaster risks. “Many laws and policies on climate change and disasters focus on women as a vulnerable group, there is an overarching need to address the underlying inequalities between men and women and the need for women’s empowerment” (ADB, 2021a, b).

Missing Link

Climate-related disasters have further exacerbated the existing gender gaps within the South Asian region. Absence of gender-sensitive legal institutional structures neglects the needs of women and the causes of vulnerabilities which further adds up to the existing structures of gender inequality. The need of the hour is to strengthen and promote national legislations which support gender inclusive DRR and disaster risk management (DRM) at the earliest. Law making, DRR, and DRM are the most integral dimensions under climatic disaster approaches that need to be developed through a gender-sensitive lens in the long run.

- Lawmakers have neglected the idea of gender-sensitive laws in the past. Gender-sensitive legislation aims in mainstreaming gender equality within laws (OSCE, 2017). Adopting the gender perspective is not the end but the means to reduce the ever-deepening gender inequality. The Economic and Social Council (ECOSOC) demanded mainstreaming of gender in all areas whereby “the declarative nature of constitutional provisions does not automatically translate in mechanisms to ensure equal opportunities for women to participate equally with men in all types of economic, political and social activities” (ECOSOC, 1997).
- United Nations Office for Disaster Risk Reduction defined the aims of disaster risk reduction (DRR), “towards preventing new and reducing existing disaster risk and managing residual risk, all of which contribute to strengthening the resilience and therefore to the achievement of sustainable development” (UNDRR, 2019). CEDAW committee’s GR37 acted as the anchor by demanding “gender related dimensions of DRR in the context of climate change” (CEDAW, 2018). It urged governments to take immediate actions to prevent and alleviate the risks and adverse effects of climatic disasters and others on the vulnerable sections especially women and girls. The limitation within the existing legislative framework had to address the wider socioeconomic structures that shaped the vulnerability parameter largely in South Asia (*ibid*). National laws have been unable to take into account the key elements that solidify the inclusion and resilience of women under the risk reduction strategies.
- Laws largely have identified women as a part of the vulnerable section but have missed out in addressing the special needs, vulnerabilities, or concerns of gender equality. Good laws and framework empower women both pre- and post-disasters under DRM. “The application of DRR policies and strategies to prevent new disaster risk, reduce existing disaster risk and manage residual risk, contributing to the strengthening of resilience and reduction of disaster losses” is defined as disaster risk management (UNDRR, 2019). In 2014 the multi-country report (IFRC; UNDP; Picard, 2014) identified the negligence of countries in incorporating gender-sensitive approaches within the formal structures of law related to disaster and climate strategies. Punjab state in India, Namibia, the Philippines, Vanuatu, and Nepal were the only examples of pledging to consult women within DRM laws (*ibid*).

Women are negligible within DRM governance or institutions that largely aids to gender exclusion within frameworks related to climate and other disaster stratagems. This failure to diagnose women's position within the civil society further explicates why gender dimensions are missing in DRM laws. There is an urgent need for "special measures in the legislation to correct a lack of formal representation and empowerment of women in governance and staffing" (Ha Noi, 2016).

- The under representation of women has been a long-standing barrier in voicing out their opinion and strengthening their capacities. Men as parliamentarians hold three quarters of position globally and four quarters in Asia, depicting women's unequal position in the political sphere till date (IPU and UN Women, 2021). The Ha Noi conference foregrounded that "women in Asia and the Pacific have the lowest decision making and political power in the world, thereby limiting their say and influence in DRR decision making processes" (Ha Noi, 2016).

Women as active decision-makers and participants at local, national, and global level will help in better climate change adaptation and mitigation policies. Intergovernmental Panel on Climate Change (IPCC) recommends "participation of women and other marginalised groups enhances the effectiveness and governance of land based climate change mitigation and adaptation" (IPCC, 2018). Gender-sensitive climate policies can be successful if women decision-makers are able to design frameworks and legislations keeping in mind their inherent structural barriers and gender gaps. Large-scale research has concluded that women's participation leads to "effectiveness of climate change adaptation measures" (UN Women, 2017) leading to more justifiable and sustainable endings.

- Climate change-related laws and strategies have been on the rise post-2009, but gender mainstreaming within them is either negligible or extremely slow. "The absence of gender inclusion in climate change and environment laws suggests a failure to undertake gender analysis during the lawmaking process when developing or amending climate change laws or environmental laws" (ADB, 2021a, b). National responses and legislation have lacked in formulating gender-sensitive climatic actions. Developed countries merely established laws as part of obligations rather than commitments under the Kyoto Protocol, whereby gender inclusion was alien to them (Resurrección et al., 2019). Despite mentioning gender, 32 countries in Asia and Pacific have not implemented any legislations in this regard, thus being unable to deal with the causes of women's vulnerability related to disasters and climate change (ADB, 2020). Gender dimensions and representations are trifling at both national and global levels.
- Absence of participatory rights in Asia and Africa largely has been assessed whereby "no lawsuits specifically detail the need for special protections for women; lesbian; gay; bisexual, transgender, queer and intersex (LGBTQI) people and gender minorities in consultations for climate related projects such as energy, transport or resettlement projects" (ADB, 2021a, b). Thus, both locally and globally participatory rights in climate litigation are important along with a gendered approach.

The above missing links within the legal regimes and policy approaches in South Asia clearly depict the deep-rooted negligence of gender norms. Very little concrete mainstreaming and inclusiveness have been acknowledged in government programs related to gender commitments that can be sustainable in the long run.

Way Forward: Conclusion

Many countries have provisions in their constitutions dedicatedly forbidding discrimination on the basis of gender, but these may not translate into actual apparatuses of gender equality. Therefore “mainstreaming gender into all forms of legislation plays a significant role in the process of promoting and attaining the ultimate objective of gender equality” (ECOSOC, 1997). The legal frameworks and institutions need to be gender sensitive and inclusive in nature to address gender inequality and women’s empowerment. As important as it is to unlay and understand how women have been a victim of sociopolitical and cultural obstinacies and circumstances further aggravated by the wrath of climate change disasters, it is equally important to realize their role in mitigating these disasters and building a sustainable and resilient framework to deal with the challenges posed by climate change disasters. Women participation as the major stakeholders while formulating the laws and policies for disaster management is the foremost step toward gender-sensitive risk management. Disasters of any kind, shape, and size will have exacerbated the existing gender gaps making women more susceptible. Therefore, international agendas over the years have been demanding to build back better for both men and women during such climatic disasters. The major objective of this chapter has been to highlight the need to mainstream gender into all kinds of climate and disaster reduction, management, and recovery mechanisms.

Recommendations

1. Climate change adaptations and disaster frameworks need to apply gender as a fundamental principle, especially in all kinds of socioeconomic development factors within an enabling environment.
2. Countries need to strengthen their policy guidelines and laws related to gender and DRR along with best practices involving gender-sensitive results.
3. Among the major challenges related to gender mainstreaming has been the marginalization of gender issues institutionally. Lack of proper knowledge and information, technical expertise, and absence of awareness and experiences in addressing gender concerns from the root have resulted in poor progress in South Asia. Greater efforts are needed at every level be it local, national, regional, or internationally to strengthen political accountability and financial assets.
4. Sex and age disaggregated data is a must to analyze, evaluate, and report on gender concerns within disaster-related statistics. Both quantitative and qualitative data gaps need to be addressed in terms of gendered impacts of climate change (UN Women, 2018).

5. All kinds of risk assessments, planning, recovery, and reconstruction responses need to take into account preexisting inequalities and gender differences in disaster impacts. Adaptive capacities of women may be hindered by the existing disadvantages and thus require special attention and support of the stakeholders and governance structures.
6. Women are important stakeholders in all kinds of DRR and DRM governance which will enable gender-sensitive policy development simultaneously. “Institutionalise the leadership of women and diverse groups in disaster preparedness response, recovery and reconstruction at all levels” (Ha Noi, 2016).
7. Lastly, a rights-based and participatory approach should be the overall guiding principle for ensuring a gender-sensitive environment.

Climate change adaptation and disaster reduction with gender is a crosscutting issue that needs multiple stakeholders and multilevel cooperation and collaboration to fulfil the goals of a sustainable future based on gender equality.

Limitations and Future Research

With increasing severity of the climate change disasters, the impacts on the low-lying region such as South Asia and that too on one of the most marginalized sections, the women, have been disruptive. One of the major limitations has been the limited availability of sex-disaggregated data or research of the impact of climate change disasters on women. Lack of gender preparedness and representation of the voices of women within policy outcomes is affected by the embryonic stage of any systematic research in the area. Women have also been reluctant in the remote rural areas. This added to the list of impediments while conducting research. The mitigation strategies by international organizations such as UN Women, intergovernmental disaster frameworks, national government agencies like the National Disaster Management Authority, and other stakeholders will provide a lesson during future research in sustainable and engendered policy measures.

Abstract

The Covid-19 pandemic is one of the most ubiquitous disasters in the history of mankind. The ferocity of the Covid-19 pandemic during 2020–2021 with the increased rate of 4.12 lakh cases to the deaths of 3,971 people a day jolted the whole nation (The Hindu: 2021). The situation worsened when the nation moved to national lockdown during the second wave of the Covid-19 pandemic in India. This national lockdown was imposed with the motive of security and safety of the citizens; however, it has raised other problems including Covid-19. The lockdown during Covid-19 has not only increased the economic burden on individuals but also impacted the lives of common people at large. However, within the Covid-19 pandemic population, it is women who worldwide suffer the most. Women are the most vulnerable section of society and hence profoundly preoccupied by the pandemic. During the lockdown, cases of domestic violence increased around the world, and therefore the United Nations declared it the “shadow pandemic” of the coronavirus-19 pandemic. According to the United Nations report, *One in three women worldwide experienced physical or sexual violence mostly by their intimate partners. And since the breakout of Covid-19,*

R. Sikandar (✉)
High Court of Judicature, Allahabad, India

the data and reports have shown that all types of violence against women and girls, particularly domestic violence, have intensified (UN: 2020). The present chapter will focus on domestic violence and its impact on women during Covid-19 pandemic. The sample size which was selected for the study was 15 in numbers; however, due to coronavirus pandemic, only five women responded which make possible a close involvement and a rigorous investigation by the researcher. The sample size was selected based on the random purposive sampling method. This chapter will be based on the primary data in the form of interviews and content analysis of the available secondary data. Access to counseling services online or offline was not available for survivors; no accommodation services were provided to the survivors; no financial assistance was provided to the survivors of domestic abuse during the pandemic; there was no sensitivity of police toward such victims; etc.

Covid-19 pandemic was a global crisis and a test of the vulnerable. Crime against women and children increased during the pandemic. This needs the attention of all executives, the legislature, and the judiciary to pay immediate consideration to domestic violence during the pandemic.

Keywords

Women · Domestic violence · Covid-19 pandemic · Lockdown · Access

Introduction

After the imposition of lockdown by the Government of India dated March 24th, 2020, the first national lockdown for 3 months was imposed. It was against the coronavirus or Covid-19 pandemic which breaks out in December 2019. The whole world comes under the incarceration of this deadly virus; however, this virus was non-inhabitant to the Indian peninsula; it was a foreign virus spreading through cough and cold while humans breathe. It is not only India that was on complete lockdown with the slogan of “Stay Home, Stay Safe,” but the whole global community issued instructions and directions to maintain distance and stay safe. This pandemic affected humanity across the world; it has not only created health hazards but also created a threat to family and social relationships, and it played a role of socially unequalized. The motto “Stay Home, Stay Safe” was for all but not equal for all. The impact of the pandemic on women was stressful and much worse than others. According to the World Health Organization, violence against women is highly prevalent, and intimate partner violence is the most common form of violence. Globally, one out of three women worldwide faced or experienced the sexual form of domestic violence by an intimate partner. Violence by the intimate partner is defined by the World Health Organization as a physical, sexual, or psychological coercive act by a current or former partner or spouse to women (WHO: 2013). Under such circumstances, the rate of domestic violence increased during pandemic. The

pandemic affected women disproportionately; it exacerbated risks, amplified inequality, and escalated the vulnerabilities preexisting in our society.

The definition of domestic violence according to *Section 3 of the Domestic Violence Act, 2005*, is as follows: *For the purposes of this Act, any act, omission or commission or conduct of the respondent shall constitute domestic violence in case it—*

- (a) *Harms or injures or endangers the health, safety, life, limb, or well-being, whether mental or physical, of the aggrieved person or tends to do so and includes causing physical abuse, sexual abuse, verbal and emotional abuse, and economic abuse; or*
- (b) *Harasses, harms, injures, or endangers the aggrieved person with a view to coerce her or any other person related to her to meet any unlawful demand for any dowry or other property or valuable security; or*
- (c) *Has the effect of threatening the aggrieved person or any person related to her by any conduct mentioned in clause (a) or clause (b); or*
- (d) *Otherwise injures or causes harm, whether physical or mental, to the aggrieved person.* (DVA: 2005)

It is essential to understand the concept on which the Protection of Women from Domestic Violence Act, 2005, was based and the insight of introducing this act. Because it is not only the physical violence that takes place between partners but also emotional, sexual, and economic abuse, this act covers all the violence as domestic violence if it took place between partners. This act recognizes and ensures the rights of women to live in a violence-free space in their homes by providing immediate and emergency relief to the victim.

Violence against women is not at all a new phenomenon in our society; before the pandemic, domestic violence against women was present in our society. It is during the pandemic the number of cases of domestic violence increased. In more than 99% of cases, the male partners are the perpetrators. The National Crime Records Bureau (NCRB) data reveals a pattern of increase in the rate of domestic violence in Indian states; these are Bihar, Haryana, and Punjab (Outlook: 2020). The National Commission for Women Chairperson Rekha Sharma said that “the main reason for the rise in domestic violence is that men are at home, and they are taking out their frustration on women and they refuse to participate in domestic work and women during the lockdown were confined into the walls of the house.” The National Commission for Women received more complaints during pandemics for domestic violence than ever; she further states that domestic violence cases have doubled than what it was before the lockdown (Outlook: 2020).

Women in obnoxious relationships face domestic violence in a much more brutal form when they stay at home during the lockdown. Women lost their jobs, and it became difficult for them to maintain their livelihood; stress of being at home with more house chores without help created psychological pressure on them. General Tedros, director of the World Health Organization, states that women in abusive relationships are more likely to be exposed to violence, as are their children, as

family members spend more time in close contact, and families cope with additional stress and potential economic or job losses (2020). According to the World Health Organization, 243 million women and girls between the ages of 15 and 49 years worldwide are subjected to sexual and physical violence (WHO: 2022).

The imposition of a worldwide lockdown to stop spreading the coronavirus has increased the risk of domestic violence, especially in the case of women and children; they faced a double pandemic as the home was more precarious than a secure place to be. In the words of Marianne Hester, domestic violence goes up when families spend more time together, such as Christmas and summer vacations (EPW: 2020). During the lockdown, no access to facilities like a police helpline available to register complaints has increased the rate of domestic violence, and women spent more time with the abusers. With almost 57% of women in India not having access to phones, their options for registering complaints under the lockdown are now limited (EPW: 2020). This phenomenon increased the dependency of women on other family members to report on their behalf. And the Press Trust of India reported that the National Commission of India had received complaints filed by a father of his daughter he alleged was being brutally beaten by her husband and being denied food (EPW: 2020). The quarantine measure heightened the risk of domestic violence in our society which further intensifies gender inequality, economic instability, use of alcohol, and confinement in homes; it further burdened the mental and physical health of women at large. Therefore, it is unquestionable to fight this phenomenon of domestic violence during pandemic; however, none of the states comes forward to show the exact rate of domestic violence during pandemic.

Background of the Problem

The literature combines to what is the situation of women during disasters, in case of missing disaster laws and tries to investigate the status of women and their access to the police stations and courts for filing any complaints regarding domestic violence and its aftermath. As most of the study only focuses on disaster and its mitigation and management, it seems that the absence of disaster laws to handle the situation of victims of domestic violence is worse; therefore, studying domestic violence and access to justice during disasters need to be procured.

Importance of Studying Disaster and Domestic Violence

In general, the study of domestic violence during disasters is very few; thus, it is a remote area of research. The number of victims are increasing during disasters however, its reporting and data availability is lacking. Therefore, this gives a raise and alarm to focus on the survivors of post-disaster abuse. As data reveals, number of representatives of sexual violence during disaster is much lower than the actual victims. There exists an association between disasters and violence against women, as explained earlier that women are confined to the boundaries of the house and

could not move during the pandemic and were easy prey for such acts. Under such conditions, the absence of disaster laws in India worsens the condition of dealing with domestic violence during disasters. The Disaster Management Act came into existence in 2005 including 11 chapters and 79 sections, and each section deals with the management of disaster, but none of them states how to deal with domestic violence or sexual offenses during the disaster. Therefore, it became essential for the legal fraternity to look into the matter; thus, keeping in mind the stipulation of the victims of sexual violence, appropriate laws, and the applicability of those laws at the place of occurrence is the most important fact for studying domestic violence and access to justice during the pandemic in India.

Methodology

Data is collected and analyzed from various courts of Delhi and Allahabad (Uttar Pradesh, India). Data assembling was made by the interviews of women who are coming to courts from different backgrounds and are victims of domestic violence. These women are chosen by purposive sampling method, and a total of 15 women were selected. However, to get a better and deeper understanding of each case, the sample size was limited to 5 only. Data collected are qualitative in nature and are in the form of a questionnaire and personal interviews. Data collected for the review of literature are quantitative in nature; therefore, the analysis will be the outcome of the collected data. According to Crouch and McKenzie, a small number of cases will facilitate the researcher's close association with the respondents and enhance the validity of fine-grained, in-depth inquiry in naturalistic settings (Crouch and McKenzie 2006).

Primary data here includes the interviews of the survivors of domestic violence during Covid-19 pandemic; these survivors are the ones who are now seeking legal aid for themselves and their children, following a short questionnaire including a few questions asked from the survivors. The secondary data includes the reports of the National Crime Report Bureau of 2020, data and reports of the National Commission for Women, Reports of the United Nations, etc.; therefore, this chapter also argues to bring certain amendments in the disaster laws identifying the key theme as disaster and domestic violence.

Analysis and Discussion

All the respondents are from different backgrounds, a few of them are working women, while others are home managers. During disasters when everybody was at home, these women coming from different backgrounds faced one factor in common, and that is domestic violence. Due to the lack of financial stability during the lockdown, many lost their jobs and were forced to be at home.

Domestic violence is always seen as a family affair and is very commonly accepted in our society. The loneliness of a victim can only be narrated by her, the

situations a woman victim goes through during the lockdown in India with no access to police stations or NGOs to access help. According to SWAYAM, a feminist organization, it is observed that, during the lockdown, there was no support of the kind that women would otherwise have got. "If you are being abused, where do you go? There is no family member and even if there is, how do you get to them if you don't have public transport? A lot of them were also not supportive, saying, stay where you are right now, you cannot come because of what is happening" (Frontline: 2022).

In another observation by Akshara, an organization based in Mumbai, being confined at home often led to increased work and sometimes domestic abuse. Men's demands did not reduce; in fact, they increased. Women had to do all the housework, and that increased the levels of resentment and anger on both sides (Frontline: 2022).

Another observation was made by an NGO based in Mumbai, Awaaz-e-Niswaan, that during the pandemic they were able to continue resolving cases of domestic violence from both their offices in Mumbra and Kurla in Mumbai. Despite the lockdown, their staff was able to come to the offices as they lived within walking distance (Frontline: 2022).

The above discussion suggests that domestic violence has increased during the lockdown and there were no recommendations provided to access police and other authorities for help. This also represents that most women were engaged in domestic chores during the lockdown and became a victim of domestic violence. Victims of such violence lived in fear psychosis of happening any unfortunate to them.

After the lockdown when police and courts become functional, many young women knocked on the doors of court against the violence that they faced inside the walls of their own homes by their own intimate partners and family. The following women told their stories of violence, also including a few questions in the form of a questionnaire during personal interaction.

Case I: During Covid-19 pandemic, her husband and family abused her for not doing house chores properly. There was physical violence in her marital life since marriage, but during the lockdown, this becomes a frequent practice; they have two children. The husband regularly beats her mercilessly in front of the children and the family which turned into physical, emotional, and psychological abuse for her. She felt alone and abandoned. But she did not inform anyone or seek any assistance for the harassment she faced because her actions were restricted due to the lockdown, without any knowledge of reaching police and legal counsels during the pandemic. However, after the lockdown when public service departments and courts get functional, she filed a complaint and sought legal assistance for justice.

Case II: During Covid-19 pandemic, her husband lost his job and started abusing her and their child. The husband abandoned her and their child because he could not bear the responsibility and started living with his parents. During the pandemic, she did not have any work to do nor any money to buy food; however, she along with the child somehow survived. She was all alone and devastated. The husband

has not returned home since 2020; she made complaints about him to the other family members, but no one responded. Now, after the lockdown, she sought legal assistance against her husband.

Case III: During Covid-19 pandemic, her husband lost his job, and she was the sole breadwinner in the family; she works from home during the pandemic. They do not have any children. Her husband was an alcoholic; during the lockdown, husband tied her hands and beat her regularly for not giving enough money. During the pandemic, her husband asked her to quit the job and migrate to their village in Haryana, which she denied; he then snatched money and cards, pushed her, and fled from home. He never came back home and have not contacted her since early 2021. Under such circumstances, as soon as the lockdown was over, she filed a case against him and his family and sought justice.

Case IV: The husband left his job immediately after marriage and asked her to take care of the family alone. She works as a teacher in a private school, and during Covid-19 pandemic, she works from home. She has one child. During the pandemic, she was at home with the family all the time doing house chores without any domestic help. Her husband never asked her if she needs any help; he abused her by discriminating and making fun of her accomplishments. He abused her family background and created pressure on her by saying that she is involved with other men and is disloyal to him; he harassed her physically, emotionally, financially, and psychologically, and she did not make any complaint against him during the lockdown, but now she is living separately and seeking legal assistance.

Case V: She works in a multinational company in Bangalore, and her husband is a government employee. During the lockdown, she was working from home and had a daughter. Her husband left her because he and his family do not want a daughter, and later he told her to quit her job and stay with him. He abused her verbally many times and around eight times physically. She complained about him many times to the family, but they asked her to manage the situation; hence, due to family pressure, she could not inform the authorities. He regularly pressured her to leave the daughter with her parents and threatened her to join him or he will divorce her. Later, her husband started living separately, and now she filed a case in the court and sought justice for herself and her daughter.

Commonalities

Among all the cases above, the commonality is that none of the survivors made complaints against their abusers during the lockdown. They were unaware of the state initiatives that took place after the orders passed by several High Courts in the country and the initiatives of the National Commission for Women, for the victims of domestic violence. The indicators of commonalities represent the physical and verbal abuse in each case. Four out of five survivors are working women and financially independent; however, during the lockdown, they faced abuse and harassment by their partners. None of the survivors states that they contacted any

police or legal assistance during the pandemic as they lack awareness about it. In each case, the situation is perceived as “domestic,” but there is a need to recognize the real problem in this word “domestic” and to help those who require urgent attention while reporting domestic violence. It is also to be noted that in India when survivors reached the authorities and complain about their partners or families at the police station, then their lives are in danger because they are bringing disgrace to the family and household.

In the interest of victims of domestic violence during Covid-19 pandemic, a public interest litigation (PIL) was filed by an NGO at the Hon'ble High Court of Judicature at Allahabad in *Ala Hazrat versus the State of UP through its Principal Secretary, Women and Child Development, Government of UP and Another*, seeking the direction of the High Court to appoint the nodal officer for the purpose of monitoring grievances of the victims of the domestic violence in Uttar Pradesh and also to provide necessary procedures in the same direction. In vide order dated 06/17/2020, the High Court of the Judicature at Allahabad directed the state to obtain the status and the steps followed by the Government of Uttar Pradesh in regard to grievances of the victims of domestic violence (PIL: 2020). In the same direction, *the Hon'ble High Court of Karnataka* asked the state about the issuance of the helplines during pandemic and actions taken by the state in matters of domestic violence. In place of another, A petition was filed in the wake of the increasing number of cases in Delhi by an NGO at the *Hon'ble High Court of Delhi* for the implementation of the *Protection of Women from Domestic Violence Act, 2005*, and the state of Delhi in its reply to the government explains about the protocol in Delhi that once the victim calls at the helpline, the receiver will forward the call to the counselor and will provide immediate help during the lockdown. The *Hon'ble High Court of Jammu and Kashmir* also took cognizance of the matters regarding domestic violence and issued directions to the state to create funds and informal spaces for the women at the grocery stores and pharmacies, where they could alarm the authorities without making aware the perpetrator (2021). After the direction issued by the Hon'ble High Court of Allahabad, a commendable step was made by the Uttar Pradesh Police by opening a hotline for women survivors of domestic violence under the tagline, “Suppress Corona Not Your Voice”; this step was taken to promote and provide an enhanced response to the matters of domestic violence during Covid-19 pandemic (2020).

Findings

After analyzing the data collected by conducting interviews and observing the responses, there are several findings that the researcher is able to find. These are as follows:

1. In this study, none of the survivors received any help during the pandemic. They felt alone and were confounded and stressed by the behavior of their partners and family during the pandemic.

2. Another finding of this research paper is that during Covid-19 pandemic many women did not have any financial assistance, nor did they have any shelter or accommodation provided by the Government of India for the abandoned.
3. There was no sensitivity of police toward the victims of domestic violence during Covid-19 pandemic.
4. Another finding of this research paper is that no team efforts were taken place by the Government to provide assistance to the survivors of Covid-19 pandemic.
5. During Covid-19 pandemic, no awareness about legal assistance was provided at the grass roots.

Recommendations and Conclusion

1. Therefore, for such survivors, there shall be counseling services to provide psychological, emotional, and legal assistance to them.
2. There shall be funding and accommodation assistance for the survivors of domestic violence; therefore, this recommendation argues that when the survivor makes a complaint against the abuser or partner, she should be supported and accommodated.
3. There is an urgent requirement for police to become more sensitive toward the survivors of domestic violence. The police shall educate the survivors on domestic violence and its remedial measures; this will help in discontinuing or intensifying domestic abuse in our society and also help in resolving the issue of bringing dishonor and disgrace to the family and allow police to engage with the community.
4. There is a pressing prerequisite for the inclusion of domestic violence and sexual violence during disasters in disaster laws in India. This act should include more sections of penalties against the criminals and sexual offenders of such offenses.
5. The court shall deal in these matters with extreme sensitivity. The judiciary shall always be respondent to the subjudicated.

The Covid-19 pandemic is not only a global crisis but also a test of the vulnerable in our society. During the lockdown, girls, women, and children were confined to the boundaries of the houses by the perpetrators. In India, women and girls have a high tolerance for domestic violence since it is derisory for them to complain about their husbands and family. Therefore, there is an urgent need to make more investments in the education and training of women against gender-based crimes such as domestic violence, sexual violence, etc. In every society, there is a long existence of domestic violence. The pandemic did not cause domestic violence; it only increased the number of cases and exposed it. In India, the Disaster Management Act 2005 does not contain any provision for the management of domestic violence or crimes against women during Covid-19 pandemic which needs urgent attention and action. Further research is recommended during the pandemic for domestic violence and the application of laws, their access, awareness, and availability of resources during a crisis. As a matter of human rights also, this needs the urgent attention of all

executives, the legislature, and the judiciary to pay immediate consideration to domestic violence during the pandemic.

Public Interest Litigation (PIL No. 635 of 2020). Ala Hazrat Helping Society versus. State of U.P Through its Principal Secretary, Women and Child Development, Government of UP and Another. At the High Court of Judicature at Allahabad (2020)

Questionnaire

1. a. What is your name?

Kalpana (name changed); age, 37 years, housewife; district, Allahabad; state, U.P.

- b. Are you a victim of DV during Covid-19? Yes (husband and in laws).

- c. Do you have children? Yes/no

Yes, two children (boys).

- d. Did you seek any help or make a complaint against your partner?

No help during Covid-19; after Covid-19 pandemic, she filed suit against him in family court under DV Act 2005 and maintenance, and right now she is not living with husband and his family.

- e. Did you know about the DV Act?

No, only through counsel.

2. a. What is your name?

Humaira (name changed); age, 32 years, housewife; dist, Allahabad; state, U.P.

- b. Are you a victim of DV during Covid-19?

Yes, victim of DV during pandemic. Her husband beats her brutally; his business was lost during pandemic, and he had no job and no money for wife and children. He left the house and did not return home. He is living with his relatives, ignoring his wife and child.

- c. Did you seek any help or make a complaint against your partner?

Yes, filed suit against him for maintenance and domestic violence after lockdown. During lockdown, she lived alone with her baby.

- d. Do you have children? Yes/no

Yes, one child (girl).

- e. Did you know about the DV Act?

No, only through counsel.

3. a. What is your name?

Lekha (name changed); age, 36 years; works at MNC; New Delhi; state, Delhi

- b. Are you a victim of DV during Covid-19?

Yes, victim of DV during pandemic by husband. Her husband lost his job, and while she works from home, he creates problems due to frustration, never cooperates, and asked her many times to quit her job too. He tied her hands and feet sometimes, beat her, and snatched money and cards from her. Once, it was so brutal that husband pushed her, the victim fainted and her husband thought she died. He left her there and ran away.

- c. Did you seek any help or make a complaint against your partner?
 Yes, filed complaint against him in the family court at Delhi.
- d. Do you have children?
 No.
- e. Did you know about the DV Act?
 Yes, but was not sure about it. Only through counsel.
4. a. What is your name?
Rajni; age, 25; works at MNC; dist, Allahabad; state, U.P.
- b. Are you a victim of DV during Covid-19?
- c. Did you seek any help or make a complaint against your partner?
 Yes, victim of DV during pandemic. Her husband left his job after marriage and asked her to take care of him and his family; later, during the pandemic, she worked from home and took care of the family too; however, he physically and economically abused her.
- c. Did you seek any help or make a complaint against your partner?
 Yes, after 2 years of marriage, I filed a complaint against my husband and filed suit in the court of law.
- d. Do you have children?
 Yes, one child (son).
- e. Did you know about the DV Act?
 Yes but very little knowledge about the act. Only through counsel.
5. a. What is your name?
Vandana; age, 32; dist, New Delhi; state, Delhi
- b. Are you a victim of DV during Covid-19?
 Yes, victim of DV during pandemic. Yes, one child (daughter). She works in MNC at Bangalore, and her husband works as assistant professor in a government university. For last 2+ years, he did not return to his wife and child. He maintains no contacts. Victim's husband and his family do not want daughter for which they abused her regularly.
- c. Did you seek any help or make a complaint against your partner?
 Yes, legal consultations and file suit against him.
- d. Do you have children?
 Yes, one child (daughter).
- e. Did you know about the DV Act?
 Yes, I was aware of domestic violence act but was not sure about it, but now I filed complaint against husband and his family in Delhi.

Abstract

The primary objective of this chapter is to present Bangladesh's antibiological disaster response to COVID-19. Since March 2020, COVID-19 has disrupted the lives of Bangladeshis and the Bangladesh economy. At the onset, to mitigate this biological disaster, the government of Bangladesh (GoB) evacuated its citizens from COVID-19-affected countries and imposed travel and entry restrictions and home quarantine on the returnees from abroad. On-arrival visas and all international flights were suspended, social-distancing measures taken, educational institutions closed, the movements of mass vehicles restricted, and lockdowns in the country imposed, all as preparedness measures. Within the fastest possible timeframe, the GoB set up COVID-19 testing facilities, supplied personnel protective equipment (PPE) such as masks to the people administering COVID-19 patient treatments, raised nationwide awareness of COVID-19 symptoms, and administered vaccinations. To recover from the damage caused to national economy and livelihoods, the GoB provided USD 15.4 billion in stimulus packages to fund various sectors of economy and to distribute cash and food to targeted communities in the country. This management approach was found effective in limiting Bangladeshis' vulnerability to COVID-19. Further, the GoB should

Bangladesh Open University, Dhaka, Gazipur, Bangladesh

maintain a comprehensive governance program for capacity building and strengthening health institutions, to augment service delivery, research, and development in line with global development perspectives on biological disasters.

Keywords

Pandemic · COVID-19 · Biological disaster · Infection · Bangladesh

Introduction

Few natural tragedies in world history have sparked as much global concern as COVID-19 has. The world had experienced pandemics earlier, but none had garnered an international response equal to that of the World Health Organization (WHO) in its mobilization against COVID-19. China, on 31 December 2019, reported to the WHO a disease of pneumonia with unknown causes that derived from an outbreak of a cluster of people in Wuhan, Hubei Province. On 12 January 2020, the WHO confirmed that a novel coronavirus was the cause of this respiratory illness. By March 2020, COVID-19 had been transmitted widely and infected most of the nations of the world, with a remarkable death toll. On 8 March 2020, this novel coronavirus was confirmed to have spread to Bangladesh. Because of the economic setback from COVID-19, the poverty rate in Bangladesh will likely increase from 20.5% to 40.9% if COVID-19 leads to a 25% decrease in family income. Consequently, the successes in alleviating poverty over the past two decades may be lost (Ahmed, 2020a).

Bangladesh is recognized as a disaster-prone country with a high population density. Natural disasters are being intensified in Bangladesh because of global climate change, which is also affecting economic growth and upsetting macroeconomic balances. Thanks to managing natural disasters by prioritizing risk reduction and adaptation, the country has an increasing growing and stable economy with basic opportunities for life and livelihood. However, Bangladesh has lately been facing the governance challenges of combating an unprecedented disaster such as the COVID-19 global pandemic, which according to all indicators poses a serious threat to public health and the economy of the country.

This chapter covers the overall situation of the COVID-19 global pandemic, which appears as a biological disaster with associated health risks to the citizens of Bangladesh. It has had impacts on the lives and livelihoods of people and the socioeconomic conditions of the country and has presented major challenges to public management approaches, such as mitigation, preparedness, response, and recovery, to limiting the adverse effects of COVID-19 in Bangladesh. It also provides concluding remarks on sustainable programs for responding to COVID-19. On the basis of published literature, public policy, and strategy actions, a comprehensive study has been carried out to assess Bangladesh's governance on COVID-19. The personal observations of researchers on the COVID-19 situation have also helped to inform this chapter.

COVID-19 in Bangladesh

The Institute of Epidemiology, Disease Control, and Research (IEDCR) of Bangladesh announced in a press conference on 8 March 2020 that two men and one woman aged between 20 and 35 years were found positive for COVID-19. The two men were Italian returnees, and the woman was a family member of one of the other returnees. Bangladesh reported its first death from COVID-19, a patient over 70 years old, on 18 March 2020. By the end of that month, the death toll had reached five, with fifty-one total infections. Since then, infection from COVID-19 had been increasing in Bangladesh day-on-day with an increasing number of deaths. Initially, the risk was exacerbated by the number of Bangladeshi migrant workers, students, visitors, etc. returning from COVID-19-affected countries, and the disease ultimately spread to the community at large. On 24 July 2021, Bangladesh recorded its highest number of COVID-19 infections—16,230—and 32.55% of tested cases were positive, while the highest death toll recorded was 264, on 10 August 2021. According to the government of Bangladesh (GoB) bulletin issued on 24 March 2022, the COVID-19 infections and the deaths caused by it in the country stood at 1,951,072 and 29,118, respectively. Initially, COVID-19 infection was mostly limited to those within the cities of Bangladesh. Subsequently, infection transmitted all over the country, particularly in May–June 2021, when the Delta variant migrated to Bangladesh. By January 2022, the Omicron variant had also visited Bangladesh with high rates of infections. Although enforcing social distancing and social isolation in a densely populated country such as Bangladesh is very difficult, the GoB took prompt measures to control the speed of spread of the novel coronavirus by imposing restrictions on movement and shutting down all nonessential businesses at the very first detection of a COVID-19 case, on March 2020. However, this put millions of people out of work.

Bangladesh is hosting more than a million Myanmar Rohingya refugees. They are residing in a cramped camp: more than 46,000 people per km², one of the densest habitation areas on earth. In the Rohingya camp, the first COVID-19 patient was detected on 14 May 2020 (Noyon, 2020). The GoB took all possible preventive measures in the refugee camp, but COVID-19 regulations, particularly social distancing, were not possible to maintain in the Rohingya camps, because they have to share a kitchen, bathrooms, and corridors. Like other parts of the country, the Rohingya camps were also under lockdown and directed prohibitions, but the arrival of the Myanmar Rohingya refugees could not be stopped. As of this writing, they are still arriving in Bangladesh.

Impact of COVID-19 in Bangladesh

The COVID-19 outbreak and its spread affected almost all the crucial sectors in Bangladesh, including public health, education, the economy, and social values. It put the health system of the country in disarray, increased coronavirus infection and mortality, and exacerbated poverty, unemployment, and food insecurity problems

owing to the reduced economic activity. It has also triggered mass panic among citizens and broken many interpersonal relationships. At an early stage of global pandemic, no COVID-19 outbreak had yet been identified in Bangladeshi hospital patients, but on-duty medical staff fled from a hospital after admitting an immigrant patient with flu-like symptoms. Out of fear of COVID-19 infection, family doctors avoided responding to their patients, and clinics and hospitals in residential and remote areas were shut down. In most cases, COVID-19 patients were avoided by their family and friends. Panic buying, terror, social stigma, and mistrust were highly visible during the lockdown period. Before the advent of COVID-19, the poverty rate in Bangladesh was 20.5%, which has risen to 42.0% during the COVID-19 period; income has decreased by 56.0%; families who were at a marginal level of poverty were maintaining their lives with their savings and their decreasing food expenditures; many children of poor families have already been engaged in child labor; the dropout rate of students rose by 8.0%; and during the COVID-19 period, there were 13,886 child marriage in twenty-one districts of Bangladesh—among them, 50.6% were between ages 16 and 17, 47.7% were between ages 13 and 15, and 1.7% were between ages 10 and 12 (Kalerkantho Report, 2021). Because of the economic setback, the poverty rate in Bangladesh is likely to increase from 20.5% to 40.9% if COVID-19 leads to a 25% decrease in family income. Consequently, the successes over the past two decades in alleviating poverty might fizzle out (Ahmed, 2020a).

Bangladesh is a densely populated country of about 170 million people. On average, the country spends less than 5% of its gross domestic product (GDP) on the health sector. Bangladesh has basic healthcare opportunities, and its immunization program is a success story. During the initial stage of the outbreak of COVID-19, the health sector of the country was adversely affected because of a lack of proper information and professional knowledge on global pandemics from coronaviruses. The unavailability of proper personnel protective equipment (PPE), such as medical masks and gloves, required for healthcare providers intensified the situation. Bangladesh had a 4% mortality rate for doctors, whereas the global statistic was 2.5%. Improper and low-quality PPE was the primary cause for such a high mortality rate of doctors in Bangladesh.

Bangladesh's education sector has endured a long-term disaster. On 17 March 2020, the GoB declared closed all the educational institutions in the country, both formal and informal, without any exception, as part of preventive measures to restrict the spread of COVID-19. Since then, students of all levels were compelled to stay at home to maintain social distancing, to keep them safe from COVID-19. The closure of educational institutions was determined as an effective strategy for stymieing the critical transmission chain during the pandemic (Luca et al., 2018). But it had negative effects as well, especially on underprivileged/disadvantaged students' academic studies, who had to discontinue their learning and whose assessments were disrupted (UNESCO, 2020a). In addition, over 60% of the students in the world were adversely affected by closures (UNESCO, 2020b). The closure of educational institutions forced internal and public assessments and related examinations to be rescheduled, postponed, or canceled, which has negatively affected

students' mental states and academic growth (Chandasiri, 2020). These students were restricted to long-term quarantine at home, which caused disturbances and deteriorations in study habits and performance, which eventually resulted in growing stress and dysfunctional learning behavior (Meo et al., 2020). One study revealed that at the undergraduate level, 57.5% of students were mentally stressed, 30.2% had anxiety, and 58.8% had depression. Bangladesh has over 5000 tertiary educational institutions, with a total of four million students (Ahmed, 2020b). Tertiary-level students have been heavily affected by the COVID-19 situation because they followed social-distancing requirements: no meetings with friends or relatives (Cao et al., 2020). They suffered from the financially difficult consequence of losing their part-time jobs; became emotionally sick from increasing frustration, anxiety, and boredom (Brooks et al., 2020); and waded through an academically uncertain situation as they grew worried over their future education and careers (Cao et al., 2020). UNISEF mentioned in its report that more than 40 million students in Bangladesh, from primary to higher education, were adversely affected by the ongoing COVID-19 situation, increasing the risk of child labor, child marriage, and violence among children and decreasing their likelihood of returning to school (Kalerkantho Report, 2021). The children of Bangladesh became detached from their academic activities as they had to stay at home because of lockdowns. They had fewer opportunities to interact with their peers and engage in physical activities with those peers (Jiao et al., 2020), which led to health hazards such as anxiety, sleeping disorders, stress, and depression (Ramchandani, 2020; Rawstrone, 2020, p. 104). One study revealed that 30.5% of Bangladeshi children experienced mild mental disturbances, 19.3% experienced moderate mental disturbances, and 7.2% experienced severe mental disturbances because of COVID-19 (Yeasmin et al., 2020). In fact, Bangladeshi children endured trauma, for which they need proper behavior and mental treatment as well as suitable opportunities for physical and academic activities in order for them to become thriving citizens.

Bangladesh has been enjoying a stable economy over recent years, with impressive GDP growth (GoB, 7th FYP, 2015). Over the Seventh Five Year Plan, FYP 2016–2020, the expected GDP growth was estimated at 7.40%, and in the first four years, the average GDP grew by 7.60%. In March 2020, COVID-19 infected Bangladesh, affecting human lives, human health, and economic growth, so GDP growth decreased to 7.13%. COVID-19 has swept the globe with impacts on output and trade because of the closure of international borders, the scarcity of raw material sources, and the cancellation of orders, which have put Bangladesh's economy at risk. Through trade and financial flows, Bangladesh's economy has heavily integrated into the global economy; thus, with the slowdown of the global economy due to COVID-19, Bangladesh will suffer worse effects on its exports, remittances, GDP growth, employment, etc. than those after the global financial crisis of 2008–09 (GoB, 8th FYP, 2020). The readymade garment (RMG) industry of Bangladesh is the sector where about four million low-income people work, 85% of whom are women, and a similar number of people indirectly depend on the RMG value chain (Dhaka Tribune, 2020a). RMG products alone cover 83% of the country's exports, but because of the global pandemic caused by COVID-19, work orders worth nearly

USD 3 billion have been canceled, which has affected about four million of the people directly involved in this industry (Paul, 2020). Many RMG workers lost their jobs and did not receive their previous month's earnings. A study by Boudreau and Naeem et al. found that Bangladesh's RMG sector reported order cancelations and renegotiations by buyers during the early stages of the global pandemic. Almost 17.4% of its revenue has declined from BGMEA-member factories in 2020 compared to 2019. Employment has declined by 7.4% in the second half of 2020 compared to pre-COVID-19 levels. Some factories have delayed or decreased their planned investments by increasing automation. On average, 3.6% of RMG factory workers experienced symptoms of or tested positive for COVID-19 between late 2020 and early 2021 (Boudreau & Naeem, 2021).

The COVID-19 intensified numerous socioeconomic crises, such as joblessness, the consumption of reserve funds/savings, and the shrinking of the country's remittance inflow. Remittance is one of the greatest resources of Bangladesh's economy. Thirteen million Bangladeshi migrant workers play significant roles in the country's economy through remitting about USD 15 billion each year. Because of COVID-19, Bangladeshi migrant workers and their 30 million dependents at home were adversely affected because most of the migrant Bangladeshi workers had to return from abroad, and thus, their source of income was reduced to a great extent. COVID-19 led to growing unemployment among Bangladeshi migrant workers; short work hours led to poor quality of life and limited their cash flow to their families. The pharmaceutical companies of the country, except a few at the top, also struggled to remain financially afloat because most drug exports and internal sales have reduced, aside from those of a few cold and fever drugs (Noyon, 2020). Because of the global restrictions and nationwide lockdowns, the airline industry has incurred considerable losses from cancelations for international and domestic flights. According to the International Air Transport Association (IATA), revenue loss in this sector may reach USD 252 million because of COVID-19 (Deb & Nafi, 2020). According to the Tour Operators Association of Bangladesh (TOAB), its members incurred losses of BDT 57 billion within the first six months of the global pandemic, while the Pacific Asia Travel Association (PATA) recorded losses of almost BDT 180 billion (Dhaka Tribune, 2020a). The Bangladesh Bank (2021) identified in its policy report several ramifications of COVID-19 on the economic sector:

- The waves of COVID-19 transmitted mostly to the real, fiscal, external, and financial sectors of the Bangladesh economy.
- The real sector includes the real economy, more specifically industry, the service sector, and the agriculture sector, which were disrupted during the second half of the 2020–21 fiscal year, so GDP declined by 2.91% from the preceding fiscal year.
- COVID-19 caused supply-chain disruptions. The manufacturing industry of the country sharply declined during the January–April 2020 period as the industry depends mostly on imported raw materials, particularly from China and India.
- Because of the COVID-19 situation, the government's revenue shrank by 1.74%, and the country's tax-to-GDP ratio declined to 7.9% in the 2020–21 fiscal year.

The agriculture sector of Bangladesh alone is the source of 40% of the country's employment, providing 14% of its GDP (GoB, 8th FYP, 2020). This sector was adversely affected, but the agriculture-dependent households remained unchanged at 10% between March and July 2020 (*Daily Prothom Alo*, 2020). During lockdown, the quarantine and regulations imposed to mitigate the spread of COVID-19 heavily affected the agricultural sector of Bangladesh because access to agricultural products, materials, markets, and advisory services was restricted; the prices of basic commodities increased at a noticeable rate because of hampered production and disruptions to supply chains; agricultural products were sold at high prices in urban areas, while marginalized farmers were deprived of earning fair prices in areas where their products grow; the transportation of animal feed was hampered, and the value chain of perishable items was disrupted, which in many cases led producers to shut down production; agricultural processing, trade, and impaired production activities were slowed down, which reduced consumer demand, particularly for hotel, restaurant, and coffee shop operations (Assaubayeva & Bi Yi, 2020). The country's crab, shrimp, and fish farmers also faced export restrictions, which caused major economic losses. Crabs farmed for the Chinese market comprise more than 70% of Bangladesh's exports, so the export ban in China was a big setback for the crab industry (Roy, 2020). Although Bangladesh did not face food shortages, nationwide lockdown measures undoubtedly affected the agricultural supply chain and the food consumption behavior of low-income Bangladeshis during the crisis period, which resulted in massive temporary unemployment in the country (GoB, 8th FYP, 2020).

COVID-19 has put millions of Bangladeshi workers out of jobs, and the average household income declined by 20%. A survey conducted by the Bangladesh Bureau of Statistics reported the following results:

- The average monthly income of each household was BDT 19,425 in March 2020, which decreased to BDT 15,492 in August 2020.
- The average expenditures of a family were BDT 15,403 in March 2020, which decreased to BDT 14,119 in August 2020—i.e., household expenditures decreased by 6.14% during this period.
- Some 68.39% of families went through financial crisis, and 21.33% of them had a monthly income of BDT 20,000 or less, which entitled them to receive government relief and assistance during April–July 2020.
- In March 2020, 8% of the country's workers were day laborers, which decreased to 4% in July 2020, but this percentage rose to 7.5% in September 2020.
- Also in March 2020, 17% of workers were businesspeople, which decreased to 10% in July 2020, but this percentage rose to 17% in September 2020.

The COVID-19 outbreak and its spread affected almost all the sectors in Bangladesh, including its social values. Huge demand for coronavirus certificates developed among Bangladeshi migrant workers for them to return to their host countries. In this situation, a few health centers emerged in the country to provide COVID-19 testing services, but some of them engaged in fraudulent business practices by issuing false test results/certificates for COVID-19. Even one of the

hospitals in the country sold huge numbers of certificates showing negative results for COVID-19 but without performing any tests. In another case, two doctors were found to have engaged in selling fake COVID-19 test results/certificates from their labs. This fraudulent activity aggravated the crisis, putting the victims in danger of not undergoing proper treatment. This fraudulence led other countries to impose entry restrictions on Bangladeshi citizens traveling for business, work, etc. A few ecommerce organizations started during the COVID-19 period and attracted people to their products by offering home delivery at cheap prices. But ultimately, most of them betrayed customers and took money in advance. However, all of them have been arrested and taken to jail while awaiting trial. But it caused a huge blow to the image of Bangladesh.

All these impacts of COVID-19 have turned Bangladesh into a biological disaster situation. Bangladesh is a disaster-prone but also disaster-resilient country. After taking proper governance measures to curb the spread of COVID-19 infections, it is now lifting restrictions on movement and withdrawing from lockdowns. Bangladesh has been successfully overcoming the shocks of COVID-19 as best it can within its limited scope and financial capacity but also thanks to the support and assistance of the international community.

Governance of COVID-19 in Bangladesh

The COVID-19 pandemic has posed a serious threat to the lives, livelihoods, economy, and development of Bangladesh. The Bangladesh community has been transformed by the global pandemic. Considering COVID-19 a biological disaster since its outbreak in the country, the GoB immediately took a disaster-management approach to save lives, livelihoods, and the economy. The government has increased its response and recovery plan, a program for strengthening health facilities; improved resource allocation for relief and stimulus packages; promoted its agriculture and manufacturing industries to ensure food security; taken steps to ensure positive and effective risk communication with citizens; and liaised with the international community for financial support, technical support, and information sharing to boost the economy and meet development targets. At the early stage of the pandemic, when COVID-19 first emerged, the GoB immediately evacuated its citizens from COVID-19-affected countries, imposed travel and entry restrictions and social-distancing measures, shut down all the educational institutions, and restricted the movements of mass vehicles while fighting against disinformation, setting up COVID-19 testing facilities, arranging treatment, building nationwide awareness of COVID-19 symptoms, tracing returnees from abroad to ensure that they quarantine at home, deploying its army to help the civil administration enforce lockdown and other COVID-19 related restrictions, providing relief goods to those in need, announcing stimulus packages for various sectors of economy, providing food to citizens at reduced prices, maintaining the stability of market prices for essential goods (Islam et al., 2020).

Imposing the lockdown sparked by COVID-19 threatened millions of people's livelihoods, including those of rickshaw pullers, day laborers, factory workers, maids, and others. Maintaining social distancing in a densely populated country like Bangladesh is an almost-impossible challenge because most people live in proximity to one another, sharing kitchens, bathrooms, and corridors (Ahmed et al., 2020). Meanwhile, the garment industry (RMG), which earned USD 29 billion in 2017 (BGMEA, 2020), was partially exempted from lockdown to maintain the livelihoods of a particular class of people and to export earnings. However, congested regions, especially in marginal communities, encountered challenges to the implementation of the WHO's social-distancing recommendations (Topader, 2020).

In March 2020, Bangladesh had only six physicians for every 10,000 people; a shortage of about 50,000 healthcare staff, including doctors; 1169 intensive care unit (ICU) beds, among which 432 were in public hospitals and 737 in private hospitals; and ninety-four laboratories to perform COVID-19 tests. As of 18 April 2020, the per-million COVID-19 test rate in Bangladesh was only 124, so many were left untested and thus unknowingly transmitted COVID-19 to others. Private hospitals in Bangladesh provide a larger share of healthcare services to patients; during the early stage of the pandemic, most the private hospitals were hesitant to treat COVID-19 patients owing to safety concerns for their non-COVID-19 patients and a lack of trained personnel to deal with COVID-19. Under these circumstances, the GoB took a strong stand on treating COVID-19 patients in private hospitals, and ultimately, well-known private hospitals came forward to treat COVID-19 patients, establishing a separate COVID-19 unit. From the beginning of the COVID-19 outbreak in the country, the GoB followed WHO directions and guidelines to limit COVID-19 transmission and provide treatment, recruited doctors and healthcare staff to fill vacancies, improved and strengthened the inadequate infrastructure of healthcare facilities, and announced stimulus packages on a priority basis to combat the challenge of COVID-19 by taking a disaster-management approach.

On 22 January 2020, the GoB required the Bangladesh airport authorities to screen travelers coming from China. On 1 February 2020, it evacuated and brought back 312 of its citizens from Wuhan, China, on a special flight that ensured that these citizens were attended to by physicians and nurses and ensured that the flights had the necessary medical equipment. All of these citizens were quarantined for fourteen days at Haji Camp, near Dhaka airport. On 22 January 2020, Dhaka Airport (Hazrat Shahjalal International Airport) was instructed to introduce thermal scanners to scan passengers coming from abroad, especially from China, for COVID-19 infection, and at the same time, the airport started tracing returnees from abroad who entered in the airport immediately before the introduction of thermal scanners. Furthermore, following the WHO prescription on 2 February 2020, the GoB suspended on-arrival visas for Chinese visitors, subsequently suspended all on-arrival visas and international flights, and directed the Chittagong Port Authority to examine all the sailors on ships coming from East Asian countries. On 17 March 2020, when eight Bangladeshis were confirmed as COVID-19 positive, all the educational institutions of the country were declared closed for the remainder of

the month. When the number of COVID-19 patients increased to thirty-three in Bangladesh on 23 March 2020, the government declared a ten-day nationwide public holiday, which was in essence a lockdown, from 26 March to 4 April 2020. During the “public holiday,” all public and private offices and organizations were forced to close, except public emergency services, pharmacies, and green markets, and people were also asked to stay at home and maintain social distancing. On 9 April 2020, the government imposed a complete lockdown in Cox’s Bazar, a district where the majority of the Myanmar Rohingya refugee camps were located. The Bangladeshi armed forces, in addition to regular law enforcement, were deployed to help the civil administration enforce social distancing and build awareness among the people. During lockdown, the government also operated a mobile court to maintain the stability of market prices for essential goods.

COVID-19 has had devastating biological impacts worldwide because there was no vaccine against this novel coronavirus, and a limited number of laboratory facilities and drugs were available to combat it. In this COVID-19 crisis situation, the GoB immediately responded with the appointment of an additional 2000 assistant surgeons (doctors) and 5054 nurses on an emergency basis. In 2021, Bangladesh expanded its laboratories to 800, its RT-PCR laboratories to 53, and its general beds and ICU beds to 12,347 and 1092, respectively, in public hospitals, all to provide COVID-19 tests and COVID-19 patient treatments (*Dhaka Tribune Report, 2021*). Meanwhile, COVID-19 laboratories have increased to 883 (*Daily Prothom Alo, 2023*). The GoB arranged for COVID-19 patient treatment in all public hospitals in the country—three of the hospitals in Dhaka earmarked for only COVID-19 treatment—and also established a new regular hospital and a field hospital at Dhaka exclusively for the treatment of COVID-19 patients.

To build nationwide awareness of COVID-19, the Directorate General of Health Services has issued daily bulletins through print, electronic, and social media featuring the latest updates on COVID-19 infections, deaths, recoveries, and other relevant information, including the specific facilities available for COVID-19 treatment and vaccination. The bulletin also covers the responsibility of citizens to avoid COVID-19 infections. In 2020, the international community was relieved to some extent by the good news that COVID-19 vaccines had been successfully invented by companies such as AstraZeneca, Moderna, Pfizer, and Sionphram, and the WHO approved those vaccines for use.

The Serum Institute of India came forward as one of the producers and merchandisers of the AstraZeneca vaccine. At the first opportunity, on 5 November 2020, the GoB and Beximco Pharma, a renowned pharmaceutical manufacturer in Bangladesh, reached an agreement with the Serum Institute of India to import thirty million doses of the AstraZeneca vaccine. Bangladesh paid in advance for fifteen million doses. On 25 January 2021, Bangladesh received five million doses of vaccine from the Serum Institute of India, as per its contract, and two million doses as gifts from the Indian government (*Dhaka Tribune, 2021*). Receiving in total seven million doses of vaccine from India, Bangladesh initiated a nationwide vaccination program on 7 February 2021, targeting 80% of the population for vaccination within six months (*Reuters, 2021*). As per its contract with the Serum

Institute of India, Bangladesh was supposed to receive five million doses of vaccine per month, but the company could supply only seven million doses before March 2021, and Bangladesh received another 3.2 million doses as a gift from the Indian government. Because of huge internal demand, India stopped exporting the AstraZeneca vaccine; therefore, Bangladesh had to suspend its first vaccination program, which was supposed to start on 26 April 2021, and look for alternative sources. Unfortunately, there was uncertainty about second doses for the 1.3 million people who had taken the AstraZeneca vaccine as their first dose. However, this uncertainty was mitigated after receiving AstraZeneca vaccine from Japan under the COVID-19 Vaccines Global Access (COVAX) initiative. Bangladesh also received the Moderna and Pfizer–BioNTech vaccines from the United States and the Sionpharm vaccine from China. As a part of its vaccine governance, the GoB launched an online registration portal prior to initiating its vaccination activities, inviting citizens aged fifty-five and above to use their national identity card (NID) number to register. Registration was gradually opened to citizens aged forty and above, then thirty-five and above, then thirty and above, and then finally eighteen and above. Later on, the government started vaccinating school-age children—i.e., those aged twelve to seventeen—and, under a special arrangement, people floating around the country who were outside of the NID network. The initial plan of the GoB was to vaccinate 80% of its citizens, but the target was revised to 70%, or about 120 million of the citizens of Bangladesh, in line with WHO directions. As of 15 February 2022, Bangladesh has administered 101.2 million doses as first doses, 72.9 million as second doses, and 2.8 million as third doses. As By 26 February 2022, the GoB complete its first-dose campaign by vaccinating ten million citizens over the age of twelve, including those who had no prior registration for vaccination or any NID or birth certificate, instead issuing them a special card for them to receive future doses (*Dhaka Tribune, 2022*).

The success of the vaccination campaign in Bangladesh entirely depended on import supply. On 23 September 2021, in a prerecorded speech for the White House Global COVID-19 Summit, Prime Minister of Bangladesh Sheikh Hasina called for effective global vaccination, for COVID-19 vaccines to be declared a global public good; to guarantee universal access, developing countries that have the capacity to locally produce vaccines must be allowed to do so. On 16 August 2021, the GoB signed a trilateral Memorandum of Understanding (MoU) for bottling, labeling, and dispensing Sinopharm's COVID-19 vaccine in Bangladesh. Under the MoU, local vaccine producer Incepta Vaccines Ltd was supposed to dispense five million doses of Sinopharm vaccine each month from its plant in Dhaka. Bangladesh agreed to purchase the necessary doses of vaccine from them, but Incepta Vaccines Ltd had not yet started production.

However, the COVID-19 situation in Bangladesh is now under control, having suffered few human casualties over a long period of time. A daily newspaper of the country reported the following: (a) The GoB has achieved remarkable success in its COVID-19 vaccination program; (b) 0.96% of those age five years and above have been vaccinated, starting from 7 June 2021; (c) 82% of people have received their booster dose—i.e., their third dose; (d) second booster doses—i.e., fourth doses—

started being administering in December 2022, and as of 20 December, more than 1.6 million Bangladeshis have received their second booster dose; finally, (e) the GoB has already spent BDT four billion to purchase, distribute, and administer COVID-19 vaccines (*Daily Prothom Alo*, 2023).

The GoB has so far allocated USD 15.4 billion to stimulus packages for various sectors of the country to restart economic activities and production and to minimize the suffering of citizens from the various effects of COVID-19 (Foyez, 2020; *Daily Star*, 2020a, b; Bangladesh Bank, 2021). From these packages, USD 166 million has been disbursed to 4.4 million beneficiaries, such as low-income people, elderly people, widows, people with disabilities, and informal sector workers.

The total package cost 3.6% of country's GDP, which had the following aims:

- Provide working capital to affected industries and service sector organizations.
- Supply working capital to the cottage, small, and medium-size industrial enterprises.
- Provide special funding for the export-oriented industries.
- Expand the facilities of the Export Development Fund (EDF), introduced by the Bangladesh Bank.
- Offer incentive packages for preshipment credit refinance schemes.
- Set up special honorariums for doctors, nurses, and other healthcare worker.
- Fund health and life insurance for medical service personnel.
- Set up an agriculture refinancing scheme and an agriculture subsidy.
- Institute a refinancing scheme for the low-income farmers and small business owners sell rice at BDT 10.00 per kg to low-income citizens distribute cash among specific communities.
- Fund incentive packages to expand the coverage of allowance programs.
- Build houses for unhoused people.
- Purchase the operation of 200,000 metric tons of Boro rice/paddy.
- Mechanize agriculture works.
- Freely distribute food materials.
- Offer financial assistance to Quami Madrasa students and teachers in two phases and to the imams and muazzin of mosques.
- Allocate funding to the Palli Sanchay Bank, the Probsahi Kalyan Bank, and the Palli Karma Sahayak Foundation to help youths and expatriates who lost their jobs because of the pandemic.
- Supply harvesters and reapers at subsidized prices.
- Provide loans for farmers at 4% interest, to offset the agricultural fallout of COVID-19 (Khatun et al., 2021).

Prime Minister Sheikh Hasina announced that all the government programs launched to help people adversely affected by the COVID-19 outbreak will continue until the crisis has ended.

The over 5000 tertiary educational institutions in Bangladesh together have four million students (Ahmed, 2020b). Aiming to diminish the disruptions to tertiary education, the GoB created a program to vaccinate all the students above age five on

a priority basis, but because of a shortage of vaccine, the program has taken time to complete. As a measure to keep students in touch with the learning process, the government announced online classes and assignment-based assessments. The University Grant Commission (UGC) provided loans to university students for them to buy laptops/smartphones for online classes. Because of a lack of resources, low-speed Internet, and mental illness, though, students could not avail themselves of the opportunity of online classes (Islam et al., 2020). Additionally, research has found that many students are uncomfortable with and distressed by online learning strategies (Al-Tammemi et al., 2020). Students faced challenges in switching to online lectures, adjusting to new online assessment methods and workloads, communicating with teachers, and dealing with many online education issues, such as the unavailability of electronic devices, weak or no Internet access, the high cost of Internet services, etc.

The government of Bangladesh (GoB) quickly responded with its limited resources and technical abilities to curb the spread of COVID-19 by instituting public health measures; funding programs to provide low-income and other vulnerable households with cash and food; and providing stimulus packages for small businesses to sustain employment in key sectors of the economy. The private sector of the country and the World Bank came forward to support the GoB in its strengthening its national arrangements for public health emergency services. During the lockdown, some nongovernment organizations (NGOs), businesspeople, politicians, and social workers in Bangladesh came forward to provide food and other aid to low-income people. In collaboration with the GoB, business hub Bashundhara Group built a 200-bed field hospital and provided masks and other PPE to doctors and other healthcare workers administering COVID-19 patient treatment. In addition to these businesses, both private financial and nonfinancial organizations also provided donations to the prime minister's special fund for COVID-19 management in Bangladesh.

The World Bank came forward (World Bank, 2020b), within 21 days of the first detection of a COVID-19 patient in Bangladesh, with a project titled "COVID-19 Emergency Response and Pandemic Preparedness Project," amounting to USD 100 million, to help Bangladesh in detecting, managing, and treating suspected and confirmed COVID-19 cases. This project has the following aims:

- Benefit Bangladeshi people with medical and testing facilities and a national health system.
- Equip designated laboratories with testing kits, reagents, and trained staff.
- Deliver medical support to meet increasing demands for the services required to handle and curb COVID-19.
- Mobilize services to ensure faster procurement when buying critical items for COVID-19 detection, prevention, and recovery.
- Support screening at designated health facilities and entry points in Bangladesh.

The World Bank also approved another few projects for Bangladesh, amounting to USD 1.745 billion, to help generate quality employment, provide services, and

start the country's economic recovery from the global pandemic, by building national resilience for the future. The projects have the following aims:

- Help Bangladesh to recover from the impacts of COVID-19 by attracting USD 2 billion in direct private investment and creating 1.5 million jobs.
- Support the GoB response to the COVID-19 crisis by facilitating recovery and building resilience in the economy as well as in workers and vulnerable populations.
- Establish an integrated cloud computing digital platform that will enable the government to operate virtually and deliver critical public services to citizens and businesses.
- Help the country recover from the economic impacts of COVID-19 by providing immediate social protection and livelihood supports to low-income people in rural areas by engaging them in labor-intensive civil works.

On 14 April 2021, the World Bank and the GoB signed three financial agreements, amounting to USD 1.04 million, to build the country's resilience to future crises, including vaccinations against COVID-19, and to accelerate the economic recovery of Bangladesh.

Virtual technology is considered one of the most effective governance tools to control the transmission of viruses in its community. The GoB has been pursuing virtual technology with its limited digital capacity since March 2020, when the first COVID-19 outbreak occurred in Bangladesh. Virtual technology has been extending critical roles in the fight against COVID-19. It is beneficial for exploring telemedicine; planning the treatment and mitigation of COVID-19 infections in the community, particularly in remote areas of the country, by building awareness among citizens; and helping to improve surveillance systems in crisis situations through live video streaming. Telemedicine, video streaming, virtual conferences, virtual courts, virtual classrooms, online educating, etc. have been used in Bangladesh to maintain social and physical distancing to control COVID-19 transmission across the country (Islam et al., 2020). Using virtual technology, the GoB and social media have been building awareness of the effects of COVID-19 among Bangladeshi citizens; of measures that need to be followed for controlling virus transmission; and of social responsibilities. The GoB produced some videos for its citizens on activities that they should do or avoid in order to stay safe from COVID-19. Almost all governments and NGOs have been carrying out their business with virtual technology, because of the increase in COVID-19 transmission. The judiciary of Bangladesh arranged virtual courts; the Ministry of Education used logistic support to encourage educational institutions to continue their academic activities; and the Heath Directorate, IEDCR, and the Ministry Health have been regularly meeting with the press through virtual means to deliver COVID-19 updates on research and development. Often by videoconferencing with local administrators and others, Prime Minister Sheikh Hasina has been closely observing the COVID-19 pandemic situation and the exceptional status of measures and initiatives taken by government to combat COVID-19. Bangladesh is increasing its digital capability, but some

financial constraints remain: It lacks technological infrastructure, and many migrants and marginalized people lack the skill to operate and the ability to purchase the devices that can access digital and virtual services.

Concluding Remarks

The COVID-19 situation in Bangladesh is rapidly evolving. Most nations in this situation opted for a total lockdown to prioritize saving lives at the expense of high costs. But a country like Bangladesh cannot afford such lockdown, because most of its huge population lives hand to mouth, with no savings and unsecure livelihoods. Thus, the GoB needs to consider lives and livelihoods equally when it takes measures such as complete lockdowns to curb the community transmission of disease. Lockdowns were undoubtedly one of the most effective measures to mitigate the transmission of COVID-19 but were not effective at mitigating the other effects of the COVID-19 crisis. Vaccination has so far been the best measure to save lives, and the GoB has given priority to vaccinating its citizens, including children, as per the guidelines of the WHO. Along with its vaccination program, the GoB instituted preventive measures against COVID-19, such as tracking cases and contacts; adding testing labs; providing sufficient testing kits; building awareness among citizens to promote, for example, good hand hygiene practices; and following strict quarantine measures. As the current number of healthcare staff members is proportionately inadequate for providing services to the about 170 million people in the country, students in the life science departments of universities were trained to carry out COVID-19 tests, immediately transforming their labs into COVID-19 testing labs. The GoB should guarantee access to proper hygiene facilities and its vaccination program for its marginalized population and a supply of PPE for its healthcare workers.

Ethnic communities, low-income families, people with disabilities, returning migrant workers, and informal and low-wage earners (such as Bangladeshis in women-headed households, sex workers, and tea plantation workers) have been at high risk of contracting COVID-19, so they need extensive humanitarian aid. The GoB should strengthen its aid program and ask the international community to help them.

About 7% of Bangladeshis are senior citizens (UN, 2020), who are especially vulnerable to COVID-19. These senior citizens more often require hospitalization and intensive care after contracting COVID-19. Thus, the GoB should arrange ICU beds and ventilation supports in at least every public hospital in the country. As a country of rivers, Bangladesh may consider arranging for mobile healthcare facilities for COVID-19 tests, using watercrafts for people in remote areas. Fear and anxiety about the pandemic have caused overwhelming stress for everyone (Xiao et al., 2020); mixed messages have ramped up stress levels, whereas facts have reduced stress levels. The GoB should task political leaders, social activists, print and electronic media, and religious leaders—particularly the imams of mosques—with disseminating factual scientific information on COVID-19 among the population of

Bangladesh. Disseminating basic COVID-19-related facts among marginalized people is the key to controlling the spread of the disease (Zhong et al., 2020).

Bangladesh needs a source of funding to restore the livelihoods that were adversely affected by COVID-19, to help its marginalized people, and to compensate it for hosting Rohingya refugees. The World Bank has come forward to support Bangladesh with projects aiming to mitigate the effects of COVID-19. Individuals and businesses in the country and government stimulus packages have supported citizens in combating the COVID-19 crisis, but these are not enough to meet the country's needs (*Dhaka Tribune*, 2020b; World Bank, 2020a). Therefore, immediate international help is required for Bangladesh to rebuild the livelihoods of its citizens and to build resilience. However, the GoB may prioritize saving money to continue combating the COVID-19 crisis, postponing less important development works and projects for the time being and working through diplomatic channels to find foreign sources of funding for its national interests.

The COVID-19 pandemic required nationwide initiatives and global cooperation because it has caused public health, economic, and social crises. Awareness needs to be raised among the public to protect themselves by abiding by health guidelines, maintaining good hygiene and social distancing, and avoiding crowded places and gatherings. On the GoB side, coordinated and effective planning and strategies are required for ongoing preparedness and a recovery program for the aftermath, to manage the COVID-19 crisis and adapt to a new normal. However, there is no alternative but to strengthen healthcare facilities and preparedness for future humanitarian efforts, in order to reach vulnerable communities. Considering the GoB should incorporate into the mid-term Five Year Plan and the long-term perspective plan the economic implications of COVID-19 on the basis of the vulnerabilities in the country that this crisis exposed. Without strong national strategic planning and multisectoral collaboration, including supports from the private sector of the country and the international community, sustainable recovery from a global pandemic such as COVID-19 may not be possible. The Bangladesh Bank (2021) recommended introducing a COVID-19 Pro-Poor Bond (PPB) as a policy option, to offer jobs to informal sector workers so that they can participate in public works projects.

Abstract

This chapter explores unsung climate heroes in correcting human-made climate change and disaster management in India. This research is based on longitudinal ethnographic fieldwork among the Kondhs in Niyamgiri, women in the village Dhinkia, and climate leaders in Nayagarh, Odisha, during 2016–2022. It presents three case studies of rural and indigenous women in Odisha leading the struggle to preserve endangered forests, mountains, rivers, and other vital natural resources. First, the Thengapalli (use sticks to protect the village and the forest) women of Nayagarh are working toward global climate action and environmental awareness. Second, the women of Dhinkia village, in leadership roles, are protesting the government of Odisha's persistent efforts to build a mega steel plant and protect their native land and livelihood. Third, indigenous women of

Niyamgiri mountain are protesting against mining to preserve their land and spirituality. Their network building through social media has resulted in a global alliance of indigenous peoples to protect the Niyamgiri mountain as a solution to the worldwide climate.

This work draws on several life experiences of grassroots organizers and activists intimately connected with their land and how their lives and livelihood have been crippled by development projects contributing to global warming. These women in rural and tribal regions teach us to create new insights for a stable and sustainable future. Their life experiences introduce us to a new vision of life and livelihood to cope with these disasters.

The stories of unsung heroes suggest women cannot be treated as marginal to the projects of development propagated by the state and corporations. The compelling evidence from India and other parts of the world shows that women have organized themselves in various movements to protect their land, livelihood, forest, and other national resources. It is incumbent upon the policy-makers at the United Nations and the respective states of various levels of local, state, federal, and supranational organizations to incorporate women's experiences and perspectives in making policies on development which has an everlasting impact on their lives and livelihood.

Unsung climate heroes · Extraction economy · Human-made climate change · Indigenous women's protest movements in Odisha

Introduction

Climate change has gravely affected people's lifestyles and devastated countries worldwide. India's bulging population and dependence on coal, gas, oil, and wood as energy sources contribute to the climate crisis. It has resulted in extreme weather – drought, floods, heatwaves, and constant drought – placing India fourth on the list of the ten most-affected countries globally on the Global Climate Risk Index (Kreft et al., 2015, p. 7). The Indian National Action Plan on Climate Change (NAPCC) notes that the effects of climate change could prove severe for women (MoEF, 2008). Khan's (2021) documentary, Overheated, observes "Indigenous people are the most acutely affected by the climate crisis – yet they are the most powerful actors in the fight against it."

With 1.4 billion people, India has one of the world's fastest-growing economies, and rural residents are migrating to cities to find work. Development projects have displaced over 21 million indigenous people, resulting in marginalization, a lack of livelihoods, and the depletion of sustainable resources. Forests, mountains, and water resources have been destroyed in the construction of national parks and reserves, roads, dams, and mining. This profit-based development model needs to be addressed in economic rationalization in the narrow paradigm of cost-benefit analysis. Because of mining, indigenous people from the mineral-rich hills have been forced to migrate to the cities in search of work. Women suffer more in these

regions than men because they provide the primary household resources (food, firewood, fodder, and water) and rear their children (Panda & Pandey, 2022). With climate change, families are getting uprooted both in the global south and north.

Women are viewed as victims of climate impacts rather than capable change agents within their communities. This problematic assumption that many policy-makers work with is reflected in state and national policies. In reality, women have proved to be the most potent change agents through effective cross-community participation and collaboration. Mary Robinson (2018) observes that “climate change, human rights, justice, equality, and individual empowerment are all inextricably linked.” Women worldwide have used their traditional and modern knowledge systems to develop alternative sources of livelihood to rebuild themselves, their culture, and the environment. By examining cross-cultural experiences, we can better understand the vital role women at the grassroots have played in dealing with disasters and climate change, coping with their wrath, and developing innovative ways of adapting to the aftermath (Arora-Jonsson, 2013; Jenkins, 2017; Hoffmann et al., 2022; Pandey & Kingsolver, 2022).

This chapter focuses on the prominence of indigenous women in introducing community solutions to global climate problems. It presents three case studies of rural and indigenous women in Odisha, leading the struggle to preserve endangered forests, mountains, rivers, and other vital natural resources: the research took place between August 2016 and September 2022. The research was primarily ethnographic, using primary and secondary sources of information. Using interviews, focus group discussions, and open-ended questionnaires, this study is based on the life experiences of climate leaders in three different regions in Odisha. (a) Women of Dhinkia village, the state’s coastal region, are protesting against the government of Odisha’s persistent efforts to build a mega steel plant and protect their native land and livelihood. (b) Indigenous women of Niyamgiri, the state’s southwestern region, are protesting against mining to preserve their land and spirituality. Their network building through social media has resulted in a global alliance of indigenous peoples to protect the Niyamgiri mountain as a solution to the worldwide climate. (c) The Thengapalli women of Nayagarh in the state’s eastern region are working toward environmental awareness and global climate action.

Methodology

1. One hundred and fifty open-ended interviews with women from the identified women’s groups, researchers working in this area, and concerned government and civil society personnel.
2. Twenty oral histories/narratives of women climate leaders who told their experiences of climate change, state imposition of mining, and corporate hold over their land.
3. Participant observation at tribal festivals, markets, schools, and villages, in different state locations.
4. Twelve women’s focus groups in rural and tribal regions were engaged in interviews. Women’s involvement and leadership in particular climate issues, and their perspectives, were investigated.

5. Secondary data collection based on existing literature review, e.g., books, articles, newsletters, and state and national policy documents about climate, gender, and environment.

This chapter draws on several life experiences of grassroots organizers and activists intimately connected with their land and how their lives and livelihood have been crippled by development projects contributing to global warming. These women in rural and tribal regions teach us to create new insights for a stable and sustainable future. Their life experiences introduce us to a new vision of life and livelihood to cope with these disasters.

Before presenting the case studies, the author will discuss her insights from a review of relevant literature on women's leadership in disaster management in different parts of the world.

The Paradox of Climate Change and Economic Development

The Sixth Assessment Report of the Intergovernmental Panel on Climate Change was released in August 2021 and concluded that climate change is now "widespread, rapid, and intensifying." Policy-makers and researchers have a broad consensus that human activities and their intervention cause the deterioration in global climate (mainly fossil fuels) (Eriksen, 2016; Hoffman et al., 2022). In contrast, the same policy-makers who complain about environmental problems also advocate continued economic growth, undermining an essential principle of ecological sustainability. Eriksen (2016) calls the sweeping neoliberal phenomena taken up by the states in collaboration with multinational corporations "a culture without a people." Its supporters share no customs, language, homeland, or religion but an exploitation motive.

"The whole climate crisis, one could argue," Kohn says, "is the product of people increasingly treating nature as a thing rather than a set of relationships" (Warren, 2021). According to Apffel-Marglin (2012), modern western males perceive themselves as autonomous, who alone determine their worlds (p. 27). They have interpreted nature as the agency of lesser others at the mercy of the masculine culture. The physical aspect of the climate crisis is connected to thoughtless economic development paying no attention to indigenous knowledge who respect nature, unlike the western capitalist civilization. A capitalist logic has prevailed in an extensive extraction economy without considering the well-being of nature and the people.

The Need for Women's Leadership Initiatives for Disaster Management

Women are becoming more visible in taking up climate leadership and engaging in environmental action everywhere. Studies show that women's participation and leadership in natural resource management make it more effective, leading to better

governance and conservation (Leisher et al., 2016). Studies have established that gender quotas make forest conservation and climate interventions more effective and lead to more significant equity in benefit sharing (Cook et al., 2019). According to a study across 91 countries, women's representation in national parliaments can lead governments to adopt more serious and effective climate change policies (Mavisakalyan & Tarverdi, 2019). However, women's voices, agency, and participation need to be more supported, which are under-resourced, undervalued, and unrecognized. In defending the land, environment, and indigenous peoples' rights, women's groups often face multiple barriers. Their voices are often silenced. They face diminishing funding for their projects and threats to their physical security. "Climate action must include investing in women activists, human rights defenders, and civil society organizations," UN Secretary-General Antonio Guterres said in a virtual town hall during the 66th session of the Commission on the Status of Women (CSW 66) March 14–25, 2022.

David Pogue (2021) reported that, in 2018, 3 years of drought dried up the water sources in Cape Town, South Africa. It rains in the winter. The water comes from the mountains and is stored in the six reservoirs in the city. With the drought, the reservoirs were empty, and 4.7 million people in the city faced day zero without water. To solve the problem, city planners and political leaders outlined expensive and environmentally disruptive projects like pipelines and desalination plants. Thandeka Mayiji-Rafu and her colleagues at Nature Conservancy, a local environmental nonprofit organization, devised an alternative approach. It will permanently provide 13 billion gallons of water by clearing 250 square miles of the invasive pine trees that had covered the nine and a half thousand different species of fynbos (fine bush) which make up the eco-reserve of the steep mountains around Cape Town. In the 1800s and early 1900s, the European colonizers brought invasive pine trees, each consuming 400 gallons of water daily. They had covered up the entire ecosystem in the mountains.

Hence the ecosystem was drying out. This project was the only permanent solution to provide water for at least 2 months to the city's population. The project hired women who had lost their agricultural jobs because of drought. Thandeka Mayiji-Rafu said, "the people that can stand on anything are women. Most of them are single parents that are the heads of the houses" (Pogue, 2021). By 2020, the teams cleared 90% of the area they had targeted. These women could earn a living for themselves and their families. Several women emerged as leaders, and this program has made a difference in their lives. This project has worked with nature and supported women to earn their livelihood.

Duolingo, 2022, reports that indigenous women combine ancestral knowledge and scientific and technological training in the Andean mountains of Peru to combat human-made climate change. Two Quechua indigenous sisters, Marcela Machaca and Magdalena, are native to the Andes mountains of Ayacucho, Perú – some 4000 m above sea level. In the rainy season, their community depended on over-flowing rivers. When the rain dried up, it turned on the melting snow on the glaciers. Since the 1970s, climate change has led to El Niño – melting glaciers – making them extinct in the Ayacucho region.

In 1992, Marcela and Magdalena returned to their village after completing their agricultural engineering degree. They were alarmed to see the worst drought they could ever remember. They listened to their elders and combined the ancient indigenous methods and local natural resources to build lagoons to capture rainwater on the mountain. The lagoons provide water for 200,000 people in the community. They are now more prepared for climate change.

Where forests in their successional variety of crops, flora, and fauna disappear, the retention of moisture, water supply chain, and sustainable economy that contributes to local livelihoods also disappear. Women in the villages of Sundarbans, known for thousands of square miles of wetland and vast mangrove forests sprawling between India and Bangladesh, have devised a new strategy to plant hundreds of thousands of additional mangrove trees to protect the battered environment (Raj, 2022).

In 2009 Cyclone Aila devastated the Sundarbans region, and 4.5 million marginalized farmers and fishermen lost their livelihoods to the excessive salination of seawater and their houses submerged in the rising sea.

In this region, men have migrated to the cities for work, and women often lead the climate change fight. Drawing on their indigenous knowledge of the Sundarbans, the women make hand-drawn maps of areas to plant mangroves. They grow saplings from seeds and transport them in boats to replant in mudflats. They keep track of their growth on a mobile app. The income from growing and planting mangrove saplings helps these women sell fish, vegetables, honey, eggs, and other local goods. “The women are like silent climate warriors,” said Shantanu Singha Thakur, an official with the district government (Raj, 2022).

Social movements from the global south compiled testimonies, images, and evidence to show how tree plantations represented “desertification, exploitation, colonization, and starvation,” while forests represented “regeneration, preservation, self-determination, and nutrition.” In Chile, an indigenous Mapuche described forest expansion by the state and private companies: “our parents and grandparents have been tortured and humiliated, we live and have lived in such precarious conditions... it is not easy to forget that” (González-Hidalgo & Zografo, 2017, p. 70). In the global north, indigenous communities experience such expansion as a “colonization of the attachment” they have to their ancestral lands (Groves, 2015). The landscape of forests is changing as they are taken over for extraction and protection, affecting indigenous communities’ identity and a sustainable future for their environments (Arora-Jonsson, 2019).

There have been instances of direct violence and more subtle strategies, practices, and governance technologies (Peluso & Lund, 2011) to control land necessary for forest extraction. In many regions, public-private investments in communal land use co-optation. For example, in pulp and timber plantations in Chile, violence and control were exercised by forest companies through “good neighbor” and “environmental education” programs that sought to foster good relationships between private and public forestry institutions and local communities by offering services such as medical care, hairdressing, and football tournaments. Arora-Jonsson et al. (2021) observe a subtle form of violence as propaganda and financial inducements to male

leaders of communities to encourage the sale of their community's lands that led to internal conflicts that reduced communities' ability and commitment to work together to protect their resources. One settler in Southern Chile remarked, "Paving our roads, building football pitches... the forestry enterprises are giving us pain-killers" (González-Hidalgo & Zografo, 2017, p. 70).

Similarly, in southeastern Cameroon, loggers began offering remuneration for cutting down moabi trees, leading to conflicts within households with men wanting to sell the lineage moabi and women actively opposing such sales because of the food, income, and medicines they got from the forests. They derived no benefits from the sales (Veuthey & Gerber, 2010). In East Kalimantan, the plantation company brought back men who had left their original communities to lead new communities to help them reclaim the abandoned lands in anticipation that they would work to ensure more company access to community lands (Colfer, 2008). The land was assumed to belong to men, not women, and compensation was given to men. This strategy, too, exacerbated internal community tensions creating new conflicts among men and between men and women.

Women's Resistance and a Quiet Politics of the Possible

Studies have highlighted women's roles in grassroots movements to protect forests (Shiva, 1989; Guha, 2002; Veuthey & Gerber, 2010). Women have been at the forefront of grassroots environmental actions to secure livelihoods (Rocheleau & Edmunds, 1997). Rural and tribal women have smashed local taverns that have threatened their family's well-being. There are widespread women's movements in India against making *arrack*, the local liquor, which significantly impacted community livelihoods (Tharu & Niranjana, 2001). There are few studies on women's protests and the lack of support for continued commercial logging to safeguard their family livelihoods (Reed, 2000). Jenkins' (2017) research in Peru and Ecuador and Pandey's research among the Dongria Kondhs (2018) contend that women's anti-mining resistance in Peru, Ecuador, and India depended on daily resistance and was rooted in women's daily lives and experiences. Their activism also implied integrating very unusual circumstances into their everyday realities, including death threats, kidnapping, torture, and imprisonment, mainly from the police, the forest department of the state, and corporations.

Based on long-term research with women's groups that organized themselves in villages in India and Sweden, Arora-Jonsson (2013, pp. 23–24) says that women's work was integral to making local village and forest governance work. However, such work does not have the recognized legitimacy accorded to the visible, male-dominated organizations and tends to remain outside the view of forest researchers and forest/development actors.

Organizing collectively in women's groups is recognized as a political act, although their focus was often on livelihood issues for the entire village. It was a "quiet politics" of belonging and caring about the local community connected to

other scales (Askins, 2014) and “politics of the possible” (Arora-Jonsson, 2013, pp. 107–150) as they navigated systems that constrained them to bring about change.

Based on the author’s ethnographic research in Odisha, the case studies of rural and indigenous women as change agents in climate justice provide alternatives and solutions that the western-centric world can learn from exploring sustainable solutions to climate change.

Case 1: Women as the Friends of the Forest: The Communities of Nayagarh, Odisha

Women in Nayagarh, Odisha, have played a vital role in protecting the trees in the lush forests and hills surrounded by the deep waters of the river Mahanadi and its tributaries. The forests of Nayagarh play an essential part in sustainable livelihood. The abundant sal trees are the common species found here, and men and women from the villages depend on the forests for fuel, fodder, timber, and medicinal plants. Women are the unsung climate heroes who do not get recognized.

With the paper mill and other associated factories, contractors active in profit making have employed local villagers to log the forests for paper, pulp, and wood. Even though they had the license to collect only bamboo for the local paper mill, illegal logging in the forests has been rampant. People from neighboring villages joined the loot, and the stonecutters were caught quarrying the forest.

The women’s movement in this region started first with the Gandhian nonprofit organization Brukshya O Jeevar Bandhu Parishad (BOJBP), translated as The Friends of Trees and Living Beings, in the village of Kesharpur in 1984. Many women joined this organization, schoolchildren were engaged in the campaigns, and their teachers organized planting activities. These leaders introduced social and environmental change irrespective of caste, class, and gender.

The women of the villages have been guarding their forests voluntarily with *thengas* against timber smugglers and are known as Thengapalli (*thenga* means pole and *palli* means turn). Women in groups take turns protecting the forest. They work with the village council, Tehsildar (revenue inspector), and even the district forest officer (DFO) to discuss illegal quarrying. Most times, they win against the wood smugglers. They have taken up forest protection by organizing themselves through Mahila Samitis (women’s organization). In 300 villages around Nayagarh, women became guards of the forests. They kept a watch on the smuggling of timber and forest produce and rejuvenated the forest land with native plantations. The forestry department in this area asserts these communities’ identities as forest caretakers.

By the late 1990s, the state of the forests in Nayagarh had changed dramatically with the BOJBP protection. Women became directly involved under *Paribesa Mahila Surakshya Vahini* (PMSV), the women’s Brigades for Environmental Protection. Manas Mishra, an environmental activist who studied the Nayagarh-Khurda belt’s forest-dwelling communities, says, “We can spot the Giant Indian Squirrel in the Nayagarh belt, which was not the case a decade ago. Even the soil moisture retention has improved” (Qureshy, 2021).

In the last decades, many other regions have taken up the Thengapalli practice. For example, women in the neighboring Mayurbhanj district have prevented logging and smuggling of wood with vigilance.

The local smugglers were afraid of these women's shame and exposure tactics, so they would not confront them, as reported by Mayurbhanj-based Sanjukta Basa, who runs NGO Sangram (*Ibid.*, March 27, 2021).

These women help the forest department provide surveillance of the forests within the Similipal Tiger Reserve in Mayurbhanj. The author has seen women in rural and tribal areas walk miles to the forest to collect food, firewood, and other sustainable resources. They have a dire stake in preserving forest resources compared to men. It falls on them to collect fodder for their animals and wood for fuel. "If the forest cover is depleted, the women must walk an extra mile to collect fuel for their daily needs" (*Orissa Post*, 2021). This awareness encouraged scores of women like Sudamani Mahakud to take up Thengapalli at Punasia village, Mayurbhanj.

Mahamud, at 65, has been guarding the forest in Punasia village for over two decades. "If I need fuel to cook food, I can take leaves and twigs from the forest, giving me greens and tubers. Some trees also have medicinal value. They are a source of food for the cattle as well. What more reasons do I need to protect the forest? I exist because the forest does" (reported in *Orissa Post*, 2021). Besides taking care of their forest, these women's *samitis* are engaged in many village development activities, like building roads by acquiring private land from high-caste landowners and collaborating with other NGOs to protect their livelihood and environment.

Nagraj Adve says that underprivileged women are the single largest social group affected by the climate crisis in South Asia. The climate justice movement must consider women's community-led efforts to better understand its impact on society and adopt a sharper gendered perspective on development (Rights and Resources Initiative, 2019). Women's collectives need to be supported to develop community building.

Women at the grassroots face many challenges in fighting for the cause of the land and the environment. In a 2018 study, UN Special Rapporteur Victoria Tauli-Corpuz explains the effectiveness of community-led conservation of nature: "many (indigenous people and local communities) share an ethical interconnection with nature through their languages, beliefs, and practices, reflecting a commitment to respecting and caring for the natural world" (2018). The worldview of the indigenous people entails their integral connection with nature rather than separate from it.

However, women have faced personal attacks by joining the forest service deemed as a male-dominated profession. Over 40-year-old Sabita Naik, a longtime Thengapalli volunteer appointed as a forest guard, Mayurbhanj, says, "since I would visit the police station often, they labeled me an 'undignified girl.' It became difficult for my parents to find me a groom. However, it did not matter to me. I had grown up listening to the stories about forests, and I did not want to lose them."

Thengapalli women in different parts of Odisha have revolutionized forest conservation since the 1980s. The Forest Rights Act (FRA) was enacted in 2006, which gives these indigenous communities the right to use and manage traditionally held forest lands. In 2009, the Odisha government promised that the forest titleholders would get a house under the Indira Awas Yojana (now Pradhan Mantri Awas

Yojana). While the forest department acknowledges these women's community service, they have yet to receive other benefits. "According to the data collected by Vasundhara, close to 32570 villages in Odisha have the potential to get Community Forest Rights (CFR), but only 2,800 applications have been approved and 2,300 titles given" (IANs, 2021).

The government blames the delay on insufficient documents, but the activists find the bureaucracy slow and insensitive. "We are talking about the rights of people who have been associated with forests for generations. They may not always have the documents. Many of them are unaware of the legalities involved and need guidance," says Bhagyalaxmi, a social activist in the region. She says many of these women environmental activists are unaware of the legalities involved.

These women understand the forest and are committed and motivated to protect it. FRA benefits will help these women and their families pursue forest conservation. Mahakud, a community activist, says, "Forest might be an entity for others, but it is our means of survival. We cannot think of a life without it." Sadly, these women are yet to be recognized by the FRA.

A 2018 Rights and Resources Initiative analysis emphasizes that major conservation investors are indigenous people and local communities. Research shows that indigenous people and local communities conserve their forests and use their communal rights to land and forests to promote biodiversity and lower carbon emissions. There is a positive link between lower carbon emissions and community-owned forests based on local rule making using forests as a surrogate for biodiversity (Chhatre & Agrawal, 2009). In the Brazilian Amazon, protected areas and indigenous territories are equally effective in protecting forests (RAISG, 2017). Research indicates that indigenous peoples and local communities are influential conservationists, with more substantial rights to land and forests positively associated with biodiversity outcomes (Pretty et al., 2009). Studies analyzing regions conserved by indigenous peoples and local communities show the effectiveness of indigenous peoples and local communities, particularly when conditions are conducive to conservation (Nolte et al., 2013). There is evidence in Asia and Latin America that indigenous people's multiple-use protected farming has a lower risk of wildfires than strictly protected areas (Nelson & Chomitz, 2011).

A 2018 report by the Rights and Resources Initiative (RRI) observes that "globally, Indigenous Peoples and local communities are investing an estimated 16–23 percent (i.e., US\$3.16–4.57 billion) of the amount spent by governments, donors, foundations, and non-governmental organizations, combined, on conservation. Much of the value invested by Indigenous Peoples and local communities are in developing countries, whereas the lion's share of public spending is in developed countries" (RRI Report, 2019).

Case 2: Rural Women Protesting Against the Establishment of Pohang Steel Company (POSCO)

In 2005, the government of Odisha signed a memorandum of understanding (MOU) with a South Korean Pohang Steel Company (POSCO) for setting up an integrated steel plant near Paradip port on the Bay of Bengal. Eight villages in three panchayats

of Jagatsinghpur district – Dhinkia, Gadakujanga, and Nuagaon will lose their land to the steel plant. Twenty-two thousand people will lose their livelihood to this 12 billion USD project and be displaced. The company will gain 2700 acres of land to produce 8 million tons of steel per annum (Mining Zone People's Solidarity Group, 2010). A local opposition group, POSCO Pratirodh Sangram Samiti (PPSS), emerged in 2006 against POSCO. Even though the state had gained 2700 hectares of land for the project, the protest from the villagers against POSCO was severe. POSCO realized it was impossible to carry on the project, and in July 2015, POSCO moved out of Odisha.

Local women played a decisive role in the victory of PPSS, the people's movement. This area's fertile land and the conducive climate help people grow paddy, vegetables, and fruits and collect fish from the rivers and streams. The land in and around Dhinkia is fertile and known for the abundant production of *Paana*, *Mina*, and *Dhana* (betel, fish, and rice paddy), and people did not want to give up their lands to build steel plants. Women joined hands with men in the movement against POSCO and the state invasion of their land. Both women and children worked on *Pana Barajas* (betel vines), collecting fish, and growing *paddy*, earning a decent living for their families. The Indian Oil Corporation Limited (IOCL) refinery has threatened the betel vines. Villagers were experiencing the polluting smoke from IOCL nearby, destroying their betel vines.

Women in Dhinkia, led by Manorama Khatua, took up the cause against the state's decision to gain land for POSCO. They joined in increasing numbers, reaching almost 5000 from all three panchayats.

In August 2014, Khatua told the author, "we will not give up '*pana baraja*' for our livelihood. Under the government-provided Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGS), older adults cannot work under the sun. Still, they can work in the beetle vines in the shade." Khatua said, "Our biggest struggle besides protecting our lands was not to allow the construction of Paradip road to pass through our village (Gobindpur). The road was critical for POSCO to progress its export activities." The road would have transported the iron ore from mining areas to the Paradip port and exported it to South Korea to process refined steel.

Women created a picket line outside their homes against POSCO. Their slogan was "POSCO hatao, Vitamati Bachao" (Remove POSCO and save our native land); "*Ame Pana, Mina, and Dhana Chadibunahi*" (We will not sacrifice our Betel Vines, Fish, and Paddy). Khatua emerged as the young leader of the movement uniting village women from different castes and tribes, vehemently opposing the state and POSCO to give up their profit-making initiative at the cost of the people.

"Children also came forward and asked the police to kill them before taking their land, as their mothers were always protesting," said Gauri from Dhinkia village. Children joined their mothers and built a human chain to stop any official from coming to their area. A respondent from the village said, "Men have supported, but women have been most active in the movement" (Panda & Pandey, 2022).

Khatua emerged as a forceful leader who had taken a vow not to allow POSCO to take over their land and livelihood at a young age. She took several rubber bullets fired by the police, still lodged in her chest. The state and police filed false criminal cases against her to intimidate her, but she remained resolute.

For 3 years (2006–2010), the movement was active with full support from women. The government declared section 144 to confine the people to their homes and cut off any food supply to these villages. Khatua says the women broke section 144 and stepped out in large numbers. (Section 144 of the Criminal Procedure Code of 1973 empowers the magistrate to prohibit an assembly of more than ten persons in an area. It will be considered an offense and liable for punishment.) The press cited “*Mahila Durga rupa Dharana kale*” (Women became the goddess Durga, who fights against evil to restore justice in the land). They defied the police and the pro-POSCO mafia and took to the streets in massive numbers. It was like a “do or die” situation for them. Until 2015, the government used many tactics to defeat the people. Pro-POSCO mafia (hired goons of POSCO contractors) threw hand bombs at the women when they were sleeping near the barricade. “This is the greatest betrayal of the state against its people to use the power of the criminal system to implicate villagers in many fabricated cases to intimidate them, instill fear in them, and, finally, break their collective strength against POSCO” (Alternative Law Forum, 2013, p. 21).

People’s protest against the company and the relentless struggle by the women have not allowed POSCO to make any headway in this region. According to Khatua, “POSCO has rolled back because of the women and their tenacity to fight the corporate forces.” People’s movement in opposition to the company and the women’s leadership left no room for POSCO to build its project.

Lately, the state government has invited JSW Utkal Steel Ltd to set up a mega steel plant. The project still needs to receive environmental clearance and is waiting to be cleared by the Union Ministry of Environment, Forest, and Climate Change. Utkal Steel has acquired 2700 acres of land from the state originally allocated to POSCO.

The POSCO *Pratirodh Sangram Samiti* (Anti-POSCO Campaign) is active in the name of the Jindal *Pratirodh Bheetamati Suraksha Samiti* (Anti-Jindal native land protection campaign) and has organized to defend the villages against the state police as in the past. Residents of the region complain that the steel projects will ruin the land and the livelihoods of over 40,000 villagers and will affect three villages of Dhinkia, Nuagaon, and Gadakujanga in the district. People are afraid of getting arrested, targeted as activists, leaving the villages, and living in fear. Padhi (2019) reports that Jindal Pratirodh Bheetamati Suraksha Samiti spokesperson Prasant Paikray said, “Amid the crackdown, over 100 people have been injured, including women and children.” Manorama Khatua noted, “There is a threat to our community and livelihood; we fear entering the village. We are currently trying to organize ourselves and fight for those who have been jailed.” The struggle continues. The state and corporate sector nexus are determined to take the land from the villagers in the name of development, a great danger to the community.

Case 3: Dongria Kondhs Protecting Niyamgiri as Their Identity and Spirituality

Niyamgiri hills, in southwestern Odisha, are home to the Dongria Kondhs, Kuttia Kondhs, and a dozen other Adivasis. Niyamgiri hills, a cluster of 1008 small and big mountain ranges and the source of Vamsadhara and Nagavali rivers, spread over

Kalahandi, Raygada, and Koraput districts in Odisha, is part of the Karlapat and Kotagarh biodiverse landscape.

The Dongria Kondhs and Kuttia Kondhs depend on Niyamgiri for their habitat, food, water, and livelihood. Sumati Jakakika, a Dongria woman, observed that “we go to Niyamgiri every day. Besides growing subsistence crops like ragi, turmeric, and paddy, we collect greens, dry wood, ants’ eggs, and all kinds of roots, vegetables, and fruits for our family and to sell in the market in exchange for clothes and medicine” (personal conversation, April 28, 2016).

Dongria and Kuttia Kondhs practice agriculture (shifting cultivation/swidden type) (In this agriculture, a patch of forest is cleared, and the undergrowth is burned. This patch is then cultivated for a few years (the Dongria Kondh refers to the patch as podu), after which another patch is cleared. The previous patch is left fallow for several years. Thus, patches are removed and used in a continuous cycle, ensuring forest regeneration in the unused patches and the availability of enough forest produce. This kind of agriculture allows the Dongria Kondh to grow a variety of millets, grains, and pulses in the fields, providing them sustenance throughout the year (Singh et al., 2018).), cultivating patches of land cleared from the hill forest in rotation, rearing livestock for meat and ritual sacrifices, and collecting various minor forest produce for sustenance and medicinal purposes (Saxena et al., 2010).

The Kondhs worship Niyamgiri as Niyam Raja, King of the Law, their source of living, identity, and heritage. The deep reverence that the Dongrias and Kuttias have for their hills and streams permeates every aspect of their lives: art, music, dance, and textile making, among others. The name Dongria is tied to *dongar*, meaning “hill,” and the word “for themselves is Jharania: protector of streams” (For details, please refer to Survival (2017)).

For the Dongria people, “the mountain is divine”; Purnima, a Dongria girl, tells New Yorker, “For many generations, we have worshipped these hills, streams, and trees” (Karnad, 2018). Many studies show the spiritual connection of women to the forest. Arora-Jonsson says that the “Swedish women’s groups also often invoked the spiritual concerning the forests” (2013, pp. 119–120). Women’s discussions of how the woods were a salve for their souls (Bergelin et al., 2009) provided transgressive spaces in an otherwise rationalized forum of employment opportunities or the environmental benefits of standing forests and the close links of scientific forestry to male foresters. Pandey and Kingsolver (2022) observe that nature as sacred and alive are treated as “partners in a successful movement by Dongria Kondh women in Odisha to stop the destruction of the Niyamgiri hills through aluminum mining. Whereas in the Appalachian region of the United States, a capitalist logic through which mountains are dead and without a role in acting on their future has prevailed in extensive coal mining through the destructive method of mountaintop removal.”

Niyamgiri hills are known for the abundance of bauxite. In 1997, the government of Odisha partnered with Vedanta, a UK-based mining firm, to extract bauxite from the hills. This ore yields the key ingredient of aluminum. The Kondhs are afraid of losing their land, livelihood, and identity and are opposed to Vedanta.

The Adivasis, a majority of them women, took their case to the supreme court and demanded protection of their land under the Forest Rights Act. In 2013, India’s supreme court ruled that the Dongria, a vulnerable tribal group, would hold a

referendum vote among the village councils to decide Vedanta's mining in Niyamgiri. The 12 Dongria villages voted unanimously against the mining project of Vedanta. Dongrias created history to choose to live in their land, their spiritual abode, without selling their soul to Vedanta. It was a historic decision for the Dongrias to live on their land without altering the climate of Niyamgiri.

Several years after the 2013 supreme court decision, new mining is introduced in the surrounding hills. The government brands protesters as Maoists and indicts them as going against the law and order of the state. The Odisha Mining Corporation, which was in a joint-venture agreement with Vedanta, continues to seek a forest clearance for the Niyamgiri mines, using its status as a state-owned corporation. In 2017, Kuni Sikaka, a Dongria Kondh woman who played a crucial role in the movement against Vedanta, was forced to surrender as a Maoist by the state police. The state coerces the Adivasis not only to lend their signatures in favor of mining but also to remain silent against injustice.

The people of Niyamgiri are not the only group to protest against the mountain as a spiritual being. In Southern Chile, indigenous Mapuche communities associate the reduction of native forests and water availability due to the expansion of tree plantations with the disappearance of the spirits (*ngen-ko*) in their territory. It is usually female Machi (shamans) who first notice this loss. If the *ngen-ko* are not there, Machi's knowledge and existence also disappear. This has impacted indigenous livelihoods and the survival of their knowledge and worldview that connect native forest biodiversity, water, medicine, and spirituality (González-Hidalgo & Zografos, 2017).

Implications

The climate heroes discussed above have put up a brave front to protect their mountains, forests, and rivers despite all the state and corporations' opposition and threats. The case studies in this chapter suggest that women's initiatives have proved necessary grounds for self-empowerment and essential to the democratic process to include women in policy-making. The campaigns made by these women prove the value of the forests beyond the commercial economy. In the industrialized capitalist world, forests are considered sources of extraction without considering the forest-dependent communities and the diversity of human-environmental relationships in and near the woods.

Extensive research on forestry across the global north and south has shown that women's work in forests is often ignored in mainstream forestry, especially related to male-dominated trade and commodification of forest products. Most of the women's forest-based labor is not recognized, and forest products that women collect for fuel, fodder, and livelihood are economically less valuable. It is high time to move away from the linear "take, make, and discard" model of resource extraction and unsustainable production and consumption toward a circular economy that restores, regenerates, is resourceful, and minimizes waste. It is important to recognize women

as climate heroes and their work and engagement with nature as essential and financially beneficial.

Numerous case studies worldwide support women as the climate heroes who have worked hard to improve the fragile environment and their livelihood and habitats. The United Nations acknowledges women's meaningful participation and leadership at all levels. Still, the challenge is to recognize their leadership, reward the women's collectives at the grassroots level for their contribution to climate healing, and ensure their role in the design, decision-making, implementation, and monitoring of the forests. The local and national governments must give these women financial support and provide them access to decision-making in climate finance. Persistent barriers still prevent climate heroes from accessing climate finance and making informed decisions (Liane Schalatek, 2020).

Conclusion

The unsung climate heroes discussed above are the heroes who have struggled hard to follow their tradition and championed the cause of a sustainable environment. They have created a new paradigm and discourse of knowledge and experience for a sustainable and equitable life reconnecting with the earth. They cannot be treated as marginal to the projects of development propagated by the state and corporations. The compelling evidence from India and other parts of the world shows that women have organized themselves in various movements to protect their land, livelihood, forest, and other national resources. It is incumbent upon the policy-makers at the United Nations and the respective states of various levels of local, state, federal, and supranational organizations to incorporate women's experiences and perspectives in making policies on development which has an everlasting impact on their lives and livelihood. It is about time that these unsung climate heroes are fully represented in the development narrative.

Abstract

Disaster response preparedness assumed critical importance in the 1990s and the decades thereafter at the international level. Yokohama Strategy Plan (1994) and Hyogo Framework for Action (2005) are considered critical documents for laying down comprehensive guidelines for prevention of disaster. This chapter highlights the critical importance of overall preparedness in mitigating the hazards of disaster. The period between 1999 and 2004 in India witnessed severe natural disasters one after other in the states of Orissa and Gujarat including Indian Ocean Tsunami. These disasters demonstrated knee-jerk reaction and exposed institutional inadequacies and limitations of the overall disaster response mechanism in India. In this backdrop, Disaster Management Act, 2005, passed by the Indian Parliament, emerged as a critical piece of legislation which is the omnibus of subordinate legislation and acts as a constitution for the institutions that handle disaster management mitigation, management, and relief at both ends of the federation in the Indian Union. This chapter examines the success model of

Odisha State Disaster Management Authority in handling natural disasters in the state under the broad institutional arrangements enshrined in the Act.

Keywords

Disaster management · Legislation and institutions · Natural and man-made disasters · Institutional response · Mitigation · Disaster management · National disaster management authority · Psychological stress and trauma · National disaster response force

Introduction

Indian subcontinent is prone to all kinds of natural disasters. Around 80% of its geographical area is vulnerable to various forms of disasters. Droughts, floods, earthquakes, cyclones, landslides, and avalanches are regular disaster activities in some regions of the country. Out of 28 states/eight union territories, 22 are prone to disaster activities of different kinds. Coastal states and union territories of India are more vulnerable to cyclones of different kinds emerging in the Bay of Bengal and Arabian sea. Several disaster-related reports have identified India as one of the most vulnerable countries to natural disasters.

Any solid edifice of disaster management requires a holistic policy and regulatory framework with supporting infrastructural and institutional arrangements. Traditionally disaster management has been conceptualized in terms of merely extending emergency relief during disaster period and postdisaster rehabilitation only. A comprehensive disaster management plan includes operational conceptualization of various scenarios which can emerge during disaster and accordingly incorporate various elements of response mechanism to handle them. It includes placement of required logistics and resources near the disaster site beforehand. The plan must have sufficient budgetary funds allocation covering the multidimensional aspects of prevention and preparedness. It should also contain roles and responsibilities of various agencies involved in management of disaster. Mitigation has always been a core concept in the overall disaster management plan. The basic objective of mitigation is to identify the reasons, mobilize institutional response, so that the impact is less on the community. Operationally, an ideal disaster management plan includes predisaster assessment, preparedness, disaster stage response, search and rescue, and reconstruction and rehabilitation stages.

The present chapter examines how management of disasters in India has evolved from an ad hoc structure to a robust methodological tool with proper policy and regulatory framework supported by institutional arrangements. Various policy initiatives for management of disasters adopted over a period of time by the Central and State governments have reduced human casualties in disaster-prone areas. The focus of the chapter is to highlight the success of Odisha State Disaster Management Authority in managing natural disasters. Before the Odisha model is discussed, it is proper to understand the broad policy framework and initiatives of government of India at macro level and how it has acted as a guiding source, replicated and

customized by various states and union territories while handling disasters. The vulnerable coastal states have acquired professional excellence in management of disaster over the years as per local conditions in their respective areas.

Institutional Response and Mechanism

Legislative Action: The main trigger point for a holistic and comprehensive plan for disaster management in India was realized after massive earthquake in Gujarat in the year 2001. The Gujarat earthquake also popularly known as Bhuj quake killed between 13,805 and 20,023 people, injured 167,000, and destroyed nearly 340,000 buildings. Gujarat Disaster Management Act was passed in the year 2003 to address various issues related to different forms of disasters including earthquake. Gujarat state was the first state in the country to have adopted such a comprehensive legislation on Disaster. Need for a similar Act was also realized in other vulnerable states/UTs. The various activities of disaster management matrix and paradigm in India got a holistic institutional response with the enactment of Disaster Management Act in 2005 passed by Central government. This is a very comprehensive Act which puts in place multidimensional operational activities of disaster management under specified agencies in a federal system of governance. This is very much evident from the concept of disaster management explained in Section 2 of the Act. The definition of disaster as mentioned in Section 2 is very broad and holistic in nature and covers all aspects of disaster management starting from prevention, mitigation, reducing risk, and capacity building. The central focus is on overall preparedness for evacuation, rescue, relief, and rehabilitation.

In other words, the comprehensive definition of disaster management takes care of predisaster, disaster, and postdisaster situations. Seventy-nine sections in the Act cover other critical dimensions of the disaster management and provide institutional response mechanism up to the grassroots level.

Creation of Bodies and Institutions: In pursuance of Section 3 of the Disaster Management Act, a national body called **National Disaster Management Authority** has been created to oversee and coordinate the various activities related to disaster under the ex officio chairmanship of the Prime Minister of India. Nine other members of the authority are nominated by the chairman. The authority acts as an apex body at the national level.

National Disaster Management Authority (NDMA): As an apex body, it has been assigned the responsibility of coordinating various activities related to disaster management with various stakeholders in a federal structure. Theoretically, management of disaster in a State is the sole responsibility of the state government. However, the magnitude, severity, and scale of any disaster could also require assistance in terms of logistics and finance from the central government. NDMA facilitates this on the ground. Some of the core responsibilities of the authority include formulating national-level plans and guidelines for management of disaster. It regularly coordinates with other stakeholders of the state and union territories during disaster situation on the ground as per standard operating protocol. National plan and guidelines are prepared by the Disaster Management Authority through

extensive consultations with all the stakeholders for effective control of natural and man-made disaster. It effectively tries to bridge the operational gaps among various stakeholders during the management of disaster. Over a period of time, it has also identified newer forms of natural and man-made disasters which require prevention. They have accordingly formulated guidelines and policies to address critical issues in handling such disasters. For example, natural disasters like thunderstorm, strong wind/cloudburst, and hail storms/glacial lake burst flood/forest fire were also brought under the overall gamut of disaster management in the national plan in 2019.

NDMA has issued various guidelines and reports covering different dimensions of the disaster since 2007. The comprehensive list of these documents may be seen in Annexure 1.

National Cyclone Risk Management Project: Keeping in view the vulnerability of Cyclone in various coastal states, National Cyclone Risk Management Project was initiated by Government of India. NDMA has been entrusted with the responsibility of coordinating and implementing this project in various coastal states. The foundation of this project is based on four critical pillars: Early Warning and Dissemination Systems (EWDS), Construction of Cyclone Risk Mitigation Infrastructure, Technical assistance for Risk Management, Capacity Building and Knowledge Creation, and Project Management and Implementation Support. The focus of this project is to create proper infrastructure in vulnerable areas covering different aspects of the disaster management. It includes construction of multipurpose cyclone centers for shifting the affected communities well in time. This also includes construction of roads and bridges in the coastal areas for speedy movement of logistics and manpower in disaster-prone areas during disaster. Early warning helps in early evacuation. This project has helped several states in reorienting and modernizing their warning dissemination technical infrastructure with accurate prediction.

India is a union of states and union territories having federal system of governance. Apart from National Authority, a similar structure known as State Disaster Management Authority (SDMA) operates in all the States/UTs under the overall leadership of the state Chief Minister of the State/ Administrator who is also designated as ex officio Chairman of the authority. The State authority has its own executive committee with experts as its members like the national body. The basic objective of the state body is to prepare a state-level plan for the whole state at par with the National Plan in the vulnerable and disaster-prone areas as per local conditions.

District Disaster Management Authority is a body which operates at district level to coordinate the disaster management activities in subdivisions up to village level. The District Magistrate (DM) is the Chairman of the district-level body. Like State-Level Plan, the DM prepares the Action Plan for the whole district. Thus, the act provides a holistic and proper framework for coordinating various activities of disaster up to the grassroots level through creation of similar institutional response mechanisms at every level starting from national level till the village level.

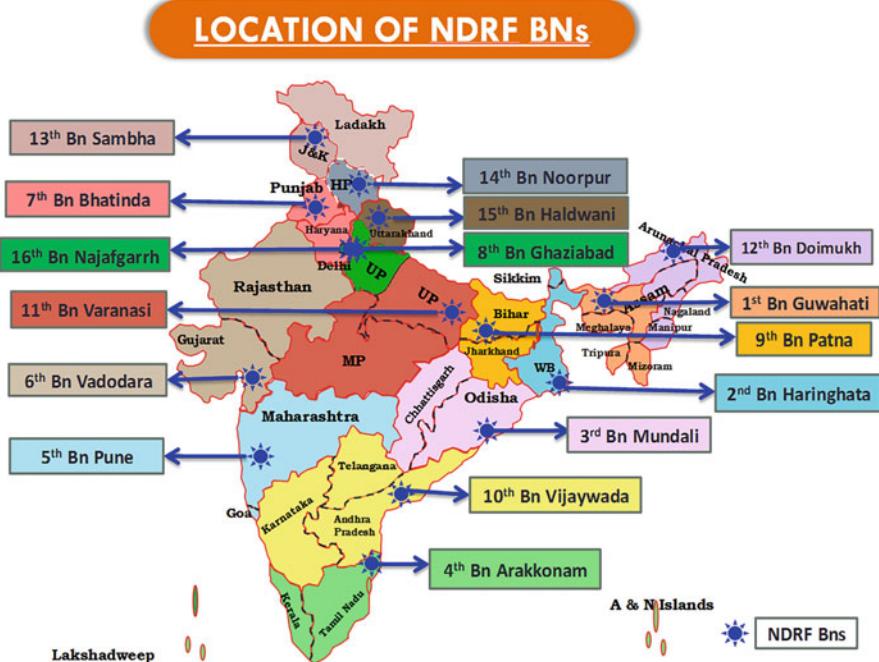

National Institute of Disaster Management: Disaster management tools and techniques are constantly improving. The nature and form of disaster has also been

changing with the passage of time. Several countries in the world prone to various forms of natural and man-made disasters have come up with new tools and techniques for response and prevention. Several Indian states and UTs prone to disaster have come up with good practices in handling disaster situations. In order to ensure that all such new research and good practices in the area of disaster management is shared through an integrated organization, a national body called National Institute of Disaster Management (NIDM) was created. NIDM collates good practices from the different states and has created a national data base of knowledge covering different aspects of disaster management. The overall responsibility of the institute is also to carry out constant research in different aspects of disaster management and train various stakeholders involved in the management of disaster from time to time.

National Disaster Response Force: Historically the management of disaster has been the responsibility of the local law-enforcing agencies. They have been an integral part of the rescue, rehabilitation, and reconstruction activities. Theoretically, local police are not properly trained to handle disaster situations in a professional manner. They always lack proper wherewithal and logistics required for handling disaster situations. Over and above, handling of disaster situations in a primary role for law-enforcing agencies always affected their core and essential citizen-centric responsibilities like prevention and detection of crime. The operational limitations of the civil Police were realized by the policy makers. It created a National Disaster Response Force exclusively to handle and respond to disaster situation across the country. Section 44 of the Disaster Act talks about the constitution of the force and other related aspects. Initially it started with a manpower of eight Battalions. The present strength of NDRF is fifteen Battalions. The manpower component of the force consists of officers and men from BSF, CISF, CRPF, ITBP, SSB, and Assam Rifles. Each Battalion consists of 1149 personnel. NDRF personnel were initially deployed for routine law and order duties also. On October 25, 2007, in a meeting of NDMA under the chairmanship of Prime Minister of India, NDRF was divested of its law-and-order responsibilities. It became a dedicated force to handle disaster-related duties only under the overall command and control of a Director General Of Police rank officer.

All the 15 battalions of NDRF are located in 16 different locations in the country on the basis of vulnerability profile. These battalions have been trained and equipped to respond to all man-made and natural disasters. The basic philosophy behind raising more battalions and placing them in vulnerable states was to reduce the response time of the force in reaching the disaster site. Creation of a separate force to handle disaster situations has proved to be a game changer. The distribution of various battalions may be seen in Graph 1.

Within a period of fifteen years, NDRF has emerged as a very effective force in rescue and rehabilitation activities of disaster management in various parts of the country. The professionalism and competence of the force has not only been recognized nationally; it has also emerged as a savior of people in distress in South Asia. Their response during Japan Tsunami in 2011 and earthquake evacuation in Nepal was highly appreciated by all.

Graph 1 Source: NDRF Website

Apart from search and rescue operations, NDRF also conducts mock exercises and community awareness programs. Various community awareness programs and mock exercises carried out by the force can be seen in Table 1.

Psychological Care and Vulnerability Reduction: Every disaster creates tremendous stress and trauma on the minds of people staying in disaster-prone areas. The trauma and stress continue even after the disaster has ended. American Psychological Association has emphasized effective management of mental trauma and stress in the pre- and postdisaster situations. In order to address the issue of psychological trauma and stress, National Disaster Management Authority has taken up a project titled “Preparation of Psychological Care and Preparedness Modules and IEC Materials.” The thrust of this project is to identify, collate, and compile research materials in the form of a training manual which could enhance the operational capacity and fine tune the response mechanism of volunteers involved in extending psychological support and assistance to distressed persons during disaster and postdisaster situations on the ground. The same document could also be shared with all the stakeholders at all levels. National Institute of Mental Health and Neurosciences (NIMHANS) has partnered with NDMA for designing, developing, and standardizing the training materials in this regard. This will go a long way in reducing psychological trauma and stress in the vulnerable communities in disaster-prone areas.

We will now discuss the response of Odisha State in handling disasters under the overall institutional framework just discussed above.

Creating a Robust Infrastructure and Empowering Community for Disasters: Orissa Model (Natural Disaster)

Odisha (renamed from Orissa in 2011) is one of the most vulnerable coastal states situated along the coast of the Bay of Bengal. Bay of Bengal is very prone to frequent natural disasters like cyclones, floods, and occasional tsunamis. Thirteen districts of the state share their boundaries with the coast. The State has acquired the tagline of disaster capital of the country due to frequency of cyclones and tsunamis. More than 100 tropical cyclones occurred during 1891–2021 in the state, highest among other coastal states.

During the October 1999 super cyclone, more than 10,000 people died and millions became homeless. Similarly, Cyclone Phalin affected more than one million people and property worth crores was damaged. Both these devastating cyclones also demonstrated the institutional inadequacies of the overall response mechanism and forced the state administration to formulate an effective and holistic response mechanism plan for handling of disasters in the state. This led to creation of Odisha State Disaster Management Authority. The authority is entrusted with the responsibility of managing disasters in the state through various stakeholders as per the mandate and institutional arrangements delineated in the Disaster Management Act. Odisha has a disaster-specific institutional mechanism which operates on the principle of decentralized governance.

The State government has reoriented its entire approach in handling the disaster situation on the basis of previous bitter encounters with deadliest tsunamis. Gradually, Odisha has achieved professional excellence in managing disasters through a very robust institutional response system with proper and critical infrastructural base in disaster-prone areas. Simultaneously, it has also empowered the community of these areas to cope with the challenges of predisaster and postdisaster situations. As a result, fatalities which used to be in 10,000s in the 1999 Cyclone came down to double digits in subsequent cyclones.

The following infrastructural arrangements under various components of the National Cyclone Risk Management Project of government of India have played a very critical role behind the success of disaster management in Odisha.

Early Warning Dissemination System (EWDS)

In the year 1999, Odisha government came to know about the cyclone and its travel route very late. By the time it could get itself ready to handle it, a super cyclone had critically damaged the communication infrastructure. As a result, communication with all the critical stakeholders got affected. Contrary to the 1999 situation, the warning system has now improved substantially. EWDS has been placed in 1205

villages in coastal blocks within 5 Km from the coastline. Satellite-based mobile data voice terminals have also been installed in the vulnerable areas. Several towers were placed within the close proximity of the community clusters situated near the coastline to ensure that early warnings of tsunami and cyclone reach the communities at large without any technical disruption and hindrance. Early accurate warning by the Indian Meteorological Department has helped the state in managing disaster better. The accurate predictions regarding route of the cyclone with little deviation have increased the confidence level of all the stakeholders on the ground. Over and above, early warning system prevented large number of unnecessary evacuations taking place in haste and panic.

Multipurpose Cyclone Shelters: On the basis of past exposure to various forms of cyclones and tsunamis, the state has constructed more than 400 multipurpose cyclone shelters all along the coastline in the state. These multipurpose shelters act as a safe habitat for the vulnerable component of the community. These centers have provision for Community Kitchen. Lifesaving materials and other critical gadgets are also available in these centers. They are fully equipped with all the critical logistics required during emergency situations. Adequate number of youths have been trained to take up the critical responsibilities of search, rescue, and immediate medical aid. The trained youth also ensure that cyclone warnings reach the affected communities in time without creating panic.

Apada Mitra (Community Support Base)

Community is at the center of any disaster situation. Preparing the community and ensuring their help in various activities like creating awareness, rescue, and rehabilitation is very critical in the overall management of disaster. The community has been integrated in the overall disaster response mechanism through a very effective Central Government scheme called “Apada Mitra” (Disaster Friend) started in 2016. The center has fixed a target of training 200 volunteers in selected 30 most flood-prone districts in 25 states of the country who could be effectively utilized during various stages of disaster. Jagatsinghpur and Puri districts have been selected as flood-prone districts in Odisha under this scheme. In both these districts, 400 Apada Mitras, 200 each, have been trained to undertake various responsibilities during predisaster and disaster situation. Apada Mitra has been very effective in overall disaster preparedness at the community level. It has also helped in speedy dissemination of alerts and mobilization of the people necessary for effective implementation of evacuation operations. A well-trained community resource base also acts as force multiplier during rescue and search operations during disaster.

Identification of tsunami-prone villages: On the basis of frequent exposure to natural disasters, the state has identified tsunami-prone villages. Identification of the villages was done on the basic criteria of intrusion of seawater. This identification helped the disaster management authority in undertaking various proactive preventive measures at various levels to minimize the damage. These measures have further enhanced their operational response capabilities at different stages of disaster. The

preparedness level of some of the villages were as per the parameters and norms of UNESCO tsunami reduction plans. The UNESCO team physically verified these parameters in 2019.

The overall disaster management response of Odisha has received praise and accolades from everyone. Learning lessons from exposure to some of the deadliest tsunamis and cyclones, Odisha has reoriented its overall response and preparedness mechanism. It has created required infrastructure in the vulnerable areas to handle multidimensional challenges emerging from natural disasters. The State Disaster Management Authority has also empowered the community as a whole in the overall disaster management plan. It has assigned critical responsibilities to the community in the vulnerable areas. The positive results of various measures adopted by the state and policy initiatives could be seen during handling of Super Cyclone Fani in the year 2019 and subsequent years. Fani witnessed one of the biggest evacuations of human beings in the human history during disaster. The effective handling of super cyclone Fani brought Odisha on the global stage. It soon became a global success story duly recognized by international bodies like United Nations. The policy initiatives of the State government of Odisha were also acknowledged and appreciated by the Prime minister of India, Shri Narendra Modi. Effective handling of Phalin stands documented in the category of best practices in 2019 by National Disaster Management Guidelines for Community Based Disaster Risk Reduction.

The emergence of Odisha as a success model in management of natural disasters has been possible largely due to creation of robust infrastructure and response mechanism and community empowerment up to village level by Odisha State Disaster Management Authority.

Conclusion

Management of natural and man-made disaster in India has evolved from an ad hoc and unstructured response system into a highly professional body. This has been possible due to an important Central legislative action by enactment of Disaster Management Act, 2005. The Act has been able to create important institutions for a holistic management of various kinds of natural as well as man-made disasters. It has also created a harmonious ecosystem of cooperation, coordination, and trust for various stakeholders in effectively handling the challenges of disaster in a federal structure. NDMA as an apex body has been constantly improving the response mechanism of States/UTs. We can sum up by highlighting some of the important institutional initiatives which have changed the whole narratives and paradigm of disaster management in India.

Early Warning Dissemination System (EWDS): Early warning regarding any disaster not only helps the various agencies in planning a proper response, but also prepares communities to respond better. Early warning helps critical stakeholders in relocating the resources and logistics in the predicted areas. It ultimately saves human lives and minimizes damage to property and critical infrastructure. We have seen how early warning system helped Odisha in evacuating the vulnerable

component to safe shelters during various cyclones. The same state suffered heavy casualties and damage to property in the absence of a modernized and improved early warning dissemination technical infrastructure.

Multi-Purpose Cyclone shelters (MPCS): Shifting the vulnerable segment to safe shelters as soon as warning signals are received is an important part of preventive strategy in disaster management. Vulnerable coastal states like Andhra, Goa, Odisha, Maharashtra, Karnataka, west Bengal, Gujarat, and Kerala have constructed sufficient number of such shelters where the affected component of the population is immediately shifted on the basis of alerts. These MPCSs have been able to prevent lot of casualties during the disaster. These MPCS are equipped with all critical logistics and resources required for effective response in disaster situations.

Apada Mitra (Disaster Friend): Community is the worst sufferer in every disaster. Any disaster affects lives and property at a large scale. Integrating community in the overall response framework of disaster management is very critical. This has been very effectively and beautifully achieved by creating an institution of "Apada Mitra" by government of India in 2016. NDMA has fixed certain targets for each State and UT. The training of volunteers under this scheme is constantly monitored and reviewed by the authority. This scheme has enhanced the overall resource base of the disaster management mechanism.

National Disaster Response Force: Creation of a special force for rescue of disaster victims has proved to be a game changer in the overall management of disaster in India. The NDRF has emerged as a highly professional force with proper infrastructure and logistics at its disposal in managing disasters. Raising of more Battalions as part of State Disaster Response Force and stationing them in vulnerable disaster-prone states has reduced drastically their response time finally saving human lives and properties at large scale. Their efforts have been duly acknowledged and recognized by the Prime Minister in his public speech on various occasions.

Subhash Chandra Bose Apada Prabandhan Puruskar: Several members of civil society including members of Disaster response force suffer heavy casualties during rescue operations. Subhash Chandra Bose Apada Prabandhan Puruskar recognizes the outstanding contribution of individuals and bodies involved in the management of disaster. Every year, three awards are given to institutions and individuals. While an institution gets an award of Rs 51 Lakhs, an individual gets 5 Lakh. This is another very important institutional milestone in the management matrix of disaster in India. Such awards recognize the unsung heroes who demonstrate exemplary bravery and courage while handling serious disaster situations putting their lives at risk. It also motivates and acts as a catalyst for individuals and civil society organizations to contribute in the management of disaster with their areas of expertise.

Coalition for Disaster Resilient Infrastructure (CDRI): Several countries in the world face multiple challenges from different forms of natural and man-made disasters on regular intervals. They have also acquired and developed professional expertise and excellence in handling them. Neighboring countries always look toward each other during disaster situations for immediate help in rescue and

rehabilitation. There was a need for an institutional mechanism to formalize the various dimensions of cooperation and assistance. India took lead in this direction. Coalition for Disaster Resilient Infrastructure created in the year 2019 is the result of this initiative. CDRI is a platform which facilitates cooperation of various governments at international level. It also brings together various development banks and other institutions and facilitates sharing of knowledge base. Creation of this body has facilitated the cooperation of 22 countries and seven organizations in effective management of disasters in India.

CDRI assumed the status of an international organization duly ratified by the government of India in July 2022. This status entitles CDRI for exemptions and other privileges as contained in United Nations Privileges & Immunities Act, 1947.

Creation of various institutions, bodies, and proactive policies under the overall umbrella of disaster management in the country has enhanced the overall reputation and credibility of National Disaster Management Authority at international level. India has also played a critical role in fostering international cooperation and coordination in management of disasters with its professional acumen and expertise. Several countries, particularly in Asia, look forward to India during disaster incidents. India has always extended all kinds of help and assistance to neighboring countries during disasters keeping in tune with its age-old philosophy of "Vasudhev Kutumbakam." Vaccine Maitri is the latest example of Vasudhev Kutumbakam. During Corona Pandemic, India provided Covid 19 Vaccines to many countries in the world. As of 21 February 2022, India had delivered around 16.29 crore doses of vaccines to 96 Countries.

Abstract

Flood is a major natural disaster that affects millions of people's livelihood. In Assam, the Brahmaputra and the Barak rivers cause floods every year, resulting in substantial economic losses. Historically, flood events have been affecting people's livelihood, particularly that of the small and marginal farmers living in low-lying water-logged areas in the Barak Valley region of Assam. Vast areas of the cultivable land in the valley remain submerged under water throughout the peak farming season, i.e., from May to October. Recurrent flooding in the lowland do not favor the farmers for agricultural production as the fields remain submerged and unused for 6–7 months. The lack of suitable livelihood options, diminishing income, and poor economic condition of the riparian community has led to the loss of interest in agricultural activities. This situation of the poor and marginalized farmers is causing the out-migration of labor to major Indian cities such as Bangalore, Pune, and Mumbai. Hence, it is necessary to design

S. Das

T. Das (✉)

Department of Ecology and Environmental Science, Assam University, Silchar, India

appropriate mechanisms and policy measures to make the community more resilient to such natural disaster.

Keywords

Flood · Community resilience · Barak Valley · Assam · Northeast India

Introduction

Flood refers to an overflow of a large amount of water beyond its reasonable limits, especially over what is usually a dry land. Among all the natural catastrophes, flooding has claimed more lives and caused destruction of infrastructure; it has affected socioeconomic and health conditions, and disturbed the natural ecosystem (Barrows & Bruin, 2006). Asia accounts for nearly 50% of flood-related fatalities in the last quarter of the twentieth century (Jonkman, 2005), where countries like Bangladesh, India, Nepal, and Pakistan exhibit a high level of vulnerability (World Risk Report, 2011). In India, the risk related to flood is expected to increase substantially in coming years as a result of both climate change and continued unplanned development (Ali et al., 2019). Therefore, flood mitigation policies and measures have to be implemented in order to enable vulnerable societies to increase their resilience to flood hazards for which there is a necessity of detailed study.

Barak valley is situated between Longitude 92°15' E and 93°15' E and Latitude 24°8' N and 25°8' N with a total geographical area of 6922 km², which comprises 8.9% of the geographical area of Assam in Northeast India. It is situated in the extreme corner of the Indian subcontinent bounded by Bangladesh in the West and the border states of India like Manipur in the East, Mizoram and Tripura in the South, and Meghalaya in the North. The valley is surrounded by hills on all sides (Fig. 1). The River Barak along with its tributaries like Jiri, Chiri, Madhura, Jatinga, Harang, Kalain, and Gumra (to the north), and Dhaleshwari, Singla, Longai, Sonai, and Katakhali (to the south), originating from hills of Manipur and Mizoram, is the second largest river basin system in northeast India (<http://india-wris.nrsc.gov.in>). Besides the river and its tributaries, the landscape is also dotted with numerous other water bodies like ponds, oxbow lakes, floodplain lakes, seasonal wetlands, marshes, and waterlogged areas (Rajbongshi et al., 2018, Reang et al., 2018). The climate of the region is warm and humid and is influenced by the Southwest monsoon extending from April to September (Mahanta & Yamane, 2020; Fig. 2). Because of its typical bowl-shaped terrain condition (Fig. 1) and characteristic rainfall pattern (Fig. 2) Barak valley has been assigned to a landscape dominated by tropical floodplain conditions. As a result, the low-lying areas experience periodic flooding and water logging from adjacent rivers and wetlands (Prasad et al., 2019). Historically, flood events in the Barak Valley region of Assam have been affecting people's livelihood particularly the small and marginal farmers living in low lying water-logged areas. During some years, due to erratic rainfall vast areas of the cultivable

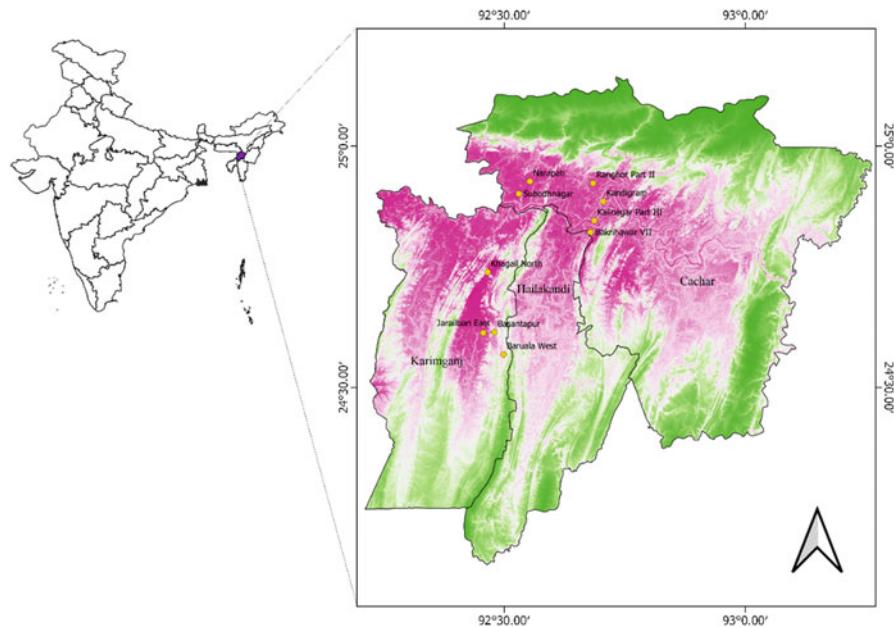

Fig. 1 Map showing the study area and the sampling villages

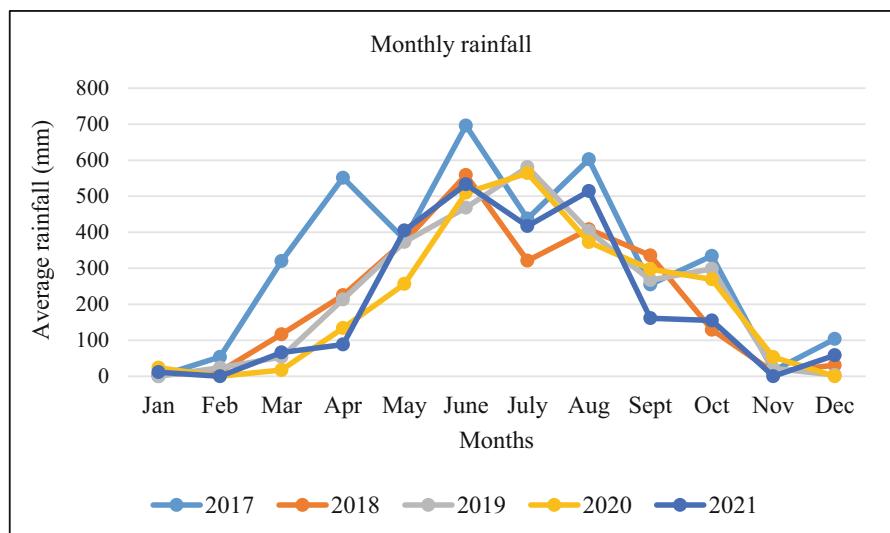

Fig. 2 Average variations in monthly rainfall in Barak Valley for the past 5 years from 2017 to 2021. (Source: [http://hydro.imd.gov.in/hydrometweb/\(S\(l41nejyxulldql45oe4l1pzd\)\)/landing.aspx](http://hydro.imd.gov.in/hydrometweb/(S(l41nejyxulldql45oe4l1pzd))/landing.aspx), and https://imdpune.gov.in/Clim_Pred_LRF_New/Grided_Data_Download.html#)

land particularly the paddy fields remain submerged throughout the peak farming season, i.e., from May to October.

Flood and the associated siltation of aquatic systems particularly in River Barak and its tributaries pose major disaster-related threats in Barak valley. It threatens riverine and wetland ecosystems due to habitat loss of many organisms and causes loss of lives and livestock, damage to infrastructure, property, crops, and many other assets of the riparian communities (Bhagabati et al., 2006). The major problems caused by floods are affecting those local communities who are solely dependent on their immediate surroundings for their livelihood by practicing agriculture, fishing, and allied activities (Goyari, 2005).

Though recently the frequency of floods in the region has decreased considerably due to measures taken by the government at different levels, many low-lying areas are still facing problems of flood and waterlogging conditions. Moreover, the flood highly affects the livelihood of thousands of villagers who are solely dependent on nature for their survival. In the present study, we aimed to identify the significant issues related to floods and the associated socioeconomic problems in Barak Valley and to suggest possible management options for increasing community resilience.

Materials and Methods

Our study area comprised the Barak valley's floodplain region, covering its three districts, viz., Cachar, Karimganj, and Hailakandi. We restricted our study to flood-affected areas (5–11 m asl) where ten flood-affected villages were purposively selected (Fig. 1). Since the estimated total number of households in selected villages are 1165 hence a sample size of 350 households have been selected for the present study so that at least 30% of the households are covered for the required data collection (Shively, 2011). Both primary and secondary data have been used in the present study. The primary data have been collected from the field by adopting tools like interview schedule ([Appendix-I](#)), direct observation, and group discussion. Secondary data have been collected from books, journals, and internet sources. Interview with the local panchayat leaders has also been conducted to collect additional information about the issues of floods and government plans and policies for rehabilitation of the victims of the flood-affected villages. The survey related to the present study was conducted in the year 2021.

Results and Discussion

Socioeconomic Profile of the Flood-Affected Communities

The socioeconomic profile of the communities residing in flood affected areas of Barak valley revealed that communities belonging to scheduled caste constituted the bulk of the population (63%) followed by Muslim minority (21%), other backward classes (14%), and the general caste (2%) (Fig. 3a). Most respondents (30%) attained

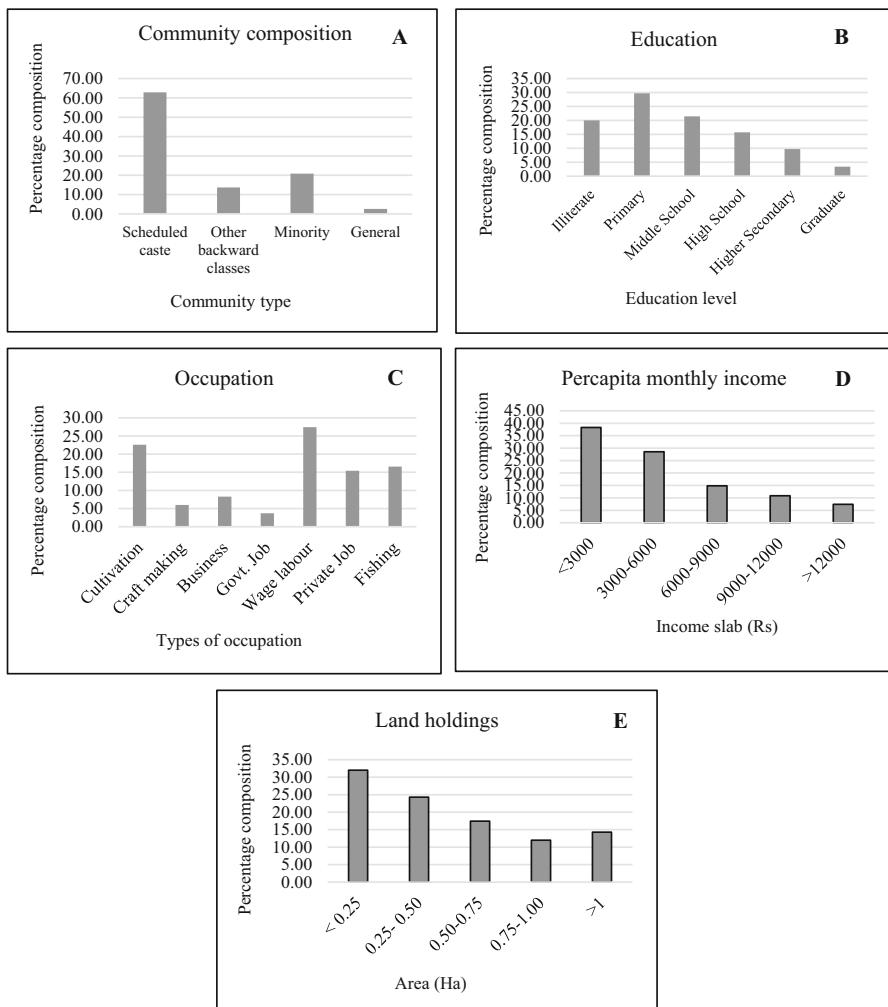

Fig. 3 (a) Community composition, (b) educational status, (c) occupation, (d) per capita monthly income, and (e) land holdings of people inhabiting flood affected areas of Barak Valley, Assam

education up to primary school and only few (3%) were graduates, while 20% of the respondents were illiterate (Fig. 3b).

The respondents were involved in different activities to sustain their livelihood that comprised of wage labor (25%), rice cultivation (23%), private job (15%), fishing (16%), business (8%), government job (4%), craft-making (6%), and vegetable cultivation (3%) (Fig. 3c). Nature-based occupations, viz., agriculture, fishing, and craft-making constituted 45%, while the remaining 55% of households depended on non-agricultural and non-fishing profession. This indicates that the

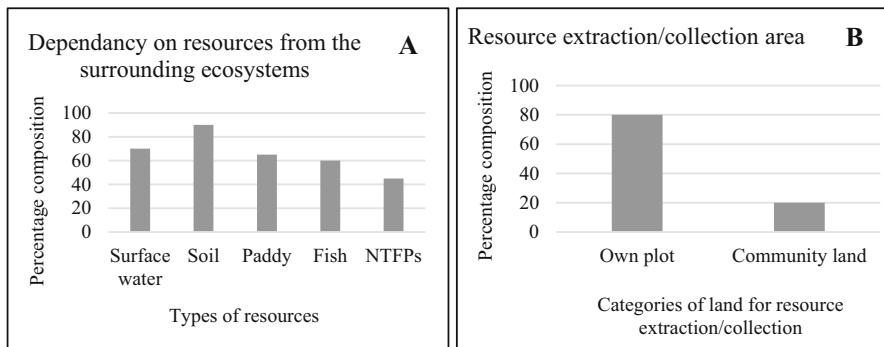

Fig. 4 (a) Dependency on resources, **(b)** resource extraction/collection area of people inhabiting flood affected areas of Barak Valley, Assam

people are involved in traditional nature-based activities as well as other livelihood options available to them.

The monthly per capita income of the majority (66%) of the households is below Rs. 6000 followed by households (15%) having monthly family income between Rs. 6000 and Rs. 9000 and only a few respondents (11%) have family income between Rs. 9000 and Rs. 12000. The number of households having a monthly income of Rs. 12000 or above was negligible (7%) (Fig. 3d). The study shows that per capita monthly income of the majority of the respondents is far below the monthly per capita net national income at current price during the study period (INR 11,182 and INR 10,735 during the year 2019–2020 and 2020–2021, respectively, source- <http://pib.nic.in>).

Majority of the households (32%) had land holding less than 0.25 hectare. Households having land holdings from 0.25 hectare to 0.5 hectare comprised of 24%. A smaller number of households (14%) have land holding more than 1 hectare (Fig. 3e).

The local communities in the study area depend on different types of resources from the nearby low-lying areas and wetlands for their survival. They are dependent on such area for cultivation of paddy (65%), fishing (60%), collecting surface water (70%), NTFPs (45%), and soil (90%) (Fig. 4a). The resources are used for their own consumption and other uses, while the surplus is sold to the local market. It is also observed that most of the respondents (80%) extract resources from their own plots of land and rest (20%) extract resources from community land (Fig. 4b).

Livelihood Issues of the Flood-Affected Communities

Livelihood is a significant issue for the people affected by flood in the study area. Their traditional means of livelihood such as fishing and cultivation are now no more sufficient to sustain their family primarily due to progressive decline in the production of such resources from their nearby ecosystems. Like cultivation, animal rearing

is also not feasible for the community due to lack of grazing land particularly in the rainy season (April to September/October). This might be attributed to the decline in soil fertility, recurrent incidence of flood, and increase in human population and livestock resulting in overexploitation of the existing resources resulting in depletion of the natural resources and less per capita availability of resources. As a result, majority of the cultivators and fishermen have now opted for wage labor to run their families. However, wage-earning is not a sustainable means of livelihood due to the non-availability of work opportunities. Moreover, the government program for rural employment, such as Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA), is insufficient to provide sustainable livelihood to the people. As a result, many youths from the study area migrate seasonally to towns and metropolitan cities of India such as Bangalore, Pune, Mumbai, and Chennai to work in the construction sector, domestic works, and security services. Such outmigration often leads to family breakups where the elderly, women, and children are left in the village without much support. Unemployment is a significant problem among the flood-affected communities of the Barak Valley. Topographical isolation and several other obstacles like lack of proper information restrain mainstream entrepreneurs from establishing industries in the area. Large-scale paddy cultivation is not possible due to erratic rainfall patterns. Moreover, commercial rice cultivation is not profitable due to the lack of market demand for local rice. Large-scale commercial cultivation of vegetable and cash crops is not practiced by the farmers, who are mostly habituated to traditional stereotypical cropping modes. Though there is much scope for commercial fishery due to the typical terrain condition of the region, it has not been utilized to a significant level. Thus, paddy cultivation and fishery sectors cannot provide sufficient livelihood options to the flood-affected communities, which calls for finding out other viable and strategic livelihood options like cultivation of vegetables and cash crops in dry season, cultivation of mushroom, fish farming, etc. However, prior to these there should be proper training and awareness program for the rural youth for sustainable livelihood and there should be proper market facility to supply the various agricultural and fishery resources for commercial purpose. This may be made possible by implementing various cooperative societies at rural level in the study area. This would also lead to generation of employment opportunities for many of the rural youths within their local vicinities. This would possibly prevent "rural-push" for their livelihood and strengthen their family support system and hence better socioeconomic system.

Flood causes multidimensional problems to individuals, community, and society. While respondents were asked about their perception related to the adverse effects of flood in their localities, majority of them (90%) opined that flood causes destruction of agricultural crops. Around 80% of the respondents reported the problem of drinking water due to floods followed by 70% respondents who reported the problem of communication and rearing of livestock, 60% reported the problem of unemployment, 40% talked about occurrence of disease, 30% reported inundation of households, and others (20%) have reported about the adverse effects on their fisheries (Fig. 5a). The provision of drinking water is a significant problem in rural areas of Barak valley, particularly for the communities living in flood-affected areas. The

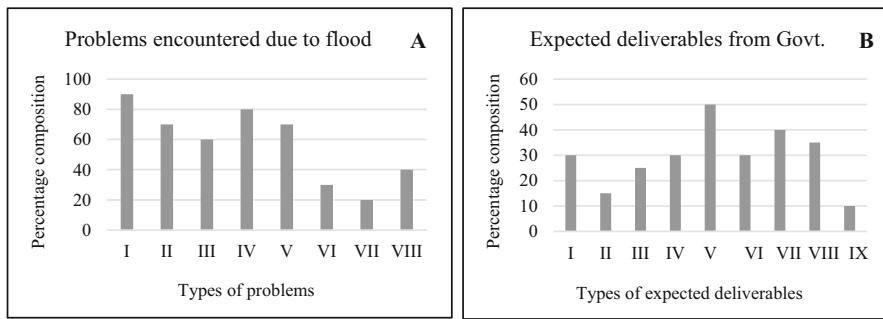

Fig. 5 (a) Perception of flood-affected communities regarding adverse effects of flood in their villages (I = Destruction of agricultural crops; II = Affect livestock; III = Unemployment; IV = Drinking water problem; V = Communication problem; VI=Inundation of households; VII = Affect fisheries; VIII = Disease) and, (b) Perception of flood-affected communities regarding deliverables from the Govt. for overcoming the adverse effects of flood in Barak Valley, Assam (I = Microfinance for starting fisheries; II = Net for protecting fish ponds; III = Irrigation facility during dry season; IV = Relief during major flood incidents; V = Provision for safe drinking water; VI=Dredging of nearby rivulets and rivers; VII=Proper implementation of MGNREGA; VIII = Microfinancing with training for self-employment; IX = Others)

people of flood-affected areas use surface water from rivers and ponds and ground-water sources like tube wells for drinking and domestic uses. Such communities face problems related to drinking and potable water during the flood. The water supply facility by Public Health Engineering Department (PHE) is not available in most surveyed villages. In addition, the flood-affected communities face communication problems due to lack of proper roads. During the monsoon, commuters in such villages depend on boats to connect to the nearest town to earn their livelihood.

Importance of Community Resilience for the Livelihood of the Flood-Affected Communities

Communities need social and institutional support to overcome the adverse effects of flood in Barak valley region of Assam. Fifty percent of the respondents said they need government help for provision of safe drinking water in their localities as they face this problem throughout the year. Around 40% of the respondents prefer proper implementation of MGNREGA to generate employment in their localities. Micro-financing with training for self-employment is preferred by 35% of the respondents whereas 30% of respondents prefer microfinancing for starting their own fisheries. Thirty percent of respondents suggested dredging of rivulets and rivers nearby their localities to avoid the problem of flood and the same number of respondents (30%) opined for relief during major flood incidence whereas some others (25%) suggested for irrigation facility during dry season. Around 15% respondents suggested government assistance to protect their fisheries by net fencing and the rest of the

respondent (10%) need other sort of government assistance such as improvements of roads, housing facility, and loans for purchasing boats (Fig. 5b).

It may be mentioned here that Barak valley has extensive water bodies of different types like ponds, wetlands, water-logged areas, etc. (Prasad et al., 2019). These are inhabited by diverse aquatic organisms like varieties of aquatic plants and fishery resources that can be used for food and other purposes for self-consumption and commercial purposes. Community participation is a crucial mechanism to execute such livelihood options. Social solidarity and cooperation among the communities living in flood-affected areas are needed to participate in community-based livelihood activities. The problems related to lack of social and human capital of the flood-affected community, primarily due to lack of awareness, illiteracy, poverty, long tradition of backwardness, and their isolation from mainstream society, are required to be taken up to make the affected community more self-dependent and resilient.

The local communities, particularly those affected by the flood should be provided with alternative options of livelihood. As the region often faces the problem of sudden heavy rainfall and the associated incidence of flood, resulting in periodic submergence of the low-lying agricultural area, there should be an initiation of some community resilient mechanism among the local farmers to mitigate the recurrent flood problem in this region in context of their livelihood sustenance. In this regard, the traditional rice farming systems such as *Asra* and *Boro* practiced in the wetlands and water-logged low-lying regions may be improvised by introducing the concurrent practice of rice-fish culture that would ensure ecological conservation as well as economic gains (Das et al., 2014; Bhattacharjee & Das, 2018). Local workshops may be organized to create awareness among the communities about the various livelihood options they may undertake by using the existing commercially important aquatic plant resources such as *Trapa natans* (Water chestnut) and *Euryale ferox* (Water cress), which have the possibilities of bioprospection and value addition. Besides, the existing aquatic habitats may be used as nursery of fish and for culture of ornamental fishes, duck raising, and practice of floating vegetable gardens. Mushroom culture and its commercialization can be another viable livelihood options. The local youths should be encouraged to opt for various start-ups through proper training and workshop. Government institutions like Fishery, Agriculture, as well as Animal husbandry and Veterinary departments of the state along with various NGOs need to extend their support to initiate such alternative means of livelihood by aiding necessary funds and adequate training to the stakeholders and arranging the marketing facilities for the agricultural and fishery production in addition to other commercial activities. Seasonal cultivation, particularly the cultivation of vegetables and cash crops in the winter season (dry phase), is another alternative solution that requires sustainable infrastructure and techniques and proper training.

The government of Assam has taken many measures to control the flood situation in the state. As a measure of flood control, recently, many plans and policies have been implemented by the government through different grants from national and international funding agencies. The two big river festivals in Assam known as Namami-Brahmaputra and Namami-Barak, in 2017, were organized by the government. Along with the mission of overall development of the regions, the festivals

also aimed to dredge the rivers to increase the water retention capacity making these rivers suitable for navigation, thereby expanding the scope for trade and commerce (India Today, 2017 November 18). Implementation of flood control projects and the construction of many dams and barrages in the hill states of Manipur and Mizoram have controlled the flood situation to a considerable extent. Moreover, the Assam State Disaster Management Agency (ASDMA) and District Disaster Management Agency (DDMA) in the Cachar district also take measures to control floods. Several measures are taken by DDMA before, during, and after the flood. The flood-prone villages are identified by DDMA to conduct rescue and relief operations in the event of flood. It also provides relief during flood in relief camps. Both temporary rehabilitations (e.g., shelter or camps) and permanent rehabilitations (e.g., setting up of check dams, river embankments, pucca houses) are provided to the affected people on the basis of requirement (<https://cachar.gov.in>, District Flood Contingency Plan, 2020–21). At the block level, there is provision for forming a Block Disaster Management Committee (BDMC) to ensure community participation in flood management activities where the local leaders, teachers, and senior members of different localities within a development block are also involved. As per the government report, many embankments have been constructed recently to control flood caused by major overflowing rivers of the region. Both short- and long-term projects have been taken by ASDMA, DDMA, and other concerned departments of the government of Assam for construction of embankments, dams, and sluice-gates to control major flood situations in the region (ASDMA, 2016). However, it may be mentioned here that though there are various plans and policies formulated by ASDMA and DDMA for flood management in the affected villages, (<http://asdma.assam.gov.in>, village disaster management plan) these are not rolling down effectively to all the flood-affected villages of the region. The respondents are of the view that the government facilities are not sufficient for their livelihood.

Conclusion

Flood has been a long-term problem for the people of Barak Valley in Assam. Though the government has taken measures to control major flood and associated problems, the attention of the government is to be drawn to resolve the problem of seasonal flood and waterlogging conditions particularly in the low-lying regions, which affects livelihood of riparian communities. This may be done by adopting community resilient mechanisms and providing alternative means of livelihood as discussed above. At the same time, community participation is to be ensured to resolve problems associated with flood and waterlogging situations in the region. The study therefore highlights the necessity of multidimensional “top-down” and “bottom-up” approaches to flood mitigation in the study area by strategically enhancing resilience of the flood-affected communities for maintaining their livelihood in a better way. The study therefore calls for a more detailed investigation in this regard incorporating all the stakeholders, viz., the flood-affected communities, different officials related to disaster management, and policy makers so that

sustainable policy measures can be implemented looking into the nature of the terrain and ecology of this region.

Appendix-I

Part A: General information and socioeconomic characteristics of the riparian communities

1. Name of village:
2. Number of households in the village.....
3. Name of respondent:
4. Age and sex.....
5. Community.....
6. Occupation:
7. Educational Qualification.....
8. Monthly/yearly income:
9. Landholdings within wetland (area)

Part B: Utilization of wetland resources and quantity of each goods collected/harvested/extracted

1. Do you extract/utilize any wetland resources? [YES/NO];

If yes, please mention the name of the resources:

2. Do you cultivate paddy? [YES/NO]; if yes, please mention the following:

- (i) Purpose of cultivation:
 - (a) Own consumption.
 - (b) Selling in markets.
 - (c) Both.
- (ii) Cropping and harvesting months.....
- (iii) Total quantity of harvest per season.....
- (iv) Total area of paddy cultivation.....
- (v) Cost for cultivation of paddy.....
- (vi) Economic value of the total yield of paddy.....
- (vii) What are the problems you encounter

- (a) Before paddy cultivation
- (b) During paddy cultivation
- (c) After paddy cultivation

3. Do you cultivate vegetables/cash crops? [YES/NO]; if yes, please mention the following:

- (i) Purpose of cultivation:
 - (a) Own consumption.
 - (b) Selling in markets.
 - (c) Both.
- (ii) Cropping and harvesting months.
- (iii) Total quantity of harvest per season.
- (iv) Total area of vegetable cultivation.
- (v) Cost for cultivation of vegetables
- (vi) Economic value of the total yield of vegetables
- (vii) What are the problems you encounter?
 - (a) Before vegetable cultivation
 - (b) During vegetable cultivation
 - (c) After vegetable cultivation

4. Do you culture/capture fish? [YES/NO]; if yes, please mention the following:

- (i) Type of fishing:
 - (a) Capture fishery.
 - (b) Cultured fishery.
 - (c) Both.
- (ii) Purpose of fish culture:
 - (a) Own consumption.
 - (b) Selling in markets.
 - (c) Both.
- (iii) Quantity of fish harvested per season from:
 - (a) Culture fishery.
 - (b) Capture fishery.
- (iv) Average cost for per kg of culture fishery resources
- (v) Average cost for per kg of capture fishery resources
- (vi) What are the problems you encounter during
 - (a) Capture fishing
 - (b) Culture fishing

5. Do you use any other wetland resources [YES/NO]; if yes, please mention the following:

- (i) Name of the resources.
- (ii) Purpose for use:
 - (a) Fuel wood.

- (b) Fodder.
- (c) Preparation of furniture/handicraft items.
- (d) Others (please specify)
